and $ax + by + cz + d_2 = 0$ is given by $\left| \frac{d_1 - d_2}{\sqrt{a^2 + b^2 + c^2}} \right|$

Intersection of Two Planes

If $a_1x + b_1y + c_1z + d_1 = 0$ and $a_2x + b_2y + c_2z + d_2 = 0$ represents two different planes, then equation of plane passing through the intersection of these planes is given by

$$(a_1x + b_1y + c_1z + d_1) + \lambda (a_2x + b_2y + c_2z + d_2) = 0$$

Angle between a Line and a Plane

Let the equations of the a line and a plane be $\frac{x-x_1}{l} = \frac{y-y_1}{m} = \frac{z-z_1}{n}$ and $ax + by + cz + d = 0$

respectively, then the angle θ between them is given by

$$\sin \theta = \frac{al + bm + cn}{\sqrt{a^2 + b^2 + c^2} \sqrt{l^2 + m^2 + n^2}}$$

If a line is parallel to the plane, then $\theta = 0$

$\Rightarrow al + bm + cn = 0$ and if line is perpendicular to the

plane, then $\frac{a}{l} = \frac{b}{m} = \frac{c}{n}$

EXAMPLE 7. The angle between the line $6x = 4y = 3z$ and the plane $\frac{x}{4} + \frac{y}{6} - \frac{z}{4} = \frac{1}{3}$ is

- a. 45° b. 0° c. $\tan^{-1}\left(\frac{32}{\sqrt{29}\sqrt{22}}\right)$ d. 90°

Sol. . Angle between the plane and line is

$$\sin \theta = \frac{al + bm + cn}{\sqrt{a^2 + b^2 + c^2} \sqrt{l^2 + m^2 + n^2}}$$

Equation of line $\frac{x}{2} = \frac{y}{3} = \frac{z}{4}$ and equation of plane

$$3x + 2y - 3z - 4 = 0$$

$$al + bm + cn = 2 \times 3 + 3 \times 2 - 4 \times 3 = 0$$

$$\therefore \sin \theta = 0 \Rightarrow \theta = 0^\circ$$

Coplanarity of Two Lines

The two lines $\frac{x-x_1}{l_1} = \frac{y-y_1}{m_1} = \frac{z-z_1}{n_1}$ and

$\frac{x-x_2}{l_2} = \frac{y-y_2}{m_2} = \frac{z-z_2}{n_2}$ are coplanar, if

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

and the equation of plane containing them is

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0 \text{ or } \begin{vmatrix} x-x_2 & y-y_2 & z-z_2 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

Skew-lines

The straight line which are not parallel and non-coplanar, i.e. non-intersecting are called skew-lines.

Shortest Distance between Two Skew-lines

The shortest distance between the lines

$$\frac{x-x_1}{l_1} = \frac{y-y_1}{m_1} = \frac{z-z_2}{n_1}$$

and $\frac{x-x_2}{l_2} = \frac{y-y_2}{m_2} = \frac{z-z_2}{n_2}$ is given by

$$d = \frac{\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix}}{\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix}}}$$

SPHERE

A sphere is the locus of a point which moves in space in such a way that its distance from a fixed point always remains constant.

(i) The general equation

$$x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0$$

represents a sphere with centre $(-u, -v, -w)$ and

$$\text{radius} = \sqrt{u^2 + v^2 + w^2 - d}$$

(ii) Let $P(x, y, z)$ be any point on the surface of a sphere whose centre is (a, b, c) and radius r , then by definition its equation is

$$(x-a)^2 + (y-b)^2 + (z-c)^2 = r^2 \quad \dots(i)$$

If centre is origin, then the equation of sphere reduces to

$$x^2 + y^2 + z^2 = r^2 \quad [\text{putting } a = b = c = 0 \text{ in Eq. (i)}]$$

(iii) If (x_1, y_1, z_1) and (x_2, y_2, z_2) be the end points of diameter of any sphere, then the equation of sphere is given by

$$(x-x_1)(x-x_2) + (y-y_1)(y-y_2) + (z-z_1)(z-z_2) = 0$$

(iv) $(x-x_1)(x-x_2) + (y-y_1)(y-y_2) + (z-z_1)(z-z_2) = 0$ represents a sphere with ends of diameter as (x_1, y_1, z_1) and (x_2, y_2, z_2) . Its centre is

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2} \right)$$

EXAMPLE 8. Find the equation of the sphere having the centre $(-2, 2, 3)$ and passing through the point $(3, 4, -1)$.

- a. $x^2 + y^2 + z^2 + 4x + 4y + 6z + 28 = 0$
 b. $x^2 + y^2 + z^2 - 4x - 4y - 6z + 28 = 0$
 c. $x^2 + y^2 + z^2 + 4x + 4y + 6z - 28 = 0$
 d. None of the above

Sol. The equation of the sphere with centre $(-2, 2, 3)$ is

$$(x+2)^2 + (y-2)^2 + (z-3)^2 = r^2$$

$$\text{Radius, } r = \sqrt{(3+2)^2 + (4-2)^2 + (-1-3)^2} = \sqrt{45}$$

\therefore Required equation of the sphere is

$$(x+2)^2 + (y-2)^2 + (z-3)^2 = (\sqrt{45})^2$$

$$\Rightarrow x^2 + y^2 + z^2 + 4x - 4y - 6z - 28 = 0$$

Note Condition for orthogonal intersection of two spheres is $2u_1u_2 + 2v_1v_2 + 2w_1w_2 = d_1 + d_2$

PRACTICE EXERCISE

- The ratio in which the line joining $(2, 4, 5)$, $(3, 5, -4)$ is divided by the YZ -plane is
(a) $2:3$ (b) $3:2$ (c) $-2:3$ (d) $4:-3$
- A straight line which makes an angle of 60° with each of Y and Z -axes, is inclined with X -axis at an angle
(a) 45° (b) 30° (c) 75° (d) 60°
- The foot of the perpendicular from $(0, 2, 3)$ to the line $\frac{x+3}{5} = \frac{y-1}{2} = \frac{z+4}{3}$ is
(a) $(-2, 3, 4)$ (b) $(2, -1, 3)$ (c) $(2, 3, -1)$ (d) $(3, 2, -1)$
- The line $\frac{x-2}{3} = \frac{y-3}{4} = \frac{z-4}{5}$ is parallel to the plane
(a) $2x + y - 2z = 0$ (b) $3x + 4y + 5z = 7$
(c) $x + y + z = 2$ (d) $2x + 3y + 4z = 0$
- The equation of line through the point $(1, 2, 3)$ parallel to line $\frac{x-4}{2} = \frac{y+1}{-3} = \frac{z+10}{8}$ is
(a) $\frac{x-1}{2} = \frac{y-2}{-3} = \frac{z-3}{8}$ (b) $\frac{x-1}{1} = \frac{y-2}{2} = \frac{z-3}{3}$
(c) $\frac{x-4}{1} = \frac{y+1}{2} = \frac{z+10}{3}$ (d) None of these
- The points $(1, 3, 4)$, $(-1, 6, 10)$, $(-7, 4, 7)$ and $(-5, 1, 1)$ are the vertices of a
(a) rhombus (b) rectangle
(c) parallelogram (d) square
- The angle between the lines with direction ratios $(1, 0, \pm \cos \alpha)$ is 60° . What is the value of α ?
(a) $\cos^{-1}\left(\frac{1}{\sqrt{2}}\right)$ (b) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$
(c) $\cos^{-1}\left(\frac{1}{3}\right)$ (d) $\cos^{-1}\left(\frac{1}{2}\right)$
- The equation of the plane passing through the point $(-2, -2, 2)$ and containing the line joining the points $(1, 1, 1)$ and $(1, -1, 2)$ is
(a) $x + 2y - 3z + 4 = 0$ (b) $3x - 4y + 1 = 0$
(c) $5x + 2y - 3z - 17 = 0$ (d) $x - 3y - 6z + 8 = 0$
- If from a point $P(a, b, c)$ perpendiculars PA, PB are drawn to YZ -plane and ZX -plane respectively, then the equation of the plane OAB is
(a) $bcx + cay + abz = 0$ (b) $bcx + cay - abz = 0$
(c) $bcx - cay + abz = 0$ (d) $-bcx + cay + abz = 0$
- Equation of the plane perpendicular to the plane $x - 2y + 5z + 1 = 0$ which passes through the points $(2, -3, 1)$ and $(-1, 1, -7)$ is given by
(a) $4x - 4y + z + 7 = 0$ (b) $4x + 7y + 2z + 11 = 0$
(c) $2x + y - z = 0$ (d) None of these
- Equation of the plane through $P(2, 3, -1)$ at right angle to OP is
(a) $2x + 3y - z = 14$ (b) $2x + y - z = \sqrt{14}$
(c) $2x + y + z + 14 = 0$ (d) None of these
- Equation of the plane that passes through the point $(2, -3, 1)$ and is perpendicular to the line joining the points $(3, 4, -1)$ and $(2, -1, 5)$ is given by
(a) $x + 5y - 6z + 19 = 0$ (b) $x - 5y + 6z - 23 = 0$
(c) $x + 5y - 6z = 19$ (d) None of these
- Direction cosines of the line which is perpendicular to the lines whose direction ratios are $1, -1, 2$ and $2, 1, -1$, are given by
(a) $\left[\frac{1}{\sqrt{35}}, \frac{5}{\sqrt{35}}, \frac{3}{\sqrt{35}}\right]$ (b) $\left[-\frac{1}{\sqrt{35}}, -\frac{5}{\sqrt{35}}, \frac{3}{\sqrt{35}}\right]$
(c) $\left[\frac{1}{\sqrt{35}}, \frac{5}{\sqrt{35}}, -\frac{3}{\sqrt{35}}\right]$ (d) None of these
- Under what condition do the planes $bx - ay = n$, $cy - bz = l$ and $az - cx = m$ intersect in a line?
(a) $a + b + c = 0$ (b) $a = b = c$
(c) $al + bm + cn = 0$ (d) $l + m + n = 0$
- A line makes the same angle α with each of the X and Y -axes. If the angle θ , which it makes with the Z -axis, is such that $\sin^2 \theta = 2 \sin^2 \alpha$, then what is the value of α ?
(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$
- The line passing through $(1, 2, 3)$ and having direction ratios given by $\langle 1, 2, 3 \rangle$ cuts the X -axis at a distance k from origin. What is the value of k ?
(a) 0 (b) 1 (c) 2 (d) 3
- What is the equation of the sphere which has its centre at $(6, -1, 2)$ and touches the plane $2x - y + 2z - 2 = 0$?
(a) $x^2 + y^2 + z^2 + 12x - 2y + 4z + 16 = 0$
(b) $x^2 + y^2 + z^2 + 12x - 2y + 4z - 16 = 0$
(c) $x^2 + y^2 + z^2 - 12x + 2y - 4z + 16 = 0$
(d) $x^2 + y^2 + z^2 - 12x + 2y - 4z + 25 = 0$
- Consider the following relations among the angles α, β and γ made by a vector with the coordinate axes.
I. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma = -1$
II. $\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma = 1$
Which of the above statement(s) is/are correct?
(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

- 19.** Consider the following statements
 I. Equation of plane parallel to X -axis is $x=0$.
 II. Projection of $P(x, y, z)$ on the plane YOZ is $(0, y, z)$.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

- 20.** Consider the points $(a-1, a, a+1)$, $(a, a+1, a-1)$ and $(a+1, a-1, a)$.
 I. These points always form the vertices of an equilateral triangle for any real value of a .
 II. The area of the triangle formed by these points is independent of a .
 III. The triangle formed with these vertices, have altitudes of length $3/\sqrt{2}$ units.
 Which of the above statement(s) is/are correct?
 (a) I and II (b) II and III (c) I, II and III (d) I and III

Directions (Q. Nos. 21-22) Line AB in three dimensional space makes angles α, β and γ with the coordinate axes.

- 21.** If $\alpha = 45^\circ$ and $\beta = 120^\circ$, then the acute angle γ is equal to
 (a) 60° (b) 75° (c) 30° (d) 45°
- 22.** Consider the following statements
 I. If $\alpha = 30^\circ$ and $\beta = 45^\circ$, then γ will be 150° .
 II. If $\alpha + \beta = 90^\circ$, then γ will be 90° .
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

Directions (Q. Nos. 23-24) Consider the sphere $x^2 + y^2 + z^2 - 3x - 2y + 2z - 15 = 0$

- 23.** If one end of a diameter AB is $A(-1, 4, -3)$, then B is
 (a) $(-2, 4, -1)$ (b) $(-4, 2, 1)$ (c) $(4, 2, -1)$ (d) $(4, -2, 1)$
- 24.** The equation of the sphere concentric with the given sphere and double the radius is
 (a) $x^2 + y^2 + z^2 - 3x - 2y + 2z - 86 = 0$
 (b) $x^2 + y^2 + z^2 - 3x + 2y + 2z - 86 = 0$
 (c) $x^2 + y^2 - z^2 - 3x - 2y + 2z + 86 = 0$
 (d) None of the above

Directions (Q. Nos. 25-27) The vertices of a cube are $(0, 0, 0)$, $(2, 0, 0)$, $(0, 2, 0)$, $(0, 0, 2)$, $(2, 2, 0)$, $(2, 0, 2)$, $(0, 2, 2)$, $(2, 2, 2)$, respectively.

- 25.** What is the angle between any two diagonals of the cube?
 (a) $\cos^{-1}\left(\frac{1}{2}\right)$ (b) $\cos^{-1}\left(\frac{1}{3}\right)$
 (c) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (d) $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$

- 26.** What is the angle between one of the edges of the cube and the diagonal of the cube intersecting the edge of the cube?

(a) $\cos^{-1}\left(\frac{1}{2}\right)$ (b) $\cos^{-1}\left(\frac{1}{3}\right)$
 (c) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (d) $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$

- 27.** What is the angle between the diagonal of one of the faces of the cube and the diagonal of the cube intersecting the diagonal of the face of the cube?

(a) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (b) $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$
 (c) $\cos^{-1}\left(\frac{\sqrt{2}}{\sqrt{3}}\right)$ (d) $\cos^{-1}\left(\frac{\sqrt{2}}{3}\right)$

Directions (Q. Nos. 28-30) Two lines whose equations are $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{\lambda}$ and $\frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3}$ lie in the same plane.

- 28.** The value of $\sin^{-1} \sin \lambda$ is equal to
 (a) 3 (b) $\pi - 3$
 (c) 4 (d) $\pi - 4$

- 29.** Point of intersection of the lines lies on
 (a) $3x + y + z = 20$ (b) $2x + y + z = 25$
 (c) $3x + 2y + z = 24$ (d) $x = y = z$

- 30.** Angle between the plane containing both the lines and the plane $4x + y + 2z = 0$ is equal to
 (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{2}$
 (c) $\frac{\pi}{6}$ (d) $\cos^{-1} \frac{2}{\sqrt{186}}$

Directions (Q. Nos. 31-33) Consider a plane $x + y - z = 1$ and point $A(1, 2, -3)$. A line L has equation $x = 1 + 3r, y = 2 - r$ and $z = 3 + 4r$.

- 31.** The coordinate of a point B of line L such that AB is parallel to the plane is
 (a) $(10, -1, 15)$ (b) $(-5, 4, -5)$
 (c) $(4, 1, 7)$ (d) $(-8, 5, -9)$

- 32.** The equation of the plane containing line L and point A has the equation.
 (a) $x - 3y + 5 = 0$ (b) $x + 3y - 7 = 0$
 (c) $3x - y - 1 = 0$ (d) $3x + y - 5 = 0$

- 33.** The distance between the points on the line which are at a distance of $\frac{4}{\sqrt{3}}$ from the plane is
 (a) $4\sqrt{26}$ (b) 20
 (c) $10\sqrt{13}$ (d) None of these

Directions (Q. Nos. 34-36) *The vertices of ΔABC are $A(3, 2, 0)$, $B(5, 3, 2)$ and $C(-9, 6, -3)$.*

- 34.** The bisector AD of $\angle A$ meets BC at D . The coordinates of D are
 (a) $\left(\frac{19}{4}, \frac{57}{4}, \frac{17}{4}\right)$ (b) $\left(\frac{19}{8}, \frac{57}{16}, \frac{17}{16}\right)$
 (c) $\left(\frac{9}{2}, \frac{17}{2}, \frac{11}{2}\right)$ (d) None of these
- 35.** If A, B and C are mid-points of PQ, QR and RP respectively, then centroid of ΔPQR is
 (a) $\left(\frac{2}{3}, 1, \frac{-2}{3}\right)$ (b) $\left(0, \frac{19}{3}, \frac{4}{3}\right)$
 (c) $\left(-\frac{1}{3}, \frac{11}{3}, \frac{-1}{3}\right)$ (d) None of these
- 36.** The area of (ΔABC) is equal to
 (a) $\frac{39}{2}$ sq units (b) 13 sq units
 (c) $\frac{3\sqrt{5}}{2}$ sq units (d) $\frac{13\sqrt{5}}{2}$ sq units

 (a) 3 units (b) 1 unit
 (c) 0 (d) None of these
- 52.** What should be the value of k for which the equation $3x^2 + 3y^2 + (k+1)z^2 + x - y + z = 0$, represents the sphere? **2013 I**
 (a) 3 (b) 2 (c) 1 (d) -1
- 53.** If a line makes 30° with the positive direction of X -axis, $\angle \beta$ with the positive direction of Y -axis and $\angle \gamma$ with the positive direction of Z -axis, then what is $\cos^2 \beta + \cos^2 \gamma$ equal to? **2013 I**
 (a) $1/4$ (b) $1/2$ (c) $3/4$ (d) 1
- 54.** What is the distance of the line $2x + y + 2z = 3$ from the origin? **2013 II**
 (a) 1 unit (b) 1.5 units (c) 2 units (d) 2.5 units

- 55.** The sum of the direction cosines of Z -axis is
(a) 0 (b) $\frac{1}{3}$ (c) 1 (d) 3 ☞ 2013 II

- 56.** If θ is the acute angle between the diagonals of a cube, then which one of the following is correct?
(a) $\theta = 30^\circ$ (b) $\theta = 45^\circ$ (c) $2\cos\theta = 1$ (d) $3\cos\theta = 1$ ☞ 2013 II

- 57.** What is the equation of the sphere with unit radius having centre at the origin? ☞ 2013 II
(a) $x^2 + y^2 + z^2 = 0$ (b) $x^2 + y^2 + z^2 = 1$
(c) $x^2 + y^2 + z^2 = 2$ (d) $x^2 + y^2 + z^2 = 3$

- 58.** What is the sum of the squares of direction cosines of X -axis?
(a) 0 (b) $\frac{1}{3}$ (c) 1 (d) 3 ☞ 2013 II

- 59.** If a line passes through the points $(6, -7, -1)$ and $(2, -3, 1)$, then what are the direction ratios of the line?
(a) $\langle 4, -4, 2 \rangle$ (b) $\langle 4, 4, 2 \rangle$ (c) $\langle -4, 4, 2 \rangle$ (d) $\langle 2, 1, 1 \rangle$ ☞ 2014 I

Directions (Q. Nos. 60-62) A straight line passes through $(1, -2, 3)$ and perpendicular to the plane $2x + 3y - z = 7$. ☞ 2014 I

- 60.** What are the direction ratios of normal to plane?
(a) $\langle 2, 3, -1 \rangle$ (b) $\langle 2, 3, 1 \rangle$
(c) $\langle -1, 2, 3 \rangle$ (d) None of these

- 61.** Where does the line meet the plane?
(a) $(2, 3, -1)$ (b) $(1, 2, 3)$ (c) $(2, 1, 3)$ (d) $(3, 1, 2)$

- 62.** What is the image of the point $(1, -2, 3)$ in the plane?
(a) $(2, -1, 5)$ (b) $(-1, 2, -3)$ (c) $(5, 4, 1)$ (d) None of these

Directions (Q. Nos. 63-65) The vertices of a $\triangle ABC$ are $A(2, 3, 1)$, $B(-2, 2, 0)$ and $C(0, 1, -1)$. ☞ 2014 I

- 63.** What is the cosine of $\angle ABC$?
(a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{2}{\sqrt{6}}$ (d) None of these

- 64.** What is the area of the triangle?
(a) $6\sqrt{2}$ sq units (b) $3\sqrt{2}$ sq units
(c) $10\sqrt{3}$ sq units (d) None of these

- 65.** What is the magnitude of the line joining mid-points of the sides AC and BC ?
(a) $\frac{1}{\sqrt{2}}$ unit (b) 1 unit (c) $\frac{3}{\sqrt{2}}$ units (d) 2 units

Directions (Q. Nos. 66-67) Consider the spheres $x^2 + y^2 + z^2 - 4y + 3 = 0$ and $x^2 + y^2 + z^2 + 2x + 4z - 4 = 0$. ☞ 2014 I

- 66.** What is the distance between the centres of the two spheres?
(a) 5 units (b) 4 units (c) 3 units (d) 2 units

- 67.** Consider the following statements
I. The two spheres intersect each other.
II. The radius of first sphere is less than that of second sphere.
Which of the above statement(s) is/are correct?
(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

Directions (Q. Nos. 68-69) Read the following information carefully and answer these question given below.

The line joining the points $(2, 1, 3)$ and $(4, -2, 5)$ cuts the plane $2x + y - z = 3$. ☞ 2014 II

- 68.** Where does the line cut the plane?
(a) $(0, -4, -1)$ (b) $(0, -4, 1)$ (c) $(1, 4, 0)$ (d) $(0, 4, 1)$
- 69.** What is the ratio in which the plane divides the line?
(a) 1 : 1 (b) 2 : 3 (c) 3 : 4 (d) None of these

Directions (Q. Nos. 70-71) Read the following information carefully and answer the question given below.

Consider the plane passing through the points $A(2, 2, 1)$, $B(3, 4, 2)$ and $C(7, 0, 6)$. ☞ 2014 II

- 70.** Which one of the following points lies on the plane?
(a) $(1, 0, 0)$ (b) $(1, 0, 1)$ (c) $(0, 0, 1)$ (d) None of these
- 71.** What are the direction ratios of the normal to the plane?
(a) $\langle 1, 0, 1 \rangle$ (b) $\langle 0, 1, 0 \rangle$
(c) $\langle 1, 0, -1 \rangle$ (d) None of these

Directions (Q. Nos. 72-74) Read the following information carefully and answer the question given below. Consider a sphere passing through the origin and the points $(2, 1, -1)$, $(1, 5, -4)$, $(-2, 4, -6)$.

- 72.** What is the radius of the sphere?
(a) $\sqrt{12}$ (b) $\sqrt{14}$ (c) 12 (d) 14 ☞ 2014 II
- 73.** What is the centre of the sphere?
(a) $(-1, 2, -3)$ (b) $(1, -2, 3)$ (c) $(1, 2, -3)$ (d) $(-1, -2, -3)$

- 74.** Consider the following statements
I. The sphere passes through the point $(0, 4, 0)$.
II. The point $(1, 1, 1)$ is at a distance of 5 unit from the centre of the sphere.

Which of the above statement(s) is/are correct?
(a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

Directions (Q. Nos. 75-76) The projections of a directed line segment on the coordinate axes are 12, 4, 3, respectively. ☞ 2015 I

- 75.** What is the length of the line segment?
 (a) 19 units (b) 17 units (c) 15 units (d) 13 units
- 76.** What are the direction cosines of the line segment?
 (a) $\left(\pm \frac{12}{13}, \pm \frac{4}{13}, \pm \frac{3}{13}\right)$ (b) $\left(\frac{12}{13}, -\frac{4}{13}, \frac{3}{13}\right)$
 (c) $\left(\frac{12}{13}, -\frac{4}{13}, -\frac{3}{13}\right)$ (d) $\left(-\frac{12}{13}, -\frac{4}{13}, \frac{3}{13}\right)$

Directions (Q. Nos. 77-78) From the point $P(3, -1, 11)$, a perpendicular is drawn on the line L given by the equation $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4}$. Let Q be the foot of the perpendicular. **2015 I**

- 77.** What are the direction ratios of the line segment PQ ?
 (a) (1, 6, 4) (b) (-1, 6, -4) (c) (-1, -6, 4) (d) (2, -6, 4)
- 78.** What is the length of the line segment PQ ?
 (a) $\sqrt{47}$ un (b) 7 un (c) $\sqrt{53}$ un (d) 8 un
 * un = unit

Directions (Q. Nos. 79-80) A triangular plane ABC with centroid $(1, 2, 3)$ cuts the coordinate axes at A, B, C , respectively. **2015 I**

- 79.** What are the intercepts made by the plane ABC on the axes?
 (a) 3, 6, 9 (b) 1, 2, 3 (c) 1, 4, 9 (d) 2, 4, 6
- 80.** What is the equation of the plane ABC ?
 (a) $x + 2y + 3z = 1$ (b) $3x + 2y + z = 3$
 (c) $2x + 3y + 6z = 18$ (d) $6x + 3y + 2z = 18$

Directions (Q. Nos. 81-82) A point $P(1, 2, 3)$ is one vertex of a cuboid formed by the coordinate planes and the planes passing through P and parallel to the coordinate planes. **2015 II**

- 81.** What is the length of one of the diagonals of the cuboid?
 (a) $\sqrt{10}$ un (b) $\sqrt{14}$ un (c) 4 un (d) 5 un
 * un = units
- 82.** What is the equation of plane passing through $P(1,2,3)$ and parallel to XY -plane?

- (a) $x + y = 3$ (b) $x - y = -1$
 (c) $z = 3$ (d) $2y + 3zx = 14$

- 83.** The lines $2x = 3y = -z$ and $6x = -y = -4z$ **2015 II**
 (a) are perpendicular (b) are parallel
 (c) intersect at an angle 45° (d) intersect at an angle 60°

- 84.** The radius of the sphere $3x^2 + 3y^2 + 3z^2 - 8x + 4y + 8z - 15 = 0$ is **2015 II**
 (a) 2 (b) 3 (c) 4 (d) 5

- 85.** The direction ratios of the line perpendicular to the lines with direction ratios $\langle 1, -2, -2 \rangle$ and $\langle 0, 2, 1 \rangle$ are **2015 II**
 (a) $\langle 2, -1, 2 \rangle$ (b) $\langle -2, 1, 2 \rangle$
 (c) $\langle 2, 1, -2 \rangle$ (d) $\langle -2, -1, -2 \rangle$

- 86.** What are the coordinates of the foot of the perpendicular drawn from the point $(3, 5, 4)$ on the plane $z = 0$? **2015 II**
 (a) (0, 5, 4) (b) (3, 5, 0) (c) (3, 0, 4) (d) (0, 0, 4)

- 87.** The lengths of the intercepts on the coordinate axes made by the plane $5x + 2y + z - 13 = 0$ are **2015 II**
 (a) (5, 2, 1) units (b) $\left(\frac{13}{5}, \frac{13}{2}, 13\right)$ units
 (c) $\left(\frac{5}{13}, \frac{2}{13}, \frac{1}{13}\right)$ units (d) (1, 2, 5) units

Directions (Q. Nos. 88-90) A plane P passes through the line of intersection of the planes $2x - y + 3z = 2$, $x + y - z = 1$ and the point $(1, 0, 1)$. **2016 I**

- 88.** What are the direction ratios of the line of intersection of the given planes?
 (a) $\langle 2, -5, -3 \rangle$ (b) $\langle 1, -5, -3 \rangle$
 (c) $\langle 2, 5, 3 \rangle$ (d) $\langle 1, 3, 5 \rangle$

- 89.** What is the equation of the plane P ?
 (a) $2x + 5y - 2 = 0$ (b) $5x + 2y - 5 = 0$
 (c) $x + z - 2 = 0$ (d) $2x - y - 2z = 0$

- 90.** If the plane P touches the sphere $x^2 + y^2 + z^2 = r^2$, then what is r equal to?
 (a) $\frac{2}{\sqrt{29}}$ units (b) $\frac{4}{\sqrt{29}}$ units (c) $\frac{5}{\sqrt{29}}$ units (d) 1 unit

HINTS AND SOLUTIONS

1. (a) Let the required ratio be $\lambda : 1$. Then, the point is

$$\left(\frac{3\lambda + 2}{\lambda + 1}, \frac{5\lambda + 4}{\lambda + 1}, \frac{-4\lambda + 5}{\lambda + 1} \right)$$

It lies on YZ -plane, so its x -coordinate of $x = 0$

$$\text{i.e. } \frac{3\lambda + 2}{\lambda + 1} = 0 \Rightarrow \lambda = -\frac{2}{3}$$

So, the ratio is $2 : 3$ externally.

2. (a) Let α be the angle, then the DC's of the line are $\left[\cos \alpha, \frac{1}{2}, \frac{1}{2} \right]$

\therefore By the formula $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$, we get

$$\therefore \cos^2 \alpha + \frac{1}{4} + \frac{1}{4} = 1 \Rightarrow \cos^2 \alpha = \frac{1}{2}$$

$$\Rightarrow \alpha = 45^\circ$$

3. (c) Any point on the given line is $(5r - 3, 2r + 1, 3r - 4)$. If it is the foot of the perpendicular from $(0, 2, 3)$, then

$$5(5r - 3 - 0) + 2(2r + 1 - 2) + 3(3r - 4 - 3) = 0$$

$$\Rightarrow 38r = 38 \Rightarrow r = 1$$

So, foot of the perpendicular is $(2, 3, -1)$.

4. (a) Let the line $\frac{x-\alpha}{l} = \frac{y-\beta}{m} = \frac{z-\gamma}{n}$ is parallel to the plane

$$ax + by + cz + d = 0$$

Then, normal to the plane is perpendicular to the line.

$$\text{i.e. } al + bm + cn = 0$$

In this question, this condition is satisfied by the plane $2x + y - 2z = 0$.

5. (a) Let the equation of line passing through $(1, 2, 3)$ is

$$\frac{x-1}{a} = \frac{y-2}{b} = \frac{z-3}{c}$$

But it is parallel to the given line

$$\therefore \frac{a}{2} = \frac{b}{-3} = \frac{c}{8}$$

Hence, the required line is

$$\frac{x-1}{2} = \frac{y-2}{-3} = \frac{z-3}{8}$$

6. (a) Let points A, B, C and D have coordinates $(1, 3, 4), (-1, 6, 10), (-7, 4, 7)$ and $(-5, 1, 1)$, respectively.

$$\therefore AB = \sqrt{(-1-1)^2 + (6-3)^2 + (10-4)^2} = 7$$

$$BC = \sqrt{(-7+1)^2 + (4-6)^2 + (7-10)^2} = 7$$

$$CD = \sqrt{(-5+7)^2 + (1-4)^2 + (1-7)^2} = 7$$

$$DA = \sqrt{(1+5)^2 + (3-1)^2 + (4-1)^2} = 7$$

$$AC = \sqrt{(-7-1)^2 + (4-3)^2 + (7-4)^2} = \sqrt{74}$$

and

$$BD = \sqrt{(-5+1)^2 + (1-6)^2 + (1-10)^2} = \sqrt{122}$$

$$\therefore AB = BC = CD = DA$$

But $BD \neq AC$

So, the points A, B, C and D are the vertices of a rhombus.

$$7. (b) \cos 60^\circ = \frac{\left[\begin{array}{c} 1 \times 1 + 0 \times 0 \\ + (\cos \alpha)(-\cos \alpha) \end{array} \right]}{\sqrt{1^2 + (0)^2 + \cos^2 \alpha} \cdot \sqrt{1^2 + (0)^2 + (-\cos \alpha)^2}}$$

$$\Rightarrow \frac{1}{2} = \frac{1 - \cos^2 \alpha}{\sqrt{1 + \cos^2 \alpha} \sqrt{1 + \cos^2 \alpha}}$$

$$\Rightarrow \frac{1}{2} = \frac{1 - \cos^2 \alpha}{1 + \cos^2 \alpha} \Rightarrow \frac{1+2}{1-2} = \frac{2}{-2\cos^2 \alpha}$$

[applying componendo and dividendo]

$$\Rightarrow \frac{3}{-1} = \frac{1}{-\cos^2 \alpha} \Rightarrow \cos \alpha = \frac{1}{\sqrt{3}}$$

$$\therefore \alpha = \cos^{-1} \left(\frac{1}{\sqrt{3}} \right)$$

8. (d) Equation of a plane through $(-2, -2, 2)$ is given by

$$a(x+2) + b(y+2) + c(z-2) = 0$$

It contains the line joining the points $(1, 1, 1)$ and $B(1, -1, 2)$, so these points also lie in the plane.

$$\therefore \text{At } (1, 1, 1) \quad 3a + 3b - c = 0$$

$$\text{and at } (1, -1, 2) \quad 3a + b + 0 \cdot c = 0$$

$$\Rightarrow \frac{a}{1} = \frac{b}{-3} = \frac{c}{-6} = r \quad [\text{say}]$$

$$\Rightarrow a = r, b = -3r, c = -6r$$

So, equation of the plane is

$$x - 3y - 6z + 8 = 0.$$

9. (b) A and B are the foot of perpendicular from $P(a, b, c)$ to YZ -plane and ZX -planes are given by $A(0, b, c)$ and $B(a, 0, c)$. A plane through origin $(0, 0, 0)$ is

$$px + qy + rz = 0 \quad \dots(i)$$

It passes through A and B , so

$$0p + bq + cr = 0 \text{ and } ap + 0q + cr = 0$$

$$\therefore \frac{p}{bc} = \frac{q}{ac} = \frac{r}{-ab} = \lambda \quad [\text{say}]$$

So, the equation of the plane OAB is

$$bcx + cay - abz = 0$$

10. (b) Equation of a plane through $(2, -3, 1)$ is

$$a(x-2) + b(y+3) + c(z-1) = 0 \dots(i)$$

It passes through $(-1, 1, -7)$.

$$\therefore -3a + 4b - 8c = 0 \dots(ii)$$

It is perpendicular to the plane

$$x - 2y + 5z + 1 = 0$$

$$\therefore a - 2b + 5c = 0 \quad \dots(iii)$$

On solving Eqs. (ii) and (iii), we get

$$\frac{a}{4} = \frac{b}{7} = \frac{c}{2} = \lambda$$

On putting these values of a, b and c in Eq. (i), we get the equation of the required plane

$$4x + 7y + 2z + 11 = 0$$

11. (a) Coordinates of the given point P are $(2, 3, -1)$.

OP is normal to the required plane, so direction ratios of the normal to the plane are $2, 3, -1$.

So, equation of the plane through $P(2, 3, -1)$ is

$$a(x-2) + b(y-3) + c(z+1) = 0.$$

Since, the direction ratios of the normal to the plane are $2, 3, -1$.

$$\text{So, we have } \frac{a}{2} = \frac{b}{3} = \frac{c}{-1}$$

Hence, the equation of the required plane is

$$2(x-2) + 3(y-3) - 1(z+1) = 0$$

$$\Rightarrow 2x + 3y - z = 14$$

12. (a) Direction ratios of the line joining the points $A(3, 4, -1), B(2, -1, 5)$ are $3-2, 4+1, -1-5$, i.e. $1, 5, -6$.

Equation of the plane through

$$P(2, -3, 1) \text{ is } a(x-2) + b(y+3) + c(z-1) = 0 \quad \dots(i)$$

This plane is perpendicular to the line AB , so the direction ratios of the normal to the plane (i) are $1, 5, -6$ and hence, we have

$$\frac{a}{1} = \frac{b}{5} = \frac{c}{-6}$$

Therefore, the equation of the required plane is

$$1(x-2) + 5(y+3) - 6(z-1) = 0 \Rightarrow x + 5y - 6z + 19 = 0$$

13. (a) Let (a, b, c) be the direction ratios of given line.
 $\therefore a - b + 2c = 0 \quad \dots(i)$
 $2a + b - c = 0 \quad \dots(ii)$
 From Eqs. (i) and (ii), we get
 $\frac{a}{-1} = \frac{b}{5} = \frac{c}{3}$

So, $(-1, 5, 3)$ are the direction ratios of given line.
 Hence, direction cosines will be

$$\left(\frac{-1}{\sqrt{35}}, \frac{5}{\sqrt{35}}, \frac{3}{\sqrt{35}} \right)$$

14. (c) The given planes are
 $bx - ay - n = 0 \quad \dots(i)$
 $cy - bz - l = 0 \quad \dots(ii)$
 $az - cx - m = 0 \quad \dots(iii)$

The equation of planes passing through the line of intersection of planes (i) and (ii) are

$$(bx - ay - n) + \lambda(cy - bz - l) = 0$$

or $bx + (-a + \lambda c)y - (b\lambda)z + (-n - \lambda l) = 0 \quad \dots(iv)$

Eqs. (iii) and (iv) are identical.
 $\therefore \frac{b}{-c} = \frac{-a + \lambda c}{0} = \frac{-b\lambda}{a - bm - cn} = \frac{-(n + \lambda l)}{-m}$
 $\Rightarrow \lambda = \frac{a}{c}$ and $\lambda = \frac{-bm - cn}{cl}$
 $\therefore \frac{a}{c} = \frac{-bm - cn}{cl} \Rightarrow al + bm + cn = 0$

15. (a) $\therefore l^2 + m^2 + n^2 = 1$
 $\Rightarrow \cos^2 \alpha + \cos^2 \alpha + \cos^2 \theta = 1 \quad \dots(i)$
 Also, $\sin^2 \theta = 2 \sin^2 \alpha \Rightarrow 1 - \cos^2 \theta = 2(1 - \cos^2 \alpha)$
 $\Rightarrow \cos^2 \theta = 2 \cos^2 \alpha - 1$
 From Eq. (i), $2 \cos^2 \alpha + 2 \cos^2 \alpha - 1 = 1$
 $\Rightarrow 4 \cos^2 \alpha = 2 \Rightarrow \cos^2 \alpha = \frac{1}{2}$
 $\Rightarrow \cos \alpha = \pm \frac{1}{\sqrt{2}} \Rightarrow \alpha = \frac{\pi}{4}, \frac{3\pi}{4}$

16. (a) The equation of line which is passing through $(1, 2, 3)$ and having direction ratio $(1, 2, 3)$ is

$$\frac{x-1}{1} = \frac{y-2}{2} = \frac{z-3}{3} = a \quad [\text{say}]$$

$\therefore x - 1 = a, y - 2 = 2a$ and $z - 3 = 3a$
 $\Rightarrow x = a + 1, y = 2a + 2$ and $z = 3a + 3$
 At X -axis, $y = 0$ and $z = 0 \Rightarrow 2a + 2 = 0$ and $3a + 3 = 0$
 $\Rightarrow a = -1$ and $a = -1$
 $\therefore x = (-1) + 1 = 0$

Hence, the line cuts X -axis at a distance $k = 0$.

17. (c) Given centre of sphere is $(6, -1, 2)$.
 $\therefore \text{Radius} = \frac{2(6) - 1(-1) + 2(2) - 2}{\sqrt{4 + 1 + 4}} = \frac{15}{3} = 5$
 \therefore Equation of sphere is $(x - 6)^2 + (y + 1)^2 + (z - 2)^2 = 5^2$
 $\Rightarrow x^2 + y^2 + z^2 - 12x + 2y - 4z + 16 = 0$

18. (a) We know that,
 $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1 \quad \dots(i)$
 I. $\cos 2\alpha + \cos 2\beta + \cos 2\gamma$
 $= 2 \cos^2 \alpha + 2 \cos^2 \beta + 2 \cos^2 \gamma - 3$
 $= 2(\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma) - 3 = 2(1) - 3 = -1$
 So, Statement I is true. [from Eq. (i)]

II. $\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma$
 $= 1 - \cos^2 \alpha + 1 - \cos^2 \beta + 1 - \cos^2 \gamma$
 $= 3 - (\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma) = 3 - 1 = 2$ [from Eq. (i)]
 So, Statement II is false.

19. (b) I. General equation of a plane is
 $ax + by + cz + \lambda = 0$
 Normal to the plane will be perpendicular to X -axis
 DR of normal to plane are a, b, c .
 DR of X -axis are $1, 0, 0$.
 $\therefore a \cdot 1 + b \cdot 0 + c \cdot 0 = 0 \Rightarrow a = 0$
 \therefore Required equation is $by + cz + \lambda = 0$
 So, Statement I is false.

II. On YOZ plane, we have $x = 0$
 \therefore Projection of $P(x, y, z)$ on YOZ plane is $(0, y, z)$.
 So, Statement II is true.

20. (c) Let $A(a - 1, a, a + 1)$,
 $B(a, a + 1, a - 1)$
 and $C(a + 1, a - 1, a)$ be the vertices of a ΔABC .
 $\therefore AB = \sqrt{(a - a + 1)^2 + (a + 1 - a)^2 + (a - 1 - a - 1)^2} = \sqrt{6}$
 $BC = \sqrt{(a + 1 - a)^2 + (a - 1 - a - 1)^2 + (a - a + 1)^2} = \sqrt{6}$
 and $CA = \sqrt{(a - 1 - a - 1)^2 + (a - a + 1)^2 + (a + 1 - a)^2} = \sqrt{6}$
 $\therefore AB = BC = CA$

Hence, given points are vertices of an equilateral triangle for any real value of a .

Now, area of a $\Delta ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}| = \frac{1}{2} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & -2 \\ 2 & -1 & -1 \end{vmatrix}$
 $= \frac{1}{2} |-3\hat{i} - 3\hat{j} - 3\hat{k}| = \frac{1}{2} \sqrt{9 + 9 + 9} = \frac{\sqrt{27}}{2}$ sq units

Thus, the area of triangle formed by these points is independent of a .

As it is an equilateral triangle of side $\sqrt{6}$ units.
 Thus, its Altitude $= \frac{\sqrt{3}}{2} \times \text{side units} = \frac{\sqrt{3}}{2} \times \sqrt{6} = \frac{3}{\sqrt{2}}$ units

21. (a) We have, $l = \cos 45^\circ = \frac{1}{\sqrt{2}}, m = \cos 120^\circ = -\frac{1}{2}$ and $n = \cos \gamma$
 $\therefore l^2 + m^2 + n^2 = 1 \Rightarrow \frac{1}{2} + \frac{1}{4} + \cos^2 \gamma = 1$
 $\Rightarrow \cos \gamma = \frac{1}{4} \Rightarrow \cos \gamma = \frac{1}{2} \quad [\because \gamma \text{ is acute}]$
 $\Rightarrow \gamma = 60^\circ$

22. (b) I. $l = \cos 30^\circ = \frac{\sqrt{3}}{2}, m = \cos 45^\circ = \frac{1}{\sqrt{2}}, n = \cos \gamma$
 $\therefore l^2 + m^2 + n^2 = 1$
 $\Rightarrow \frac{3}{4} + \frac{1}{2} + \cos^2 \gamma = 1 \Rightarrow \cos^2 \gamma = \frac{-1}{4}$

Which is not possible.
 So, Statement I is false.

II. Here, $\cos^2 \alpha + \cos^2(90^\circ - \alpha) + \cos^2 \gamma = 1$
 $\Rightarrow \cos^2 \alpha + \sin^2 \alpha + \cos^2 \gamma = 1$
 $\Rightarrow \cos^2 \gamma = 0 \Rightarrow \gamma = 90^\circ$
 So, Statement II is true.

23. (d) We have, $2u = -3, 2v = -2, 2w = 2$
 $\Rightarrow u = -\frac{3}{2}, v = -1, w = 1$

\therefore Centre is $(-u, -v, -w)$, i.e. $(\frac{3}{2}, 1, -1)$

Let coordinates of B be $B(x, y, z)$. Then, centre is the mid-point of AB .

$\therefore \frac{-1+x}{2} = \frac{3}{2}, \frac{4+y}{2} = 1, \frac{-3+z}{2} = -1$

$\Rightarrow x = 4, y = -2, z = 1$

$\therefore B(4, -2, 1)$ is the required point.

24. (d) Radius of given sphere = $\sqrt{(\frac{3}{2})^2 + (1)^2 + (-1)^2 + 15} = \frac{1}{2}\sqrt{77}$

Radius of new sphere = $\sqrt{77}$

\therefore Required sphere is $(x - \frac{3}{2})^2 + (y - 1)^2 + (z + 1)^2 = (\sqrt{77})^2$

$\Rightarrow x^2 + y^2 + z^2 - 3x - 2y + 2z - \frac{291}{4} = 0$

$\Rightarrow 4x^2 + 4y^2 + 4z^2 - 12x - 8y + 8z - 291 = 0$

Sol. (Q. Nos. 25-27)

25. (b) DR of OP are 2, 2, 2 or 1, 1, 1.
 DR of AL are -2, 2 and 2 or -1, 1, 1.
 Therefore, required angle = $\cos^{-1}(\frac{-1+1+1}{\sqrt{3} \cdot \sqrt{3}}) = \cos^{-1}(\frac{1}{3})$

26. (c) DR of OC are 0, 0, 2 or 0, 0, 1
 DR of OP are 1, 1, 1.
 \therefore Required angle = $\cos^{-1}(\frac{0+0+1}{\sqrt{3} \cdot \sqrt{1}}) = \cos^{-1}(\frac{1}{\sqrt{3}})$

27. (c) DR of CP are 2, 3, 0 or 1, 1, 0.
 DR of OP are 1, 1, 1.
 \therefore Required angle = $\cos^{-1}(\frac{1+1+0}{\sqrt{3}\sqrt{2}}) = \cos^{-1}(\frac{\sqrt{2}}{3})$

28. (d) Since, both lines are coplanar.
 $\therefore \begin{vmatrix} 2 & 3 & \lambda \\ 3 & 2 & 3 \\ 1 & -1 & 1 \end{vmatrix} = 0 \Rightarrow 2(-2+3) + 3(3+3) + \lambda(-3-2) = 0 \Rightarrow \lambda = 4$
 $\sin^{-1}(\sin 4) = \sin^{-1}\{\sin(\pi - 4)\} = \pi - 4$

29. (d) Let $\frac{x-3}{2} = \frac{y-2}{3} = \frac{z-1}{4} = r_1$
 $\Rightarrow x = 3 + 2r_1, y = 2 + 3r_1, z = 1 + 4r_1$
 It will lie on $\frac{x-2}{3} = \frac{y-3}{2} = \frac{z-2}{3} \Rightarrow r_1 = 1$
 So, point of intersection is $(5, 5, 5)$.

30. (b) Equation of plane contains both lines

$$\begin{vmatrix} x-3 & y-2 & z-1 \\ 2 & 3 & 4 \\ 3 & 2 & 3 \end{vmatrix} = 0$$
 $(x-3)(1) + (y-2)(12-6) + (z-1)(4-9) = 0$
 $x + 6y - 5z = 10$

Thus, the angle is $\frac{\pi}{2}$.

31. (d) The line $\frac{x-1}{3} = \frac{y-2}{-1} = \frac{z-3}{4} = r$
 Any point say $B \equiv (3r + 1, 2 - r, 3 + 4r)$ (on the line L)
 $AB = 3r, -r, 4r + 6$
 Hence, AB is parallel to $x + y - z = 1$
 $\Rightarrow 3r - r - 4r - 6 = 0$ or $r = -3, B$ is $(-8, 5, -9)$

32. (b) The equation of plane containing the line L is
 $A(x-1) + B(y-2) + C(z+3) = 0$... (i)
 where $3A - B + 4C = 0$... (ii)
 Put $B = (-8, 5, -9)$ in Eq. (i)
 from where, we get $3A - B + 2C = 0$... (iii)

On solving Eqs. (ii) and (iii), we get
 $C = 0$ and $3A = B$

Now, put $3A = B$ in Eq (i)
 $A(x-1) + 3A(y-2) = 0$
 $A\{x-1+3(y-2)\} = 0$
 $x-1+3y-6=0$

$x + 3y - 7 = 0$, is the required equation of the plane.

33. (d) As the point lies on the line L , the point be $(1 + 3r, 2 - r, 3 + 4r)$ which is at a distance of $\frac{4}{\sqrt{3}}$ from the plane. Then, The distance of point $(1 + 3r, 2 - r, 3 + 4r)$

$$\frac{|1 + 3r + 2 - r - 3 - 4r - 1|}{\sqrt{1 + 1 + 1}} = \frac{4}{\sqrt{3}}$$

$$\Rightarrow \frac{|2r + 1|}{\sqrt{3}} = \frac{4}{\sqrt{3}} \Rightarrow r = \frac{3}{2}, -\frac{5}{2}$$
 Hence, the points are $A(\frac{11}{2}, \frac{1}{2}, \frac{10}{2})$ and $B(\frac{-13}{2}, \frac{9}{2}, \frac{-14}{2})$
 $\Rightarrow AB = \sqrt{292}$

34. (b) We have, $A(3, 2, 0), B(5, 3, 2)$ and $C(-9, 6, -3)$. D divides BC in the ratio $AB : AC$
 $AB = \sqrt{(5-3)^2 + (3-2)^2 + (2-0)^2} = 3$
 $AC = \sqrt{(-9-3)^2 + (6-2)^2 + (-3-0)^2} = 13$
 $\therefore D$ divides BC is the ratio 3 : 13.
 \therefore Coordinates of D are
 $(\frac{3 \times (-9) + 13 \times 5}{3 + 13}, \frac{3 \times 6 + 13 \times 3}{3 + 13}, \frac{3 \times (-3) + 13 \times 2}{3 + 13})$
 $= (\frac{19}{8}, \frac{57}{16}, \frac{17}{16})$

35. (c) Centroid of ΔPQR is coincide with centroid of ΔABC .
 \therefore Centroid of $\Delta PQR = (\frac{3+5-9}{3}, \frac{2+3+6}{3}, \frac{0+2-3}{3})$
 $= (\frac{-1}{3}, \frac{11}{3}, \frac{-1}{3})$

36. (d) We have, $\cos A = \frac{-2}{3}$
 $\therefore \sin A = \sqrt{1 - \left(\frac{-2}{3}\right)^2} = \frac{\sqrt{5}}{3}$
 Area ($\triangle ABC$)
 $= \frac{1}{2} AB \times AC \times \sin A$
 $= \frac{1}{2} \times 3 \times 13 \times \frac{\sqrt{5}}{3} = \frac{13\sqrt{5}}{2}$ sq units

37. (b) The direction ratios are 2, -1, 2 or $1, -\frac{1}{2}, 1$

38. (b) Given equation of two planes,
 $x + y + z + 1 = 0$ and $2x - 2y + 2z + 1 = 0$
 Here, $a_1 = 1, b_1 = 1$ and $c_1 = 1$
 $a_2 = 2, b_2 = -2$ and $c_2 = 2$

Let θ be the angle between them.
 Then, $\cos \theta = \frac{|a_1 a_2 + b_1 b_2 + c_1 c_2|}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$
 $\Rightarrow \cos \theta = \frac{|(1)(2) + (1)(-2) + (1)(2)|}{\sqrt{(1)^2 + (1)^2 + (1)^2} \sqrt{(2)^2 + (-2)^2 + (2)^2}}$
 $\Rightarrow \cos \theta = \frac{|2 - 2 + 2|}{\sqrt{3} \sqrt{12}} = \frac{|2|}{\sqrt{3}(2\sqrt{3})} \Rightarrow \cos \theta = \frac{1}{3}$

39. (d) The equation of sphere,
 $x^2 + y^2 + z^2 - 4x + 6y - 8z - 7 = 0$
 On comparing with
 $ax^2 + by^2 + cz^2 + 2ux + 2vy + 2wz + d = 0$, we get
 $u = -2, v = 3, w = -4$ and $d = -7$
 \therefore Radius of sphere $= \sqrt{u^2 + v^2 + w^2 - d}$
 $= \sqrt{(-2)^2 + (3)^2 + (-4)^2 + 7}$
 $= \sqrt{4 + 9 + 16 + 7} = \sqrt{36} = 6$
 \therefore Diameter $= 2 \times \text{Radius} = 2 \times 6 = 12$ units

40. (b) The equation of line passing through (x_1, y_1, z_1) and (x_2, y_2, z_2) is
 $\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}$... (i)

Here, $(x_2 - x_1), (y_2 - y_1)$ and $(z_2 - z_1)$ direction ratios of that line.

Then, its direction cosines are
 $l = \frac{(x_2 - x_1)}{\sqrt{\Sigma(x_2 - x_1)^2}}, m = \frac{(y_2 - y_1)}{\sqrt{\Sigma(x_2 - x_1)^2}}$ and $n = \frac{(z_2 - z_1)}{\sqrt{\Sigma(x_2 - x_1)^2}}$

Here, $(x_1, y_1, z_1) = (1, 2, -3)$ and $(x_2, y_2, z_2) = (-2, 3, 1)$

$\therefore l = \frac{(-2 - 1)}{\sqrt{(-3)^2 + (1)^2 + (4)^2}}, m = \frac{(3 - 2)}{\sqrt{(-3)^2 + (1)^2 + (4)^2}}$

and $n = \frac{(1 + 3)}{\sqrt{(-3)^2 + (1)^2 + (4)^2}}$

$\Rightarrow l = \frac{-3}{\sqrt{26}}, m = \frac{1}{\sqrt{26}}, n = \frac{4}{\sqrt{26}}$

$\therefore l^2 + m^2 + n^2 = \left(\frac{-3}{\sqrt{26}}\right)^2 + \left(\frac{1}{\sqrt{26}}\right)^2 + \left(\frac{4}{\sqrt{26}}\right)^2$
 $= \frac{9}{26} + \frac{1}{26} + \frac{16}{26} = \frac{26}{26} = 1$

41. (b) The direction ratios of Z-axis are 0, 0, 1.
 \therefore Required equation of line is $\frac{x - a}{0} = \frac{y - b}{0} = \frac{z - c}{1}$

42. (a) The distance of point $P(x, y, z)$ from YZ- plane is x-coordinate
 \therefore Required distance = 1 unit

43. (a) In $\triangle AOP$, $\sin \alpha = \frac{z}{OP} = \frac{z}{r}$

$\Rightarrow z = r \sin \alpha$

Again, in $\triangle AOP$, $\cos \alpha = \frac{x}{OP} = \frac{x}{r}$

$\Rightarrow x = r \cos \alpha$ and the y-coordinate in XZ-plane is always zero.

So, the coordinate of P in XZ-plane is $(r \cos \alpha, 0, r \sin \alpha)$.

44. (c) Given, the distance between the points
 $(7, 1, -3)$ and $(4, 5, \lambda) = 13$
 $\Rightarrow \sqrt{(4 - 7)^2 + (5 - 1)^2 + (\lambda + 3)^2} = 13$
 $\Rightarrow \sqrt{(-3)^2 + (4)^2 + (\lambda + 3)^2} = 13$
 $\Rightarrow \sqrt{9 + 16 + (\lambda + 3)^2} = 13 \Rightarrow \sqrt{25 + (\lambda + 3)^2} = 13$

On squaring equation both sides, we get

$25 + (\lambda + 3)^2 = 169 \Rightarrow 25 + \lambda^2 + 9 + 6\lambda - 169 = 0$
 $\Rightarrow \lambda^2 + 6\lambda - 135 = 0 \Rightarrow \lambda^2 + 15\lambda - 9\lambda - 135 = 0$
 $\Rightarrow \lambda(\lambda + 15) - 9(\lambda + 15) = 0 \Rightarrow (\lambda + 15)(\lambda - 9) = 0$
 $\therefore \lambda = 9, -15$

45. (c) Given equations of the plane $x = 3z + 4$
 $\Rightarrow \frac{x - 4}{3} = \frac{z - 0}{1}$... (i)
 and $y = 2z - 3 \Rightarrow \frac{y + 3}{2} = \frac{z - 0}{1}$... (ii)

Therefore, the required equation of the line intersecting by two planes (i) and (ii),

$\frac{x - 4}{3} = \frac{y + 3}{2} = \frac{z - 0}{1}$... (iii)

Hence, the direction ratio's of line (iii) is

$\langle a_1, b_1, c_1 \rangle = \langle 3, 2, 1 \rangle$

46. (c) The equation of any plane parallel to the plane $3x + 4y - 5z = 0$ may be taken as

$3x + 4y - 5z + k = 0$... (i)

If plane (i) passes through the point (1, 2, 3), we get

$3(1) + 4(2) - 5(3) + k = 0$
 $3 + 8 - 15 + k = 0$
 $-4 + k = 0 \Rightarrow k = 4$... (ii)

On putting $k = 4$ in Eq. (i), we get required equation
 i.e. $3x + 4y - 5z + 4 = 0$

47. (a) Given lines are $\frac{x - 2}{1} = \frac{y + 1}{-2} = \frac{z + 2}{1}$... (i)

and $\frac{x - 1}{1} = \frac{2y + 3}{3} = \frac{z + 5}{2}, \frac{x - 1}{1} = \frac{2(y + 3/2)}{3} = \frac{z + 5}{2}$
 $\frac{x - 1}{1} = \frac{y + 3/2}{3/2} = \frac{z + 5}{2}$... (ii)

If θ is the acute angle between lines (i) and (ii), then

$$\begin{aligned}\cos\theta &= \frac{1 \times 1 + (-2) \left(\frac{3}{2}\right) + 1(2)}{\sqrt{1 + (-2)^2 + 1^2} \sqrt{1^2 + \left(\frac{3}{2}\right)^2 + 2^2}} \\ &= \frac{1 + (-3) + 2}{\sqrt{1+4+1} \sqrt{1+\frac{9}{4}+4}} = \frac{0}{\sqrt{6} \sqrt{\frac{29}{4}}} = 0\end{aligned}$$

$$\therefore \cos\theta = 0 \Rightarrow \theta = \cos^{-1}(0) = \frac{\pi}{2}$$

48. (a) If α, β and γ are the angles that a line makes with the coordinate axes.

Then, $l = \cos \alpha, m = \cos \beta$ and $n = \cos \gamma$

$$\therefore l^2 + m^2 + n^2 = 1 \Rightarrow \cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1 \quad \dots(i)$$

Here, $\alpha = \beta = \gamma$, as line is equally inclined to axes.

$$\text{From Eq. (i), } \cos^2 \alpha + \cos^2 \alpha + \cos^2 \alpha = 1 \Rightarrow \cos \alpha = \frac{1}{\sqrt{3}}$$

[since, direction cosines of a line which is equally inclined to the positive directions of the axis, so we take only positive sign]

$$\therefore \cos \alpha = \cos \beta = \cos \gamma = \frac{1}{\sqrt{3}} \text{ or } l = m = n = \frac{1}{\sqrt{3}}$$

Hence, the required direction cosines are $\left\langle \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \right\rangle$.

49. (d) Given equation of planes

$$2x - y - 2z + 1 = 0 \quad \dots(i)$$

$$\text{and } 3x - 4y + 5z - 3 = 0 \quad \dots(ii)$$

Here, $a_1 = 2, b_1 = -1$ and $c_1 = -2$

and $a_2 = 3, b_2 = -4, c_2 = 5$ are direction ratios of planes (i) and (ii) respectively.

Let θ be the angle between two planes.

$$\begin{aligned}\text{Then, } \cos\theta &= \frac{|a_1 a_2 + b_1 b_2 + c_1 c_2|}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}} \\ &= \frac{|(2)(3) + (-1)(-4) + (-2)(5)|}{\sqrt{4+1+4} \sqrt{4+16+25}} = \frac{|6+4-10|}{\sqrt{9} \sqrt{45}} = 0 = \cos \frac{\pi}{2}\end{aligned}$$

So, the required angle is $\frac{\pi}{2}$.

50. (d) Given that, equation of straight line is

$$\frac{x-x_0}{l} = \frac{y-y_0}{m} = \frac{z-z_0}{n} \quad \dots(i)$$

$$\text{and equation of plane is } ax + by + cz + d = 0 \quad \dots(ii)$$

Since, the straight line is parallel to the plane, i.e. normal to the plane is perpendicular to the straight line.

By perpendicularity condition,

$$l_1 l_2 + m_1 m_2 + n_1 n_2 = 0 \Rightarrow al + bm + cn = 0$$

51. (d) The given equation of planes

$$x - 2y + z - 1 = 0 \quad \dots(i)$$

$$\text{and } -3x + 6y - 3z + 2 = 0 \Rightarrow x - 2y + z - 2/3 = 0 \quad \dots(ii)$$

Since, both planes are parallel to each other, then distance between them

$$= \frac{\left| \frac{-2}{3} - (-1) \right|}{\sqrt{(1)^2 + (-2)^2 + (1)^2}} = \frac{\left| \frac{-2}{3} + 1 \right|}{\sqrt{1+4+1}} = \frac{1/3}{\sqrt{6}} = \frac{1}{3\sqrt{6}}$$

52. (b) The given equation represents the equation of sphere, if coefficient of x^2, y^2 and z^2 are same, i.e. $k + 1 = 3 \Rightarrow k = 2$

53. (a) We know that, if a line makes an $\angle \alpha$ with the positive direction of X -axis, $\angle \beta$ with the positive direction of Y -axis and $\angle \gamma$ with the positive direction of Z -axis, then

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$$

Given that, $\alpha = 30^\circ$

$$\therefore \cos^2 30^\circ + \cos^2 \beta + \cos^2 \gamma = 1$$

$$\Rightarrow \left(\frac{\sqrt{3}}{2}\right)^2 + \cos^2 \beta + \cos^2 \gamma = 1 \Rightarrow \cos^2 \beta + \cos^2 \gamma = 1 - \frac{3}{4}$$

$$\therefore \cos^2 \beta + \cos^2 \gamma = \frac{1}{4}$$

54. (a) Distance of the line $2x + y + 2z = 3$ from the origin

$$= \frac{|2 \times 0 + 0 + 2 \times 0 - 3|}{\sqrt{(2)^2 + (1)^2 + (2)^2}} = \frac{|0 + 0 + 0 - 3|}{\sqrt{4+1+4}} = \frac{|-3|}{\sqrt{9}} = \frac{3}{3} = 1 \text{ unit}$$

55. (c) We know that, the direction cosines of Z -axis are $(0, 0, 1)$.

\therefore Sum of the direction cosines of Z -axis $= 0 + 0 + 1 = 1$

56. (d) Let a be length of the edge of the cube.

Let direction ratios of the diagonal OP of the cube is

$$\langle a_1, b_1, c_1 \rangle = \langle a - 0, a - 0, a - 0 \rangle = \langle a, a, a \rangle$$

and direction ratios of the diagonal AD of the cube is

$$\langle a_2, b_2, c_2 \rangle = \langle 0 - a, a - 0, a - 0 \rangle = \langle -a, a, a \rangle$$

Let θ be the acute angle between the diagonals OP and AD of a cube.

$$\begin{aligned}\therefore \cos\theta &= \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}} \\ &= \frac{(a)(-a) + (a)(a) + (a)(a)}{\sqrt{a^2 + a^2 + a^2} \sqrt{a^2 + a^2 + a^2}} = \frac{-a^2 + a^2 + a^2}{\sqrt{3a^2} \sqrt{3a^2}} \\ &= \frac{a^2}{3a^2} = \frac{1}{3} \Rightarrow 3 \cos\theta = 1\end{aligned}$$

57. (b) We know that, the standard equation of the sphere, whose centre at (x_1, y_1, z_1) and radius is r , is

$$(x - x_1)^2 + (y - y_1)^2 + (z - z_1)^2 = r^2 \quad \dots(i)$$

But given that, centre $= (0, 0, 0)$ and radius $= 1$

\therefore Required equation of sphere is

$$(x - 0)^2 + (y - 0)^2 + (z - 0)^2 = (1)^2 \Rightarrow x^2 + y^2 + z^2 = 1$$

58. (c) We know that, the direction cosines of X -axis is $\langle 1, 0, 0 \rangle$.

\therefore Sum of squares of direction cosine

$$= (1)^2 + (0)^2 + (0)^2 = 1 + 0 + 0 = 1$$

59. (c) If a line passes through the points (x_1, y_1, z_1) and (x_2, y_2, z_2) , then its direction ratio is $\langle x_2 - x_1, y_2 - y_1, z_2 - z_1 \rangle$.

\therefore The direction ratio of the line which passes through the points $(6, -7, -1)$ and $(2, -3, 1)$ is

$$\langle 2 - 6, -3 + 7, 1 + 1 \rangle = \langle -4, 4, 2 \rangle$$

Sol. (Q. Nos. 60-62) Given that, a line passes through the point $(1, -2, 3)$ and perpendicular to the plane $2x + 3y - z = 7$, i.e. this straight line is a normal to the plane.

60. (a) Equation of the plane, $2x + 3y - z = 7$

On comparing with $ax + by + cz = d$, $a = 2$, $b = 3$ and $c = -1$
Which is the required direction ratios of normal to the plane.

i.e. $\langle a, b, c \rangle = \langle 2, 3, -1 \rangle$

61. (d) The point, where the line meet the plane = Foot (x, y, z) of a point $(1, -2, 3)$ in a plane $2x + 3y - z = 7$

$$\therefore \frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} = \frac{-(ax_1 + by_1 + cz_1 + d)}{a^2 + b^2 + c^2}$$

$$\Rightarrow \frac{x - 1}{2} = \frac{y + 2}{3} = \frac{z - 3}{-1} = \frac{-[2(1) + 3(-2) - (3) - 7]}{(2)^2 + (3)^2 + (-1)^2}$$

$$\Rightarrow \frac{x - 1}{2} = \frac{y + 2}{3} = \frac{z - 3}{-1} = \frac{-(2 - 6 - 3 - 7)}{4 + 9 + 1} = \frac{-(-14)}{14}$$

$$\Rightarrow \frac{x - 1}{2} = 1 \Rightarrow x - 1 = 2 \Rightarrow x = 3$$

$$\Rightarrow \frac{y + 2}{3} = 1 \Rightarrow y + 2 = 3 \Rightarrow y = 1$$

$$\Rightarrow \frac{z - 3}{-1} = 1 \Rightarrow z - 3 = -1 \Rightarrow z = 2$$

\therefore Required point $= (x, y, z) = (3, 1, 2)$

62. (c) We know that, the image (x, y, z) of a point (x_1, y_1, z_1) in a plane

$$ax + by + cz + d = 0 \text{ is given by } \frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c}$$

$$= \frac{-2(ax_1 + by_1 + cz_1 + d)}{a^2 + b^2 + c^2}$$

\therefore Image of the point $(1, -2, 3)$ in the plane $2x + 3y - z - 7 = 0$

$$\text{is, } \frac{x - 1}{2} = \frac{y + 2}{3} = \frac{z - 3}{-1} = \frac{-2[2(1) + 3(-2) + (-1)(3) - 7]}{(2)^2 + (3)^2 + (-1)^2} = \frac{-2[2 + (-6) + (-3) - 7]}{4 + 9 + 1}$$

$$= \frac{-2(-14)}{14} = 2$$

$$\Rightarrow \frac{x - 1}{2} = 2 \Rightarrow x - 1 = 4 \Rightarrow x = 5$$

$$\Rightarrow \frac{y + 2}{3} = 2 \Rightarrow y + 2 = 6 \Rightarrow y = 4$$

$$\Rightarrow \frac{z - 3}{-1} = 2 \Rightarrow z - 3 = -2 \Rightarrow z = 1$$

Hence, the required image is $(5, 4, 1)$.

Sol. (Q. Nos. 63-65) Given that vertices of a triangle are,

$$\text{let } (x_1, y_1, z_1) \equiv A(2, 3, 1), (x_2, y_2, z_2) \equiv B(-2, 2, 0),$$

$$\text{and } (x_3, y_3, z_3) \equiv C(0, 1, -1)$$

63. (a) Now, of DR's $AB = \langle a_1, b_1, c_1 \rangle = \langle -2 - 2, 2 - 3, 0 - 1 \rangle = \langle -4, -1, -1 \rangle$

$$\text{and DR's of } BC = \langle a_2, b_2, c_2 \rangle = \langle 0 + 2, 1 - 2, -1 - 0 \rangle = \langle 2, -1, -1 \rangle$$

Let θ be the angle between AB and BC .

$$\therefore \cos \theta = \frac{(a_1 a_2 + b_1 b_2 + c_1 c_2)}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}} = \frac{\left[-4 \times 2 + (-1)(-1) + (-1)(-1) \right]}{\left[\sqrt{16 + 1 + 1} \sqrt{4 + 1 + 1} \right]} = \frac{(-8 + 1 + 1)}{\left[\sqrt{18} \sqrt{6} \right]} = \frac{-6}{6\sqrt{3}} = \frac{-1}{\sqrt{3}} = \frac{1}{\sqrt{3}}$$

$$\therefore \cos \theta = \cos \angle ABC = \frac{1}{\sqrt{3}}$$

64. (d) Now, we find

$$\Delta_x = \frac{1}{2} \begin{vmatrix} y_1 & z_1 & 1 \\ y_2 & z_2 & 1 \\ y_3 & z_3 & 1 \end{vmatrix} = \frac{1}{2} \begin{vmatrix} 3 & 1 & 1 \\ 2 & 0 & 1 \\ 1 & -1 & 1 \end{vmatrix} = \frac{1}{2} \{3(0 + 1) - 1(2 - 1) + 1(-2 - 0)\}$$

$$= \frac{1}{2} (3 - 1 - 2) = \frac{1}{2} (3 - 3) = \frac{1}{2} \times 0 = 0$$

$$\Delta_y = \frac{1}{2} \begin{vmatrix} z_1 & x_1 & 1 \\ z_2 & x_2 & 1 \\ z_3 & x_3 & 1 \end{vmatrix} = \frac{1}{2} \begin{vmatrix} 1 & 2 & 1 \\ 0 & -2 & 1 \\ -1 & 0 & 1 \end{vmatrix}$$

$$= \frac{1}{2} \{1(-2 - 0) - 2(0 + 1) + 1(0 - 2)\}$$

$$= \frac{1}{2} (-2 - 2 - 2) = \frac{1}{2} \times (-6) = -3$$

$$\text{and } \Delta_z = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \frac{1}{2} \begin{vmatrix} 2 & 3 & 1 \\ -2 & 2 & 1 \\ 0 & 1 & -1 \end{vmatrix}$$

$$= \frac{1}{2} \{2(-2 - 1) - 3(2 - 0) + 1(-2 - 0)\}$$

$$= \frac{1}{2} (-6 - 6 - 2) = \frac{1}{2} \times -14 = -7$$

\therefore Required area of ΔABC

$$= \sqrt{\Delta_x^2 + \Delta_y^2 + \Delta_z^2} = \sqrt{(0)^2 + (-3)^2 + (-7)^2} = \sqrt{0 + 9 + 49} = \sqrt{58}$$

65. (c) Mid-point of $AC = \left(\frac{2+0}{2}, \frac{3+1}{2}, \frac{1-1}{2} \right)$

$$P = (1, 2, 0)$$

$$\text{and mid-point of } BC = \left(\frac{-2+0}{2}, \frac{2+1}{2}, \frac{0-1}{2} \right)$$

$$Q = (-1, 3/2, -1/2)$$

Now, magnitude of the line joining P and $Q = |PQ|$

$$= \sqrt{(1+1)^2 + (2-3/2)^2 + (0+1/2)^2}$$

$$= \sqrt{(2)^2 + (1/2)^2 + (1/2)^2} = \frac{3}{\sqrt{2}} \text{ units}$$

Sol. (Q. Nos. 66-67) Given equations of sphere,

$$x^2 + y^2 + z^2 - 4y + 3 = 0 \quad \dots(i)$$

and $x^2 + y^2 + z^2 + 2x + 4z - 4 = 0 \quad \dots(ii)$

Compare with the standard equation of sphere,

$$x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0,$$

we get $u_1 = 0, v_1 = -2, w_1 = 0$ and $d_1 = 3$ [for first sphere]

and $u_2 = 1, v_2 = 0, w_2 = 2$ and $d_2 = -4$ [for second sphere]

66. (c) Centre of Ist sphere, i.e. $C_1 \rightarrow (-u_1, -v_1, -w_1) \rightarrow (0, 2, 0)$

and centre of IInd sphere, i.e. $C_2 \rightarrow (-u_2, -v_2, -w_2) \rightarrow (-1, 0, -2)$

Now, distance between two centres, i.e.

$$C_1 C_2 = \sqrt{(-1-0)^2 + (0-2)^2 + (-2-0)^2} = \sqrt{1+4+4}$$

$$[\because d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}]$$

$$= \sqrt{9} = 3 \text{ units}$$

67. (c) I. Radius of Ist sphere,

$$r_1 = \sqrt{u_1^2 + v_1^2 + w_1^2 - d_1} = \sqrt{(0)^2 + (2)^2 + (0)^2 - (3)}$$

$$= \sqrt{4-3} = \sqrt{1} = 1$$

Radius of IInd sphere,

$$r_2 = \sqrt{u_2^2 + v_2^2 + w_2^2 - d_2} = \sqrt{(-1)^2 + (0)^2 + (-2)^2 + (4)}$$

$$= \sqrt{1+4+4} = \sqrt{9} = 3$$

Now, $r_1 + r_2 = 1 + 3 = 4$

$\therefore C_1 C_2 < r_1 + r_2$

So, both sphere intersect each other.

II. We have, radius of Ist sphere (r_1) = 1

and radius of IInd sphere (r_2) = 3

i.e. $r_1 < r_2$

So, the radius of first sphere is less than that of second sphere.

68. (d) Equation of line passing through the points (2, 1, 3) and (4, -2, 5) is

$$\frac{x-2}{4-2} = \frac{y-1}{-2-1} = \frac{z-3}{5-3} = \lambda \Rightarrow \frac{x-2}{2} = \frac{y-1}{-3} = \frac{z-3}{2} = \lambda$$

$$\Rightarrow x = 2\lambda + 2, y = -3\lambda + 1 \text{ and } z = 2\lambda + 3$$

Since, this line cuts the plane, $2x + y - z = 3$.

So, $(2\lambda + 2, -3\lambda + 1, 2\lambda + 3)$ satisfies the equation of plane.

$$\therefore 2(2\lambda + 2) - 3\lambda + 1 - 2\lambda - 3 = 3 \Rightarrow \lambda = -1$$

Hence, points are $[2(-1) + 2, -3(-1) + 1, 2(-1) + 3]$,

i.e. (0, 4, 1)

69. (d) Let the ratio in which plane divides the line be $k : 1$.

$$\text{Then, } 0 = \frac{4k+2}{k+1} \Rightarrow 4k+2=0 \Rightarrow k = -\frac{1}{2}$$

$$\Rightarrow 4 = \frac{-2k+1}{k+1} \Rightarrow 4k+4 = -2k+1 \Rightarrow k = -\frac{1}{2}$$

Hence, plane divides the line in ratio 1 : 2 externally.

70. (b) We know that, equation of plane passing through three non-collinear points $(x_1, y_1, z_1), (x_2, y_2, z_2)$ and (x_3, y_3, z_3) is

$$\begin{vmatrix} x-x_1 & y-y_1 & z-z_1 \\ x_2-x_1 & y_2-y_1 & z_2-z_1 \\ x_3-x_1 & y_3-y_1 & z_3-z_1 \end{vmatrix} = 0$$

Putting the value of $(x_1, y_1, z_1), (x_2, y_2, z_2)$

and (x_3, y_3, z_3) , we get

$$\begin{vmatrix} x-2 & y-2 & z-1 \\ 1 & 2 & 1 \\ 5 & -2 & 5 \end{vmatrix} = 0$$

$$\Rightarrow (x-2)(10+2) - (y-2)(5-5) + (z-1)(-2-10) = 0$$

$$\Rightarrow 12x - 12z = 12 \Rightarrow x - z = 1$$

Hence, the equation of plane passes through (1, 0, 1).

71. (c) Direction ratios of the normal to the plane $x - z = 1$ are (1, 0, -1).

72. (b) Equation of sphere passing through origin is

$$x^2 + y^2 + z^2 + 2ux + 2vy + 2wz = 0$$

Which passes through the points,

(2, 1, -1), (1, 5, -4) and (-2, 4, -6).

$$\therefore 4u + 2v - 2w = -6 \quad \dots(i)$$

$$2u + 10v - 8w = -42 \quad \dots(ii)$$

$$\text{and } -4u + 8v - 12w = -56 \quad \dots(iii)$$

On solving above equations, we get

$$u = 1, v = -2 \text{ and } w = 3$$

$$\therefore \text{Radius of sphere} = \sqrt{u^2 + v^2 + w^2} = \sqrt{1+4+9} = \sqrt{14}$$

73. (a) Centre of sphere

$$(-u, -v, -w) = (-1, 2, -3)$$

74. (a) I. Equation of sphere is

$$x^2 + y^2 + z^2 + 2x - 4y + 6z = 0$$

Put the value (0, 4, 0)

$$\text{we get } 0 + 16 + 0 + 0 - 16 + 0 = 0$$

So, the sphere passes through the point (0, 4, 0).

II. Distance between (1, 1, 1) and centre of sphere (-1, 2, -3)

$$= \sqrt{(1+1)^2 + (1-2)^2 + (1+3)^2}$$

$$= \sqrt{4+1+16} = \sqrt{21} \neq 5$$

Hence, only Statement II is not correct.

75. (d) Length of the line segment

$$= \sqrt{a^2 + b^2 + c^2} = \sqrt{12^2 + 4^2 + 3^2}$$

$$= 13 \text{ units}$$

76. (a) Direction cosines of the line segment = $\left(\pm \frac{12}{13}, \pm \frac{4}{13}, \pm \frac{3}{13}\right)$

$$\left[\because \frac{\pm a}{\sqrt{a^2 + b^2 + c^2}}, \frac{\pm b}{\sqrt{a^2 + b^2 + c^2}}, \frac{\pm c}{\sqrt{a^2 + b^2 + c^2}} \right]$$

- 77.** (b) We have, $\frac{x}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda$
 $\Rightarrow x = 2\lambda, y = 3\lambda + 2, z = 4\lambda + 3$
 \therefore Direction ratios of the line passing through P
 $P(3, -1, 11)$ is $[(2\lambda - 3), (3\lambda + 2 + 1), (4\lambda + 3 - 11)]$
 $= 2\lambda - 3, 3\lambda + 3, 4\lambda - 8$
 $\therefore (2\lambda - 3) \cdot 2 + (3\lambda + 3) \cdot 3 + (4\lambda - 8) \cdot 4 = 0$
 $\Rightarrow 4\lambda - 6 + 9\lambda + 9 + 16\lambda - 32 = 0$
 $\Rightarrow 29\lambda = 29 \Rightarrow \lambda = 1$
 \therefore Direction ratios
 $\equiv (2 - 3, 3 + 3, 4 - 8) \equiv (-1, 6, -4)$
- 78.** (c) Length of the line segment PQ , when $Q \equiv (2, 5, 7)$
 $\therefore PQ = \sqrt{(2-3)^2 + (5+1)^2 + (7-11)^2}$
 $= \sqrt{1+36+16} = \sqrt{53}$ units
- 79.** (a) We have, $\frac{x}{A} + \frac{y}{B} + \frac{z}{C} = 1$
 Since, triangular plane ABC with centroid $(1, 2, 3)$ cuts the coordinate axes,
 \therefore Intercepts made by X -axis, Y -axis and Z -axis are, $3, 6, 9$.
- 80.** (d) We have, $\frac{x}{A} + \frac{y}{B} + \frac{z}{C} = 1$
 Since, triangular plane ABC with centroid $(1, 2, 3)$ cuts the coordinate axes,
 \therefore Intercepts made by X -axis, Y -axis and Z -axis are $3, 6, 9$.
 \therefore Equation of the plane ABC is
 $\frac{x}{3} + \frac{y}{6} + \frac{z}{9} = 1$
 or $6x + 3y + 2z = 18$
- 81.** (b) Length of diagonals of the cuboid
 $= \sqrt{1^2 + 2^2 + 3^2} = \sqrt{14}$ units
- 82.** (c) The equation of the plane passing through $P(1, 2, 3)$ and parallel to XY -plane is $z = 3$.

- 83.** (a) Here, $\frac{x}{\frac{1}{6}} = \frac{y}{\frac{3}{-1}} = \frac{z}{\frac{-1}{4}}$
 and $\frac{2}{\frac{1}{6}} = \frac{3}{-1} = \frac{z}{-\frac{1}{4}}$
 DR's of the lines are $\langle \frac{1}{2}, \frac{1}{3}, -1 \rangle$
 and $\langle \frac{1}{6}, -1, -\frac{1}{4} \rangle$,
 i.e. $\frac{1}{2} \times \frac{1}{6} + \frac{1}{3}(-1) + (-1)\left(-\frac{1}{4}\right)$
 $= \frac{1}{12} - \frac{1}{3} + \frac{1}{4} = 0$
 Hence, both lines are perpendicular.
- 84.** (b) Given, $3x^2 + 3y^2 + 3z^2 - 8x + 4y + 8z - 15 = 0$
 $\Rightarrow x^2 + y^2 + z^2 - \frac{8}{3}x + \frac{4}{3}y + \frac{8}{3}z - 5 = 0$
 Compare it with equation of a sphere
 $x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0$, we get
 $2u = -\frac{8}{3}, 2v = \frac{4}{3}, 2w = \frac{8}{3}, d = -5$
 $\therefore u = -\frac{4}{3}, v = \frac{2}{3}, w = \frac{4}{3}, d = -5$
 Now, radius of a sphere
 $= \sqrt{u^2 + v^2 + w^2 - d}$
 $= \sqrt{\frac{16}{9} + \frac{4}{9} + \frac{16}{9} + 5}$
 $= \sqrt{4+5} = \sqrt{9} = 3$
- 85.** (a) Let DR's of the line be a, b, c .
 We have, $a - 2b - 2c = 0$
 and $0 \cdot a + 2b + c = 0$
 $\therefore \frac{a}{-2+4} = \frac{-b}{1-0} = \frac{c}{2-0}$
 $\Rightarrow \frac{a}{2} = \frac{b}{-1} = \frac{c}{2}$
- 86.** (b) The foot of perpendicular drawn from $(3, 5, 4)$ on $z = 0$ is
 $\frac{x-3}{0} = \frac{y-5}{0} = \frac{z-4}{1} = -\frac{4}{1}$
 $\Rightarrow x = 3, y = 5, z = 0$
 Hence, $(x, y, z) = (3, 5, 0)$

- 87.** (b) Given, $5x + 2y + z - 13 = 0$
 or $\frac{x}{\frac{13}{5}} + \frac{y}{\frac{13}{2}} + \frac{z}{13} = 1$
 \therefore Lengths of intercepts are $\frac{13}{5}, \frac{13}{2}$
 and 13 .
- 88.** (a) Given equations of plane are
 $2x - y + 3z = 2$... (i)
 and $x + y - z = 1$... (ii)
 Let the direction ratios of line of intersection be $\langle a, b, c \rangle$.
 $\therefore 2a - b + 3c = 0$... (iii)
 and $a + b - c = 0$... (iv)
 $[\because a_1 a_2 + b_1 b_2 + c_1 c_2 = 0]$
 On solving Eqs. (iii) and (iv), we get
 $\frac{a}{-2} = \frac{-b}{-5} = \frac{c}{3}$
 $\Rightarrow \frac{a}{-2} = \frac{b}{5} = \frac{c}{3}$ or $\frac{a}{2} = \frac{b}{-5} = \frac{c}{-3}$
 $\Rightarrow \langle a, b, c \rangle = \langle 2, -5, -3 \rangle$
- 89.** (b) The equation of plane P is
 $(2x - y + 3z - 2) + \lambda(x + y - z - 1) = 0$
 It passes through $(1, 0, 1)$, we get
 $(2 - 0 + 3 - 2) + \lambda(1 + 0 - 1 - 1) = 0$
 $\Rightarrow 3 - \lambda = 0 \Rightarrow \lambda = 3$
 Hence, equation of plane P is
 $(2x - y + 3z - 2) + 3(x + y - z - 1) = 0$
 $\Rightarrow 5x + 2y - 5 = 0$
- 90.** (c) Plane P touches the sphere
 $x^2 + y^2 + z^2 = r^2$
 Here, the centre of sphere is $(0, 0, 0)$.
 \therefore Radius of sphere, $r =$ Perpendicular distance from centre of sphere to the tangent plane.
 $r = \left| \frac{0+0+0-5}{\sqrt{5^2+2^2}} \right| = \left| \frac{-5}{\sqrt{29}} \right|$
 $\Rightarrow r = \frac{5}{\sqrt{29}}$ units

20

LIMITS, CONTINUITY AND DIFFERENTIABILITY

In NDA exam, generally 6-8 questions are asked from this chapter which are based on finding limits of various functions, check continuity / differentiability of functions in different conditions.

LIMIT OF A FUNCTION

Let $y = f(x)$ be a function of x . If at $x = a$, $f(x)$ takes indeterminate form, then we consider the values of the function which are very close to a . If these values tend to a definite unique number as x tends to a , then the unique number so obtained is called the limit of $f(x)$ at $x = a$ and we can write it as $\lim_{x \rightarrow a} f(x)$.

Right Hand Limit

If x approaches from the right, i.e. from larger values of x than a , then the limit of $f(x)$ is called the Right Hand Limit (RHL) and is written as,

$$\lim_{x \rightarrow a^+} f(x) \text{ or } \lim_{x \rightarrow (a+0)} f(x) \text{ or } f(a+0)$$

To find RHL, put $x = a + h$ and replace $x \rightarrow a^+$ by $h \rightarrow 0$ and then simplify $\lim_{h \rightarrow 0} f(a + h)$ using appropriate formula.

Left Hand Limit

If x approaches a from the left, i.e. from the smaller values of x than a , then the limit of $f(x)$ is called the Left Hand Limit (LHL) and is written as, $\lim_{x \rightarrow a^-} f(x)$ or $f(a-0)$.

To find LHL, put $x = a - h$ and replace $x \rightarrow a^-$ by $h \rightarrow 0$ and then simplify $\lim_{h \rightarrow 0} f(a - h)$ using appropriate formula. When the left hand limit equals to the right hand limit, we say that the function has a limiting values. Thus, for the existence of $\lim_{x \rightarrow a} f(x)$, the necessary and sufficient condition is

$$\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^+} f(x) \text{ or } f(a-h) = f(a+h)$$

Note Left hand limit and right hand limit are specially used, when the function is defined by more than one rule, e.g. Modulus functions.

IMPORTANT RESULTS RELATED TO LIMIT

- (i) $\lim_{x \rightarrow a} [f(x) \pm \phi(x)] = \lim_{x \rightarrow a} f(x) \pm \lim_{x \rightarrow a} \phi(x)$
- (ii) $\lim_{x \rightarrow a} [c \cdot f(x)] = c \lim_{x \rightarrow a} f(x)$, where c is a constant.
- (iii) $\lim_{x \rightarrow a} [f(x) \cdot \phi(x)] = \lim_{x \rightarrow a} f(x) \cdot \lim_{x \rightarrow a} \phi(x)$
- (iv) $\lim_{x \rightarrow a} \frac{f(x)}{\phi(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} \phi(x)}$, provided $\lim_{x \rightarrow a} \phi(x) \neq 0$
- (v) $\lim_{x \rightarrow a} \log f(x) = \log[\lim_{x \rightarrow a} f(x)]$, provided $\lim_{x \rightarrow a} f(x) > 0$
- (vi) $\lim_{x \rightarrow a} e^{f(x)} = e^{\lim_{x \rightarrow a} f(x)}$
- (vii) $\lim_{x \rightarrow a} [1 + f(x)]^{1/\phi(x)} = e^{\lim_{x \rightarrow a} \frac{f(x)}{\phi(x)}}$
- (viii) $\lim_{x \rightarrow a} [f(x)]^{\phi(x)} = \left\{ \lim_{x \rightarrow a} f(x) \right\}^{\lim_{x \rightarrow a} \phi(x)}$
- (ix) If $\lim_{x \rightarrow a} f[\phi(x)] = f[\lim_{x \rightarrow a} \phi(x)]$, provided ' f ' is continuous at $\phi(x) \in R$

EXAMPLE 1. If $f(x)$ is defined as $f(x) = \begin{cases} 2kx + 3, & \text{if } x < 1 \\ 1 - kx^2, & \text{if } x > 1 \end{cases}$ then for what values of k does $\lim_{x \rightarrow 1}$ exist?

- a. 0
- b. 1
- c. $\frac{1}{2}$
- d. $-\frac{2}{3}$

Sol. d. We have, $\lim_{x \rightarrow 1^-} f(x) = \lim_{h \rightarrow 0} f(1-h) = \lim_{h \rightarrow 0} [2k(1-h) + 3]$
 $= [2k(1-0) + 3] = 2k + 3$
 and $\lim_{x \rightarrow 1^+} f(x) = \lim_{h \rightarrow 0} f(1+h) = \lim_{h \rightarrow 0} [1 - k(1+h)^2]$
 $= 1 - k(1+0)^2 = 1 - k$
 Now, $\lim_{x \rightarrow 1} f(x)$ exists, if $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x)$
 $\Rightarrow 2k + 3 = 1 - k \Rightarrow 3k = -2 \Rightarrow k = -\frac{2}{3}$

Sandwich Theorem (or Squeeze theorem)

If f, g and h are functions such that $f(x) \leq g(x) \leq h(x)$ for all x in some neighbourhood of the point a (except possibly at $x = a$) and if $\lim_{x \rightarrow a} f(x) = l = \lim_{x \rightarrow a} h(x)$, then $\lim_{x \rightarrow a} g(x) = l$.

EXAMPLE 2. The value of $\lim_{x \rightarrow \infty} \frac{x + 7 \sin x}{-2x + 13}$, using

sandwich theorem, is

- a. $\frac{1}{3}$
- b. $\frac{1}{2}$
- c. 0
- d. $-\frac{1}{2}$

Sol. d. We know that, $-1 \leq \sin x \leq 1$ for all x
 $\Rightarrow -7 \leq 7 \sin x \leq 7 \Rightarrow x - 7 \leq x + 7 \sin x \leq x + 7$
 Now, dividing throughout by $(-2x + 13)$, we get
 $\frac{x - 7}{-2x + 3} \geq \frac{x + 7 \sin x}{-2x + 13} \geq \frac{x + 7}{-2x + 13}$ for all x that are large.
 Now, $\lim_{x \rightarrow \infty} \frac{x - 7}{-2x + 13} = \lim_{x \rightarrow \infty} \frac{1 - \frac{7}{x}}{-2 + \frac{13}{x}} = \frac{1 - 0}{-2 + 0} = -\frac{1}{2}$
 and $\lim_{x \rightarrow \infty} \frac{x + 7}{-2x + 13} = \lim_{x \rightarrow \infty} \frac{1 + \frac{7}{x}}{-2 + \frac{13}{x}} = \frac{1 + 0}{-2 + 0} = -\frac{1}{2}$

Limit of a Rational Function

Limit of a rational function $f(x)$, of the form $\lim_{x \rightarrow a} \frac{p(x)}{q(x)}$, can be found out using factorisation or substitution methods.

Indeterminate Form

If the expression obtained after substitution of value of the limit give the following forms $0^0, 0/0, 1^\infty, \infty - \infty, \infty/\infty, 0 \times \infty$ and ∞^0 , then it is known as an indeterminate form.

EXAMPLE 3. If $\lim_{x \rightarrow 1} \frac{x^4 - 1}{x - 1} = \lim_{x \rightarrow k} \frac{x^3 - k^3}{x^2 - k^2}$, then find

the value of k .

- a. 0
- b. $\frac{8}{3}$
- c. 0 and $\frac{8}{3}$
- d. $\frac{3}{8}$

Sol. b. We have, $\lim_{x \rightarrow 1} \frac{x^4 - 1}{x - 1} = \lim_{x \rightarrow k} \frac{x^3 - k^3}{x^2 - k^2}$
 $\Rightarrow \lim_{x \rightarrow 1} \frac{(x^2 + 1)(x + 1)(x - 1)}{x - 1} = \lim_{x \rightarrow k} \frac{(x - k)(x^2 + xk + k^2)}{(x - k)(x + k)}$
 $\Rightarrow \lim_{x \rightarrow 1} (x^2 + 1)(x + 1) = \lim_{x \rightarrow k} \frac{x^2 + xk + k^2}{x + k}$
 $\Rightarrow (1^2 + 1)(1 + 1) = \frac{k^2 + k \cdot k + k^2}{k + k}$
 $\Rightarrow 4 = \frac{3k^2}{2k} \Rightarrow 3k^2 - 8k = 0$
 $\Rightarrow k(3k - 8) = 0 \Rightarrow k = 0, \frac{8}{3}$
 Since, $k = 0$ does not satisfy the given equation, therefore $k = 8/3$.

Exponential and Logarithmic Limits

For finding the limits of exponential and logarithmic functions, following results are useful

1. $\lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log_e a, a > 0$
2. $\lim_{x \rightarrow 0} \frac{e^x - 1}{x} = 1$
3. $\lim_{x \rightarrow 0} (1+x)^{\frac{1}{x}} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e$
4. $\lim_{x \rightarrow 0} \left(1 + \frac{a}{x}\right)^x = e^a$
5. $\lim_{x \rightarrow 0} \frac{\log x}{x^m} = 0, (m > 0)$
6. $\lim_{x \rightarrow 0} \frac{\log_a(1+x)}{x} = \log_a e, (a > 0, a \neq 1)$
7. $\lim_{x \rightarrow 0} \frac{\log(1+x)}{x} = 1$
8. $\lim_{x \rightarrow 0} (1 + \lambda x)^{1/x} = e^\lambda$

EXAMPLE 4. The value of $\lim_{x \rightarrow 0} \frac{\log(5+x) - \log(5-x)}{x}$ is

- a. $\frac{5}{2}$ b. $\frac{1}{5}$ c. $\frac{2}{5}$ d. 0

Sol. c. We have, $\lim_{x \rightarrow 0} \frac{\log(5+x) - \log(5-x)}{x}$ $\left[\frac{0}{0} \text{ form}\right]$

$$= \lim_{x \rightarrow 0} \frac{\log\left\{5\left(1 + \frac{x}{5}\right)\right\} - \log\left\{5\left(1 - \frac{x}{5}\right)\right\}}{x}$$

$$= \lim_{x \rightarrow 0} \frac{\left\{\log 5 + \log\left(1 + \frac{x}{5}\right)\right\} - \left\{\log 5 + \log\left(1 - \frac{x}{5}\right)\right\}}{x}$$

$$= \lim_{x \rightarrow 0} \frac{\log\left(1 + \frac{x}{5}\right) - \log\left(1 - \frac{x}{5}\right)}{x}$$

$$= \lim_{x \rightarrow 0} \frac{\log\left(1 + \frac{x}{5}\right)}{x/5} + \lim_{x \rightarrow 0} \frac{\log\left(1 - \frac{x}{5}\right)}{-x/5} \cdot \frac{1}{(-5)} = \frac{1}{5} + \frac{1}{5} = \frac{2}{5}$$

Trigonometric Limits

- (i) $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$
- (ii) $\lim_{x \rightarrow 0} \sin x = 0$
- (iii) $\lim_{x \rightarrow 0} \cos x = 1$
- (iv) $\lim_{x \rightarrow 0} \frac{\tan x}{x} = 1$
- (v) $\lim_{x \rightarrow 0} \frac{\sin^{-1} x}{x} = 1$
- (vi) $\lim_{x \rightarrow 0} \frac{\tan^{-1} x}{x} = 1$

EXAMPLE 5. The value of $\lim_{x \rightarrow 0} \frac{\sin|x|}{x}$ is

- a. 1 b. -1 c. ∞ d. Does not exist

Sol. d. $\therefore \lim_{x \rightarrow 0} \frac{\sin|x|}{x}$, LHL = $\lim_{x \rightarrow 0^-} \frac{\sin(-x)}{x}$

$$= -\lim_{x \rightarrow 0} \frac{\sin x}{x} = -1$$

and RHL = $\lim_{x \rightarrow 0^+} \frac{\sin x}{x} = 1$

\therefore LHL \neq RHL

So, the limit does not exist.

EXAMPLE 6. Evaluate $\lim_{x \rightarrow \pi/2} (\sec x - \tan x)$.

- a. 0 b. 1 c. -1 d. $\frac{1}{2}$

Sol. a. $\lim_{x \rightarrow \pi/2} (\sec x - \tan x) = \lim_{x \rightarrow \pi/2} \left(\frac{1}{\cos x} - \frac{\sin x}{\cos x}\right)$

$$= \lim_{x \rightarrow \pi/2} \left(\frac{1 - \sin x}{\cos x}\right) = \lim_{x \rightarrow \pi/2} \frac{\left(\frac{\cos x}{2} - \frac{\sin x}{2}\right)^2}{\cos^2 \frac{x}{2} - \sin^2 \frac{x}{2}}$$

$$= \lim_{x \rightarrow \pi/2} \frac{\cos \frac{x}{2} - \sin \frac{x}{2}}{\cos \frac{x}{2} + \sin \frac{x}{2}} = \frac{\cos \frac{\pi}{4} - \sin \frac{\pi}{4}}{\cos \frac{\pi}{4} + \sin \frac{\pi}{4}} = \frac{\frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}} = 0$$

L' HOSPITAL'S RULE

In this method, we first check, whether the form of the function after substituting the limit is $\frac{0}{0}$ or not.

If it is not of this form, then make necessary operation in the function otherwise we differentiate both numerator and denominator with respect to x . Differentiation can be done n number of times according to the problem. The above rule can be applied for other indeterminate forms such as

$$\frac{\infty}{\infty}, \infty - \infty, 0 \times \infty, 1^\infty, 0^0 \text{ and } \infty^0 \text{ etc.}$$

EXAMPLE 7. The value of $\lim_{x \rightarrow 0} \frac{\sin^{-1} x - \tan^{-1} x}{x^3}$ is

- a. 0 b. $\frac{1}{2}$
c. $\frac{1}{3}$ d. 3

Sol. b. We have, $\lim_{x \rightarrow 0} \frac{\sin^{-1} x - \tan^{-1} x}{x^3}$

$$= \lim_{x \rightarrow 0} \frac{(1+x^2) - \sqrt{1+x^2}}{3x^2\sqrt{1-x^2}(1+x^2)} \quad [\text{use L'Hospital's Rule, as } \frac{0}{0} \text{ form}]$$

$$= \lim_{x \rightarrow 0} \frac{(1+x^2)^2 - (1-x^2)}{3x^2(\sqrt{1-x^2})(1+x^2)} \times \frac{1}{(1+x^2)(\sqrt{1-x^2})} \quad [\text{rationalise}]$$

$$= \lim_{x \rightarrow 0} \frac{x^4 + 3x^2}{3x^2\sqrt{1-x^2}(1+x^2)} \times \frac{1}{(1+x^2) + (\sqrt{1-x^2})}$$

$$= \lim_{x \rightarrow 0} \frac{x^2 + 3}{3(\sqrt{1-x^2})(1+x^2)} \times \frac{1}{(1+x^2) + (\sqrt{1-x^2})} = \frac{1}{2}$$

SOME IMPORTANT FORMULAE

- (i) $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \infty$
- (ii) $e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots \infty$
- (iii) $a^x = 1 + x \log_e a + \frac{x^2(\log_e a)^2}{2!} + \frac{x^3(\log_e a)^3}{3!} + \dots \infty$
- (iv) $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \infty, |x| < 1$
- (v) $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \infty$
- (vi) $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots \infty$
- (vii) $\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \dots \infty$
- (viii) $\sin^{-1} x = x + 1^2 \cdot \frac{x^3}{3!} + 1^2 \cdot 3^2 \cdot \frac{x^5}{5!} + \dots$
- (ix) $\cos^{-1} x = x - \frac{x^3}{6} + \dots$
- (x) $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \dots$

CONTINUITY

A function $f(x)$ is defined for $x = a$ is said to be continuous at $x = a$, if

1. $f(a)$, i.e. the value of $f(x)$ at $x = a$ is a definite number and
2. The limit of the function $f(x)$ as $x \rightarrow a$ exists and is equal to the value of $f(x)$ at $x = a$.

or $f(x)$ is continuous at $x = a$,

if $\lim_{x \rightarrow a^+} f(x) = \lim_{x \rightarrow a^-} f(x) = f(a)$

or $f(a+0) = f(a-0) = f(a)$

If $f(x)$ is not continuous at $x = a$, it is said to be discontinuous and the point a is called a point of discontinuity.

Continuity of a Function in Interval

- (i) A function $f(x)$ is said to be continuous over an open interval $]a, b[$ if it is continuous at every point over the interval (a, b) .
- (ii) A function $f(x)$ is said to be continuous over closed interval $[a, b]$, if it is continuous over the open interval $]a, b[$ and is continuous at the point a from the right and continuous at point b from the left.

Properties of Continuous Functions

If $f(x)$ and $g(x)$ are continuous functions at $x = a$, then

- (i) $f(x) \pm g(x)$ are also continuous at $x = a$.
- (ii) $f(x) \cdot g(x)$ is also continuous at $x = a$.
- (iii) $\frac{f(x)}{g(x)}$ is also continuous at $x = a$, if $g(a) \neq 0$.
- (iv) $k f(x)$ is also continuous, where k is a constant.
- (v) $1/f(x)$ is also continuous at $x = a$, if $f(a) \neq 0$
- (vi) $|f(x)|$ is also continuous.

Discontinuity of a Function

A function $f(x)$, which is not continuous at a point $x = a$, is said to be discontinuous at that point.

EXAMPLE 8. If $f(x) = \begin{cases} \frac{\sin 2x}{2}, & \text{when } x \neq 0 \\ \sin 3x, & \text{when } x = 0 \end{cases}$, then at

$x = 0$, function is

- a. continuous
- b. not continuous, since $\lim_{x \rightarrow 0} f(x)$ is not defined
- c. not continuous, since $\lim_{x \rightarrow 0} f(x) \neq f(0)$
- d. None of the above

Sol. c. We have, $f(0) = 2$, [given]

Also, $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\sin 2x}{\sin 3x} = \lim_{x \rightarrow 0} \left(\frac{\sin 2x}{2x} \times \frac{3x}{\sin 3x} \cdot \frac{2}{3} \right)$
 $= \frac{2}{3} \lim_{x \rightarrow 0} \frac{\sin 2x}{2x} \times \frac{1}{\lim_{x \rightarrow 0} \frac{\sin 3x}{3x}} = \frac{2}{3} \times 1 \times \frac{1}{1} = \frac{2}{3}$

$\therefore \lim_{x \rightarrow 0} f(x) \neq f(0)$

Hence, $f(x)$ is not continuous at $x = 0$.

EXAMPLE 9. A function f is defined as follows

$f(x) = x^p \cos\left(\frac{1}{x}\right), x \neq 0, f(0) = 0$. What conditions should

be imposed on p , so that f may be continuous at $x = 0$?

- a. $p = 0$
- b. $p > 0$
- c. $p < 0$
- d. No value of p

Sol. b. $\therefore f(x) = \begin{cases} x^p \cos\left(\frac{1}{x}\right), & x \neq 0 \\ 0, & x = 0 \end{cases}, \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} x^p \cos\left(\frac{1}{x}\right)$

Since, $f(x)$ is continuous at $x = 0$.

$\therefore \lim_{x \rightarrow 0} x^p \cos\left(\frac{1}{x}\right) = 0$

which is possible only, if $p > 0$.

DIFFERENTIABILITY

Let k denotes the open interval (a, b) in R and $c \in k$. Then, a function $f: k \rightarrow R$ is said to be differentiable at c , if and only if $\lim_{h \rightarrow 0} \left[\frac{f(c+h) - f(c)}{h} \right]$ exists and is denoted by $f'(c)$.

Let $y = f(x)$

Then, the value $f'(x_0^+)$

$$= \lim_{\delta x \rightarrow 0} \frac{f(x_0 + \delta x) - f(x_0)}{\delta x}, \delta x > 0 \quad \dots(i)$$

is called the right hand derivative of $f(x)$ at x_0 and the value

$$f'(x_0^-) = \lim_{\delta x \rightarrow 0} \frac{f(x_0 - \delta x) - f(x_0)}{-\delta x}, \delta x > 0 \quad \dots(ii)$$

is called the left hand derivative of $f(x)$ at x_0 .

SOME IMPORTANT RESULTS

- (i) Trigonometric functions, inverse trigonometric functions, logarithmic functions, exponential functions and modulus functions are continuous in their domain.
- (ii) Every polynomial is continuous at every point of the real line.
- (iii) The composition of differentiable functions is a differentiable function.
- (iv) If a function is not differentiable but it is continuous at a point, it geometrically implies there is a sharp corner or a kink at that point.

Relation between Differentiability and Continuity

Generally, a function which is differentiable at a point is necessarily continuous at that point, i.e. differentiability at a point \Rightarrow continuity at that point, but converse is not necessary true.

EXAMPLE 10. The function $f(x) = (x-2)^{1/3}$ is

- a. differentiable at $x=2$
- b. not differentiable at $x=2$
- c. Cannot be determined
- d. None of the above

Sol. b. $\because f(x) = (x-2)^{1/3}$

$$\text{Now, } f(x+2) = (x+2-2)^{1/3} = (x)^{1/3}$$

$$\therefore f(2) = (x-2)^{1/3} \\ = (2-2)^{1/3} = 0$$

$$\text{We have, } f'(2) = \lim_{h \rightarrow 0} \frac{f(2+h) - f(2)}{h}$$

$$= \lim_{h \rightarrow 0} \frac{h^{1/3} - 0}{h}$$

$$= \lim_{h \rightarrow 0} \frac{1}{h^{2/3}}$$

which is not defined. Hence, the function is not differentiable at $x=2$.

PRACTICE EXERCISE

1. $\lim_{x \rightarrow a} \frac{\sqrt{(a+2x)} - \sqrt{3x}}{\sqrt{(3a+x)} - 2\sqrt{x}}$, $a \neq 0$ is equal to
(a) $\frac{1}{3}$ (b) $\frac{1}{3\sqrt{3}}$ (c) $\frac{2}{3\sqrt{3}}$ (d) 0
2. $\lim_{x \rightarrow \infty} \frac{x^3 - 3x + 2}{2x^3 + x - 3}$ is equal to
(a) 2 (b) $\frac{1}{2}$ (c) 0 (d) 1
3. $\lim_{x \rightarrow 0} \frac{2^x - 1}{(1+x)^{1/2} - 1}$ is equal to
(a) $\log 2$ (b) $2 \log 2$ (c) $\frac{1}{2} \log 2$ (d) 0
4. $\lim_{x \rightarrow 3} \frac{(x-3)}{|x-3|}$ is equal to
(a) 0 (b) 1 (c) -1 (d) does not exist

5. $\lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x \sin x}$ is equal to
(a) $\frac{1}{2}$ (b) $\frac{3}{2}$ (c) $\frac{9}{2}$ (d) $\frac{9}{4}$
6. $\lim_{x \rightarrow \pi/2} \frac{2x - \pi}{\cos x}$ is equal to
(a) 1 (b) 2 (c) -2 (d) 0
7. $\lim_{\theta \rightarrow \pi/4} \frac{\sqrt{2} - \cos \theta - \sin \theta}{(4\theta - \pi)^2}$ is equal to
(a) $\frac{1}{16}$ (b) $\frac{1}{16\sqrt{2}}$ (c) $\frac{1}{8}$ (d) $\frac{1}{8\sqrt{2}}$
8. $\lim_{x \rightarrow \infty} \sqrt{\frac{x + \sin x}{x - \cos x}}$ is equal to
(a) 0 (b) 1 (c) -1 (d) ± 1

9. $\lim_{x \rightarrow 0} \left[\frac{\sin(x+a) + \sin(a-x) - 2\sin a}{x \sin x} \right]$ is equal to
 (a) $\sin a$ (b) $\cos a$ (c) $-\sin a$ (d) $\frac{1}{2} \cos a$
10. If $f(x) = \begin{cases} \frac{\sin [x]}{[x]}, & [x] \neq 0 \\ 0, & [x] = 0 \end{cases}$, where $[x]$ denotes the greatest integer less than or equal to x , then $\lim_{x \rightarrow 0} f(x)$ equals to
 (a) 1 (b) 0 (c) -1 (d) does not exist
11. If $\lim_{x \rightarrow a} \frac{a^x - x^a}{x^x - a^a} = -1$, then
 (a) $a = 1$ (b) $a = 0$ (c) $a = e$ (d) 2
12. $\lim_{x \rightarrow \pi/4} \frac{1 - \cot^3 x}{2 - \cot x - \cot^3 x}$ is equal to
 (a) $\frac{3}{4}$ (b) $\frac{11}{4}$ (c) $\frac{1}{2}$ (d) $\frac{2}{5}$
13. The function $\frac{\log(1+ax) - \log(1-bx)}{x}$ is not defined at $x = 0$. The value which should be assigned to f at $x = 0$, so that it is continuous at $x = 0$ is
 (a) $a - b$ (b) $1 + b$
 (c) $\log a + \log b$ (d) None of these
14. If $f(x) = \frac{\sin(e^{x-2} - 1)}{\log(x-1)}$, then $\lim_{x \rightarrow 2} f(x)$ is given by
 (a) -2 (b) -1 (c) 0 (d) 1
15. What is $\lim_{x \rightarrow \infty} (\sqrt{a^2 x^2 + ax + 1} - \sqrt{a^2 x^2 + 1})$ equal to?
 (a) $\frac{1}{2}$ (b) 1 (c) 2 (d) 0
16. What is the value of k for which the following function $f(x)$ is continuous for all x ?

$$f(x) = \begin{cases} \frac{x^3 - 3x + 2}{(x-1)^2}, & \text{for } x \neq 1 \\ k, & \text{for } x = 1 \end{cases}$$

 (a) 3 (b) 2 (c) 1 (d) -1
17. What is the value of $\lim_{x \rightarrow \infty} \left(\frac{x+6}{x+1} \right)^{x+4}$?
 (a) e (b) e^2 (c) e^4 (d) e^5
18. The function $f(x) = \begin{cases} x^2/a, & 0 \leq x < 1 \\ a, & 1 \leq x < \sqrt{2} \\ (2b^2 - 4b)/x^2, & \sqrt{2} \leq x < \infty \end{cases}$ is continuous for $0 \leq x < \infty$, then the most suitable values of a and b are
 (a) $a = 1, b = -1$ (b) $a = -1, b = 1 + \sqrt{2}$
 (c) $a = -1, b = 1$ (d) None of these
19. The set of all points of differentiability of the function $f(x) = \begin{cases} x^2 \sin(1/x), & x \neq 0 \\ 0, & x = 0 \end{cases}$ is
 (a) $(-\infty, 0)$ (b) $(-\infty, \infty) - \{0\}$ (c) $(0, \infty)$ (d) $(-\infty, \infty)$
20. Which one of the following is correct in respect of the function $f(x) = |x| + x^2$?
 (a) $f(x)$ is not continuous at $x = 0$
 (b) $f(x)$ is differentiable at $x = 0$
 (c) $f(x)$ is continuous but not differentiable at $x = 0$
 (d) None of the above
21. $\lim_{x \rightarrow 0} e^{-1/x}$ is equal to
 (a) 0 (b) ∞ (c) e (d) does not exist
22. What is the set of all points, where the function $f(x) = \frac{x}{1+|x|}$ is differentiable?
 (a) $(-\infty, \infty)$ only (b) $(0, \infty)$ only
 (c) $(-\infty, 0) \cup (0, \infty)$ only (d) $(-\infty, 0)$ only
23. Let $f(x) = \begin{cases} 3x - 4, & 0 \leq x \leq 2 \\ 2x + l, & 2 < x \leq 9 \end{cases}$. If f is continuous at $x = 2$, then what is the value of l ?
 (a) 0 (b) 2 (c) -2 (d) -1
24. If $f: R \rightarrow R$ be defined as $f(x) = \sin(|x|)$, then which one of the following is correct?
 (a) f is not differentiable only at 0
 (b) f is differentiable only at 0
 (c) f is differentiable everywhere except at $x = 0$
 (d) f is non-differentiable at many points
25. Consider the following statements
 I. $f(x) = |x - 3|$ is continuous at $x = 0$.
 II. $f(x) = |x - 3|$ is differentiable at $x = 0$.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
26. Consider the following statement
 I. $f(x) = |x|$ is continuous $\forall x \in R$
 II. $f(x) = x^3 + x^2 - 1$ is not continuous $\forall x \in R$
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
27. Consider the following statements
 I. $\lim_{x \rightarrow 0} \sqrt{\frac{\tan^{-1} x}{x} - \frac{\sin^{-1} x}{x}}$
 II. $\lim_{x \rightarrow 0} \sqrt{\frac{\sin^{-1} x}{x} - \frac{\tan^{-1} x}{x}}$
 where, $|x| < 1$, then

Which of the above statement(s) is/are correct?

- (a) Only I
- (b) Only II
- (c) Both I and II
- (d) Neither I nor II

28. Consider the following statements

I. $\lim_{x \rightarrow 0} \frac{x^2}{x}$ exists. II. $\left(\frac{x^2}{x}\right)$ is not continuous at $x=0$.

III. $\lim_{x \rightarrow 0} \frac{|x|}{x}$ does not exist.

Which of the above statement(s) is/are correct?

- (a) I, II and III
- (b) I and II
- (c) II and III
- (d) I and III

Directions (Q. Nos. 29-30) Given the function,

$$f(x) = \begin{cases} x + a\sqrt{2} \sin x, & 0 \leq x < \frac{\pi}{4} \\ 2x \cot x + b, & \frac{\pi}{4} \leq x < \frac{\pi}{2} \\ a \cos 2x - b \sin x, & \frac{\pi}{2} \leq x \leq \pi \end{cases} \text{ is continuous}$$

in $[0, \pi]$, then

29. Find the value of a .

- (a) $\frac{\pi}{6}$
- (b) $-\frac{\pi}{6}$
- (c) $\frac{\pi}{12}$
- (d) $-\frac{\pi}{12}$

30. Find the value of b .

- (a) $\frac{\pi}{6}$
- (b) $-\frac{\pi}{6}$
- (c) $\frac{\pi}{12}$
- (d) $-\frac{\pi}{12}$

Directions (Q. Nos. 31-33) If f, g , and h are function having a common domain D and $h(x) \leq f(x) \leq g(x)$, $x \in D$ and if $\lim_{x \rightarrow a} h(x) = \lim_{x \rightarrow a} g(x) = l$, then $\lim_{x \rightarrow a} f(x) = l$.

This is known as sandwich theorem. Using this result, complete the following limits.

31. The value of $\lim_{x \rightarrow 0} \frac{|x|}{\sqrt{x^4 + 4x^2 + t}}$ is

- (a) 1
- (b) 0
- (c) $\frac{1}{2}$
- (d) does not exist

32. Let $f(x) = x^2 \left(\frac{e^{1/x} - e^{-1/x}}{e^{1/x} + e^{-1/x}}\right)$, $x \neq 0$ and $f(0) = 1$, then

- (a) $\lim_{x \rightarrow 0^+} f(x)$ doesn't exist
- (b) $\lim_{x \rightarrow 0} f(x)$ doesn't exist
- (c) $\lim_{x \rightarrow 0} f(x)$ exists
- (d) $f(x)$ is a continuous function

33. Let $f(x) = x^5 \left\lceil \frac{1}{x^3} \right\rceil$, $x \neq 0$ and $f(0) = 0$, where $\lceil \cdot \rceil$ is greatest integer function, then

- (a) $\lim_{x \rightarrow 0} f(x)$ doesn't exist
- (b) f is not continuous at $x = 0$
- (c) $\lim_{x \rightarrow 0} f(x) = 1$
- (d) $\lim_{x \rightarrow 0} f(x) = 0$

Directions (Q. Nos. 34-37) If $\lim_{x \rightarrow a} f(x) = 1$ and $\lim_{x \rightarrow a} g(x) = \infty$, then $\lim_{x \rightarrow a} [f(x)]^{g(x)} = e^{\lim_{x \rightarrow a} [f(x) - 1]g(x)}$, then

34. $\lim_{x \rightarrow 0} (\cos x)^{\cot^2 x}$ equals

- (a) e
- (b) e^2
- (c) $e^{-1/2}$
- (d) 1

35. $\lim_{x \rightarrow 0} \left(\tan\left(\frac{\pi}{4} + x\right)\right)^{1/4}$ equals

- (a) 0
- (b) 1
- (c) e
- (d) e^2

36. $\lim_{x \rightarrow 0} \left(\frac{x-1+\cos x}{x}\right)^{1/x}$ equals

- (a) $e^{1/2}$
- (b) $e^{-1/2}$
- (c) e
- (d) e^{-1}

37. $\lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3}\right)^{2/x}$ equals

- (a) $a^{2/3} + b^{2/3} + c^{2/3}$
- (b) abc
- (c) $(abc)^{2/3}$
- (d) 1

PREVIOUS YEARS' QUESTIONS

38. What is the value of $\lim_{x \rightarrow 0} \frac{\sqrt{1+x}-1}{x}$? ☑ 2012 II

- (a) 0
- (b) 1/2
- (c) 1
- (d) -1/2

39. What is the value of $\lim_{x \rightarrow 2} \frac{x-2}{x^2-4}$? ☑ 2012 II

- (a) 0
- (b) 1/4
- (c) 1/2
- (d) 1

40. What is the value of $\lim_{x \rightarrow -2} \left(\frac{x+2}{x^3+8}\right)$? ☑ 2012 II

- (a) 1/4
- (b) -1/4
- (c) 1/12
- (d) -1/12

41. What is the value of $\lim_{x \rightarrow 0} x^2 \sin\left(\frac{1}{x}\right)$? ☑ 2012 II

- (a) 0
- (b) 1
- (c) 1/2
- (d) -1

42. What is the value of $\lim_{x \rightarrow 0} \frac{2(1-\cos x)}{x^2}$? ☑ 2012 II

- (a) 0
- (b) 1/2
- (c) 1/4
- (d) 1

43. Which one of the following is correct in respect of the function $f(x) = \frac{x^2}{|x|}$ for $x \neq 0$ and $f(0) = 0$? ☑ 2012 II

- (a) $f(x)$ is discontinuous everywhere
- (b) $f(x)$ is continuous everywhere
- (c) $f(x)$ is continuous at $x = 0$ only
- (d) $f(x)$ is discontinuous at $x = 0$ only

44. Consider the following statements

I. $\lim_{x \rightarrow 0} \frac{1}{x}$ exists. II. $\lim_{x \rightarrow 0} e^{1/x}$ does not exist.

Which of the above statement(s) is/are correct? ☑ 2012 II

- (a) Only I
- (b) Only II
- (c) Both I and II
- (d) Neither I nor II

45. Which one of the following functions is differentiable for all real values of x ? ☑ 2012 II
 (a) $\frac{x}{|x|}$ (b) $x|x|$ (c) $\frac{1}{|x|}$ (d) $\frac{1}{x}$

46. Consider the following in respect of the function $f(x) = |x - 3|$
 I. $f(x)$ is continuous at $x = 3$.
 II. $f(x)$ is differentiable at $x = 0$.
 Which of the above statement(s) is/are correct?
☑ 2012 II
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

47. What is the value of $\lim_{x \rightarrow 0} \frac{1 - \sqrt{1+x}}{x}$? ☑ 2013 I
 (a) 1/2 (b) -1/2 (c) 1 (d) -1

48. Which is $\lim_{x \rightarrow 0} \frac{\sin x - \tan x}{x}$ equal to? ☑ 2013 I
 (a) 0 (b) 1 (c) -1 (d) 1/2

49. The derivative of $|x|$ at $x = 0$ is ☑ 2013 I
 (a) 1 (b) -1 (c) 0 (d) does not exist

50. Consider the following statements in respect of a function $f(x)$
 I. $f(x)$ is continuous at $x = a$, iff $\lim_{x \rightarrow a} f(x)$ exists.
 II. If $f(x)$ is continuous at a point, then $\frac{1}{f(x)}$ is also continuous at the point.
 Which of the above statement(s) is/are correct?
☑ 2013 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

51. Consider the following statements
 I. $\lim_{x \rightarrow 0} \sin \frac{1}{x}$ does not exist. II. $\lim_{x \rightarrow 0} x \sin \frac{1}{x}$ exists.
 Which of the above statement(s) is/are correct?
☑ 2013 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

52. Consider the function $f(x) = \begin{cases} x^2, & x > 2 \\ 3x - 2, & x \leq 2 \end{cases}$
 Which one of the following statements is correct in respect of the above function? ☑ 2013 I
 (a) $f(x)$ is derivable but not continuous at $x = 2$
 (b) $f(x)$ is continuous but not derivable at $x = 2$
 (c) $f(x)$ is neither continuous nor derivable at $x = 2$
 (d) $f(x)$ is continuous as well as derivable at $x = 2$

53. If $f(9) = 9$ and $f'(9) = 4$, then what is $\lim_{x \rightarrow 9} \frac{\sqrt{f(x)} - 3}{\sqrt{x} - 3}$ equal to? ☑ 2014 I
 (a) 36 (b) 9 (c) 4 (d) None of these

54. Consider the following statements
 I. The function $f(x) = \sqrt[3]{x}$ is continuous at all x except at $x = 0$.
 II. The function $f(x) = [x]$ is continuous at $x = 2.99$, where $[]$ is the bracket function.
 Which of the above statement(s) is/are correct?
☑ 2014 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

55. Consider the following statements
 I. The function $f(x) = |x|$ is not differentiable at $x = 1$.
 II. The function $f(x) = e^x$ is differentiable at $x = 0$.
 Which of the above statement(s) is/are correct?
☑ 2014 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

Directions (Q. Nos. 56-58) Let $f(x)$ be a function defined in $1 \leq x < \infty$ by

$$f(x) = \begin{cases} 2 - x, & \text{for } 1 \leq x \leq 2 \\ 3x - x^2, & \text{for } x > 2 \end{cases}$$
 ☑ 2014 I

56. Consider the following statements
 I. The function is continuous at every point in the interval $[1, \infty)$.
 II. The function is differentiable at $x = 1.5$.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

57. What is the differentiable coefficient of $f(x)$ at $x = 3$?
 (a) 1 (b) 2 (c) -1 (d) -3

58. Consider the following statements
 I. $f'(2+0)$ does not exist.
 II. $f'(2-0)$ does not exist.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

59. What is $\lim_{x \rightarrow 0} \frac{(1+x)^n - 1}{x}$ equal to? ☑ 2014 I
 (a) 0 (b) 1 (c) n (d) $n - 1$

60. What is $\lim_{x \rightarrow 0} \frac{x}{\sqrt{1 - \cos x}}$ equal to? ☑ 2014 I
 (a) $\sqrt{2}$ (b) $-\sqrt{2}$ (c) $\frac{1}{\sqrt{2}}$ (d) does not exist

Directions (Q. Nos. 61-62) Consider the function $f(x) = \frac{1 - \sin x}{(\pi - 2x)^2}$, where $x \neq \frac{\pi}{2}$ and $f\left(\frac{\pi}{2}\right) = \lambda$. ☑ 2014 I

61. What is $\lim_{x \rightarrow \frac{\pi}{2}} f(x)$ equal to?
 (a) 1 (b) 1/2 (c) 1/4 (d) 1/8

- 62.** What is the value of λ , if the function is continuous at $x = \frac{\pi}{2}$?
- (a) $1/8$ (b) $1/4$ (c) $1/2$ (d) 1

Directions (Q. Nos. 63-64) Read the following information carefully and answer the questions given below.

Consider the function $f(x) = \begin{cases} x^2 - 5, & x \leq 3 \\ \sqrt{x+13}, & x > 3 \end{cases}$ **2014 I**

- 63.** What is $\lim_{x \rightarrow 3} f(x)$ equal to?
- (a) 2 (b) 4 (c) 5 (d) 13
- 64.** Consider the following statements
- I. The function is discontinuous at $x=3$.
 II. The function is not differentiable at $x=0$.
- Which of the above statement(s) is/are correct?
- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

- 65.** Consider the function $f(x) = \begin{cases} \frac{\tan kx}{x}, & x < 0 \\ 3x + 2k^2, & x \geq 0 \end{cases}$
- What is the non-zero value of k for which the function is continuous at $x=0$? **2014 II**
- (a) $1/4$ (b) $1/2$ (c) 1 (d) 2

- 66.** What is $\lim_{x \rightarrow 0} \frac{5^x - 1}{x}$ equal to? **2014 II**
- (a) $\log_e 5$ (b) $\log_5 e$ (c) 5 (d) 1

- 67.** What is $\lim_{n \rightarrow \infty} \frac{1+2+3+\dots+n}{1^2+2^2+3^2+\dots+n^2}$ equal to? **2014 II**
- (a) 5 (b) 2 (c) 1 (d) 0

- 68.** What is $\lim_{x \rightarrow 0} \frac{\log_5(1+x)}{x}$ equal to? **2014 II**
- (a) 1 (b) $\log_5 e$ (c) $\log_e 5$ (d) 5

- 69.** Consider the following statements
- I. The function $f(x) = [x]$, where $[]$ is the greatest integer function defined on R , is continuous at all points except at $x=0$.
 II. The function $f(x) = \sin|x|$ is continuous for all $x \in R$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) only II **2014 II**
 (c) Both I and II (d) Neither I nor II
- 70.** If $G(x) = \sqrt{25-x^2}$, then what is $\lim_{x \rightarrow 1} \frac{G(x) - G(1)}{x-1}$ equal to? **2015 I**
- (a) $-\frac{1}{2\sqrt{6}}$ (b) $\frac{1}{5}$ (c) $-\frac{1}{\sqrt{6}}$ (d) $\frac{1}{\sqrt{6}}$

- 71.** Consider the following statements
- I. $f(x) = [x]$, where $[]$ is the greatest integer function, is discontinuous at $x=n$, where $n \in Z$.
 II. $f(x) = \cot x$ is discontinuous at $x=n\pi$, where $n \in Z$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II **2015 I**
 (c) Both I and II (d) Neither I nor II

Directions (Q. Nos. 72-73) Given a function

$$f(x) = \begin{cases} -1, & \text{if } x \leq 0 \\ ax + b, & \text{if } 0 < x < 1, \text{ where } a, b \text{ are constants.} \\ 1, & \text{if } x \geq 1 \end{cases}$$

The function is continuous everywhere. **2015 I**

- 72.** What is the value of b ?
- (a) -1 (b) 1 (c) 0 (d) 2
- 73.** What is the value of a ?
- (a) -1 (b) 0 (c) 1 (d) 2

Directions (Q. Nos. 74-75) Given that,

$$\lim_{x \rightarrow \infty} \left(\frac{2+x^2}{1+x} - Ax - B \right) = 3. \quad \text{2015 I}$$

- 74.** What is the value of A ?
- (a) -1 (b) 1 (c) 2 (d) 3
- 75.** What is the value of B ?
- (a) -1 (b) 3 (c) -4 (d) -3

Directions (Q. Nos. 76-77) Consider the function

$$f(x) = \begin{cases} \alpha \cos x, & \text{if } x \neq \frac{\pi}{2} \\ \pi - 2x, & \text{if } x = \frac{\pi}{2} \end{cases} \text{ which is continuous at}$$

$x = \frac{\pi}{2}$, where α is a constant. **2015 I**

- 76.** What is the value of α ?
- (a) 6 (b) 3 (c) 2 (d) 1
- 77.** What is $\lim_{x \rightarrow 0} f(x)$ equal to?
- (a) 0 (b) 3 (c) $\frac{3}{\pi}$ (d) $\frac{6}{\pi}$
- 78.** If $f(x) = \sqrt{25-x^2}$, then what is $\lim_{x \rightarrow 1} \frac{f(x) - f(1)}{x-1}$ equal to? **2015 II**
- (a) $\frac{1}{5}$ (b) $\frac{1}{\sqrt{24}}$ (c) $\sqrt{24}$ (d) $-\frac{1}{\sqrt{24}}$
- 79.** If $f(x) = \frac{\sin(e^x - 2) - 1}{\ln(x-1)}$, then $\lim_{x \rightarrow 2} f(x)$ is equal to **2015 II**
- (a) -2 (b) -1 (c) 0 (d) 1
- 80.** The function $f(x) = \frac{1 - \sin x + \cos x}{1 + \sin x + \cos x}$ is not defined

at $x = \pi$. The value of $f(\pi)$, so that $f(x)$ is continuous at $x = \pi$, is **2015 II**

- (a) $-\frac{1}{2}$ (b) $\frac{1}{2}$ (c) -1 (d) 1

81. Consider the following functions

$$\text{I. } f(x) = \begin{cases} \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \quad \text{II. } f(x) = \begin{cases} 2x + 5, & \text{if } x > 0 \\ x^2 + 2x + 5, & \text{if } x \leq 0 \end{cases}$$

Which of the above function(s) is/are derivable at $x = 0$? ☑ 2015 II

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

82. Consider the function

$$f(x) = \begin{cases} ax - 2, & \text{for } -2 < x < -1 \\ -1, & \text{for } -1 \leq x \leq 1 \\ a + 2(x - 1)^2, & \text{for } 1 < x < 2 \end{cases}$$

What is the value of a for which $f(x)$ is continuous at $x = -1$ and $x = 1$? ☑ 2015 II

- (a) -1 (b) 1 (c) 0 (d) 2

Directions (Q. Nos. 83-84) Consider the function

$$f(x) = \begin{cases} -2 \sin x, & \text{if } x \leq -\frac{\pi}{2} \\ A \sin x + B, & \text{if } -\frac{\pi}{2} < x < \frac{\pi}{2} \\ \cos x, & \text{if } x \geq \frac{\pi}{2} \end{cases}, \text{ which is}$$

continuous everywhere. ☑ 2015 II

83. The value of A is

- (a) 1 (b) 0 (c) -1 (d) -2

84. The value of B is

- (a) 1 (b) 0 (c) -1 (d) -2

85. If $\lim_{x \rightarrow 0} \phi(x) = a^2$, where $a \neq 0$, then what is

$$\lim_{x \rightarrow 0} \phi\left(\frac{x}{a}\right) \text{ equal to?}$$

- (a) a^2 (b) a^{-2} (c) $-a^2$ (d) $-a$ ☑ 2016 I

86. What is $\lim_{x \rightarrow 0} e^{-\frac{1}{x^2}}$ equal to? ☑ 2016 I

- (a) 0 (b) 1
(c) -1 (d) Limit does not exist

Directions (Q. Nos. 87-88) Consider the function

$$f(x) = \frac{a^{[x]+x} - 1}{[x] + x}$$

where $[\cdot]$ denotes the greatest integer function. ☑ 2016 I

87. What is $\lim_{x \rightarrow 0^+} f(x)$ equal to?

- (a) 1 (b) $\ln a$
(c) $1 - a^{-1}$ (d) Limit does not exist

88. What is $\lim_{x \rightarrow 0^-} f(x)$ equal to?

- (a) 0 (b) $\ln a$
(c) $1 - a^{-1}$ (d) Limit does not exist

Directions (Q. Nos. 89-90) A function $f(x)$ is defined as follows

$$f(x) = \begin{cases} x + \pi, & \text{for } x \in [-\pi, 0) \\ \pi \cos x, & \text{for } x \in \left[0, \frac{\pi}{2}\right] \\ \left(x - \frac{\pi}{2}\right)^2, & \text{for } x \in \left(\frac{\pi}{2}, \pi\right] \end{cases}$$

☑ 2016 I

89. Consider the following statements

- I. The function $f(x)$ is continuous at $x = 0$.
II. The function $f(x)$ is continuous at $x = \pi/2$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

90. Consider the following statements

- I. The function $f(x)$ is differentiable at $x = 0$.
II. The function $f(x)$ is differentiable at $x = \pi/2$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

HINTS AND SOLUTIONS

$$\begin{aligned}
 1. \quad (c) \quad & \lim_{x \rightarrow a} \frac{(\sqrt{a+2x})^2 - (\sqrt{3x})^2}{\sqrt{a+2x} + \sqrt{3x}} \\
 & \times \frac{\sqrt{3a+x} + 2\sqrt{x}}{\sqrt{a+2x} - (2\sqrt{x})^2} \quad [\text{rationalise}] \\
 & \lim_{x \rightarrow a} \frac{(a-x)}{3(a-x)} \times \frac{\sqrt{3a+x} + \sqrt{4x}}{\sqrt{a+2x} + \sqrt{3x}} \\
 & = \frac{1}{3} \cdot \frac{\sqrt{4a} + \sqrt{4a}}{\sqrt{3a} + \sqrt{3a}} = \text{continue}
 \end{aligned}$$

2. (b) Here, degree of numerator and denominator being same. So, we divide both by x^3 , we get

$$\lim_{x \rightarrow \infty} \frac{1 - \frac{3}{x^2} + \frac{2}{x^3}}{2 + \frac{1}{x^2} - \frac{3}{x^2}} = \frac{1}{2}$$

$$\begin{aligned}
 3. \quad (b) \quad & \lim_{x \rightarrow 0} \frac{2^x - 1}{(1+x)^{1/2} - 1} \\
 & = \lim_{x \rightarrow 0} \frac{(2^x - 1)\{(1+x)^{1/2} + 1\}}{\{(1+x)^{1/2} - 1\}\{(1+x)^{1/2} + 1\}} \\
 & = \lim_{x \rightarrow 0} \frac{2^x - 1}{1+x-1} \{(1+x)^{1/2} + 1\} \\
 & = \lim_{x \rightarrow 0} \frac{2^x - 1}{x} \lim_{x \rightarrow 0} \{(1+x)^{1/2} + 1\} \\
 & = (\log 2) \cdot 2 = 2 \log 2 \\
 & \left[\because \lim_{x \rightarrow 0} \frac{2^x - 1}{x} = \left(\frac{0}{0}\right) \right. \\
 & \quad \left. = \lim_{x \rightarrow 0} \frac{2^x \log 2}{1} = \log 2 \right]
 \end{aligned}$$

$$\begin{aligned}
 4. \quad (d) \quad & \text{RHL} = \lim_{b \rightarrow 0} \frac{3+b-3}{|3+b-3|} = \lim_{b \rightarrow 0} \frac{b}{|b|} \\
 & = \lim_{b \rightarrow 0} \frac{b}{b} = 1 \\
 & \text{LHL} = \lim_{b \rightarrow 0} \frac{3-b-3}{|3-b-3|} = 1
 \end{aligned}$$

Since, RHL \neq LHL

So, the limit does not exist.

$$\begin{aligned}
 5. \quad (c) \quad & \lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x \sin x} = \lim_{x \rightarrow 0} \frac{(1 - \cos 3x)x}{x^2 \sin x} \\
 & = \lim_{x \rightarrow 0} \frac{1 - \cos 3x}{x^2} \cdot \lim_{x \rightarrow 0} \frac{x}{\sin x} \\
 & = \lim_{x \rightarrow 0} \frac{3 \sin 3x}{2x} \cdot 1 = \lim_{x \rightarrow 0} \frac{9 \cos 3x}{2} = \frac{9}{2}
 \end{aligned}$$

6. (c)

$$\begin{aligned}
 7. \quad (b) \quad & \lim_{\theta \rightarrow \pi/4} \frac{\sqrt{2} - \sqrt{2} \cos(\theta - \pi/4)}{16(\theta - \pi/4)^2} \\
 & = \lim_{y \rightarrow 0} \frac{\sqrt{2} \cdot (1 - \cos y)}{16 y^2}
 \end{aligned}$$

$$\begin{aligned}
 & \text{where, } y = \theta - \frac{\pi}{4} \rightarrow 0 \text{ as } \theta \rightarrow \frac{\pi}{4} \\
 & = \frac{1}{8\sqrt{2}} \cdot \lim_{y \rightarrow 0} \frac{2 \sin^2(y/2)}{y^2} \\
 & = \frac{1}{8\sqrt{2}} \cdot \frac{1}{2} = \frac{1}{16\sqrt{2}} \quad \left[\because \lim_{\theta \rightarrow 0} \sin \theta = 0 \right]
 \end{aligned}$$

8. (b)

$$\begin{aligned}
 9. \quad (c) \quad & \lim_{x \rightarrow 0} \frac{2 \sin a (\cos x - 1)}{x \sin x} \\
 & = \lim_{x \rightarrow 0} -2 \sin a \cdot \frac{(1 - \cos x)}{x^2} \left(\frac{x}{\sin x} \right) \\
 & = \lim_{x \rightarrow 0} -2 \sin a \cdot \frac{2 \sin^2(x/2)}{4 \left(\frac{x}{2}\right)^2} \left(\frac{\sin x}{x} \right) = -\sin a
 \end{aligned}$$

10. (d) By the definition of the greatest integer function,

$$[x] = -1 \text{ when } -1 \leq x < 0$$

$$\text{and } [x] = 0 \text{ when } 0 \leq x < 1$$

Hence, by the definition of the greatest integer function

$$f(x) = \frac{\sin(-1)}{-1} = \sin 1 \quad \dots(i)$$

when $-1 \leq x < 0$

$$\text{and } f(x) = \frac{\sin 0}{0} = \frac{0}{0} \quad \dots(ii)$$

when, $0 \leq x < 1$

$$\therefore Lf(0-0) = \lim_{h \rightarrow 0} \sin 1 = \sin 1$$

$$\text{and } Rf(0+0) = \lim_{h \rightarrow 0} 0 = 0$$

Since, $f(0-0) \neq f(0+0)$, then the limit of $f(x)$ at $x = 0$, does not exist.

11. (a) Using L'Hospital's rule,

$$\begin{aligned}
 \lim_{x \rightarrow a} \frac{a^x - x^a}{x^x - a^a} & = \lim_{x \rightarrow a} \frac{a^x \log_e a - a x^{a-1}}{x^x + x^x \log_e x} \\
 & = \frac{a^a \log_e a - a \cdot a^{a-1}}{a^a + a^a \log_e a} = \frac{\log_e a - 1}{\log_e a + 1}
 \end{aligned}$$

satisfied only, when $a = 1$.

12. (a) 13. (d)

14. (d) Let $e^{x-2} - 1 = \theta$, then as $x \rightarrow 2, \theta \rightarrow 0$

$$\therefore \lim_{\theta \rightarrow 0} \sin \theta = \theta = e^{x-2} - 1$$

$$\therefore \lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} \frac{e^{x-2} - 1}{\log(x-1)} \left[\frac{0}{0} \text{ form} \right]$$

Since, $\log 1$ is 0.

Apply L'Hospital's rule,

$$\begin{aligned}
 \text{Limit} & = \lim_{x \rightarrow 2} \frac{(e^{x-2})}{1/(x-1)} \\
 & = e^0 \cdot (2-1) = 1 \cdot 1 = 1
 \end{aligned}$$

$$15. \quad (a) \quad \lim_{x \rightarrow \infty} (\sqrt{a^2 x^2 + ax + 1} - \sqrt{a^2 x^2 + 1})$$

After rationalisation,

$$\begin{aligned}
 & = \lim_{x \rightarrow \infty} \left\{ \frac{ax}{\sqrt{a^2 x^2 + ax + 1} + \sqrt{a^2 x^2 + 1}} \right\} \\
 & = \lim_{x \rightarrow \infty} \left\{ \frac{ax}{x \sqrt{a^2 + \frac{a}{x} + \frac{1}{x^2}} + x \sqrt{a^2 + \frac{1}{x^2}}} \right\} \\
 & = \lim_{x \rightarrow \infty} \left\{ \frac{a}{\sqrt{a^2 + \frac{a}{x} + \frac{1}{x^2}} + \sqrt{a^2 + \frac{1}{x^2}}} \right\} \\
 & = \frac{a}{\sqrt{a^2 + 0} + \sqrt{a^2}} = \frac{a}{a+a} = \frac{a}{2a} = \frac{1}{2}
 \end{aligned}$$

$$16. \quad (a) \quad f(x) = \begin{cases} x^3 - 3x + 2, & \text{for } x \neq 1 \\ k, & \text{for } x = 1 \end{cases}$$

Since, the function is continuous.

$$\therefore \lim_{x \rightarrow 1} f(x) = f(1)$$

$$\begin{aligned}
 \Rightarrow \quad & k = \lim_{x \rightarrow 1} \frac{x^3 - 3x + 2}{(x-1)^2} \\
 & = \lim_{x \rightarrow 1} \frac{(x-1)^2(x+2)}{(x-1)^2} \\
 \Rightarrow \quad & k = (1+2) \Rightarrow k = 3
 \end{aligned}$$

$$\begin{aligned}
 17. \quad (d) \quad & \lim_{x \rightarrow \infty} \left(\frac{x+6}{x+1} \right)^{x+4} \\
 & = \lim_{x \rightarrow \infty} \left(1 + \frac{5}{x+1} \right)^{\frac{x+4}{5} \cdot \frac{5}{x+1} \cdot (x+1)} \\
 & = \lim_{x \rightarrow \infty} \left[\left(1 + \frac{5}{x+1} \right)^{\frac{x+1}{5}} \right]^{\frac{5 \cdot (x+4)}{x+1}} \\
 & = e^{\lim_{x \rightarrow \infty} \frac{1 + \frac{4}{x}}{1 + \frac{1}{x}}} = e^5
 \end{aligned}$$

18. (c) For continuity at $x = 1$,

$$\text{RHL} = \text{LHL} = V$$

$$\Rightarrow \frac{1}{a} = a \Rightarrow a = 1, -1$$

For continuity at $x = \sqrt{2}$,

$$\text{RHL} = \text{LHL} = V \Rightarrow a = b^2 - 2b$$

$$\text{When, } a = 1, b^2 - 2b - 1 = 0$$

$$\therefore b = 1 \pm \sqrt{2}$$

$$\text{When, } a = -1, b^2 - 2b + 1 = 0$$

$$\therefore b = 1$$

19. (d) We have, $f(0+0)$

$$= \lim_{b \rightarrow 0} (0 + b)^2 \sin \frac{1}{0 + b}$$

$$= \lim_{b \rightarrow 0} b^2 \sin \frac{1}{b} = 0$$

Similarly, $f(0 - 0) = 0$

Since, $f(0 + 0) = f(0 - 0) = f(0)$,

So, the function is continuous at $x = 0$.

$$Rf'(0) = \lim_{b \rightarrow 0} \frac{(0 + b)^2 \sin[1/(0 + b)] - 0}{b}$$

$$= \lim_{b \rightarrow 0} b \sin(1/b) = 0$$

Similarly, $Lf'(0) = 0$

Hence, f is differentiable at $x = 0$ and hence, for all x .

20. (c) Given function, $f(x) = |x| + x^2$

Again, defining the function $f(x)$,

$$f(x) = \begin{cases} x^2 - x, & x < 0 \\ x^2 + x, & x \geq 0 \end{cases} \text{ at } x = 0,$$

$$\text{LHL} = f(0 - 0) = \lim_{b \rightarrow 0} f(0 - b)$$

$$= \lim_{b \rightarrow 0} (-b)^2 - (-b) = 0$$

$$\text{RHL} = f(0 + 0) = \lim_{b \rightarrow 0} f(0 + b)$$

$$= \lim_{b \rightarrow 0} (b)^2 + (b) = 0$$

Also, $f(0) = 0$

\therefore LHL = RHL = $f(0) = 0$

So, function is continuous at $x = 0$.

$$\text{Now, } Rf'(0) = \lim_{b \rightarrow 0} \frac{f(0 + b) - f(0)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{b(b + 1) - 0}{b} = 1$$

$$Lf'(0) = \lim_{b \rightarrow 0} \frac{f(0 - b) - f(0)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{(b^2 + b) - 0}{-b} = -1$$

$\therefore Lf'(0) \neq Rf'(0)$

So, $f(x)$ is not differentiable at $x = 0$.

21. (d) LHL = $\lim_{b \rightarrow 0} e^{\frac{1}{(0 - b)}}$

$$= \lim_{b \rightarrow 0} e^{1/b} = e^\infty = \infty$$

$$\text{RHL} = \lim_{b \rightarrow 0} e^{\frac{1}{(0 + b)}} = \lim_{b \rightarrow 0} e^{-\frac{1}{b}} = e^{-\infty}$$

= does not exist

22. (a) $\therefore f(x) = \frac{x}{1 + |x|} = \begin{cases} \frac{x}{1 - x}, & x < 0 \\ \frac{x}{1 + x}, & x \geq 0 \end{cases}$

\therefore LHD = $f'(0^-)$

$$= \lim_{b \rightarrow 0} \frac{f(0 - b) - f(0)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{\frac{-b}{1 - (-b)} - 0}{-b} = \lim_{b \rightarrow 0} \frac{1 + b}{-b} = \lim_{b \rightarrow 0} \frac{1}{1 + b} = 1$$

and RHD = $f'(0^+)$

$$= \lim_{b \rightarrow 0} \frac{f(0 + b) - f(0)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{1 + b}{b} = \lim_{b \rightarrow 0} \frac{1}{1 + b} = 1$$

\therefore LHD = RHD

So, $f(x)$ is differentiable at $x = 0$.

Hence, $f(x)$ is differentiable in $(-\infty, \infty)$.

23. (c) $\therefore f(x) = \begin{cases} 3x - 4, & 0 \leq x \leq 2 \\ 2x + l, & 2 < x \leq 9 \end{cases}$

and $f(x)$ is continuous at $x = 2$

$$\therefore \lim_{x \rightarrow 2} f(x) = f(2)$$

$$\Rightarrow \lim_{x \rightarrow 2} (2x + l) = 3(2) - 4$$

$$\Rightarrow \lim_{b \rightarrow 0} \{2(2 - b) + l\} = 6 - 4$$

$$\Rightarrow 4 + l = 2 \Rightarrow l = -2$$

24. (c)

25. (c) $\therefore f(x) = |x - 3| = \begin{cases} x - 3, & x \geq 3 \\ 3 - x, & x < 3 \end{cases}$

$$\therefore \text{LHL} = \lim_{x \rightarrow 0^-} f(x) = \lim_{b \rightarrow 0} f(0 - b)$$

$$= \lim_{b \rightarrow 0} (3 + b) = 3$$

$$\text{and RHL} = \lim_{x \rightarrow 0^+} f(x) = \lim_{b \rightarrow 0} f(0 + b)$$

$$= \lim_{b \rightarrow 0} (3 - b) = 3$$

\Rightarrow LHL = RHL

So, $f(x)$ is continuous at $x = 0$.

Now, LHD

$$= f'(0^-) = \lim_{b \rightarrow 0} \frac{f(0) - f(0 - b)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{3 - (3 - b)}{b} = 1$$

and RHD

$$= f'(0^+) = \lim_{b \rightarrow 0} \frac{f(0 + b) - f(0)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{3 + b - 3}{b} = 1$$

\Rightarrow LHD = RHD

$\therefore f(x)$ is differentiable at $x = 0$.

Hence, both Statements I and II are correct.

26. (a) For $f(x) = |x|$, $f(x) = \begin{cases} -x, & x < 0 \\ x, & x \geq 0 \end{cases}$

For continuous

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0)$$

$$\lim_{x \rightarrow 0^-} (-x) = \lim_{x \rightarrow 0^+} f(x) = f(0) = 0$$

$$0 = 0 = 0$$

Hence, $f(x) = |x|$ is continuous for all x for $f(x) = x^3 + x^2 - 1$

Clearly, $x^3 + x^2 - 1$ is defined for all value of x .

Hence, $f(x)$ is continuous, $\forall x \in R$.

27. (b) We know that,

$$\frac{\tan^{-1} x}{x} < 1 \text{ and } \frac{\sin^{-1} x}{x} > 1, x \in R$$

$$\therefore \frac{\tan^{-1} x}{x} - \frac{\sin^{-1} x}{x} < 0$$

$$\text{and } \frac{\sin^{-1} x}{x} - \frac{\tan^{-1} x}{x} > 0$$

28. (a) I. $\lim_{x \rightarrow 0} \frac{x^2}{x} = \lim_{x \rightarrow 0} (x) = 0$

II. It is true that $\frac{x^2}{x}$ is not continuous at $x = 0$.

$$\text{III. LHL} = \lim_{b \rightarrow 0} \frac{|0 - b|}{(0 - b)} = \lim_{b \rightarrow 0} \frac{b}{-b} = -1$$

$$\text{RHL} = \lim_{b \rightarrow 0} \frac{|0 + b|}{(0 + b)} = \lim_{b \rightarrow 0} \frac{b}{b} = 1$$

\therefore LHL \neq RHL So, it does not exist.

Sol. (Q. Nos. 29-30)

$$f\left(\frac{\pi}{4}\right) = b + \frac{\pi}{2}$$

$$f\left(\frac{\pi}{4} + 0\right) = b + \frac{\pi}{2}$$

$$f\left(\frac{\pi}{4} - 0\right) = \frac{\pi}{4} + a$$

Since, $f(x)$ is continuous in $[0, \pi]$.

$$\therefore f\left(\frac{\pi}{4} + 0\right) = f\left(\frac{\pi}{4}\right) = f\left(\frac{\pi}{4} - 0\right)$$

$$\Rightarrow b + \frac{\pi}{2} = \frac{\pi}{4} + a \Rightarrow a - b = \frac{\pi}{4} \dots(i)$$

$$\text{Now, } f\left(\frac{\pi}{2}\right) = -a - b$$

$$f\left(\frac{\pi}{2} + 0\right) = -a - b \Rightarrow f\left(\frac{\pi}{2} - 0\right) = b$$

$$\text{Again, } f\left(\frac{\pi}{2}\right) = f\left(\frac{\pi}{2} + 0\right) = f\left(\frac{\pi}{2} - 0\right)$$

$$\Rightarrow -a - b = b \Rightarrow a = -2b \dots(ii)$$

From Eqs. (i) and (ii), we get

$$a = \frac{\pi}{6}, b = -\frac{\pi}{12}$$

29. (a) 30. (d)

31. (b) Since, $\sqrt{x^4 + 4x^2 + 4} \geq 1$

$$\text{So, } 0 \leq \frac{|x|}{\sqrt{x^4 + 4x^2 + 4}} \leq |x|,$$

$$\text{but } \lim_{x \rightarrow 0} |x| = 0$$

$$\text{Hence, } \lim_{x \rightarrow 0} \frac{|x|}{\sqrt{x^4 + 4x^2 + 4}} = 0$$

32. (c) $0 \leq x^2 \left(\frac{e^{1/x} - e^{-1/x}}{e^{1/x} + e^{-1/x}} \right)$

$$= x^2 \left(\frac{1 - e^{-2/x}}{1 + e^{-2/x}} \right) \leq x^2, \forall x > 0$$

So, $\lim_{x \rightarrow 0^+} f(x) = 0$, Also,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0} x^2 \left(\frac{e^{2/x} - 1}{e^{2/x} + 1} \right) = 0$$

Hence, $\lim_{x \rightarrow 0} f(x) = 0$ and exists.

33. (d) Since, $x - 1 \leq [x] \leq x, \forall x \in R$
 $\frac{1}{x^3} - 1 \leq \left[\frac{1}{x^3} \right] \leq \frac{1}{x^3}$
 $\Rightarrow x^5 \left(\frac{1}{x^3} - 1 \right) \leq x^5 \left[\frac{1}{x^3} \right] \leq x^2 \forall x > 0$
 and $x^2 \leq x^5 \left[\frac{1}{x^3} \right] \leq x^5 \left(\frac{1}{x^3} - 1 \right) \forall x < 0$
 So, $\lim_{x \rightarrow 0} x^5 \left[\frac{1}{x^3} \right] = 0$

34. (c) $\lim_{x \rightarrow 0} (\cos x)^{\cot^2 x} = e^{\lim_{x \rightarrow 0} (\cos x - 1) \cot^2 x}$
 $= e^{\lim_{x \rightarrow 0} \frac{\cos x - 1}{\tan^2 x} \times x^2} = e^{\lim_{x \rightarrow 0} \frac{\cos x - 1}{x^2}}$
 $= e^{-1/2} \left[\because \lim_{x \rightarrow 0} \frac{1 - \cos x}{x^2} = \frac{1}{2} \right]$

35. (d) $\lim_{x \rightarrow 0} \left[\tan \left(\frac{\pi}{4} + x \right) \right]^{1/x}$
 $= \lim_{x \rightarrow 0} \left(\frac{1 + \tan x}{1 - \tan x} \right)^{1/x} = e^{\lim_{x \rightarrow 0} \left(\frac{1 + \tan x}{1 - \tan x} - 1 \right) \frac{1}{x}}$
 $= e^{\lim_{x \rightarrow 0} \left(\frac{2 \tan x}{1 - \tan x} \right) \frac{1}{x}} = e^2$

36. (b) $\lim_{x \rightarrow 0} \left(\frac{x - 1 + \cos x}{x} \right)^{1/x}$
 $= \lim_{x \rightarrow 0} \left(1 - \frac{(1 - \cos x)}{x} \right)^{1/x}$
 $= e^{\lim_{x \rightarrow 0} - \left(\frac{1 - \cos x}{x} \right) \times \frac{1}{x}} = e^{\lim_{x \rightarrow 0} - \left(\frac{1 - \cos x}{x^2} \right)}$
 $= e^{-1/2} \left[\because \lim_{x \rightarrow 0} \frac{1 - \cos x}{x^2} = \frac{1}{2} \right]$

37. (c) $\lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x}{3} \right)^{2/x}$
 $= \lim_{x \rightarrow 0} \left(\frac{a^x + b^x + c^x - 1}{3} + 1 \right)^{2/x}$
 $= e^{\lim_{x \rightarrow 0} \left(\frac{a^x - 1}{x} + \frac{b^x - 1}{x} + \frac{c^x - 1}{x} \right) \times \frac{2}{3}}$
 $= (\log a + \log b + \log c) \times \frac{2}{3}$
 $\left[\because \lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log a \right]$
 $= e^{\frac{2}{3} \log (abc)} = (abc)^{\frac{2}{3}}$

38. (b) 39. (b) 40. (c)

41. (a) $\lim_{x \rightarrow 0} x^2 \sin \left(\frac{1}{x} \right)$
 Put $x = 1/y = \lim_{y \rightarrow \infty} \frac{1}{y^2} \cdot \sin(y)$
 $= \lim_{y \rightarrow \infty} \frac{\sin y}{y^2}$
 $\left[\because -1 \leq \sin \theta \leq 1, \forall \theta \in R \right]$
 $= \frac{\sin \infty}{\infty} = 0 \times (\text{finite value}) = 0$

42. (d) Given, $\lim_{x \rightarrow 0} \frac{2(1 - \cos x)}{x^2}$
 $= \lim_{x \rightarrow 0} \frac{2 \left(1 - 1 + 2 \sin^2 \frac{x}{2} \right)}{x^2}$
 $= \lim_{x \rightarrow 0} \frac{4 \sin^2 \frac{x}{2}}{x^2} = \lim_{x \rightarrow 0} \left(\frac{\sin \frac{x}{2}}{\frac{x}{2}} \right)^2$
 $= (1)^2 = 1 \left[\because \lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta} = 1 \right]$

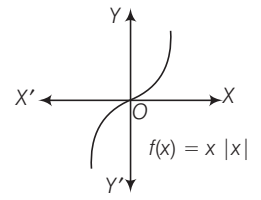

43. (b) $f(x) = \frac{x^2}{|x|}, x \neq 0$
 As, $f(0) = 0$ (given)
 or $f(x) = \begin{cases} \frac{x^2}{x} = x, & \text{if } x > 0 \\ \frac{x^2}{-x} = -x, & \text{if } x < 0 \end{cases}$

$\therefore f(0) = 0$
 Clearly, it is a modulus function and modulus function is continuous everywhere.

44. (b) I. Given, $\lim_{x \rightarrow 0} \frac{1}{x}$
 LHL = $f(0 - 0) = \lim_{x \rightarrow 0} f(0 - h)$
 $= \lim_{x \rightarrow 0} -\frac{1}{h} = -\infty$
 RHL = $f(0 + 0) = \lim_{x \rightarrow 0} f(0 + h)$
 $= \lim_{x \rightarrow 0} \frac{1}{h} = +\infty$
 $\therefore \text{LHL} \neq \text{RHL}$
 So, $\lim_{x \rightarrow 0} \frac{1}{x}$ does not exist.

II. Given, $\lim_{x \rightarrow 0} e^{1/x}$
 LHL = $f(0 - 0) = \lim_{h \rightarrow 0} f(0 - h)$
 $f(0 - h) = \lim_{x \rightarrow 0} e^{-\frac{1}{h}} = e^{-\infty} = 0$
 RHL = $f(0 + 0) = \lim_{h \rightarrow 0} f(0 + h)$
 $= \lim_{h \rightarrow 0} e^{\frac{1}{h}} = e^{\infty} = \infty$
 $\therefore \text{LHL} \neq \text{RHL}$
 $\therefore \lim_{x \rightarrow 0} e^{1/x}$ does not exist.
 Hence, only Statement II is true.

45. (b) Let us take the function $f(x) = x|x|$
 Redefine this function,
 $f(x) = \begin{cases} x^2, & \text{if } x \geq 0 \\ -x^2, & \text{if } x < 0 \end{cases}$
 $Lf'(0) = \lim_{h \rightarrow 0} \frac{f(0 - h) - f(0)}{-h}$
 $= \lim_{h \rightarrow 0} \frac{-(-h)^2 - 0}{-h}$
 $= \lim_{h \rightarrow 0} \frac{-h^2}{-h} = \lim_{h \rightarrow 0} (+h) = 0$

$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{h}$
 $= \lim_{h \rightarrow 0} \frac{h^2 - 0}{h}$

 $\lim_{h \rightarrow 0} h = 0$

$\therefore Lf'(0) = Rf'(0)$
 So, $f(x)$ is differentiable for all real values of x .

46. (c) Given function, $f(x) = |x - 3|$

I. LHL at $x = 3, f(3 - 0)$
 $= \lim_{x \rightarrow 3^-} f(3) = \lim_{h \rightarrow 0} f(3 - h)$
 $= \lim_{x \rightarrow 0} |3 - h - 3| = \lim_{x \rightarrow 0} |-h| = \lim_{x \rightarrow 0} h = 0$

RHL at $x = 3, f(3 + 0)$
 $= \lim_{x \rightarrow 3^+} f(3) = \lim_{h \rightarrow 0} f(3 + h)$
 $= \lim_{h \rightarrow 0} |3 + h - 3| = \lim_{h \rightarrow 0} |h| = 0$

Here, LHL = RHL = $f(3)$
 So, $f(x)$ is continuous at $x = 3$.

II. $Lf'(0) = \lim_{x \rightarrow 0} \frac{f(0 - h) - f(0)}{-h}$
 $= \lim_{h \rightarrow 0} \frac{|-h - 3| - |-3|}{-h}$
 $= \lim_{h \rightarrow 0} \frac{h + 3 - 3}{-h} = \lim_{h \rightarrow 0} \frac{h}{-h} = -1$

$Rf'(0) = \lim_{h \rightarrow 0} \frac{f(0 + h) - f(0)}{h}$
 $= \lim_{h \rightarrow 0} \frac{|h - 3| - |-3|}{h}$
 $= \lim_{h \rightarrow 0} \frac{-h + 3 - 3}{h} = \lim_{h \rightarrow 0} \frac{-h}{h} = -1$

$\therefore Lf'(0) = Rf'(0)$
 $\Rightarrow f(x)$ is differentiable at $x = 0$.
 \Rightarrow Both Statements exist.

47. (b) $\lim_{x \rightarrow 0} \frac{1 - \sqrt{1+x}}{x}$
 $= \lim_{x \rightarrow 0} \frac{1 - \sqrt{1+x}}{x} \times \frac{1 + \sqrt{1+x}}{1 + \sqrt{1+x}}$ [rationalisation]
 $= \lim_{x \rightarrow 0} \frac{1 - (1+x)}{x(1 + \sqrt{1+x})}$
 $= \lim_{x \rightarrow 0} \frac{-x}{x(1 + \sqrt{1+x})} = \lim_{x \rightarrow 0} \frac{-1}{1 + \sqrt{1+x}}$
 $= \frac{-1}{1 + \sqrt{1+0}} = \frac{-1}{1+1} = \frac{-1}{2}$

48. (a) $\lim_{x \rightarrow 0} \frac{\sin x - \tan x}{x}$ which is of the form $\left(\frac{0}{0}\right)$.

Now, applying L' Hospital's rule,

$$= \lim_{x \rightarrow 0} \frac{\cos x - \sec^2 x}{1}$$

$$= \frac{\cos 0 - \sec^2 0}{1} = \frac{1 - 1}{1} = \frac{0}{1} = 0$$

49. (d) Let $y = |x|$

Redefined the given curve,

$$y = \begin{cases} x, & x > 0 \\ 0, & x = 0 \\ -x, & x < 0 \end{cases}$$

$$\text{LHD} = Lf'(0) = \lim_{b \rightarrow 0} \frac{f(0-b) - f(0)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{-(-b) - 0}{-b} = \lim_{b \rightarrow 0} \frac{b}{-b} = -1$$

$$\text{RHD} = Rf'(0) = \lim_{b \rightarrow 0} \frac{f(0+b) - f(0)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{b - 0}{b} = 1$$

$\therefore Lf'(0) \neq Rf'(0)$

Hence, the derivative of $|x|$ at $x=0$ does not exist.

Note Curve $|x|$ have sharp turn at $x=0$

50. (d) I. We know that,

If $f(a) = \lim_{x \rightarrow a} f(x)$, then $f(x)$ is continuous at $x = a$, while both hand must exist.

II. If $f(x)$ is continuous at a point, then it is not necessary that $\frac{1}{f(x)}$ is also

continuous at that point.

e.g.

(i) $f(x) = x$ is continuous at $x = 0$ but $f(x) = \frac{1}{x}$ is not continuous at $x = 0$.

(ii) $f(x) = e^x$ is continuous at $x = 0$ and $f(x) = e^{-x}$ is also continuous at $x = 0$.

51. (c) I. $\lim_{x \rightarrow 0} \sin \frac{1}{x}$

LHL = $f(0-0) = \lim_{b \rightarrow 0} f(0-b)$

$$= \lim_{b \rightarrow 0} \sin \frac{1}{(-b)} = \lim_{b \rightarrow 0} -\sin \frac{1}{b} = -\sin(\infty)$$

 $= -[\text{A definite number persist between } -1 \text{ to } +1]$

RHL = $f(0+0) = \lim_{b \rightarrow 0} (0+b)$

$$= \lim_{b \rightarrow 0} \sin \frac{1}{b} = \sin(\infty)$$

= [A definite number persist between -1 to +1]

$\therefore \text{LHL} \neq \text{RHL}$

Hence, $\lim_{x \rightarrow 0} \sin \left(\frac{1}{x}\right)$ does not exist.

II. $\lim_{x \rightarrow 0} x \sin \left(\frac{1}{x}\right)$

LHL = $f(0-0) = \lim_{b \rightarrow 0} f(0-b)$

$$= \lim_{b \rightarrow 0} (-b) \sin \left(\frac{-1}{b}\right)$$

$$= \lim_{b \rightarrow 0} b \sin \frac{1}{b} = 0 \times (\text{Finite value}) = 0$$

RHL = $f(0+0) = \lim_{b \rightarrow 0} f(0+b)$

$$= \lim_{b \rightarrow 0} (b) \sin \left(\frac{1}{b}\right)$$

$$= 0 \times \sin(\infty) = 0 \times (\text{Finite value}) = 0$$

$\therefore \text{LHL} = \text{RHL}$

Hence, $\lim_{b \rightarrow 0} x \sin \left(\frac{1}{x}\right)$ exists.

52. (b) Given function,

$$f(x) = \begin{cases} x^2, & x > 2 \\ 3x - 2, & x \leq 2 \end{cases}$$

First, we check the continuity of $f(x)$ at $x = 2$.

LHL = $f(2-0) = \lim_{b \rightarrow 0} f(2-b)$

$$= \lim_{b \rightarrow 0} 3(2-b) - 2 = \lim_{b \rightarrow 0} 6 - 3b - 2$$

$$= \lim_{b \rightarrow 0} 4 - 3b = 4 - 0 = 4$$

RHL = $f(2+0) = \lim_{b \rightarrow 0} f(2+b)$

$$= \lim_{b \rightarrow 0} (2+b)^2 = (2+0)^2 = 4$$

and $f(2) = 3(2) - 2 = 6 - 2 = 4$

$\therefore f(2) = \text{LHL} = \text{RHL}$

Hence, $f(x)$ is continuous at $x = 2$.

Now, we check the differentiability of $f(x)$ at $x = 2$.

LHD = $Lf'(2) = \lim_{b \rightarrow 0} \frac{f(2-b) - f(2)}{-b}$

$$= \lim_{b \rightarrow 0} \frac{3(2-b) - 2 - (3 \cdot 2 - 2)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{-3b}{-b} = 3$$

RHD = $Rf'(2) = \lim_{b \rightarrow 0} \frac{f(2+b) - f(2)}{b}$

$$= \lim_{b \rightarrow 0} \frac{(2+b)^2 - f(2)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{4 + b^2 + 4b - (3 \cdot 2 - 2)}{b} = 4$$

$\therefore Lf'(2) \neq Rf'(2)$

Hence, $f(x)$ is not differentiable at $x = 2$.

53. (c) Given that,

$f(9) = 9$ and $f'(9) = 4$

$$\lim_{x \rightarrow 9} \frac{\sqrt{f(x)} - 3}{\sqrt{x} - 3} \quad \left[\frac{0}{0} \text{ form} \right]$$

[$\therefore f(9) = 9 \Rightarrow f(x) = x$ i.e., $x = 9$]

Using L' Hospital's rule,

$$\lim_{x \rightarrow 9} \frac{\frac{1}{2\sqrt{f(x)}} \cdot f'(x)}{\frac{1}{2\sqrt{x}} \cdot 1} = \lim_{x \rightarrow 9} \frac{f'(x) \times \sqrt{x}}{\sqrt{f(x)}}$$

$$= \frac{f'(9) \times \sqrt{9}}{\sqrt{f(9)}} = \frac{4 \times 3}{\sqrt{9}} = \frac{4 \times 3}{3} = 4$$

54. (b)

I. Given, $f(x) = \sqrt[3]{x}$, $f(x) = (x)^{1/3}$
 Now, we check the continuity of the function at $x = 0$.

LHL = $f(0-0) = \lim_{b \rightarrow 0} f(0-b)$

$$= \lim_{b \rightarrow 0} (0-b)^{1/3} = (0-0)^{1/3} = 0$$

RHL = $f(0+0) = \lim_{b \rightarrow 0} f(0+h)$

$$= \lim_{b \rightarrow 0} (0+h)^{1/3} = (0+0)^{1/3} = 0$$
 and $f(0) = (0)^{1/3} = 0$

$\therefore \text{LHL} = \text{RHL} = f(0)$

So, function is continuous at $x = 0$.

II. Given, $f(x) = [x]$, which is greatest integer function.

We know that, the greatest integer function is continuous for all x except integer values of x . So, $f(x) = [x]$ is continuous at $x = 2.99$.

Alternate method

LHL = $f(2.99-0) = \lim_{b \rightarrow 0} (2.99-b)$

$$= \lim_{b \rightarrow 0} (2.99-b) = \lim_{b \rightarrow 0} 2 = 2$$
 and RHL = $f(2.99+0)$

$$= \lim_{b \rightarrow 0} f(2.99+b)$$

$$= \lim_{b \rightarrow 0} (2.99+b) = \lim_{b \rightarrow 0} 2 = 2$$
 and $f(2.99) = (2.99) = 2$

$\therefore \text{LHL} = \text{RHL} = f(2.99)$

So, $f(x)$ is continuous at $x = 2.99$.

55. (b) I. From Graph of $f(x) = |x|$, we observe that the curve has sharp turn at $x = 0$.

So, the function $f(x) = |x|$ is not differentiable only at $x = 0$. i.e. $f(x) = |x|$ is differentiable at $x = 1$.

II. Given function, $f(x) = e^x$.

Now, we check the differentiability of $f(x)$ at $x = 0$.

$Rf'(0) = \lim_{b \rightarrow 0} \frac{f(0+b) - f(0)}{b}$

$$= \lim_{b \rightarrow 0} \frac{e^{(0+b)} - e^0}{b}$$

$$= \lim_{b \rightarrow 0} \frac{e^b - 1}{b} \quad \left[\frac{0}{0} \text{ form} \right]$$

Use L' Hospital's rule,

$$= \lim_{b \rightarrow 0} \frac{e^b - 0}{1} = e^0 = 1$$

$$\begin{aligned}
 Lf'(0) &= \lim_{h \rightarrow 0} \frac{f(0-h) - f(0)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{e^{-h} - e^0}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{1 - e^{-h}}{h} \quad \left[\frac{0}{0} \text{ form} \right]
 \end{aligned}$$

Use L' Hospital's rule,

$$= \lim_{h \rightarrow 0} \frac{e^{-h}}{1} = e^{-0} = 1$$

Since, $Rf'(0) = Lf'(0)$

Hence, $f(x) = e^x$ is differentiable at $x = 1$

Sol. (Q. Nos. 56-58) Given function,

$$f(x) = \begin{cases} 2-x & \text{for } 1 \leq x \leq 2 \\ 3x-x^2 & \text{for } x > 2 \end{cases}$$

and whole function defined in $1 \leq x < \infty$.

56. (b) I. Since, the function is polynomial, so it is continuous as well as differentiable in its domain $[1, \infty) - \{2\}$.

Now, we check the continuity of the function at $x = 2$.

$$\begin{aligned}
 \text{LHL} &= f(2-0) = \lim_{h \rightarrow 0} f(2-h) \\
 &= \lim_{h \rightarrow 0} 2 - (2-h) = \lim_{h \rightarrow 0} h = 0
 \end{aligned}$$

$$\begin{aligned}
 \text{RHL} &= f(2+0) = \lim_{h \rightarrow 0} (2+h) \\
 &= \lim_{h \rightarrow 0} 3(2+h) - (2+h)^2 \\
 &= 3(2+0) - (2+0)^2 = 6 - 4 = 2
 \end{aligned}$$

and $f(2) = 2 - 2 = 0$

$\therefore f(2) = \text{LHL} \neq \text{RHL}$

So, the function is not continuous at every point in the interval $[1, \infty)$, i.e. not continuous at $x = 2$.

II. We also check the differentiability of the function at $x = 15$.

$$\begin{aligned}
 Rf'(1.5) &= \lim_{h \rightarrow 0} \frac{f(1.5+h) - f(1.5)}{h} \\
 &= \lim_{h \rightarrow 0} \frac{2 - (1.5+h) - (2-1.5)}{h}
 \end{aligned}$$

$$= \lim_{h \rightarrow 0} \frac{0.5 - h - 0.5}{h} = \lim_{h \rightarrow 0} -\frac{h}{h} = -1$$

$$\begin{aligned}
 Lf'(15) &= \lim_{h \rightarrow 0} \frac{f(15-h) - f(15)}{-h} \\
 &= \lim_{h \rightarrow 0} \frac{2 - (15-h) - (2-15)}{-h}
 \end{aligned}$$

$$= \lim_{h \rightarrow 0} \frac{0.5 + h - 0.5}{-h} = \lim_{h \rightarrow 0} \frac{h}{-h} = -1$$

$\therefore Lf'(15) = Rf'(15)$

So, the function is differentiable at $x = 1.5$.

$$\begin{aligned}
 57. (d) \therefore f(x) &= \begin{cases} 2-x & \text{for } 1 \leq x \leq 2 \\ 3x-x^2 & \text{for } x > 2 \end{cases} \\
 \Rightarrow f'(x) &= \begin{cases} -1 & \text{for } 1 \leq x \leq 2 \\ 3-2x & \text{for } x > 2 \end{cases} \quad \dots(i)
 \end{aligned}$$

So, the differentiable coefficient of $f(x)$ at $x = 3$ is

$$\begin{aligned}
 f'(3) &= 3 - 2(3) = 3 - 6 = -3 \\
 [\therefore f'(x) &= 3 - 2x \text{ for } x > 2]
 \end{aligned}$$

58. (d) Here, we check the existence of limit of $f'(x)$ at $x = 2$.

$$\begin{aligned}
 \text{So, } f'(2+0) &= \text{RHL} = \lim_{h \rightarrow 0} f'(2+h) \\
 &= \lim_{h \rightarrow 0} 3 - 2(2+h) \quad [\text{from Eq. (i)}] \\
 &= \lim_{h \rightarrow 0} 3 - 4 - 2h = \lim_{h \rightarrow 0} -1 - 2h = -1 \\
 \text{and } f'(2-0) &= \text{LHL} = \lim_{h \rightarrow 0} f'(2-h) \\
 &= \lim_{h \rightarrow 0} -1 = -1
 \end{aligned}$$

So, both $f'(2+0)$ and $f'(2-0)$ exists i.e. $f'(x)$ exist at $x = 2$.

$$\begin{aligned}
 59. (c) \lim_{x \rightarrow 0} \left\{ \frac{(1+x)^n - 1}{x} \right\} \\
 = \lim_{x \rightarrow 0} \frac{(1+nx + \frac{n(n-1)}{2!}x^2 + \dots) - 1}{x} \\
 [\text{by binomial expansion in any index}] \\
 = \lim_{x \rightarrow 0} \frac{nx + \frac{n(n-1)}{2!}x^2 + \dots}{x} \\
 = \lim_{x \rightarrow 0} n + \frac{n(n-1)}{2!}x + \dots \\
 = n + 0 + 0 + \dots = n
 \end{aligned}$$

$$\begin{aligned}
 60. (d) \lim_{x \rightarrow 0} \frac{x}{\sqrt{1-\cos x}} \\
 = \lim_{x \rightarrow 0} \frac{x}{\sqrt{1-(1-2\sin^2 \frac{x}{2})}} \\
 = \lim_{x \rightarrow 0} \frac{x}{\sqrt{2\sin^2 \frac{x}{2}}} = \frac{1}{\sqrt{2}} \lim_{x \rightarrow 0} \frac{x}{|\sin \frac{x}{2}|} \\
 \text{LHL} = f(0-0) = \lim_{h \rightarrow 0} f(0-h) \\
 = \frac{1}{\sqrt{2}} \lim_{h \rightarrow 0} \frac{-h}{\left| \sin \left(\frac{-h}{2} \right) \right|} \\
 = -\frac{1}{\sqrt{2}} \lim_{h \rightarrow 0} \frac{h}{\left| -\sin \left(\frac{h}{2} \right) \right|} \\
 = -\frac{1}{\sqrt{2}} \lim_{h \rightarrow 0} \frac{2 \cdot \left(\frac{h}{2} \right)}{\sin \frac{h}{2}} = -\frac{1}{\sqrt{2}} \times 2 \times 1 \\
 = -\sqrt{2}
 \end{aligned}$$

$$\text{RHL} = f(0+0) = \lim_{h \rightarrow 0} f(0+h)$$

$$\begin{aligned}
 &= \frac{1}{\sqrt{2}} \lim_{h \rightarrow 0} \frac{h}{\left| \sin \frac{h}{2} \right|} = \frac{1}{\sqrt{2}} \lim_{h \rightarrow 0} \frac{2 \left(\frac{h}{2} \right)}{\sin \left(\frac{h}{2} \right)} \\
 &= \frac{1}{\sqrt{2}} \times 2 \times 1 \\
 &\left[\therefore \lim_{\theta \rightarrow 0} \frac{\theta}{\sin \theta} = 1 \right] \\
 &= \sqrt{2} \\
 &\therefore \text{LHL} \neq \text{RHL} \\
 &\text{So, limit does not exist.}
 \end{aligned}$$

Sol (Q. Nos. 61-62) Given function,

$$f(x) = \frac{1 - \sin x}{(\pi - 2x)^2}$$

where, $x \neq \frac{\pi}{2}$ and $f\left(\frac{\pi}{2}\right) = \lambda$

$$61. (d) \lim_{x \rightarrow \pi/2} f(x) = \lim_{x \rightarrow \pi/2} \frac{1 - \sin x}{(\pi - 2x)^2} \quad (0/0 \text{ form})$$

Use L' Hospital's rule,

$$\begin{aligned}
 &= \lim_{x \rightarrow \pi/2} \frac{-\cos x}{2(\pi - 2x)(-2)} \\
 &= \lim_{x \rightarrow \pi/2} \frac{\cos x}{4(\pi - 2x)} \quad \left[\frac{0}{0} \text{ form} \right]
 \end{aligned}$$

Again, use L' Hospital's rule,

$$\begin{aligned}
 &= \lim_{x \rightarrow \pi/2} \frac{-\sin x}{4(-2)} = \lim_{x \rightarrow \pi/2} \frac{\sin x}{8} \\
 &= \frac{1}{8} \cdot \sin \frac{\pi}{2} = \frac{1}{8} \times 1 = \frac{1}{8}
 \end{aligned}$$

62. (a) Since, the given function is continuous at $x = \pi/2$.

$$\therefore f\left(\frac{\pi}{2}\right) = \lim_{x \rightarrow \pi/2} \frac{1 - \sin x}{(\pi - 2x)^2}$$

$$\Rightarrow \lambda = \frac{1}{8} \quad [\text{from upper part}]$$

63. (b) We have, $f(x) = \begin{cases} x^2 - 5, & x \leq 3 \\ \sqrt{x+13}, & x > 3 \end{cases}$

To find $\lim_{x \rightarrow 3} f(x)$

$$\text{LHL} = \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^-} x^2 - 5$$

$$= \lim_{x \rightarrow 3^-} [(3-h)^2 - 5]$$

$$= \lim_{h \rightarrow 0} (9 - 6h + h^2 - 5) = 4$$

$$\text{RHL} = \lim_{x \rightarrow 3^+} \sqrt{x+13}$$

$$= \lim_{x \rightarrow 3^+} \sqrt{3+h+13} = \lim_{h \rightarrow 0} \sqrt{16+h} = 4$$

$$\therefore \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = 4$$

$$\lim_{x \rightarrow 3} f(x) = 4$$

64. (d) For continuous,

$$\lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = f(3)$$

$$\therefore \lim_{x \rightarrow 3^-} f(x) = \lim_{x \rightarrow 3^+} f(x) = 4$$

$\Rightarrow f(x)$ is continuous at $x = 4$.

We have, $f(x) = x^2 - 5, x \leq 3$
 $\Rightarrow f'(x) = 2x \Rightarrow f'(0) = 0$
 Hence, $f(x)$ is differentiable at $x = 0$.
 So, neither I nor II Statement are correct.

65. (b) We have, $f(x) = \begin{cases} \frac{\tan kx}{x}, & x < 0 \\ 3x + 2k^2, & x \geq 0 \end{cases}$

$\therefore f(x)$ is continuous at $x = 0$.
 $\therefore \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0)$
 $\Rightarrow \lim_{x \rightarrow 0^-} \frac{\tan kx}{x} = \lim_{x \rightarrow 0^+} 3x + 2k^2$
 $= 3(0) + 2k^2$
 $\Rightarrow \lim_{x \rightarrow 0^-} \frac{\tan k(0-b)}{0-b}$
 $= \lim_{x \rightarrow 0^+} 3(0+b) + 2k^2 = 2k^2$
 $\Rightarrow \lim_{b \rightarrow 0} \frac{\tan kb}{b} = 2k^2 \Rightarrow \lim_{b \rightarrow 0} \frac{k \tan kb}{kb} = 2k^2$
 $\Rightarrow k = 2k^2 \quad \left[\because \lim_{x \rightarrow 0} \frac{\tan x}{x} = 1 \right]$
 $\therefore k = 1/2$

66. (a) $\lim_{x \rightarrow 0} \frac{5^x - 1}{x} = \log_e 5$
 $\left[\because \lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log_e a \right]$

67. (d)

68. (b) $\lim_{x \rightarrow 0} \frac{\log_5(1+x)}{x}$
 $= \lim_{x \rightarrow 0} \frac{\log_e(1+x)}{x \log_e 5} \left[\because \log_a b = \frac{\log_e b}{\log_e a} \right]$
 $= \frac{1}{\log_e 5} \lim_{x \rightarrow 0} \frac{\log_e(1+x)}{x} \log_5 e$
 $\left[\because \lim_{x \rightarrow 0} \frac{\log_e(1+x)}{x} = 1 \right]$
 and $\log_a b = \frac{1}{\log_b a}$

69. (b) I. The greatest integer function is continuous at all points except integer. Therefore, Statement I is false.

II. Let $h(x) = \sin x$ and $g(x) = |x|$
 $h \circ g(x) = \sin |x|$
 $\therefore f(x) = h \circ g(x) = \sin |x|$

So, $g(x)$ is continuous, $\forall x \in R$ and $h(x)$ is continuous, $\forall x \in R$.

We know that, if $g(x)$ is continuous and $h(x)$ is continuous.

Then, $h \circ g(x)$ is continuous.

Hence, $f(x)$ is continuous, $\forall x \in R$.

70. (a) We have, $G(x) = \sqrt{25 - x^2}$

To find $\lim_{x \rightarrow 1} \frac{G(x) - G(1)}{x - 1}$

Clearly, $\lim_{x \rightarrow 1} \frac{G(x) - G(1)}{x - 1} = G'(1) \dots(i)$

Now, let us first find $G'(x)$, which is given by

$$G'(x) = \frac{1}{2} \times \frac{1}{\sqrt{25 - x^2}} (-2x)$$

$$= G'(x) = \frac{-x}{\sqrt{25 - x^2}}$$

$$= G'(1) = \frac{-1}{\sqrt{24}} = \frac{-1}{2\sqrt{6}}$$

71. (c) I. We have, $f(x) = [x]$

Clearly, $\lim_{x \rightarrow n^-} f(x) = \lim_{b \rightarrow 0} f(n+b)$

$$= \lim_{b \rightarrow 0} [n+b] = n$$

and $\lim_{x \rightarrow n^+} f(x) = \lim_{b \rightarrow 0} f(n-b)$

$$= \lim_{b \rightarrow 0} [n-b] = n-1$$

$\therefore \lim_{x \rightarrow n^+} f(x) \neq \lim_{x \rightarrow n^-} f(x)$ for all $n \in Z'$

So, f is discontinuous at $x = n \leftarrow Z'$

II. We have, $f(x) = \cot x$, consider,

$$\lim_{x \rightarrow n\pi^+} f(x) = \lim_{b \rightarrow 0} f(n\pi + b)$$

$$= \lim_{b \rightarrow 0} \cot(n\pi + b)$$

$$= \lim_{b \rightarrow 0} \cot b\pi \text{ which does not exist}$$

Thus, f is discontinuous at $x = n\pi, n \in Z'$.

Sol. (Q. Nos. 72-73)

We have

$$f(x) = \begin{cases} -1, & \text{if } x \leq 0 \\ ax + b, & \text{if } 0 < x < 1 \\ 1, & \text{if } x \geq 1 \end{cases}$$

where a and b are constants and $f(x)$ is continuous everywhere.

As $f(x)$ is continuous everywhere, therefore f is continuous at $x = 0$ and $x = 1$ also.

72. (a) $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} f(x) = f(0)$

and $\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^-} f(x) = f(1)$

Now, consider $\lim_{x \rightarrow 0^+} f(x) = f(0)$

$$\Rightarrow \lim_{b \rightarrow 0} f(0+b) = -1$$

$$\Rightarrow \lim_{b \rightarrow 0} a(0+b) + b = -1$$

$$\therefore b = -1$$

73. (d) $\lim_{x \rightarrow 1^-} f(x) = f(1)$

$$\Rightarrow \lim_{b \rightarrow 0} f(1-b) = 1$$

$$\Rightarrow \lim_{b \rightarrow 0} a(1-b) + b = 1 \Rightarrow a + b = 1$$

$$\therefore a = 2$$

74. (b) $\lim_{x \rightarrow \infty} \left(\frac{2+x^2}{1+x} - Ax - B \right) = 3$

$$\Rightarrow \lim_{x \rightarrow \infty} \left(\frac{2+x^2 - (Ax+B)(1+x)}{1+x} \right) = 3$$

$$\Rightarrow \lim_{x \rightarrow \infty} \left(\frac{2+x^2 - (Ax+Ax^2+B+Bx)}{1+x} \right) = 3$$

$$\Rightarrow \lim_{x \rightarrow \infty} \left(\frac{2+x^2 - Ax - Ax^2 - B - Bx}{1+x} \right) = 3$$

$$\Rightarrow \lim_{x \rightarrow \infty} \left(\frac{2x - A - 2Ax - B}{1} \right) = 3$$

[using L' Hospital's rule]

$$\Rightarrow \lim_{x \rightarrow \infty} [x(2-2A) - (A+B)] = 3$$

For limit to exist and equal to 3, we should have

$$2 - 2A = 0 \text{ and } A + B = -3 \dots(i)$$

$$\Rightarrow A = 1$$

75. (c) From Eq. (i), $A + B = -3$,

$$1 + B = -3 \Rightarrow B = -4$$

76. (a) We have, $f(x) = \begin{cases} \frac{\alpha \cos x}{\pi - 2x}, & \text{if } x \neq \frac{\pi}{2} \\ 3, & \text{if } x = \frac{\pi}{2} \end{cases}$

is continuous at $x = \frac{\pi}{2}$, where α is a constant.

$$\Rightarrow \lim_{x \rightarrow \frac{\pi}{2}} f(x) = f\left(\frac{\pi}{2}\right) = 3 \dots(i)$$

Now, consider $\lim_{x \rightarrow \frac{\pi}{2}} = \lim_{x \rightarrow \frac{\pi}{2}} \frac{\alpha \cos x}{\pi - 2x}$
 $= \alpha \lim_{x \rightarrow \frac{\pi}{2}} \frac{\cos x}{\pi - 2x}$

Now, put $y = x - \frac{\pi}{2}$,

then as $x \rightarrow \frac{\pi}{2} \Rightarrow y \rightarrow 0$

$$\therefore \lim_{x \rightarrow \frac{\pi}{2}} f(x) = \alpha \lim_{y \rightarrow 0} \frac{\cos\left(y + \frac{\pi}{2}\right)}{\pi - 2\left(\frac{\pi}{2} + y\right)}$$

$$= \alpha \lim_{y \rightarrow 0} \frac{-\sin y}{-2y}$$

$$= \frac{\alpha}{2} \lim_{y \rightarrow 0} \frac{\sin y}{y} = \frac{\alpha}{2} \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{\alpha}{2} = 3 \Rightarrow \alpha = 6$$

77. (d) Consider,

$$\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{6 \cos x}{\pi - 2x} = 6 \lim_{x \rightarrow 0} \frac{\cos x}{\pi - 2x}$$

$$= 6 \left(\frac{\cos 0}{\pi - 2(0)} \right) = \frac{6}{\pi} [\because \cos 0 = 1]$$

78. (d) Refer Ques 70

79. (d) Consider, $\lim_{x \rightarrow 2} \frac{\sin(e^{x-2} - 1)}{\ln(x-1)}$ [0 form]

[use L' Hospital's rule]

$$= \lim_{x \rightarrow 2} \frac{\cos(e^{x-2} - 1) \cdot e^{x-2}}{\frac{1}{x-1}} = \frac{1 \times 1}{1} = 1$$

80. (c) Clearly, for f to be continuous at $x = \pi$,

$$\begin{aligned} f(\pi) &= \lim_{x \rightarrow \pi} \frac{1 - \sin x + \cos x}{1 + \sin x + \cos x} \left[\frac{0}{0} \text{ form} \right] \\ &= \lim_{x \rightarrow \pi} \frac{-\cos x - \sin x}{\cos x - \sin x} \\ &\quad \text{[by L'Hospital's rule]} \\ &= \frac{-\cos \pi - \sin \pi}{\cos \pi - \sin \pi} \\ &= \frac{-(-1) - 0}{-1 - 0} = \frac{1}{-1} = -1 \end{aligned}$$

81. (b) I. Consider,

$$\begin{aligned} \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} &= \lim_{h \rightarrow 0} \frac{1/h - 0}{h} \\ &= \lim_{h \rightarrow 0} \frac{1}{h^2} = \infty \text{ (not defined)} \end{aligned}$$

Hence, f is not differentiable at $x = 0$.

II. We have,

$$\begin{aligned} f(x) &= \begin{cases} 2x + 5, & x > 0 \\ x^2 + 2x + 5, & x \leq 0 \end{cases} \\ \Rightarrow f'(x) &= \begin{cases} 2, & x > 0 \\ 2x + 2, & x \leq 0 \end{cases} \end{aligned}$$

\therefore LHL of $f'(x)$ = RHL of $f'(x)$

$\therefore f$ is differentiable at $x = 0$.

82. (a)

Sol. (Q. Nos. 83-84)

Given,

$$f(x) = \begin{cases} -2 \sin x, & \text{if } x \leq -\frac{\pi}{2} \\ A \sin x + B, & \text{if } -\frac{\pi}{2} < x < \frac{\pi}{2} \\ \cos x, & \text{if } x \geq \frac{\pi}{2} \end{cases}$$

- I. For continuity at $x = \frac{\pi}{2}$,

$$\begin{aligned} \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) &= \lim_{x \rightarrow \frac{\pi}{2}^-} f(x) = f\left(\frac{\pi}{2}\right) \\ \Rightarrow \lim_{b \rightarrow 0} f\left(\frac{\pi}{2} - b\right) \\ &= \lim_{b \rightarrow 0} f\left(\frac{\pi}{2} + b\right) = f\left(\frac{\pi}{2}\right) \\ \Rightarrow \lim_{b \rightarrow 0} A \sin\left(\frac{\pi}{2} - b\right) + B \\ &= \lim_{b \rightarrow 0} \cos\left(\frac{\pi}{2} + b\right) = \cos\left(\frac{\pi}{2}\right) \\ \Rightarrow A \sin \frac{\pi}{2} + B &= \cos \frac{\pi}{2} = 0 \\ \Rightarrow A + B &= 0 \quad \dots(i) \end{aligned}$$

- II. For continuity at $x = -\frac{\pi}{2}$,

$$\begin{aligned} \lim_{x \rightarrow -\frac{\pi}{2}^-} f(x) &= \lim_{x \rightarrow -\frac{\pi}{2}^+} f(x) = f\left(-\frac{\pi}{2}\right) \\ \Rightarrow \lim_{b \rightarrow 0} f\left(-\frac{\pi}{2} - b\right) &= \lim_{b \rightarrow 0} \left(-\frac{\pi}{2} + b\right) \\ &= f\left(-\frac{\pi}{2}\right) \\ \Rightarrow \lim_{b \rightarrow 0} \left[-2 \sin\left(-\frac{\pi}{2} - b\right)\right] \\ &= \lim_{b \rightarrow 0} \left[A \sin\left(-\frac{\pi}{2} + b\right) + B\right] \\ &= -2 \sin\left(-\frac{\pi}{2}\right) \end{aligned}$$

$$\Rightarrow 2 = -A + B = 2$$

$$\Rightarrow A - B = -2 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get $A = -1$ and $B = 1$

83. (c) The value of A is -1 .

84. (a) The value of B is 1 .

85. (a) Given, $\lim_{x \rightarrow 0} \phi(x) = a^2$

$$\text{To find } \lim_{x \rightarrow 0} \phi\left(\frac{x}{a}\right)$$

$$\therefore \lim_{x \rightarrow 0} \phi\left(\frac{x}{a}\right) = a^2$$

86. (a) $\lim_{x \rightarrow 0} e^{-1/x^2} = \lim_{b \rightarrow 0} e^{-1/(0+b)^2} = 0$

87. (b) Given, $f(x) = \frac{a^{[x]+x} - 1}{[x] + x}$

$$\text{Now, RHL} = \lim_{x \rightarrow 0^+} \frac{a^{[x]+x} - 1}{[x] + x}$$

As, $x \rightarrow 0^+$ (i.e. approaches 0 from the right), we get $[x] = 0$

$$\begin{aligned} \therefore \lim_{x \rightarrow 0^+} f(x) &= \lim_{x \rightarrow 0^+} \frac{a^x - 1}{x} \\ &= \lim_{b \rightarrow 0} \frac{a^{(0+b)} - 1}{(0+b)} = \lim_{b \rightarrow 0} \frac{a^b - 1}{b} = \ln a \end{aligned}$$

88. (c) $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{a^{[x]+x} - 1}{[x] + x}$

As $x \rightarrow 0^-$ [i.e. approaches 0 from left], we get $[x] = -1$

$$\begin{aligned} \therefore \lim_{x \rightarrow 0^-} f(x) &= \lim_{x \rightarrow 0^-} \frac{a^{-1+x} - 1}{-1+x} \\ &= \lim_{b \rightarrow 0} \frac{a^{-1+(0-b)} - 1}{-1+(0-b)} = \frac{a^{-1} - 1}{-1} \\ &= 1 - a^{-1} \end{aligned}$$

89. (c) LHL = $\lim_{x \rightarrow 0^-} f(x)$

$$= \lim_{x \rightarrow 0^-} (x + \pi) = \pi$$

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \pi \cos x \\ &= \pi \cos(0) = \pi \end{aligned}$$

Also, $f(0) = \pi \cos(0) = \pi$

Hence, $f(x)$ is continuous at $x = 0$.

Statement I is correct. Now, for $x = \frac{\pi}{2}$

$$\text{LHL} = \lim_{x \rightarrow \pi/2^-} f(x)$$

$$= \lim_{x \rightarrow \pi/2} \pi \cos x = 0$$

$$\text{RHL} = \lim_{x \rightarrow \pi/2^+} f(x) = \lim_{x \rightarrow \frac{\pi}{2}} \left(x - \frac{\pi}{2}\right)^2$$

$$= \left(\frac{\pi}{2} - \frac{\pi}{2}\right)^2 = 0$$

$$\text{Also, } f\left(\frac{\pi}{2}\right) = \pi \cos \frac{\pi}{2} = 0$$

Hence, $f(x)$ is continuous at $x = \frac{\pi}{2}$.

Statement II is correct.

90. (d) For $x = 0$,

$$\text{LHD} = \lim_{b \rightarrow 0} \frac{f(0-b) - f(0)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{f(-b) - f(0)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{(-b + \pi) - \pi}{-b} = \lim_{b \rightarrow 0} \frac{-b}{-b} = 1$$

$$\text{RHD} = \lim_{b \rightarrow 0^+} \frac{f(0+b) - f(0)}{b}$$

$$= \lim_{b \rightarrow 0^+} \frac{f(b) - f(0)}{b} = \lim_{b \rightarrow 0} \frac{\pi \cos b - \pi}{2}$$

$$= \lim_{b \rightarrow 0} \frac{\pi [-2 \sin^2(b/2)]}{b}$$

$$= \lim_{b \rightarrow 0} \pi \left[-\sin\left(\frac{b}{2}\right) \times \sin\left(\frac{b}{2}\right)\right] = 0$$

LHD \neq RHD

Hence, $f(x)$ is not differentiable at $x = 0$.

\therefore Statement I is not correct.

For $x = \frac{\pi}{2}$,

$$\text{LHD} = \lim_{b \rightarrow 0} \frac{f(\pi/2 - b) - f(\pi/2)}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{\pi \cos\left(\frac{\pi}{2} - b\right) - 0}{-b}$$

$$= \lim_{b \rightarrow 0} \frac{\pi \sin b}{-b} = -\pi$$

$$\text{RHD} = \lim_{b \rightarrow 0} \frac{f(\pi/2 + b) - f(\pi/2)}{b}$$

$$= \lim_{b \rightarrow 0} \frac{\left(\frac{\pi}{2} + b - \frac{\pi}{2}\right)^2 - 0}{b}$$

LHD \neq RHD

Hence, $f(x)$ is not differentiable at $x = \frac{\pi}{2}$.

Statement II is not correct.

24

DIFFERENTIATION

In NDA exam, generally 3-5 questions are asked from this chapter, which are based on finding derivative of implicit, parametric and logarithmic functions, one function with respect to another function and successive differentiation.

Differentiation is a method to compute the rate at which a dependent variable y changes with respect to the change in the independent variable x . This rate of change is called the derivative of y with respect to x . Differential coefficient (derivative) of a function $y = f(x)$, is defined as

$$\frac{dy}{dx} = \lim_{\delta x \rightarrow 0} \frac{f(x + \delta x) - f(x)}{\delta x}$$

The above definition of derivative is known as the first principle of derivative. Mathematically, we may define $\frac{dy}{dx}$ at $x = a$ as $\left(\frac{dy}{dx}\right)_{x=a} = \lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$. Also, $\left(\frac{dy}{dx}\right)_{x=a} = \lim_{\delta x \rightarrow 0} \frac{f(a + \delta x) - f(a)}{\delta x}$

Rules of Differentiation

- (i) $\frac{d(C)}{dx} = 0$, where $C = \text{constant}$
- (ii) $\frac{d}{dx} \{kf(x)\} = k \frac{d\{f(x)\}}{dx}$, where k is a constant.
- (iii) $\frac{d}{dx} \{f(x) \pm g(x)\} = \frac{d\{f(x)\}}{dx} \pm \frac{d\{g(x)\}}{dx}$
- (iv) $\frac{d}{dx} \{k_1 f(x) \pm k_2 g(x)\} = \frac{k_1 d\{f(x)\}}{dx} \pm \frac{k_2 d\{g(x)\}}{dx}$
- (v) $\frac{d}{dx} \left[\frac{f(x)}{g(x)} \right] = \frac{g(x)f'(x) - f(x)g'(x)}{\{g(x)\}^2}$
- (vi) $\frac{d}{dx} [f(x)g(x)] = f(x)g'(x) + g(x)f'(x)$

Note Result (vi) can be generalised to find the derivative of the product of any number of differentiable functions.

Differentiation of Some Standard Function

- (i) $\frac{d}{dx} x^n = nx^{n-1}$
- (ii) $\frac{d}{dx} (\log_e x) = \frac{1}{x}$, for $x > 0$
- (iii) $\frac{d}{dx} \log_a x = \frac{1}{x \log a}$, for $x > 0, a > 0, a \neq 1$
- (iv) $\frac{d}{dx} a^x = a^x \log a$, for $a > 0$
- (v) $\frac{d}{dx} e^x = e^x$
- (vi) $\frac{d}{dx} (\sin x) = \cos x$

$$\begin{aligned}
 \text{(vii)} \quad \frac{d}{dx}(\cos x) &= -\sin x & \text{(viii)} \quad \frac{d}{dx}(\tan x) &= \sec^2 x \\
 \text{(ix)} \quad \frac{d}{dx}(\sec x) &= \sec x \tan x \\
 \text{(x)} \quad \frac{d}{dx} \operatorname{cosec} x &= -\operatorname{cosec} x \cot x & \text{(xi)} \quad \frac{d}{dx} \cot x &= -\operatorname{cosec}^2 x \\
 \text{(xii)} \quad \frac{d}{dx} \sin^{-1} x &= \frac{1}{\sqrt{1-x^2}} & \text{(xiii)} \quad \frac{d}{dx} \cos^{-1} x &= \frac{-1}{\sqrt{1-x^2}} \\
 \text{(xiv)} \quad \frac{d}{dx} \sec^{-1} x &= \frac{1}{|x|\sqrt{x^2-1}}, \text{ for } |x| > 1 \\
 \text{(xv)} \quad \frac{d}{dx} \operatorname{cosec}^{-1} x &= \frac{-1}{|x|\sqrt{x^2-1}} \\
 \text{(xvi)} \quad \frac{d}{dx} \tan^{-1} x &= \frac{1}{1+x^2} & \text{(xvii)} \quad \frac{d}{dx} \cot^{-1} x &= \frac{-1}{1+x^2}
 \end{aligned}$$

EXAMPLE 1. If $y = x^{1/3} + x^{1/2}$, then find $\frac{dy}{dx}$ at $x = 81$.

- a. $3^{-1/3} + \frac{1}{18}$ b. $3^{-10/3} + \frac{1}{6}$
 c. $3^{-11/3} + \frac{1}{18}$ d. None of these

Sol. c. We have, $y = x^{1/3} + x^{1/2}$

$$\begin{aligned}
 \therefore \frac{dy}{dx} &= \frac{d}{dx}(x^{1/3}) + \frac{d}{dx}(x^{1/2}) \Rightarrow \frac{dy}{dx} = \frac{1}{3}x^{-2/3} + \frac{1}{2}x^{-1/2} \\
 \therefore \left(\frac{dy}{dx}\right)_{x=81} &= \frac{1}{3}(81)^{-2/3} + \frac{1}{2}(81)^{-1/2} \\
 &= \frac{1}{3}[(3^4)^{-2/3}] + \frac{1}{2}[(9^2)^{-1/2}] = \frac{1}{3} \times 3^{-8/3} + \frac{1}{2} \cdot 9^{-1} \\
 &= 3^{-8/3-1} + \frac{1}{2} \cdot \frac{1}{9} = 3^{-11/3} + \frac{1}{18}
 \end{aligned}$$

EXAMPLE 2. What will be the value of $\frac{dy}{dx}$, when

$$y = \frac{e^x + e^{-x}}{e^x - e^{-x}}?$$

- a. $\frac{4}{(e^x - e^{-x})^2}$ b. $\frac{4}{e^{2x} - e^{-2x}}$ c. $\frac{-4}{(e^x - e^{-x})^2}$ d. $\frac{-4}{e^x - e^{-2x}}$

Sol. c. We have, $y = \frac{e^x + e^{-x}}{e^x - e^{-x}}$. Then, $\frac{dy}{dx} = \frac{d}{dx} \left(\frac{e^x + e^{-x}}{e^x - e^{-x}} \right)$.

$$\begin{aligned}
 &= \frac{(e^x - e^{-x}) \frac{d}{dx}(e^x + e^{-x}) - (e^x + e^{-x}) \frac{d}{dx}(e^x - e^{-x})}{(e^x - e^{-x})^2} \\
 &= \frac{(e^x - e^{-x})(e^x - e^{-x}) - (e^x + e^{-x})(e^x + e^{-x})}{(e^x - e^{-x})^2} \\
 &= \frac{(e^x - e^{-x})^2 - (e^x + e^{-x})^2}{(e^x - e^{-x})^2} = \frac{-4}{(e^x - e^{-x})^2}
 \end{aligned}$$

Chain Rule

Let $y = f(u)$ be a differentiable function of u and $u = g(x)$ be a differentiable function of x .

Then, $y = f(u) = f[g(x)]$ is called a function of a function or composite function.

In this case, $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$

This rule is called the chain rule. This rule can be generalised for more functions.

EXAMPLE 3. If $x = 2 \cos t - \cos 2t$, $y = 2 \sin t - \sin 2t$ then at $t = \frac{\pi}{4}$, $\frac{dy}{dx}$ is equal to

- a. $\sqrt{2} + 1$ b. $\sqrt{2} - 1$
 c. $\frac{\sqrt{2} + 1}{2}$ d. None of these

Sol. a. $\frac{dx}{dt} = -2 \sin t + 2 \sin 2t$ and $\frac{dy}{dt} = 2 \cos t - 2 \cos 2t$

$$\frac{dy}{dx} = \frac{\cos t - \cos 2t}{\sin 2t - \sin t}$$

Put $t = \frac{\pi}{4}$, we have

$$\begin{aligned}
 \left(\frac{dy}{dx}\right)_{t=\frac{\pi}{4}} &= \frac{\cos \pi/4 - \cos \pi/2}{\sin \pi/2 - \sin \pi/4} \\
 &= \sqrt{2} + 1
 \end{aligned}$$

Differentiation of an Implicit Function

When independent variable x and dependent variable y occur together in an equation, then it is not convenient or possible to express y in terms of x . In such cases, y is an implicit function of x and both are connected by a relation of the form $f(x, y) = 0$.

In order to find $\frac{dy}{dx}$ from $f(x, y) = 0$, adopt the following procedure

- Differentiate each term of $f(x, y) = 0$ with respect to x , noting that y as a function of x .
- Simplify the equation thus obtained for $\frac{dy}{dx}$.

EXAMPLE 4. If $x^2 + 2xy + y^3 = 42$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{-2(x+y)}{2x+3y^2}$ b. $\frac{-(2x+3y^2)}{2(x+y)}$
 c. $\frac{-2(x+y)}{2y+3x^2}$ d. $\frac{2(x^2+y^2)}{2x+3y^2}$

Sol. a. $\therefore x^2 + 2xy + y^3 = 42$
 $\therefore \frac{d}{dx}(x^2 + 2xy + y^3) = \frac{d}{dx} 42$
 $\Rightarrow 2x + 2\left(x \frac{dy}{dx} + y \frac{dx}{dx}\right) + 3y^2 \frac{dy}{dx} = 0$
 $\Rightarrow 2x + 2x \frac{dy}{dx} + 2y + 3y^2 \frac{dy}{dx} = 0$
 $\Rightarrow \frac{dy}{dx}(2x + 3y^2) = -2(x + y) \Rightarrow \frac{dy}{dx} = \frac{-2(x + y)}{2x + 3y^2}$

Important Substitutions

Inverse trigonometric functions involving the terms given below, can be reduced to simple forms by the following substitutions

S. No.	Functions involving terms	Substitutions
1.	$a^2 - x^2$	$x = a \sin \theta$ or $a \cos \theta$
2.	$a^2 + x^2$	$x = a \tan \theta$ or $a \cot \theta$
3.	$x^2 - a^2$	$x = a \sec \theta$ or $a \operatorname{cosec} \theta$
4.	$\sqrt{\frac{a+x}{a-x}}$ or $\sqrt{\frac{a-x}{a+x}}$	$x = a \cos 2\theta$
5.	$\sqrt{\frac{a^2+x^2}{a^2-x^2}}$ or $\sqrt{\frac{a^2-x^2}{a^2+x^2}}$	$x^2 = a^2 \cos 2\theta$
6.	$\frac{2x}{1+x^2}$ or $\frac{2x}{1-x^2}$	$x = \tan \theta$
7.	$a \sin x + b \cos x$	$a = r \cos \alpha, b = r \sin \alpha$

EXAMPLE 5. Find $\frac{dy}{dx}$, if $y = \sin\left(2 \tan^{-1} \sqrt{\frac{1-x}{1+x}}\right)$.

- a. 1 b. -1 c. $\frac{x}{\sqrt{x^2-1}}$ d. $\frac{-x}{\sqrt{1-x^2}}$

Sol. d. $y = \sin\left(2 \tan^{-1} \sqrt{\frac{1-x}{1+x}}\right)$

On putting $x = \cos 2\theta$, we get
 $y = \sin\left[2 \tan^{-1} \sqrt{\frac{1-\cos 2\theta}{1+\cos 2\theta}}\right] = \sin\left[2 \tan^{-1} \sqrt{\frac{2 \sin^2 \theta}{2 \cos^2 \theta}}\right]$
 $= \sin[2 \tan^{-1}(\tan \theta)] = \sin 2\theta = \sqrt{1-\cos^2 2\theta}$
 $\Rightarrow y = \sqrt{1-x^2} = (1-x^2)^{1/2}$
 $\therefore \frac{dy}{dx} = \frac{1}{2}(1-x^2)^{-1/2} \cdot \frac{d}{dx}(1-x^2)$
 $= \frac{1}{2\sqrt{1-x^2}} \cdot (0-2x) = \frac{-x}{\sqrt{1-x^2}}$

Differentiation of Infinite Series

Sometimes y is given as an infinite series and we have to find the derivative of y . To find this we use the fact that if a term is deleted from infinite series, it remains unaffected.

EXAMPLE 6. If $y = \sqrt{\sin x + \sqrt{\sin x + \sqrt{\sin x + \dots \infty}}}$, then $\frac{dy}{dx}$ is equal to

- a. $\frac{\cos x}{2x-1}$ b. $\frac{\cos x}{2y-1}$ c. $\frac{\cos x}{2x+1}$ d. None of these

Sol. b. We have, $y = \sqrt{\sin x + \sqrt{\sin x + \sqrt{\sin x + \dots \infty}}}$

$\Rightarrow y = \sqrt{\sin x + y} \Rightarrow y^2 = \sin x + y$

On differentiating both sides w.r.t. x , we get

$2y \frac{dy}{dx} = \cos x + \frac{dy}{dx} \Rightarrow (2y-1) \frac{dy}{dx} = \cos x$

$\therefore \frac{dy}{dx} = \frac{\cos x}{2y-1}$

Differentiation of Parametric Functions

If $x = f(t)$, $y = g(t)$, where t is parameter,

then $\frac{dy}{dx} = \frac{(dy/dt)}{(dx/dt)} = \frac{\frac{d}{dt}(g(t))}{\frac{d}{dt}(f(t))} = \frac{g'(t)}{f'(t)}$

We can always find $\frac{dy}{dx}$ in such cases, without first

eliminating the parameters by the formula $\frac{dy}{dx} = \frac{dy/dt}{dx/dt}$.

EXAMPLE 7. Find $\frac{dy}{dx}$, when $x = \frac{3at}{1+t^3}$ and $y = \frac{3at^2}{1+t^3}$.

- a. $\frac{t^3-4}{1-2t^3}$ b. $\frac{t(2-t^3)}{1-2t^3}$ c. $\frac{t(2+t^3)}{1+2t^3}$ d. None of these

Sol. b. We have, $x = 3a \cdot \frac{t}{1+t^3}$

$\therefore \frac{dx}{dt} = 3a \cdot \frac{(1+t^3) \frac{d}{dt} t - t \cdot \frac{d}{dt} (1+t^3)}{(1+t^3)^2}$
 $= 3a \cdot \frac{(1+t^3) \cdot 1 - t \cdot 3t^2}{(1+t^3)^2} = 3a \cdot \frac{1-2t^3}{(1+t^3)^2}$

Again, $y = 3a \cdot \frac{t^2}{1+t^3}$

$\therefore \frac{dy}{dt} = 3a \cdot \frac{(1+t^3) \frac{d}{dt} t^2 - t^2 \frac{d}{dt} (1+t^3)}{(1+t^3)^2}$
 $= 3a \cdot \frac{(1+t^3) \cdot 2t - t^2 \cdot 3t^2}{(1+t^3)^2} = 3a \cdot \frac{t(2-t^3)}{(1+t^3)^2}$

$\therefore \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3at(2-t^3)}{(1+t^3)^2} \cdot \frac{(1+t^3)^2}{3a(1-2t^3)} = \frac{t(2-t^3)}{1-2t^3}$

> PRACTICE EXERCISE

1. If $y = \sec \tan^{-1} x$, then $\frac{dy}{dx}$ is equal to
 (a) $xy/(1+x)$ (b) $xy\sqrt{1+x^2}$
 (c) $y/\sqrt{1+x^2}$ (d) $xy/(1+x^2)$
2. If $y = \tan^{-1} \left(\frac{\sin x}{1 + \cos x} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) $1/4$ (b) $1/2$ (c) $1 + \cos^2 x$ (d) $-1/4$
3. If $y = \{x + \sqrt{1+x^2}\}^m$, then $(1+x^2)y_2 + xy_1 - m^2y$ is equal to
 (a) 2 (b) 1 (c) -1 (d) 0
4. If $f(x) = \log_a (\log_a x)$, then $f'(x)$ is equal to
 (a) $\frac{\log_a e}{x \log_e x}$ (b) $\frac{\log_e a}{x \log_a x}$
 (c) $\frac{\log_e a}{x}$ (d) $\frac{x}{\log_e a}$
5. If $x = a(1 - \cos \theta)$, $y = a(\theta - \sin \theta)$, then $\left(\frac{dy}{dx}\right)_{\theta = \pi/2}$ is equal to
 (a) -2 (b) -4 (c) 1 (d) -1
6. The derivative of the function $\cot^{-1}[(\cos 2x)^{1/2}]$ at $x = \frac{\pi}{6}$ is
 (a) $(2/3)^{1/2}$ (b) $(1/3)^{1/2}$
 (c) $3^{1/2}$ (d) $6^{1/2}$
7. If $y = \tan^{-1} \{[\sqrt{1+x^2} - 1]/x\}$, then
 (a) $y'(0) = 1$ (b) $y'(0) = 1/2$
 (c) $y'(0) = 0$ (d) None of these
8. If $y = \sin^{-1} \frac{\sqrt{1+x} + \sqrt{1-x}}{2}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{\sqrt{1-x^2}}$ (b) $-\frac{1}{\sqrt{1-x^2}}$
 (c) $-\frac{1}{2\sqrt{1-x^2}}$ (d) None of these
9. If $y = \sin^{-1} \sqrt{1-x} + \cos^{-1} \sqrt{x}$, then dy/dx is equal to
 (a) $\frac{1}{\sqrt{x(1-x)}}$ (b) $-\frac{1}{\sqrt{x(1-x)}}$
 (c) $\frac{1}{\sqrt{x(1+x)}}$ (d) None of these
10. If $y = \tan^{-1} \left[\frac{\sqrt{1+x^2} + \sqrt{1-x^2}}{\sqrt{1+x^2} - \sqrt{1-x^2}} \right]$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{\sqrt{1-x^4}}$ (b) $\frac{-1}{\sqrt{1-x^4}}$ (c) $\frac{x}{\sqrt{1-x^4}}$ (d) $\frac{-x}{\sqrt{1-x^4}}$
11. If $y = \tan^{-1} \frac{x}{1 + \sqrt{1-x^2}} + \sin \left\{ 2 \tan^{-1} \sqrt{\frac{1-x}{1+x}} \right\}$, then dy/dx is equal to
 (a) $\frac{x}{\sqrt{1-x^2}}$ (b) $\frac{1-2x}{\sqrt{1-x^2}}$ (c) $\frac{1-2x}{2\sqrt{1-x^2}}$ (d) $\frac{1}{1+x^2}$
12. If $\sin^{-1} \left(\frac{x^2 - y^2}{x^2 + y^2} \right) = \log a$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{x}{y}$ (b) $\frac{y}{x^2}$ (c) $\frac{x^2}{y}$ (d) $\frac{y}{x}$
13. If $x = a[\cos t + \log \tan(t/2)]$, $y = a \sin t$, then dy/dx is equal to
 (a) $\tan t$ (b) $\cos t$ (c) $\sec t$ (d) $\operatorname{cosec} t$
14. If $x = 2 \log \cot t$ and $y = \tan t + \cot t$, then $\frac{dy}{dx} \sin 2t + 1$ is equal to
 (a) $\cos^2 t$ (b) $\sin^2 t$ (c) $\cos 2t$ (d) $2\cos^2 t$
15. If $y = \log \left(\frac{1 + \sqrt{x}}{1 - \sqrt{x}} \right)$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{1}{\sqrt{x}(1+x)}$ (b) $\frac{1}{\sqrt{x}(1-x)}$ (c) $\frac{\sqrt{x}}{1+x}$ (d) None of these
16. If $x^p y^q = (x+y)^{p+q}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{y}{x}$ (b) $\frac{py}{qx}$ (c) $\frac{x}{y}$ (d) $\frac{qy}{px}$
17. $\frac{d}{dx} \left[\cos^{-1} \left(\frac{4x^3}{27} - x \right) \right]$ is equal to
 (a) $\frac{3}{\sqrt{9-x^2}}$ (b) $\frac{1}{\sqrt{9-x^2}}$ (c) $\frac{-3}{\sqrt{9-x^2}}$ (d) $\frac{-1}{\sqrt{9-x^2}}$
18. The derivative of $\tan^{-1} \left(\frac{\sqrt{1+x^2} - 1}{x} \right)$ with respect to $\tan^{-1} \left(\frac{2x\sqrt{1-x^2}}{1-2x^2} \right)$ at $x = 0$, is
 (a) $1/8$ (b) $1/4$ (c) $1/2$ (d) 1

- 19.** What is the derivative of $\sin^2 x$ with respect to $\cos^2 x$?
 (a) $\tan^2 x$ (b) $\cot^2 x$ (c) -1 (d) 1
- 20.** If $\sqrt{x} + \sqrt{y} = 2$, then what is $\frac{dy}{dx}$ at $y = 1$ equal to?
 (a) 5 (b) 4 (c) 2 (d) -1
- 21.** What is the differentiation of $\log_x x$ with respect to $\log x$?
 (a) 0 (b) 1 (c) $1/x$ (d) x
- 22.** If $y = \sqrt{\cos x + \sqrt{\cos x + \sqrt{\cos x + \sqrt{\cos x + \dots \infty}}}}$, then $\frac{dy}{dx}$ is equal to
 (a) $\frac{\cos x}{1-2y}$ (b) $\frac{\sin x}{1-2y}$ (c) $\frac{-\sin x}{1-2y}$ (d) $\frac{-\cos x}{1-2y}$
- 23.** If $x = t + \frac{1}{t}$, $y = t - \frac{1}{t}$, then $\frac{d^2y}{dx^2}$ is equal to
 (a) $-4t(t^2 - 1)^{-2}$ (b) $-4t^3(t^2 - 1)^{-3}$
 (c) $(t^2 + 1)(t^2 - 1)^{-1}$ (d) $-4t^2(t^2 - 1)^{-2}$
- 24.** If $y = \sin x + e^x$, then $\frac{d^2x}{dy^2}$ is equal to
 (a) $(-\sin x + e^x)^{-1}$ (b) $\frac{\sin x + e^x}{(\cos x + e^x)^2}$
 (c) $\frac{\sin x - e^x}{(\cos x + e^x)^3}$ (d) $\frac{\sin x + e^x}{(\cos x + e^x)^3}$
- 25.** If ϕ is inverse of f and $f'(x) = \frac{1}{1+x^n}$, then $\phi'(x)$ is equal to
 (a) $1+x^n$ (b) $1+[f(x)]^n$
 (c) $1+[\phi(x)]^n$ (d) None of these
- 26.** If $y = (1+x^{1/4})(1+x^{1/2})(1-x^{1/4})$, then what is $\frac{dy}{dx}$ equal to?
 (a) 1 (b) -1 (c) 0 (d) $-2x$
- 27.** What is the derivative of $x\sqrt{a^2-x^2} + a^2 \sin^{-1}\left(\frac{x}{a}\right)$?
 (a) $\sqrt{a^2-x^2}$ (b) $2\sqrt{a^2-x^2}$ (c) $\sqrt{x^2-a^2}$ (d) $2\sqrt{x^2-a^2}$
- 28.** If $x = k(\theta + \sin\theta)$ and $y = k(1 + \cos\theta)$, then what is the derivative of y with respect to x at $\theta = \pi/2$?
 (a) -1 (b) 0 (c) 1 (d) 2
- 29.** If $\sqrt{1-x^2} + \sqrt{1-y^2} = a$, then what is $\frac{dy}{dx}$ equal to?
 (a) $\sqrt{(1-x^2)(1-y^2)}$ (b) $\sqrt{\frac{1-y^2}{1-x^2}}$
 (c) $\sqrt{\frac{1-x^2}{1-y^2}}$ (d) None of these
- 30.** If for a continuous function f , $f(0) = f(1) = 0$, $f'(1) = 2$ and $g(x) = f(e^x)e^{f(x)}$, then $g'(0)$ is equal to
 (a) 1 (b) 2 (c) 0 (d) 3
- 31.** If $x = \cos(2t)$ and $y = \sin^2 t$, then what is $\frac{d^2y}{dx^2}$ equal to?
 (a) 0 (b) $\sin(2t)$ (c) $-\cos(2t)$ (d) $-\frac{1}{2}$
- 32.** If $y = e^{2x}$, then $\frac{d^2y}{dx^2} \cdot \frac{d^2x}{dy^2}$ is equal to
 (a) e^{-2x} (b) $-2e^{-2x}$ (c) $2e^{-2x}$ (d) 1
- 33.** If $y^2 = P(x)$ is a polynomial of degree 3, then $2 \frac{d}{dx} \left(y^3 \frac{d^2y}{dx^2} \right)$ is equal to
 (a) $P'''(x) + P'(x)$ (b) $P'(x)P'''(x)$
 (c) $P(x)P'''(x)$ (d) a constant
- 34.** If $y = \tan^{-1} \left(\frac{\log(e/x^2)}{\log(ex^2)} \right) + \tan^{-1} \left(\frac{3+2\log x}{1-6\log x} \right)$, then $\frac{d^2y}{dx^2}$ is equal to
 (a) 2 (b) 1 (c) 0 (d) -1
- 35.** If $f(x) = x^{1/x}$, then $f''(e)$ is equal to
 (a) $e^{1/e}$ (b) $e^{(1/e)-2}$ (c) $2^{1/(e-3)}$ (d) $-e^{(1/e)-3}$
- 36.** What is the derivative of $\log_x 5$ with respect to $\log_5 x$?
 (a) $-(\log_5 x)^{-2}$ (b) $(\log_5 x)^{-2}$ (c) $-(\log_x 5)^{-2}$ (d) $(\log_x 5)^{-2}$
- 37.** If $e^y + xy = e$, then what is the value of $\frac{d^2y}{dx^2}$ at $x = 0$?
 (a) e^{-1} (b) e^{-2} (c) e (d) 1
- 38.** If $3^x + 3^y = 3^{x+y}$, then what is $\frac{dy}{dx}$ equal to?
 (a) $\frac{3^{x+y} - 3^x}{3^y}$ (b) $\frac{3^{x-y}(3^y - 1)}{1 - 3^x}$ (c) $\frac{3^x + 3^y}{3^x - 3^y}$ (d) $\frac{3^x + 3^y}{1 + 3^{x+y}}$
- 39.** If $f(x) = \cos x$, $g(x) = \log x$ and $y = (gof)(x)$, then what is the value of $\frac{dy}{dx}$ at $x = 0$?
 (a) 0 (b) 1 (c) -1 (d) 2
- 40.** If $y = f(x)$, $p = \frac{dy}{dx}$ and $q = \frac{d^2y}{dx^2}$, then what is $\frac{d^2x}{dy^2}$ equal to?
 (a) $-\frac{q}{p^2}$ (b) $-\frac{q}{p^3}$ (c) $\frac{1}{q}$ (d) $\frac{q}{p^2}$

41. If $x = \sin t - t \cos t$ and $y = t \sin t + \cos t$, then what is $\frac{dy}{dx}$ at point $t = \frac{\pi}{2}$?

- (a) 0 (b) $\frac{\pi}{2}$ (c) $-\frac{\pi}{2}$ (d) 1

42. If the curve $\sqrt{x} + \sqrt{y} = 1$, then what is the value of $\frac{dy}{dx}$ at $(\frac{1}{4}, \frac{1}{4})$?

- (a) $\frac{1}{2}$ (b) 1 (c) -1 (d) 2

43. If $y = \frac{1}{\log_{10} x}$, then what is $\frac{dy}{dx}$ equal to?

- (a) x (b) $x \log_e 10$
 (c) $-\frac{(\log_x 10)^2 (\log_{10} e)}{x}$ (d) $x \log_{10} e$

44. If $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$, then what is $\frac{dy}{dx}$ equal to?

- (a) $\cos^{-1} x + \cos^{-1} \sqrt{1-x^2}$ (b) $\frac{1}{\cos x} + \frac{1}{\cos \sqrt{1-x^2}}$
 (c) $\frac{\pi}{2}$ (d) 0

45. If $f(x) = e^{\sin(\log \cos x)}$ and $g(x) = \log \cos x$, then what is the derivative of $f(x)g(x)$?

- (a) $f(x) \cos [g(x)]$ (b) $f(x) \sin [g(x)]$
 (c) $g(x) \cos [f(x)]$ (d) $g(x) \sin [f(x)]$

46. The first derivative of the function

$$\left[\cos^{-1} \left(\sin \frac{\sqrt{1+x}}{2} \right) + x^x \right] \text{ with respect to } x \text{ at}$$

$x = 1$ is

- I. $f'(1) = \frac{3}{4}$ II. $f'(2) = \frac{-1}{2\sqrt{6}} + 4(\log 2 + 1)$

Select the correct answer using the codes given below.

- (a) Only I (b) Only II
 (c) Both I and II (d) None of these

47. If $y = a \sin x + b \cos x$, then $y^2 + \left(\frac{dy}{dx}\right)^2$ is a

- I. Function of x II. Function of y III. Constant

Select the correct answer using the codes given below.

- (a) Only I (b) Only II
 (c) Only III (d) None of these

48. If $y = \frac{e^{2x} + e^{-2x}}{e^{2x} - e^{-2x}}$, then $\frac{dy}{dx}$ equals to

- I. $\frac{-8}{(e^{2x} - e^{-2x})^2}$ II. $\frac{-4}{(e^x - e^{-x})^2}$ III. $\frac{8}{(e^{2x} - e^{-2x})^2}$

Select the correct answer using the codes given below.

- (a) Only I (b) Only II
 (c) Only III (d) None of these

Directions (Q. Nos. 49-50) Consider,

$$f(x) = \frac{\sqrt{x-2}\sqrt{x-1}}{\sqrt{x-1}-1} \cdot x$$

49. Find the value of $f'(10)$.

- (a) 1 (b) 0 (c) 10 (d) -1

50. Find the value of $f'\left(\frac{3}{2}\right)$.

- (a) 0 (b) 1 (c) -1 (d) None of these

Directions (Q. Nos. 51-52) If $y = (x + \sqrt{1+x^2})^n$, then

51. Find $\frac{dy}{dx}$.

- (a) $\frac{1}{\sqrt{1+x^2}}$ (b) $\frac{y}{\sqrt{1+x^2}}$
 (c) $\frac{ny}{\sqrt{1+x^2}}$ (d) None of these

52. Find $\frac{d^2y}{dx^2}(1+x^2) + x \frac{dy}{dx}$.

- (a) y (b) x (c) n^2y (d) nx

Directions (Q. Nos. 53-55) Consider function

$$u = e^x \sin x \text{ and } v = e^x \cos x, \text{ then}$$

53. $v \frac{du}{dx} - u \frac{dv}{dx}$ is equal to

- (a) $u + v$ (b) v^2 (c) $u^2 + v^2$ (d) None of these

54. $\frac{d^2u}{dx^2}$ is equal to

- (a) $2u$ (b) $2v$ (c) u (d) v

55. $\frac{d^2v}{dx^2}$ is equal to

- (a) $2u$ (b) $2v$ (c) $-2v$ (d) $-2u$

Directions (Q. Nos. 56-58) Let $f(x)$ be a polynomial function $ax^2 + bx + c$ of second degree. If $f(1) = f(-1)$ and a, b, c are in AP, then

56. Find the value of $f'(a)$.

- (a) $2a^2$ (b) $2b^2$ (c) $2ab$ (d) $2ac$

57. Find the value of $f'(c)$.

- (a) $2ab$ (b) $2ac$ (c) $2bc$ (d) $2c^2$

58. $f'(a), f'(b)$ and $f'(c)$ are in

- (a) AP (b) GP (c) HP
 (d) Arithmetico-Geometric Progression

Directions (Q. Nos. 59-61) Let $f(x) = e^x, g(x) = \sin^{-1} x$ and $h(x) = f[g(x)]$

59. Find the value of $\frac{h'(x)}{h(x)}$.

- (a) $e^{\sin^{-1} x}$ (b) $\frac{1}{\sqrt{1-x^2}}$ (c) $\sin^{-1} x$ (d) $\frac{1}{1-x^2}$

60. Find the value of $[f(x) \cdot g(x)]'$.

- (a) $e^x \left(\frac{1}{\sqrt{1-x^2}} + \sin^{-1} x \right)$ (b) $e^x \cdot \sin^{-1} x$
 (c) $e^x \frac{1}{\sqrt{1-x^2}}$ (d) None of these

61. Find the value of $h'(0) \cdot f(0)$.

- (a) 1 (b) -1 (c) 0 (d) None of these

PREVIOUS YEARS' QUESTIONS

62. If $f(x) = 2^x$, then what is $f''(x)$ is equal to?

- (a) $2^x (\log_e 2)^2$ (b) $x(x-1)2^{x-2}$ **2012 I**
 (c) $2^{x+1} (\log 2)$ (d) $2^x (\log_{10} 2)^2$

63. If $y = \frac{x+1}{x-1}$, then what is the value of $\frac{dy}{dx}$?

- (a) $\frac{-2}{x-1}$ (b) $\frac{-2}{(x-1)^2}$ (c) $\frac{2}{(x-1)^2}$ (d) $\frac{2}{x-1}$ **2012 I**

64. What is the rate of change of $\sqrt{x^2+16}$ w.r.t. x^2 at $x=3$?

- (a) 1/5 (b) 1/10 (c) 1/20 (d) $\frac{1}{15}$ **2012 I**

65. If $y = \cos t$ and $x = \sin t$, then what is the value of $\frac{dy}{dx}$?

- (a) xy (b) x/y (c) $-y/x$ (d) $-x/y$ **2012 I**

66. If $f(x) = 2^{\sin x}$, then what is the derivative of $f(x)$?

- (a) $2^{\sin x} \ln 2$ (b) $(\sin x) 2^{\sin x-1}$ **2012 II**
 (c) $(\cos x) 2^{\sin x-1}$ (d) None of these

67. If $y = \ln(e^{mx} + e^{-mx})$, then what is the value of $\frac{dy}{dx}$ at $x=0$?

- (a) -1 (b) 0 (c) 1 (d) 2 **2012 II**

68. If $x^m + y^m = 1$, such that $\frac{dy}{dx} = -\frac{x}{y}$, then what should be the value of m ?

- (a) 0 (b) 1 (c) 2 (d) -1 **2012 II**

69. Consider the following statements

- I. If $y = \ln(\sec x + \tan x)$, then $\frac{dy}{dx} = \sec x$
 II. If $y = \ln(\operatorname{cosec} x - \cot x)$, then $\frac{dy}{dx} = \operatorname{cosec} x$

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II **2012 II**
 (c) Both I and II (d) Neither I nor II

70. The derivative of $\sec^2 x$ w.r.t. $\tan^2 x$ is **2013 I**

- (a) 1 (b) 2
 (c) $2\sec x \tan x$ (d) $2\sec^2 x \tan x$

71. If $y = \sin(ax+b)$, then what is $\frac{d^2y}{dx^2}$ at $x = -\frac{b}{a}$,

where a and b are constants and $a \neq 0$? **2013 I**

- (a) 0 (b) -1 (c) $\sin(a-b)$ (d) $\sin(a+b)$

72. If $y = x^x$, then what is the value of $\frac{dy}{dx}$ at $x=1$?

- (a) 0 (b) 1 (c) -1 (d) 2 **2013 I**

73. If $2x^3 - 3y^2 = 7$, then what is $\frac{dy}{dx}$ equal to

(where, $y \neq 0$)? **2013 II**

- (a) $\frac{x^2}{2y}$ (b) $\frac{x}{2y}$ (c) $\frac{x^2}{y}$ (d) None of these

74. What is the derivative of $\sin(\sin x)$? **2013 II**

- (a) $\cos(\cos x)$ (b) $\cos(\sin x)$
 (c) $\cos(\sin x)\cos x$ (d) $\cos(\cos x)\cos x$

75. What is the derivative of x^3 w.r.t. x^2 ? **2013 II**

- (a) $3x^2$ (b) $\frac{3x}{2}$ (c) x (d) $\frac{3}{2}$

76. If $f(x) = 2x^2 + 3x - 5$, then what is $f'(0) + 3f'(-1)$ equal to?

- (a) -1 (b) 0 (c) 1 (d) 2 **2013 II**

77. What is the derivative of $|x-1|$ at $x=2$? **2013 II**

- (a) -1 (b) 0 (c) 1 (d) 2

78. If $z = f \circ f(x)$ where $f(x) = x^2$, then what is $\frac{dz}{dx}$ equal to?

- (a) x^3 (b) $2x^3$ (c) $4x^3$ (d) $4x^2$ **2014 I**

79. What is the derivative of $\sqrt{\frac{1+\cos x}{1-\cos x}}$?

- (a) $\frac{1}{2}\sec^2 \frac{x}{2}$ (b) $-\frac{1}{2}\operatorname{cosec}^2 \frac{x}{2}$ **2014 I**
 (c) $-\operatorname{cosec}^2 \frac{x}{2}$ (d) None of these

80. If $y = x \ln x + xe^x$, then what is the value of $\frac{dy}{dx}$ at $x=1$?

- (a) $1+e$ (b) $1-e$ (c) $1+2e$ (d) None of these **2014 II**

Directions (Q. Nos. 81-82) Consider the curve $x = a(\cos \theta + \theta \sin \theta)$ and $y = a(\sin \theta - \theta \cos \theta)$. **2014 II**

81. What is $\frac{dy}{dx}$ equal to?

- (a) $\tan \theta$ (b) $\cot \theta$ (c) $\sin 2\theta$ (d) $\cos 2\theta$

82. What is $\frac{d^2y}{dx^2}$ equal to?

- (a) $\sec^2 \theta$ (b) $-\operatorname{cosec}^2 \theta$
 (c) $\frac{\sec^3 \theta}{d\theta}$ (d) None of these

83. Eliminating the arbitrary constants B and C in the expression $y = \frac{2}{3C}(Cx - 1)^{3/2} + B$, we get

☑ 2014 II

(a) $x \left[1 + \left(\frac{dy}{dx} \right)^2 \right] = \frac{d^2y}{dx^2}$ (b) $2x \left(\frac{dy}{dx} \right) \frac{d^2y}{dx^2} = 1 + \left(\frac{dy}{dx} \right)^2$

(c) $\left(\frac{dy}{dx} \right) \frac{d^2y}{dx^2} = 1$ (d) $\left(\frac{dy}{dx} \right)^2 + 1 = \frac{d^2y}{dx^2}$

84. What is the differential coefficient of

$$f(x) = \begin{cases} x^2 - 5, & x \leq 3 \\ \sqrt{x + 13}, & x > 3 \end{cases} \text{ at } x = 12 ?$$

☑ 2014 II

- (a) 5/2 (b) 5
(c) 1/5 (d) 1/10

Directions (Q. Nos. 85-87) Consider the parametric

$$\text{equations } x = \frac{a(1-t^2)}{1+t^2}, y = \frac{2at}{1+t^2}.$$

☑ 2015 I

85. What does the equation represent?

- (a) It represents a circle of diameter a
(b) It represents a circle of radius a
(c) It represents a parabola
(d) None of the above

86. What is $\frac{dy}{dx}$ equal to?

- (a) $\frac{y}{x}$ (b) $-\frac{y}{x}$ (c) $\frac{x}{y}$ (d) $-\frac{x}{y}$

87. What is $\frac{d^2y}{dx^2}$ equal to?

- (a) $\frac{a^2}{y^2}$ (b) $\frac{a^2}{x^2}$ (c) $-\frac{a^2}{x^2}$ (d) $-\frac{a^2}{y^3}$

Directions (Q. Nos. 88-89) Given that,

$$\frac{d}{dx} \left(\frac{1+x^2+x^4}{1+x+x^2} \right) = Ax + B (\cos x + e^x)^{-1}.$$

☑ 2015 I

88. What is the value of A ?

- (a) -1 (b) 1
(c) 2 (d) 4

89. What is the value of B ?

- (a) -1 (b) 1
(c) 2 (d) 4

90. What is the derivative of $\tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right)$ with respect to $\tan^{-1} x$?

☑ 2015 I

- (a) 0 (b) $\frac{1}{2}$
(c) 1 (d) x

91. The derivative of $\ln(x + \sin x)$ with respect to $(x + \cos x)$ is

☑ 2015 II

- (a) $\frac{1 + \cos x}{(x + \sin x)(1 - \sin x)}$ (b) $\frac{1 - \cos x}{(x + \sin x)(1 + \sin x)}$
(c) $\frac{1 - \cos x}{(x - \sin x)(1 + \cos x)}$ (d) $\frac{1 + \cos x}{(x - \sin x)(1 - \cos x)}$

92. If $x^a y^b = (x - y)^{a+b}$, then the value of $\frac{dy}{dx} - \frac{y}{x}$ is equal to

☑ 2015 II

- (a) $\frac{a}{b}$ (b) $\frac{b}{a}$ (c) 1 (d) 0

93. If $y = \cot^{-1} \left[\frac{\sqrt{1 + \sin x} + \sqrt{1 - \sin x}}{\sqrt{1 + \sin x} - \sqrt{1 - \sin x}} \right]$, where

$0 < x < \frac{\pi}{2}$, then $\frac{dy}{dx}$ is equal to

☑ 2015 II

- (a) $-\frac{1}{2}$ (b) 2
(c) $\sin x + \cos x$ (d) $\sin x - \cos x$

94. If $y = \log_{10} x + \log_x 10 + \log_x x + \log_{10} 10$,

then what is $\left(\frac{dy}{dx} \right)_{x=10}$ equal to?

☑ 2016 I

- (a) 10 (b) 2 (c) 1 (d) 0

Directions (Q. Nos. 95-96) Consider the function

$$f(x) = |x^2 - 5x + 6|.$$

☑ 2016 I

95. What is $f'(4)$ equal to?

- (a) -4 (b) -3 (c) 3 (d) 2

96. What is $f''(2.5)$ equal to?

- (a) -3 (b) -2 (c) 0 (d) 2

Directions (Q. Nos. 97-100) Let $f : R \rightarrow R$ be a function such that

$$f(x) = x^3 + x^2 f'(1) + x f''(2) + f'''(3) \text{ for } x \in R.$$

☑ 2016 I

97. What is $f(1)$ equal to?

- (a) -2 (b) -1 (c) 0 (d) 4

98. What is $f'(1)$ equal to?

- (a) -6 (b) -5 (c) 1 (d) 0

99. What is $f'''(10)$ equal to?

- (a) 1 (b) 5 (c) 6 (d) 8

100. Consider the following

I. $f(2) = f(1) - f(0)$ II. $f''(2) - 2f'(1) = 12$

Which of the above is/are correct?

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

HINTS AND SOLUTIONS

1. (d) $y = \sec \tan^{-1} x$

$$\Rightarrow \frac{dy}{dx} = \sec \tan^{-1} x \tan \tan^{-1} x \cdot \frac{1}{1+x^2}$$

$$= y \cdot x \cdot \frac{1}{1+x^2} = \frac{xy}{1+x^2}$$

2. (b)

3. (d) $y_1 = m \{x + \sqrt{(1+x^2)}\}^{m-1}$

$$\left\{ 1 + \frac{1 \cdot 2x}{2\sqrt{(1+x^2)}} \right\} = \frac{my}{\sqrt{1+x^2}}$$

$$\therefore y_1^2 (1+x^2) = m^2 y^2$$

Again, differentiating w.r.t. x , we get

$$2y_1 y_2 (1+x^2) + y_1^2 \cdot 2x = m^2 \cdot 2y y_1$$

$$\Rightarrow y_2 (1+x^2) + x y_1 - m^2 y = 0$$

4. (a)

5. (c)

6. (a) $\frac{dy}{dx} = -\frac{1}{1+\cos 2x}$

$$= \frac{1}{2\sqrt{(\cos 2x)}} (-2\sin 2x)$$

Now, put $x = \frac{\pi}{6}$, $\cos 2x = \frac{1}{2}$

and $\sin 2x = \frac{\sqrt{3}}{2}$

$$\therefore \left(\frac{dy}{dx} \right)_{x=\frac{\pi}{6}} = -\frac{1}{\left(1+\frac{1}{2}\right)} \cdot \frac{1}{2\sqrt{\frac{1}{2}}} (-2) \sqrt{\frac{3}{2}} = \sqrt{\frac{2}{3}}$$

7. (b) Put $x = \tan \theta$

$$\therefore y = \tan^{-1} \left(\frac{\sec \theta - 1}{\tan \theta} \right)$$

$$= \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right)$$

$$y = \tan^{-1} \left(\tan \frac{\theta}{2} \right) = \frac{1}{2} \theta = \frac{1}{2} \tan^{-1} x$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{2} \cdot \frac{1}{1+x^2} = \frac{1}{2} \text{ at } x=0$$

8. (c) Put $x = \cos \theta$,

$$1 + \cos \theta = 2 \cos^2 (\theta/2)$$

$$1 - \cos \theta = 2 \sin^2 (\theta/2)$$

$$\therefore y = \sin^{-1} \left[\frac{1/\sqrt{2}}{2} (\cos \theta/2 + \sin \theta/2) \right]$$

$$= \sin^{-1} \sin (\theta/2 + \pi/4)$$

$$= \theta/2 + \pi/4$$

$$y = \frac{1}{2} \cos^{-1} x + \frac{\pi}{4}$$

$$\therefore \frac{dy}{dx} = \frac{-1}{2\sqrt{(1-x^2)}}$$

9. (b) Put $x = \cos^2 \theta \Rightarrow \theta = \cos^{-1} \sqrt{x}$

$$\therefore y = \sin^{-1} (\sqrt{1-x}) + \cos^{-1} (\sqrt{x})$$

$$= \sin^{-1} (\sqrt{\sin^2 \theta}) + \cos^{-1} (\sqrt{\cos^2 \theta})$$

$$\Rightarrow y = \sin^{-1} (\sin \theta) + \cos^{-1} (\cos \theta)$$

$$\Rightarrow y = \theta + \theta = 2\theta$$

$$\Rightarrow y = 2 \cos^{-1} \sqrt{x}$$

$$\therefore \frac{dy}{dx} = -\frac{2}{\sqrt{1-x}} \times \frac{1}{2\sqrt{x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{-1}{\sqrt{x(1-x)}}$$

10. (d) Put $x^2 = \cos 2\theta$,

$$1 + \cos 2\theta = 2 \cos^2 \theta,$$

$$1 - \cos 2\theta = 2 \sin^2 \theta$$

$$\therefore y = \tan^{-1} \left(\frac{\cos \theta + \sin \theta}{\cos \theta - \sin \theta} \right)$$

$$= \tan^{-1} \tan [\pi/4 + \theta]$$

$$= \pi/4 + \theta$$

$$y = \frac{\pi}{4} + \frac{1}{2} \cos^{-1} x^2$$

$$\therefore \frac{dy}{dx} = \frac{1}{2} \cdot \frac{-1}{\sqrt{(1-x^4)}} \cdot 2x$$

$$= -\frac{x}{\sqrt{(1-x^4)}}$$

11. (c) Put $x = \cos \theta$, $y = \tan^{-1} \left(\frac{\cos \theta}{1 + \sin \theta} \right)$

$$+ \sin \left[2 \tan^{-1} \sqrt{\frac{1 - \cos \theta}{1 + \cos \theta}} \right]$$

$$= \tan^{-1} \left(\frac{\sin \phi}{1 + \cos \phi} \right) + \sin \left[2 \tan^{-1} \tan \left(\frac{\theta}{2} \right) \right]$$

$$\text{[where, } \phi = \frac{\pi}{2} - \theta \text{]}$$

$$= \tan^{-1} \{ \tan (\phi/2) \} + \sin (2 \cdot \theta/2)$$

$$= (\phi/2) + \sin \theta$$

$$= \pi/4 - \theta/2 + \sqrt{(1 - \cos^2 \theta)}$$

$$= \frac{\pi}{4} - \frac{1}{2} \cos^{-1} x + \sqrt{(1-x^2)}$$

$$\therefore \frac{dy}{dx} = \frac{1}{2} \cdot \frac{1}{\sqrt{(1-x^2)}} + \frac{1}{2\sqrt{(1-x^2)}} (-2x)$$

$$= \frac{1-2x}{2\sqrt{(1-x^2)}}$$

12. (d) $\frac{x^2 - y^2}{x^2 + y^2} = \sin(\log a) = \lambda,$
 $\therefore x^2(1 - \lambda) = y^2(1 + \lambda) \dots(i)$
 $2x(1 - \lambda) = 2y \frac{dy}{dx}(1 + \lambda) \dots(ii)$

On dividing Eq. (ii) by Eq. (i), we get
 $\frac{2}{x} = \frac{2}{y} \frac{dy}{dx}$
 $\therefore \frac{dy}{dx} = \frac{y}{x}$

13. (a) Given, $x = a \left[\cos t + \log \tan \left(\frac{t}{2} \right) \right]$

and $y = a \sin t$
 $\Rightarrow \frac{dx}{dt} = a \left[-\sin t + \frac{\sec^2 \frac{t}{2}}{2 \tan \frac{t}{2}} \right]$

and $\frac{dy}{dt} = a \cos t$

$\Rightarrow \frac{dx}{dt} = a \left[-\sin t + \frac{1}{\sin t} \right]$

and $\frac{dy}{dt} = a \cos t$

$\Rightarrow \frac{dx}{dt} = \frac{a \cos^2 t}{\sin t}$ and $\frac{dy}{dt} = a \cos t$

$\therefore \frac{dy}{dx} = \frac{a \cos t}{\frac{a \cos^2 t}{\sin t}} = \tan t$

14. (d) $x = 2 \log \cot t,$
 $y = \frac{\sin^2 t + \cos^2 t}{\sin t \cos t} = \frac{2}{\sin 2t}$
 $\frac{dx}{dt} = \frac{2}{\cot t} \cdot (-\operatorname{cosec}^2 t)$
 $= \frac{-2}{\sin t \cdot \cos t} = \frac{-4}{\sin 2t}$
 $\frac{dy}{dt} = \frac{-2}{\sin^2 2t} \cdot 2 \cos 2t = -\frac{4 \cos 2t}{\sin^2 2t}$
 $\therefore \frac{dy}{dx} = \frac{\cos 2t}{\sin 2t}$
 $\Rightarrow \frac{dy}{dx} \sin 2t + 1 = \cos 2t + 1 = 2 \cos^2 t$

15. (d) Given, $y = \log \left(\frac{1 + \sqrt{x}}{1 - \sqrt{x}} \right)$
 $y = \log(1 + \sqrt{x}) - \log(1 - \sqrt{x})$
 $\frac{dy}{dx} = \frac{1}{1 + \sqrt{x}} \cdot \frac{1}{2\sqrt{x}} - \frac{1}{1 - \sqrt{x}} \left(-\frac{1}{2\sqrt{x}} \right)$
 $= \frac{1}{2\sqrt{x}} \left[\frac{1}{1 + \sqrt{x}} + \frac{1}{1 - \sqrt{x}} \right]$
 $= \frac{1}{2\sqrt{x}} \left[\frac{1 - \sqrt{x} + 1 + \sqrt{x}}{1 - x} \right]$
 $= \frac{1}{2\sqrt{x}} \cdot \frac{2}{1 - x} = \frac{1}{\sqrt{x}(1 - x)}$

16. (a) On taking log both sides, we get
 $p \log x + q \log y = (p + q) \log(x + y)$
 $\Rightarrow p \frac{1}{x} + q \frac{1}{y} \frac{dy}{dx}$
 $= (p + q) \frac{1}{x + y} \cdot \left(1 + \frac{dy}{dx} \right)$

$\frac{p}{x} - \frac{p + q}{x + y} = \left(\frac{p + q}{x + y} - \frac{q}{y} \right) \frac{dy}{dx}$

$\Rightarrow \frac{py - qx}{x(x + y)} = \frac{py - qx}{y(x + y)} \cdot \frac{dy}{dx}$

$\therefore \frac{dy}{dx} = \frac{y}{x}$

17. (c) $\frac{d}{dx} \left[\cos^{-1} \left(\frac{4x^3 - x}{27} \right) \right]$
 $= -\frac{1}{\sqrt{1 - \left(\frac{4x^3 - x}{27} \right)^2}} \left\{ \frac{4}{27} (3x^2 - 1) \right\}$
 $= \frac{-27}{\sqrt{729 - (4x^3 - 27x)^2}} \left(\frac{4}{9} x^2 - 1 \right)$
 $= \frac{-3(4x^2 - 9)}{\sqrt{(4x^2 - 9)^2(9 - x^2)}}$
 $= \frac{-3(4x^2 - 9)}{(4x^2 - 9)\sqrt{(9 - x^2)}} = \frac{-3}{\sqrt{(9 - x^2)}}$

18. (b) On putting $x = \tan \theta,$ we have
 $y = \tan^{-1} \left(\tan \frac{\theta}{2} \right) = \frac{\theta}{2} = \frac{1}{2} \tan^{-1} x$

$\therefore \frac{dy}{dx} = \frac{1}{2} \cdot \frac{1}{1 + x^2} = \frac{1}{2}$ at $x = 0$

Again, putting $x = \sin \phi,$ we get

$z = \tan^{-1} \left(\frac{2 \sin \phi \cos \phi}{1 - 2 \sin^2 \phi} \right)$
 $= \tan^{-1} \left(\frac{\sin 2\phi}{\cos 2\phi} \right)$
 $= \tan^{-1}(\tan 2\phi) = 2\phi = 2 \sin^{-1} x$

$\Rightarrow \frac{dz}{dx} = \frac{2}{\sqrt{1 - x^2}} = 2$ at $x = 0$

$\therefore \frac{dy}{dx} = \frac{dy}{dz} \cdot \frac{dz}{dx} = \frac{1/2}{2} = \frac{1}{4}$

19. (c) 20. (d) 21. (a)

22. (b) $y = \sqrt{\cos x + \sqrt{\cos x + \sqrt{\cos x + \dots}}}$,

$\therefore y = \sqrt{\cos x + y} \Rightarrow y^2 = \cos x + y$

On differentiating w.r.t. $x,$ we get

$2y \frac{dy}{dx} = -\sin x + \frac{dy}{dx}$

$\Rightarrow \sin x = (1 - 2y) \frac{dy}{dx}$

$\Rightarrow \frac{dy}{dx} = \frac{\sin x}{1 - 2y}$

23. (b) We have, $\frac{dx}{dt} = 1 - \frac{1}{t^2}, \frac{dy}{dt} = 1 + \frac{1}{t^2}$
 $\therefore \frac{dy}{dx} = \frac{t^2 + 1}{t^2 - 1} = \left(1 + \frac{2}{t^2 - 1} \right)$

and $\frac{d^2y}{dx^2} = \frac{d}{dt} \left(\frac{dy}{dx} \right) \cdot \frac{dt}{dx}$
 $= 2 \cdot \frac{-1}{(t^2 - 1)^2} \cdot 2t \times \frac{t^2}{t^2 - 1} = \frac{-4t^3}{(t^2 - 1)^3}$

24. (c) We have, $y = \sin x + e^x$
 $\frac{dy}{dx} = \cos x + e^x \Rightarrow \frac{dx}{dy} = (\cos x + e^x)^{-1}$

$\Rightarrow \frac{d^2x}{dy^2} = -(\cos x + e^x)^{-2} (-\sin x + e^x) \frac{dx}{dy}$

$\Rightarrow \frac{d^2x}{dy^2} = \frac{\sin x - e^x}{(\cos x + e^x)^2} \cdot (\cos x + e^x)^{-1}$
 $= \frac{\sin x - e^x}{(\cos x + e^x)^3}$

25. (c) By given condition, $\phi(x) = f^{-1}(x)$

$\therefore f[\phi(x)] = x$

On differentiating w.r.t. $x,$ we get

$f'[\phi(x)] \phi'(x) = 1$

or $\phi'(x) = \frac{1}{f'(\phi(x))} = 1 + [\phi(x)]^n,$

by definition of $f'(x).$

26. (b) $y = (1 + x^{1/4})(1 + x^{1/2})(1 - x^{1/4})$
 $= (1 + x^{1/2})(1 - x^{1/2}) = 1 - x$

$\therefore \frac{dy}{dx} = -1$

27. (b) $\frac{dy}{dx} = x \cdot \frac{1}{2\sqrt{a^2 - x^2}} \cdot (-2x)$
 $+ \sqrt{a^2 - x^2} + \frac{a^2}{\sqrt{1 - \frac{x^2}{a^2}}} \cdot \frac{1}{a}$
 $= \frac{-x^2}{\sqrt{a^2 - x^2}} + \sqrt{a^2 - x^2} + \frac{a^2 \cdot a}{\sqrt{a^2 - x^2}} \cdot \frac{1}{a}$
 $= \frac{a^2 - x^2}{\sqrt{a^2 - x^2}} + \sqrt{a^2 - x^2} = 2\sqrt{a^2 - x^2}$

28. (a) $\therefore x = k(\theta + \sin \theta)$
 and $y = k(1 + \cos \theta)$
 $\Rightarrow \frac{dx}{d\theta} = k(1 + \cos \theta)$ and $\frac{dy}{d\theta} = -k \sin \theta$

$\therefore \frac{dy}{dx} = \frac{-k \sin \theta}{k(1 + \cos \theta)}$

$= \frac{-2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}}{2 \cos^2 \frac{\theta}{2}} = -\tan \frac{\theta}{2}$

$\Rightarrow \left(\frac{dy}{dx} \right)_{\theta = \frac{\pi}{2}} = -\tan \frac{\pi}{4} = -1$

29. (d)

30. (b) $g(x) = f(e^x) e^{f(x)}$

$$\therefore g'(x) = f'(e^x) \cdot e^x \cdot e^{f(x)} + f'(e^x) \cdot e^{f(x)} \cdot f'(x)$$

On putting $x = 0$,

$$f(0) = f(1) = 0, f'(1) = 2, \text{ we get } g'(0) = 2 \cdot 1 \cdot 1 + 0 = 2$$

31. (a)

32. (b) We have, $y = e^{2x}$

$$\Rightarrow \frac{dy}{dx} = e^{2x} \cdot 2$$

$$\Rightarrow \frac{d^2y}{dx^2} = 4e^{2x}$$

$$\text{Now, } \log y = 2x, \quad x = \frac{1}{2} \log y$$

$$\frac{dx}{dy} = \frac{1}{2y}, \quad \frac{d^2x}{dy^2} = -\frac{1}{2y^2} = -\frac{1}{2e^{4x}}$$

$$\therefore \frac{d^2y}{dx^2} \cdot \frac{d^2x}{dy^2} = 4e^{2x} \times \left(-\frac{1}{2e^{4x}}\right) = -2e^{-2x}$$

33. (c) $\therefore y^2 = P(x)$... (i)

$$2y \frac{dy}{dx} = P'(x) \quad \dots \text{(ii)}$$

$$\text{and } 2y \frac{d^2y}{dx^2} + 2 \left(\frac{dy}{dx}\right)^2 = P''(x)$$

$$\Rightarrow 2y \frac{d^2y}{dx^2} = P''(x) - 2 \left(\frac{dy}{dx}\right)^2$$

$$\Rightarrow 2y^3 \frac{d^2y}{dx^2} = y^2 P''(x) - 2 \left(y \frac{dy}{dx}\right)^2$$

$$\Rightarrow 2y^3 \frac{d^2y}{dx^2} = P(x)P''(x) - 2 \left\{\frac{P'(x)}{2}\right\}^2$$

[using Eqs. (i) and (ii)]

$$\Rightarrow 2y^3 \frac{d^2y}{dx^2} = P(x)P''(x) - \frac{1}{2} \{P'(x)\}^2$$

$$\Rightarrow 2 \frac{d}{dx} \left\{y^3 \frac{d^2y}{dx^2}\right\}$$

$$= P(x)P'''(x) + P'(x)P''(x) - \frac{1}{2} \cdot 2 P'(x)P''(x)$$

$$= P(x)P'''(x)$$

34. (c) $\tan^{-1} \left(\frac{1-2\log x}{1+2\log x}\right)$

$$+ \tan^{-1} \left(\frac{3+2\log x}{1-3 \cdot 2\log x}\right)$$

$$= \tan^{-1} 1 - \tan^{-1} (2\log x) + \tan^{-1} 3 + \tan^{-1} (2\log x) = \tan^{-1} 1 + \tan^{-1} 3$$

$\therefore y = \text{constant}$

$$\therefore \frac{dy}{dx} = 0 \text{ and } \frac{d^2y}{dx^2} = 0$$

35. (d) Let $y = x^{1/x}$

$$\text{At } x = e, y(e) = e^{1/e},$$

$$\log y = \frac{1}{x} \log x$$

$$\frac{1}{y} \cdot y_1 = \frac{1}{x} \cdot \frac{1}{x} - \frac{1}{x^2} \cdot \log x$$

$$\Rightarrow \frac{1}{y} \cdot y_1 = \frac{1 - \log x}{x^2}$$

$$\Rightarrow y_1 = y \left(\frac{1 - \log x}{x^2}\right)$$

$$\Rightarrow y_2 = y_1 \left(\frac{1 - \log x}{x^2}\right) + y$$

$$\left[\frac{x^2 \left(-\frac{1}{x}\right) - (1 - \log x)(2x)}{x^4} \right]$$

$$= y_1 \left(\frac{1 - \log x}{x^2}\right) + \frac{y(-x - 2x + 2x \log x)}{x^4}$$

$$= y_1 \left(\frac{1 - \log x}{x^2}\right) + \frac{y(2x \log x - 3x)}{x^4}$$

$$\Rightarrow y_2(e) = 0 + \frac{e^{1/e}(2e - 3e)}{e^4} = \frac{-e^{1/e}}{e^3} = -e^{(1/e)-3}$$

36. (a) Let $u = \log_x 5$ and $v = \log_5 x$

$$\Rightarrow u = \frac{\log_e 5}{\log_e x} \text{ and } v = \frac{\log_e x}{\log_e 5}$$

On differentiating w.r.t. x , we get

$$\frac{du}{dx} = -\frac{\log_e 5}{x(\log_e x)^2} \text{ and } \frac{dv}{dx} = \frac{1}{x \log_e 5}$$

$$\therefore \frac{du}{dv} = \frac{du/dx}{dv/dx} = -\frac{\log_e 5}{x(\log_e x)^2} \times x \log_e 5$$

$$= -\left(\frac{\log_e 5}{\log_e x}\right)^2 = -(\log_x 5)^2 = -(\log_5 x)^{-2}$$

37. (b) $e^y + xy = e$, when $x = 0$, then $y = 1$

On differentiating w.r.t. x , we get

$$\Rightarrow e^y \frac{dy}{dx} + y + x \frac{dy}{dx} = 0 \quad \dots \text{(i)}$$

$$\text{At } x = 0, e \frac{dy}{dx} + 1 + 0 = 0 \Rightarrow \frac{dy}{dx} = -\frac{1}{e}$$

Again, differentiating Eq. (i) w.r.t. x , we get

$$e^y \frac{d^2y}{dx^2} + e^y \left(\frac{dy}{dx}\right)^2 + \frac{dy}{dx}$$

$$+ x \frac{d^2y}{dx^2} + \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{d^2y}{dx^2} (e^y + x) + e^y \left(\frac{dy}{dx}\right)^2 + 2 \frac{dy}{dx} = 0$$

$$\text{At } x = 0, \frac{d^2y}{dx^2} (e + 0) + e \left(-\frac{1}{e}\right)^2$$

$$+ 2 \left(-\frac{1}{e}\right) = 0$$

$$\Rightarrow e \frac{d^2y}{dx^2} - \frac{1}{e} = 0 \Rightarrow \frac{d^2y}{dx^2} = e^{-2}$$

38. (b) $3^x + 3^y = 3^{x+y}$

On differentiating w.r.t. x , we get

$$3^x \log 3 + 3^y \log 3 \frac{dy}{dx} = 3^{(x+y)} \log 3 \left(1 + \frac{dy}{dx}\right)$$

$$\Rightarrow 3^x + 3^y \frac{dy}{dx} = 3^{x+y} + 3^{(x+y)} \frac{dy}{dx}$$

$$\Rightarrow \frac{dy}{dx} (-3^{x+y} + 3^y) = 3^{x+y} - 3^x$$

$$\Rightarrow \frac{dy}{dx} = \frac{3^x(3^y - 1)}{3^y(1 - 3^x)} = \frac{3^{x-y}(3^y - 1)}{(1 - 3^x)}$$

39. (a) $\therefore y = g \circ f(x) = g\{f(x)\}$

$$= \log(\cos x)$$

$$\therefore \frac{dy}{dx} = \frac{1}{\cos x} (-\sin x) = -\tan x$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{x=0} = -\tan 0 = 0$$

40. (b) We have, $\frac{dy}{dx} = p \Rightarrow \frac{dx}{dy} = \frac{1}{p}$

$$\therefore \frac{d^2x}{dy^2} = -\frac{1}{p^2} \cdot \frac{dp}{dy} = -\frac{1}{p^2} \cdot \frac{d}{dy} \left(\frac{dy}{dx}\right)$$

$$= -\frac{1}{p^2} \cdot \frac{d^2y}{dx^2} \cdot \frac{dx}{dy} = -\frac{q}{p^3}$$

41. (a) We have, $x = \sin t - t \cos t$

and $y = t \sin t + \cos t$

$$\Rightarrow \frac{dx}{dt} = \cos t - 1 \cdot \cos t + t \sin t = t \sin t$$

$$\Rightarrow \frac{dy}{dt} = 1 \cdot \sin t + t \cos t - \sin t = t \cos t$$

$$\therefore \frac{dy}{dx} = \frac{t \cos t}{t \sin t} = \cot t$$

$$\left(\frac{dy}{dx}\right)_{t=\frac{\pi}{2}} = \cot \frac{\pi}{2} = 0$$

42. (c)

$$43. (c) \therefore y = \frac{1}{\log_{10} x}$$

$$\therefore \frac{dy}{dx} = -\frac{1}{(\log_{10} x)^2} \cdot \frac{1}{x} \log_{10} e$$

$$= -\frac{(\log_x 10)^2 \cdot \log_{10} e}{x}$$

44. (d) $y = \sin^{-1} x + \sin^{-1} \sqrt{1-x^2}$

$$= \sin^{-1} x + \cos^{-1} x = \frac{\pi}{2}, \frac{dy}{dx} = 0$$

45. (a) $\therefore f(x) = e^{\sin(\log \cos x)}$

$$\therefore f'(x) = e^{\sin(\log \cos x)} \cdot$$

$$\cos(\log \cos x) \cdot \frac{1}{\cos x} (-\sin x) = -e^{\sin(\log \cos x)}$$

$\cos(\log \cos x) \cdot \tan x$

and $g(x) = \log \cos x$

$$\therefore g'(x) = \frac{1}{\cos x} (-\sin x) = -\tan x$$

$$\text{Hence, } \frac{f'(x)}{g'(x)}$$

$$= \frac{-e^{\sin(\log \cos x)} \cdot \cos(\log \cos x) \cdot \tan x}{-\tan x}$$

$$= e^{\sin(\log \cos x)} \cdot \cos(\log \cos x)$$

$$= f(x) \cdot \cos[g(x)]$$

46. (c) We have,

$$f(x) = \left[\cos^{-1} \left(\sin \sqrt{\frac{1+x}{2}} \right) \right] + x^x$$

$$= \cos^{-1} \left[\cos \left(\frac{\pi}{2} - \sqrt{\frac{1+x}{2}} \right) \right] + x^x$$

$$= \frac{\pi}{2} - \sqrt{\frac{1+x}{2}} + x^x$$

$$\Rightarrow f'(x) = \frac{-1}{\sqrt{2}} \times \frac{1}{2\sqrt{1+x}} + x^x (1 + \log x)$$

$$\Rightarrow f'(1) = \frac{-1}{4} + 1 = \frac{3}{4}$$

$$\Rightarrow f'(2) = \frac{-1}{\sqrt{2}} \times \frac{1}{2\sqrt{3}} + 2^2 (1 + \log 2)$$

$$= \frac{-1}{2\sqrt{6}} + 4(1 + \log 2)$$

47. (c) $y = a \sin x + b \cos x$
On differentiating with respect to x , we get

$$\frac{dy}{dx} = a \cos x - b \sin x$$

Now, $\left(\frac{dy}{dx}\right)^2 = (a \cos x - b \sin x)^2$

$$= a^2 \cos^2 x + b^2 \sin^2 x - 2ab \sin x \cos x$$

and $y^2 = (a \sin x + b \cos x)^2$

$$= a^2 \sin^2 x + b^2 \cos^2 x + 2ab \sin x \cos x$$

So, $\left(\frac{dy}{dx}\right)^2 + y^2 = a^2 (\sin^2 x + \cos^2 x) + b^2 (\sin^2 x + \cos^2 x)$

$$\Rightarrow \left(\frac{dy}{dx}\right)^2 + y^2 = a^2 + b^2 = \text{constant}$$

48. (a) We have, $y = \frac{e^{2x} + e^{-2x}}{e^{2x} - e^{-2x}}$

$$\frac{dy}{dx} = \frac{(e^{2x} - e^{-2x})2(e^{2x} - e^{-2x}) - (e^{2x} + e^{-2x})2(e^{2x} + e^{-2x})}{(e^{2x} - e^{-2x})^2}$$

$$\frac{dy}{dx} = \frac{-8}{(e^{2x} - e^{-2x})^2}$$

Sol. (Q. Nos. 49-50)

Given,

$$f(x) = \frac{\sqrt{(\sqrt{x-1})^2 + 1} - 2\sqrt{x-1}}{\sqrt{x-1} - 1} \cdot x$$

$$= \frac{|\sqrt{x-1}-1|}{\sqrt{x-1}-1} \cdot x = \begin{cases} -x, & \text{if } x \in [1, 2) \\ x, & \text{if } x \in (2, \infty) \end{cases}$$

49. (a) $f'(10) = 1$

50. (b) $f'\left(\frac{3}{2}\right) = 1$

51. (c) $y = (x + \sqrt{1+x^2})^n$
On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = n(x + \sqrt{1+x^2})^{n-1}$$

$$\left(1 + \frac{x}{\sqrt{x^2+1}}\right) = \frac{n[x + \sqrt{1+x^2}]^n}{\sqrt{1+x^2}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{ny}{\sqrt{1+x^2}}$$

52. (c) From solution 51, $\frac{dy}{dx} = \frac{ny}{\sqrt{1+x^2}}$

$$\Rightarrow \left(\frac{dy}{dx}\right)^2 (1+x^2) = n^2 y^2$$

Again, differentiating w.r.t. x , we get

$$2 \frac{dy}{dx} \frac{d^2y}{dx^2} (1+x^2) + 2x \left(\frac{dy}{dx}\right)^2 = 2n^2 y \frac{dy}{dx}$$

$$\Rightarrow \frac{d^2y}{dx^2} (1+x^2) + x \frac{dy}{dx} = n^2 y$$

Sol. (Q. Nos. 53-55) Given, $u = e^x \sin x$ and

$$v = e^x \cos x$$

$$\frac{du}{dx} = e^x (\sin x + \cos x),$$

$$\frac{dv}{dx} = e^x (\cos x - \sin x)$$

$$\frac{du}{dx} = u + v \quad \text{and} \quad \frac{dv}{dx} = v - u$$

53. (c) $v \frac{du}{dx} - u \frac{dv}{dx} = v(u+v) - u(v-u)$

$$\Rightarrow v \frac{du}{dx} - u \frac{dv}{dx} = u^2 + v^2$$

54. (b) $\frac{d^2u}{dx^2} = \frac{du}{dx} + \frac{dv}{dx} = 2v$

55. (d) $\frac{d^2v}{dx^2} = \frac{dv}{dx} - \frac{du}{dx} = -2u$

Sol. (Q. Nos. 56-58)

Let $f(x) = ax^2 + bx + c$

Then, $f(1) = a + b + c$

and $f(-1) = a - b + c$

Since, $f(1) = f(-1)$

$$\Rightarrow a + b + c = a - b + c$$

$$\Rightarrow 2b = 0 \Rightarrow b = 0$$

$$\therefore f(x) = ax^2 + c$$

56. (a) $f(x) = ax^2 + c$

$$f'(x) = 2ax$$

$$f'(a) = 2a(a) = 2a^2$$

57. (b) $f'(c) = 2a(c) = 2ac$

58. (a) We have, $f'(a) = 2a^2$, $f'(b) = 2ab$ and $f'(c) = 2ac$

Since, a , b and c are in AP.

$$\therefore 2b = a + c$$

$$\Rightarrow 2a \cdot 2b = 2a \cdot a + 2a \cdot c$$

$$\Rightarrow 2(2ab) = 2a^2 + 2ac$$

$$\Rightarrow 2f'(b) = f'(a) + f'(c)$$

Hence, $f'(a)$, $f'(b)$ and $f'(c)$ are in AP.

59. (b) $f(x) = e^x$ and $g(x) = \sin^{-1} x$

and $h(x) = f[g(x)]$

$$\Rightarrow h(x) = f(\sin^{-1} x) = e^{\sin^{-1} x}$$

$$\therefore h(x) = e^{\sin^{-1} x}$$

$$\Rightarrow h'(x) = e^{\sin^{-1} x} \frac{1}{\sqrt{1-x^2}}$$

$$\Rightarrow \frac{h'(x)}{h(x)} = \frac{1}{\sqrt{1-x^2}}$$

60. (a) $f(x) = e^x$ and $g(x) = \sin^{-1} x$

$$\Rightarrow (f(x) \cdot g(x))' = (e^x \cdot \sin^{-1} x)'$$

$$= e^x \frac{d}{dx} \sin^{-1} x + \sin^{-1} x \frac{d}{dx} e^x$$

$$= e^x \frac{1}{\sqrt{1-x^2}} + e^x \sin^{-1} x$$

$$= e^x \left(\frac{1}{\sqrt{1-x^2}} + \sin^{-1} x \right)$$

61. (a) We have,

$$h'(x) = e^{\sin^{-1} x} \frac{1}{\sqrt{1-x^2}} \text{ and } f(x) = e^x$$

Now, $h'(0) = e^{\sin^{-1}(0)} \frac{1}{\sqrt{1-(0)^2}}$ and

$$h'(0) = 1 \text{ and } f(0) = 1$$

$$\Rightarrow h'(0) \cdot f(0) = 1 \times 1 = 1$$

and $f(0) = 1$

62. (a) $f(x) = 2^x$, $f'(x) = 2^x \log_e 2$

$$f''(x) = 2^x \log_e 2 \cdot \log_e 2 = 2^x (\log_e 2)^2$$

63. (b) We have, $y = \frac{x+1}{x-1}$

Now, differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{(x-1) \frac{d}{dx} (x+1) - (x+1) \frac{d}{dx} (x-1)}{(x-1)^2}$$

$$= \frac{(x-1) \cdot 1 - (x+1) \cdot 1}{(x-1)^2}$$

$$= \frac{x-1-x-1}{(x-1)^2} = \frac{-2}{(x-1)^2}$$

64. (b) Let $u = \sqrt{x^2 + 16}$ and $v = x^2$

Now, $\frac{du}{dx} = \frac{1}{2\sqrt{x^2+16}} \times 2x$

$$= \frac{x}{\sqrt{x^2+16}} \text{ and } \frac{dv}{dx} = 2x$$

Now, rate of change of u w.r.t. v is,

$$\frac{du}{dv} = \frac{du/dx}{dv/dx} = \frac{x}{\sqrt{x^2+16}} \times \frac{1}{2x}$$

$$\begin{aligned}\frac{du}{dv} &= \frac{1}{2\sqrt{x^2+16}} \frac{du}{dv} \text{ at } (x=3) \\ &= \frac{1}{2\sqrt{9+16}} = \frac{1}{2\sqrt{25}} = \frac{1}{2 \times 5} = \frac{1}{10} \\ \therefore \frac{d\sqrt{(x^2+16)}}{d(x^2)} &= \frac{1}{10} \text{ at } x=3\end{aligned}$$

65. (d) Given that, $y = \cos t$ and $x = \sin t$

$$\text{Then, } \frac{dy}{dt} = -\sin t$$

$$\text{and } \frac{dx}{dt} = \cos t$$

$$\text{Now, } \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{-\sin t}{\cos t} = \frac{-x}{y}$$

66. (d) We have, $f(x) = 2^{\sin x}$
 $f'(x) = 2^{\sin x} \cdot \log(\cos x)$

67. (b) $y = \ln(e^{mx} + e^{-mx})$

On differentiating w.r.t. x , we get

$$\begin{aligned}\frac{dy}{dx} &= \frac{1}{e^{mx} + e^{-mx}} \cdot \frac{d}{dx}(e^{mx} + e^{-mx}) \\ &= \frac{1}{e^{mx} + e^{-mx}} (me^{mx} - me^{-mx}) \\ &= \left[\frac{m(e^{mx} - e^{-mx})}{e^{mx} + e^{-mx}} \right]\end{aligned}$$

$$\therefore \left(\frac{dy}{dx} \right)_{\text{at } x=0} = m \left(\frac{1-1}{1+1} \right) = 0$$

68. (c) Given, $x^m + y^m = 1$

On differentiating both sides w.r.t. x , we get

$$mx^{m-1} + my^{m-1} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{mx^{m-1}}{my^{m-1}}$$

$$= -\frac{x^{m-1}}{y^{m-1}} = -\left(\frac{x^m}{y^m} \right) \left(\frac{y}{x} \right)$$

$$\text{Given, } \frac{-x}{y} = -\left(\frac{x^m}{y^m} \right) \left(\frac{y}{x} \right)$$

$$\therefore \left(\frac{x}{y} \right)^{m-2} = 1$$

which is true when $m = 2$.

69. (c) Given, $y = \ln + (\sec x + \tan x)$

On differentiating it w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{(\sec x + \tan x)} \frac{d}{dx}(\sec x + \tan x)$$

$$= \frac{1}{(\sec x + \tan x)} (\sec x \cdot \tan x + \sec^2 x)$$

$$= \frac{1}{(\sec x + \tan x)} \sec x (\tan x + \sec x)$$

$$= \sec x$$

Given, $y = \log(\operatorname{cosec} x - \cot x)$

$$\frac{dy}{dx} = \frac{1}{(\operatorname{cosec} x - \cot x)}$$

$$\begin{aligned}\frac{d}{dx}(\operatorname{cosec} x - \cot x) &= \frac{1}{(\operatorname{cosec} x - \cot x)} \\ &= \frac{1}{(-\operatorname{cosec} x \cdot \cot x + \operatorname{cosec}^2 x)} \\ &= \operatorname{cosec} x \cdot \frac{(\operatorname{cosec} x - \cot x)}{(\operatorname{cosec} x - \cot x)} = \operatorname{cosec} x\end{aligned}$$

So, both statements I and II are true.

70. (a) Let $u = \sec^2 x$ and $v = \tan^2 x$

$$\text{Now, } \frac{du}{dx} = 2\sec x \cdot \sec x \cdot \tan x$$

$$= 2\sec^2 x \cdot \tan x$$

$$\text{and } \frac{dv}{dx} = 2\tan x \cdot \sec^2 x$$

$$\begin{aligned}\therefore \frac{du}{dv} &= \frac{d(\sec^2 x)}{d(\tan^2 x)} = \frac{du/dx}{dv/dx} \\ &= \frac{2\sec^2 x \cdot \tan x}{2\tan x \cdot \sec^2 x} = 1\end{aligned}$$

71. (a) Given, $y = \sin(ax + b)$, where a and b

are constants and $a \neq 0$

Now, differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \cos(ax + b) \cdot a$$

Again, differentiating both sides w.r.t. x , we get

$$\frac{d^2y}{dx^2} = -\sin(ax + b) \cdot a \cdot a$$

$$= a^2 \sin(ax + b) = -a^2 y \quad [\because y = \sin(ax + b)]$$

$$\therefore \left(\frac{d^2y}{dx^2} \right)_{\text{at } x = \frac{-b}{a}}$$

$$= -a^2 \sin \left\{ a \cdot \left(\frac{-b}{a} \right) + b \right\}$$

$$= -a^2 \cdot \sin(-b + b) = -a^2 \cdot \sin 0$$

$$= -a^2 \cdot 0 = 0$$

72. (b) Given, $y = x^x$

On taking log both sides, $\log y = x \log x$

On differentiating both sides w.r.t. x , we get

$$\frac{1}{y} \cdot \frac{dy}{dx} = x \cdot \frac{1}{x} + \log x \cdot 1$$

$$\Rightarrow \frac{dy}{dx} = (1 + \log x) \cdot y$$

$$\Rightarrow \frac{dy}{dx} = x^x (1 + \log x)$$

$$\therefore \left(\frac{dy}{dx} \right)_{\text{at } x=1} = (1)^1 (1 + \log 1)$$

$$= 1(1+0) = 1$$

73. (c) Given, $2x^3 - 3y^2 = 7$, $y \neq 0$.

Now, differentiating both sides w.r.t. x , we get

$$\begin{aligned}2 \cdot 3 \cdot x^2 - 3 \cdot 2 \cdot y \cdot \frac{dy}{dx} &= 0 \\ \Rightarrow x^2 - y \frac{dy}{dx} &= 0 \Rightarrow \frac{dy}{dx} = \frac{x^2}{y}\end{aligned}$$

74. (c) Let $f(x) = \sin(\sin x)$

On differentiating w.r.t. x , we get

$$\begin{aligned}f'(x) &= \cos(\sin x) \cdot \frac{d}{dx}(\sin x) \\ &= \cos x \cdot \cos(\sin x)\end{aligned}$$

75. (b)

76. (b) $f(x) = 2x^2 + 3x - 5$

$$\text{Now, } f'(x) = 4x + 3$$

$$\text{At } x = 0, f'(0) = 4 \times 0 + 3 = 3$$

$$\text{and at } x = -1, f'(-1) = 4 \times (-1) + 3 = -4 + 3 = -1$$

$$\therefore f'(0) + 3f'(-1) = 3 + 3(-1) = 3 - 3 = 0$$

77. (c) Let $f(x) = |x - 1|$

Redefined the function $f(x)$,

$$f(x) = \begin{cases} 1-x, & x < 1 \\ x-1, & x > 1 \end{cases}$$

$$\Rightarrow f'(x) = \begin{cases} -1, & x < 1 \\ 1, & x > 1 \end{cases} \Rightarrow f'(2) = 1$$

78. (c) Given that, $z = f \circ f(x)$ and $f(x) = x^2$

$$\Rightarrow z = f\{f(x)\} \Rightarrow z = f(x^2)$$

$$\Rightarrow z = (x^2)^2 = x^4$$

On differentiate w.r.t. x , we get

$$\frac{dz}{dx} = 4x^3$$

79. (b) Let $y = \sqrt{\frac{1+\cos x}{1-\cos x}}$

$$\Rightarrow y = \sqrt{\frac{(1+\cos x) \cdot (1+\cos x)}{(1-\cos x) \cdot (1+\cos x)}}$$

$$\Rightarrow y = \sqrt{\frac{(1+\cos x)^2}{(1-\cos^2 x)}}$$

$$\Rightarrow y = \frac{1+\cos x}{\sqrt{\sin^2 x}} = \frac{1+\cos x}{\sin x}$$

$$\Rightarrow y = \frac{1+2\cos^2 \frac{x}{2} - 1}{2\sin \frac{x}{2} \cdot \cos \frac{x}{2}} = \frac{2\cos^2 \frac{x}{2}}{2\sin \frac{x}{2} \cdot \cos \frac{x}{2}}$$

$$\therefore y = \frac{\cos \frac{x}{2}}{\sin \frac{x}{2}} = \cot \frac{x}{2}$$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = -\operatorname{cosec}^2 \frac{x}{2} \cdot \frac{d}{dx} \left(\frac{x}{2} \right)$$

$$\Rightarrow \frac{dy}{dx} = -\frac{1}{2} \operatorname{cosec}^2 \frac{x}{2}$$

80. (c) Given, $y = x \log x + x e^x$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \Rightarrow \frac{dy}{dx} &= x \cdot \frac{1}{x} + \log x + x e^x + e^x \\ \Rightarrow \frac{dy}{dx} &= 1 + \log x + x \cdot e^x + e^x \\ \Rightarrow \left(\frac{dy}{dx}\right)_{x=1} &= 1 + \log 1 + 1 \cdot e^1 + e^1 \\ &= 1 + 2e \quad [\because \log 1 = 0] \end{aligned}$$

81. (a) We have, $x = a(\cos \theta + \theta \sin \theta)$
and $y = a(\sin \theta - \theta \cos \theta)$

$$\begin{aligned} \Rightarrow \frac{dx}{d\theta} &= a(-\sin \theta + \theta \cos \theta + \sin \theta) \\ \Rightarrow \frac{dx}{d\theta} &= a\theta \cos \theta \\ \text{and } \frac{dy}{d\theta} &= a(\cos \theta + \theta \sin \theta - \cos \theta) \\ \Rightarrow \frac{dy}{d\theta} &= a\theta \sin \theta, \\ \frac{dy}{dx} &= \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{a\theta \sin \theta}{a\theta \cos \theta} = \tan \theta \end{aligned}$$

82. (c) We have, $\frac{dy}{dx} = \tan \theta$

$$\begin{aligned} \Rightarrow \frac{d^2y}{dx^2} &= \sec^2 \theta \frac{d\theta}{dx} \\ \Rightarrow \frac{d^2y}{dx^2} &= \sec^2 \theta \left(\frac{1}{a\theta \cos \theta} \right) \\ &\quad \left[\because \frac{dx}{d\theta} = a\theta \cos \theta \right] \\ \Rightarrow \frac{d^2y}{dx^2} &= \frac{\sec^3 \theta}{a\theta} \end{aligned}$$

83. (b) Consider the given expression is

$$y = \frac{2}{3C} (Cx - 1)^{3/2} + B$$

On differentiating both sides w.r.t. x , we get

$$\begin{aligned} \frac{dy}{dx} &= \frac{2}{3C} \cdot \frac{3}{2} (Cx - 1)^{1/2} \cdot C + 0 \\ \Rightarrow \frac{dy}{dx} &= (Cx - 1)^{1/2} \end{aligned}$$

On squaring both sides, we get

$$\begin{aligned} \left(\frac{dy}{dx}\right)^2 &= Cx - 1 \\ \Rightarrow \left(\frac{dy}{dx}\right)^2 + 1 &= Cx \quad \dots(i) \end{aligned}$$

Now, on differentiating w.r.t. x , we get

$$2 \left(\frac{dy}{dx}\right) \cdot \frac{d^2y}{dx^2} = C$$

From Eq. (i), $\left(\frac{dy}{dx}\right)^2 + 1 = 2x \left(\frac{dy}{dx}\right) \frac{d^2y}{dx^2}$

84. (d) We have, $f(x) = \sqrt{x+13}$, $x > 3$

$$\Rightarrow f'(x) = \frac{1}{2\sqrt{x+13}}$$

$$\therefore f'(12) = \frac{1}{2\sqrt{12+13}} = \frac{1}{10}$$

Sol. (Q. Nos. 85-87) We have,

$$x = \frac{a(1-t^2)}{1+t^2} \text{ and } y = \frac{2at}{1+t^2}$$

85. (b) On squaring and adding above expression, we get

$$\begin{aligned} x^2 + y^2 &= \frac{a^2(1-t^2)^2}{(1+t^2)^2} + \frac{4a^2t^2}{(1+t^2)^2} \\ &= \frac{a^2}{(1+t^2)^2} [(1-t^2)^2 + 4t^2] \\ &= \frac{a^2}{(1+t^2)^2} (1+t^4 - 2t^2 + 4t^2) \\ &= \frac{a^2}{(1+t^2)^2} (1+t^2)^2 \end{aligned}$$

$$\Rightarrow x^2 + y^2 = a^2 \quad \dots(i)$$

Which is an equation of circle with radius a .

86. (d) Consider $x = \frac{a(1-t^2)}{1+t^2}$

$$\begin{aligned} \Rightarrow \frac{dx}{dt} &= a \left[\frac{(1+t^2)(-2t) - (1-t^2)(2t)}{(1+t^2)^2} \right] \\ &= -2at \left[\frac{1+t^2 + 1-t^2}{(1+t^2)^2} \right] = \frac{-4at}{(1+t^2)^2} \end{aligned}$$

and $y = \frac{2at}{1+t^2}$

$$\Rightarrow \frac{dy}{dt} = 2a \left[\frac{(1+t^2) \cdot 1 - t(2t)}{(1+t^2)^2} \right]$$

Now, $\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx}$

$$\begin{aligned} &= 2a \frac{(1-t^2)}{(1+t^2)^2} \cdot \frac{(1+t^2)^2}{-4at} \\ &= \frac{(1-t^2)}{2t} = \frac{-x}{y} \quad \dots(ii) \end{aligned}$$

87. (d) From above we have,

$$\begin{aligned} y \frac{dy}{dx} &= -x \quad [\text{using Eq. (ii)}] \\ \Rightarrow y \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 &= -1 \\ \Rightarrow y \frac{d^2y}{dx^2} + \frac{x^2}{y^2} &= -1 \quad [\text{using Eq. (ii)}] \\ \Rightarrow y \frac{d^2y}{dx^2} &= -1 - \frac{x^2}{y^2} \\ \Rightarrow y \frac{d^2y}{dx^2} &= -\frac{[y^2 + x^2]}{y^2} \\ \Rightarrow \frac{d^2y}{dx^2} &= \frac{-a^2}{y^3} \quad [\text{using Eq. (i)}] \end{aligned}$$

Sol. (Q. Nos. 88-89) We have,

$$\frac{d}{dx} \left(\frac{1+x^2+x^4}{1+x+x^2} \right) = Ax + B \quad \dots(i)$$

Let us first divide $x^4 + x^2 + 1$ by $x^2 + x + 1$.

$$\begin{array}{r} x^2 - x + 1 \\ x^4 + x^2 + 1 \\ \hline x^4 + x^3 + x^2 \\ \hline -x^3 - x^2 - x \\ \hline x^2 + x + 1 \\ \hline x^2 + x + 1 \\ \hline 0 \end{array}$$

Thus, $\frac{x^4 + x^2 + 1}{x^2 + x + 1} = x^2 - x + 1$

\therefore From Eq. (i),

we have $\frac{d}{dx} (x^2 - x + 1) = Ax + B$

$$\Rightarrow 2x - 1 = Ax + B \quad \dots(ii)$$

88. (c) On comparing, the coefficient of A , we get

$$\Rightarrow A = 2$$

89. (a) On comparing the coefficient of constant terms in Eq. (ii), we get $B = -1$

90. (b) Let $u = \tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right)$

and $v = \tan^{-1} x$

To find $\frac{du}{dv}$, Consider,

$$u = \tan^{-1} \left(\frac{\sqrt{1+x^2}-1}{x} \right)$$

On putting $x = \tan \theta$, we get,

$$\begin{aligned} u &= \tan^{-1} \left(\frac{\sqrt{1+\tan^2 \theta} - 1}{\tan \theta} \right) \\ &= \tan^{-1} \left(\frac{\sec \theta - 1}{\tan \theta} \right) = \tan^{-1} \left(\frac{1 - \cos \theta}{\sin \theta} \right) \end{aligned}$$

$$= \tan^{-1} \left(\frac{2 \sin^2 \frac{\theta}{2}}{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}} \right)$$

$$= \tan^{-1} \left(\tan \frac{\theta}{2} \right) = \frac{\theta}{2} \Rightarrow u = \frac{1}{2} \tan^{-1} x$$

$$\Rightarrow \frac{du}{dx} = \frac{1}{2} \left(\frac{1}{1+x^2} \right) \dots(i)$$

Now, consider $v = \tan^{-1} x$

$$\Rightarrow \frac{dv}{dx} = \frac{1}{1+x^2} \quad \dots(ii)$$

From Eqs. (i) and (ii), we have

$$\begin{aligned} \frac{du}{dv} &= \frac{du}{dx} \cdot \frac{dx}{dv} \\ &= \frac{1}{2} \left(\frac{1}{1+x^2} \right) \cdot (1+x^2) = \frac{1}{2} \end{aligned}$$

91. (a) Let $u = \ln(x + \sin x)$ and $v = x + \cos x$

Now, $\frac{du}{dx} = \frac{1}{(x + \sin x)} (1 + \cos x)$ and

$$\frac{dv}{dx} = 1 - \sin x$$

Now, we can find derivative of u w.r.t. v , we get

$$\frac{du/dx}{dv/dx} = \frac{(1 + \cos x)/(x + \sin x)}{1 - \sin x}$$

$$\Rightarrow \frac{du}{dv} = \frac{1 + \cos x}{(x + \sin x)(1 - \sin x)}$$

92. (d) We have, $x^a y^b = (x - y)^{a+b}$

On taking log both sides, we get

$$a \log x + b \log y = (a + b) \log (x - y)$$

Now, on differentiating both sides, we get

$$\frac{a}{x} + \frac{b}{y} \frac{dy}{dx} = (a + b) \frac{1}{x - y} \left(1 - \frac{dy}{dx}\right)$$

$$\Rightarrow \frac{dy}{dx} \left(\frac{b}{y} + \frac{a + b}{x - y}\right) = \frac{a + b}{x - y} - \frac{a}{x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} \left(\frac{bx + ay}{bx + ay}\right) = \frac{y}{x}$$

$$\frac{dy}{dx} - \frac{y}{x} = 0$$

93. (a) We have, $y = \cot^{-1} \left[\frac{\sqrt{1 + \sin x} + \sqrt{1 - \sin x}}{\sqrt{1 + \sin x} - \sqrt{1 - \sin x}} \right]$

$$= \cot^{-1} \left[\frac{\left| \frac{\sin \frac{x}{2} + \cos \frac{x}{2}}{2} \right| + \left| \frac{\sin \frac{x}{2} - \cos \frac{x}{2}}{2} \right|}{\left| \frac{\sin \frac{x}{2} + \cos \frac{x}{2}}{2} \right| - \left| \frac{\sin \frac{x}{2} - \cos \frac{x}{2}}{2} \right|} \right] \left[\because 0 < x < \frac{\pi}{2} \right]$$

$$\therefore y = \cot^{-1} \left[\frac{\left(\frac{\sin \frac{x}{2} + \cos \frac{x}{2}}{2} \right) + \left(\frac{\sin \frac{x}{2} - \cos \frac{x}{2}}{2} \right)}{\left(\frac{\sin \frac{x}{2} + \cos \frac{x}{2}}{2} \right) - \left(\frac{\sin \frac{x}{2} - \cos \frac{x}{2}}{2} \right)} \right]$$

$$y = \cot^{-1} \left(\tan \frac{x}{2} \right) = \cot^{-1} \left[\cot \left(\frac{\pi}{2} - \frac{x}{2} \right) \right]$$

$$y = \frac{\pi}{2} - \frac{x}{2}, \quad \frac{dy}{dx} = -\frac{1}{2}$$

94. (d) Given, $y = \log_{10} x + \log_x 10 + \log_x x + \log_{10} 10$

$$= \frac{\log x}{\log 10} + \frac{\log 10}{\log x} + 1 + 1, \quad y = \frac{\log x}{\log 10} + \frac{\log 10}{\log x} + 2$$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{\log 10} \cdot \frac{1}{x} + \log 10 \left(-\frac{1}{(\log x)^2} \cdot \frac{1}{x} \right)$$

$$\text{At } x = 10, \left(\frac{dy}{dx} \right)_{x=10} = \frac{1}{10 \log 10} - \frac{\log 10}{10 (\log 10)^2}$$

$$= \frac{1}{10 \log 10} - \frac{1}{10 \log 10} \Rightarrow \left(\frac{dy}{dx} \right)_{x=10} = 0$$

95. (c) Given, $f(x) = |x^2 - 5x + 6| \Rightarrow f(x) = |(x - 2)(x - 3)|$

At $x = 4$, we take, $f(x) = (x - 2)(x - 3) = x^2 - 5x + 6$

On differentiating both sides w.r.t. x , we get $f'(x) = 2x - 5$,

$$\text{At } x = 4, f'(4) = 2 \times 4 - 5 = 3$$

96. (b) Given, $f(x) = |x^2 - 5x + 6|$

At $x = 2.5$, $f(x) = -(x - 2)(x - 3) = -(x^2 - 5x + 6)$

On differentiating both sides w.r.t. x , twice, we get

$$\Rightarrow f'(x) = -(2x - 5) \Rightarrow f''(x) = -2$$

$$\Rightarrow f''(2.5) = -2$$

97. (d) $f(x) = x^3 + x^2 f'(1) + x f''(2) + f'''(3)$... (i)

On differentiating Eq. (i) w.r.t. x , thrice, we get

$$\Rightarrow f'(x) = 3x^2 + 2x f'(1) + 0 + f''(2) + 0 + 0 \quad \dots \text{(ii)}$$

$$\Rightarrow f''(x) = 6x + 2f'(1) \quad \dots \text{(iii)}$$

$$\text{and } f'''(x) = 6 \quad \dots \text{(iv)}$$

On putting $x = 1, 2, 3$ in Eqs. (ii), (iii) and (iv) respectively, we get

$$f'(1) = 3 + 2f'(1) + f''(2)$$

$$f''(2) = 12 + 2f'(1),$$

$$f'''(3) = 6$$

On solving these equations, we get

$$f'(1) = -5, f''(2) = 2, f'''(3) = 6$$

$$\therefore f(x) = x^3 + x^2(-5) + x(2) + 6$$

$$\Rightarrow f(x) = x^3 - 5x^2 + 2x + 6$$

$$f(1) = (1)^3 - 5(1)^2 + 2(1) + 6 = 1 - 5 + 2 + 6 = 4$$

98. (b) We have, $f(x) = x^3 - 5x^2 + 2x + 6$

On differentiating w.r.t. x , we get

$$f'(x) = 3x^2 - 10x + 2$$

$$\text{At } x = 1, f'(1) = 3(1)^2 - 10(1) + 2 = 3 - 10 + 2 = -5$$

99. (c) We have, $f(x) = x^3 - 5x^2 + 2x + 6$

On differentiating w.r.t. x , thrice, we get

$$f'(x) = 3x^2 - 10x + 2$$

$$\Rightarrow f''(x) = 6x - 10 \Rightarrow f'''(x) = 6$$

$$\therefore f'''(10) = 6$$

100. (c) I. We have, $f(x) = x^3 - 5x^2 + 2x + 6$

$$\text{Now, } f(1) = 1^3 - 5(1)^2 + 2 \times 1 + 6 = 4, f(0) = 6$$

$$\text{and } f(2) = (2)^3 - 5(2)^2 + 2(2) + 6 = 8 - 20 + 4 + 6 = -2$$

$$\text{Now, } f(1) - f(0) = 4 - 6 = -2$$

$$\therefore f(2) = f(1) - f(0)$$

II. Here, $f''(x) = 6x - 10 \Rightarrow f''(2) = 12 - 10 = 2$

$$\text{and } f'(x) = 3x^2 - 10x + 2$$

$$\Rightarrow f'(1) = 3(1)^2 - 10 \times 1 + 2 = -5$$

$$\therefore f''(2) - 2f'(1) = 2 - 2 \times (-5) = 12$$

Here, both statements I and II are correct.

22

APPLICATION OF DERIVATIVES

In NDA exam, 3-4 questions are asked from this chapter which are generally based on types of sets, operations on sets and number of elements in a set.

In Application of Derivatives, differentiation is used to solve different types of problems, such as rate of change of quantities, maxima and minima, increasing and decreasing, slope of tangent to a curve, etc.

RATE OF CHANGE OF QUANTITIES

Rate of change of any variable (say x) with respect to some other variable is derivative of the first variable with respect to other variable. In particular, if x and v denote the displacement and velocity of a particle at any instant t , then velocity is given by

$$v = \frac{dx}{dt} \text{ and acceleration } a = \frac{dv}{dt} = \frac{d^2x}{dt^2}$$

where, v represents the rate of change of x (displacement) with t (time) and a represents the rate of change of v (velocity) with t (time).

EXAMPLE 1. A body moves in a straight line according to the law $s = t^3 - 4t^2 - 3t$. What are the values of time and acceleration when velocity of the body is zero?

a. 3, -10

b. 3, 10

c. 2, -10

d. 2, 10

Sol. b. We have, $s = t^3 - 4t^2 - 3t \Rightarrow \frac{ds}{dt} = 3t^2 - 8t - 3$ and $\frac{d^2s}{dt^2} = 6t - 8$

Now,

$$\frac{ds}{dt} = 0$$

[since, velocity is zero]

$$\therefore 3t^2 - 8t - 3 = 0 \Rightarrow (3t + 1)(t - 3) = 0 \Rightarrow t = 3$$

$$\left[\because t \neq -\frac{1}{3} \right]$$

$$\therefore \text{Acceleration} = \frac{d^2s}{dt^2} = 6 \times 3 - 8 = 18 - 8 = 10$$

TANGENTS AND NORMALS

If $y = f(x)$ is the equation of a curve, then slope of its tangent at any point (x_1, y_1) is given by $m = \left(\frac{dy}{dx}\right)_{(x_1, y_1)}$

$$\begin{aligned} \text{Slope of normal} &= \frac{-1}{\text{Slope of the tangent at } (x_1, y_1)} \\ &= \frac{-1}{\left(\frac{dy}{dx}\right)_{(x_1, y_1)}} \end{aligned}$$

Equation of tangent at (x_1, y_1) is

$$y - y_1 = \left(\frac{dy}{dx}\right)_{(x_1, y_1)} (x - x_1)$$

Equation of normal at (x_1, y_1) is

$$y - y_1 = -\left(\frac{dx}{dy}\right)_{(x_1, y_1)} (x - x_1)$$

SOME POINTS RELATED TO TANGENTS AND NORMALS

- (i) If tangent of any curve is parallel to X -axis, then $\frac{dy}{dx} = 0$.
- (ii) If tangent of a curve is parallel to Y -axis, then $\frac{dx}{dy} = 0$.
- (iii) If tangent of a curve is equally inclined to both the axes, then $\frac{dy}{dx} = \pm 1$.
- (iv) Product of slope of tangent and slope of normal to a curve is equal to -1 .

EXAMPLE 2. Find the equation of the tangent to the curve $y = \frac{x-7}{(x-2)(x-3)}$ at the point, where it cuts the X -axis.

- a. $x + 20y + 7 = 0$ b. $20y + x - 7 = 0$
c. $20y - x + 7 = 0$ d. $20x - y - 7 = 0$

Sol. c. Put $y = 0$ (for X -axis) in the given equation

$$y = \frac{x-7}{(x-2)(x-3)}, \text{ we get the point } (7, 0).$$

$$\text{Now, } \frac{dy}{dx} = \frac{d}{dx} \left[\frac{5}{x-2} - \frac{4}{x-3} \right] \quad [\text{by partial fraction}]$$

$$\Rightarrow \frac{dy}{dx} = -\frac{5}{(x-2)^2} + \frac{4}{(x-3)^2}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(7,0)} = -\frac{5}{25} + \frac{4}{16} = \frac{1}{20}$$

\therefore Required equation of tangent is

$$y - 0 = \frac{1}{20}(x - 7) \Rightarrow 20y - x + 7 = 0$$

ANGLE BETWEEN TWO CURVES

Angle between two curves is the angle between their tangents at their intersection point. If $y = f(x)$ and $y = g(x)$ are two curves, then

$$m_1 = \left(\frac{df}{dx}\right)_{(x_1, y_1)} \quad \text{and} \quad m_2 = \left(\frac{dg}{dx}\right)_{(x_1, y_1)}$$

where, (x_1, y_1) is the point of intersection of two curves.

If θ is the angle between them, then $\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$

Orthogonal Curves

If the angle of intersection of two curves is a right angle, the two curves are said to intersect orthogonally.

Therefore, $\theta = \pi/2$ thus $m_1 m_2 = -1$

INCREASING AND DECREASING FUNCTIONS

Let $y = f(x)$ be a function defined on an interval I , contained in the domain of the function $f(x)$. Let x_1, x_2 be any two points in I , where x_1, x_2 are not the end points of the interval.

- (i) **A strictly increasing function** If $f(x_1) < f(x_2)$, whenever $x_1 \leq x_2$, $x_1, x_2 \in I$.

Here, $\frac{dy}{dx} > 0$

- (ii) **A non-decreasing function** (A rising function) If $f(x_1) \leq f(x_2)$, whenever $x_1 \leq x_2$.

Here, $\frac{dy}{dx} \geq 0$

- (iii) **A strictly decreasing function** If $f(x_1) > f(x_2)$, whenever $x_1 < x_2$, $\forall x_1, x_2 \in I$.

Here, $\frac{dy}{dx} < 0$

- (iv) **A non-increasing function** (A falling function) If $f(x_1) \geq f(x_2)$, whenever $x_1 \leq x_2$

Here, $\frac{dy}{dx} \leq 0$

EXAMPLE 3. For which interval the given function $f(x) = -2x^3 - 9x^2 - 12x + 1$ is decreasing?

- a. $(-2, \infty)$ b. $(-2, -1)$
c. $(-\infty, -1)$ d. $(-\infty, -2)$ and $(-1, \infty)$

Sol. d. $f(x) = -2x^3 - 9x^2 - 12x + 1 \Rightarrow f'(x) = -6x^2 - 18x - 12$

To be decreasing $f'(x) < 0$, i.e. $-6x^2 - 18x - 12 < 0$

$\Rightarrow x^2 + 3x + 2 > 0 \Rightarrow (x + 2)(x + 1) > 0$

Therefore, either $x < -2$ or $x > -1 \Rightarrow x \in (-\infty, -2) \cup (-1, \infty)$

Monotonic Function

A function which is either increasing or decreasing in the entire interval I , is called a monotonic function.

Note Usually, we use the terminology of increasing or decreasing functions as strictly increasing or strictly decreasing functions.

EXAMPLE 4. $f(x) = e^{\sin x}$, $x \in (-\pi, \pi)$ is monotonically

- a. increasing on $(-\pi, \pi)$
- b. increasing on $(-\pi, 0)$
- c. decreasing on $(0, \pi)$
- d. increasing on $(-\frac{\pi}{2}, \frac{\pi}{2})$

Sol. d. $\because f(x) = e^{\sin x}$, $x \in (-\pi, \pi) \Rightarrow f'(x) = e^{\sin x} \cos x > 0$
 $\Rightarrow e^{\sin x} > 0$ and $\cos x > 0 \Rightarrow x \in (-\pi, \pi)$ and $x \in (-\frac{\pi}{2}, \frac{\pi}{2})$
 So, $f(x)$ is monotonically increasing on $(-\frac{\pi}{2}, \frac{\pi}{2})$.

MAXIMA AND MINIMA

Let f be a function defined on an interval I . Then, f is said to have a maxima or minima (or local maxima/local minima) in I depending on $f(x) > f(c)$ or $f(x) < f(c)$, $\forall x \in I$, where c is a point in I .

Here, $f(c)$ is called maximum or minimum value of functions f and c is called point of maximum or minimum in I . f is said to have an extreme value in I , if there exist a point c in I , such that $f(c)$ is either maximum or minimum.

Rules for Finding Maxima and Minima

If $y = f(x)$ is a given function, then first of all find $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$. Solve $\frac{dy}{dx} = 0$ and we get the value of x .

For each of these values of x , calculate the corresponding value of y and find the sign of $\frac{d^2y}{dx^2}$.

If $\frac{d^2y}{dx^2} < 0$, then y is maximum.

If $\frac{d^2y}{dx^2} > 0$, then y is minimum.

EXAMPLE 5. The area of a rectangle will be maximum for the given perimeter, when rectangle is a

- a. parallelogram
- b. trapezium
- c. square
- d. None of these

Sol. c. We know that, perimeter of a rectangle
 $S = 2(x + y)$ where x and y are adjacent sides
 $\Rightarrow y = \frac{S - 2x}{2}$

Now, area of rectangle $A = xy = \frac{x}{2}(S - 2x) = \frac{1}{2}(Sx - 2x^2)$

On differentiating w.r.t. x of A , we get

$$\frac{dA}{dx} = \frac{1}{2}(S - 4x) = 0 \Rightarrow x = \frac{S}{4} \text{ and } y = \frac{S}{4}$$

Again, $\frac{d^2A}{dx^2} = -ve$

Hence, the area of rectangle will be maximum when rectangle is a square.

Critical Points of a Function

Points, where first derivative (differentiable coefficient) of a function is zero, are called the critical points of the function $f(x)$. These are also known as stationary or turning points.

Point of Inflection

Consider function $f(x) = x^3$. At $x = 0$, $f'(x) = 0$.

Also, $f''(x) = 0$ at $x = 0$. Such point is called point of inflection, where second derivative is zero.

At point of inflection,

- (i) it is not necessary that first derivative is zero.
- (ii) second derivative must be zero.

ROLLE'S THEOREM

According to Rolle's theorem

If a function $f(x)$ is

- (i) continuous in the closed interval $[a, b]$.
- (ii) differentiable in an open interval (a, b) , i.e. differentiable at each point in the open interval (a, b) .
- (iii) $f(a) = f(b)$

Then, there exists a point c in the interval (a, b) such that $f'(c) = 0$.

- Note**
- If $f(x)$ is increasing, then $f^{-1}(x)$ is also increasing.
 - If $f(x)$ is decreasing, then $f^{-1}(x)$ is also decreasing.
 - If $x = a$ is a point of inflexion, then $f'(a) = 0$ and $f''(a) = 0$ but vice-versa is not necessarily true.

LAGRANGE'S MEAN VALUE THEOREM

If a function $f(x)$ is

- (i) continuous in the closed interval $[a, b]$.
- (ii) differentiable in an open interval (a, b) .

Then, there exists a point c , where $a < c < b$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Note Rolle's theorem is derived from LMVT.

> PRACTICE EXERCISE

- The interval in which function $f(x) = x - e^x + \tan \frac{2\pi}{7}$ increases is equal to
(a) $(0, \infty)$ (b) $(1, \infty)$ (c) $(2, \infty)$ (d) $(-\infty, -1)$
- If $f(x) = xe^{x(1-x)}$, then $f(x)$ is
(a) increasing on $[-\frac{1}{2}, 1]$ (b) decreasing on R
(c) increasing on R (d) decreasing on $[-\frac{1}{2}, 1]$
- The point at which the tangent to the curve $y = 2x^2 - x + 1$ is parallel to $y = 3x + 9$ will be
(a) $(2, 1)$ (b) $(1, 2)$ (c) $(3, 9)$ (d) $(-2, 1)$
- The function $f(x) = \log_e(x^3 + \sqrt{x^6 + 1})$ is
(a) even (b) odd
(c) decreasing (d) None of these
- The maximum value of $\frac{(\log x)}{x}$ is
(a) 1 (b) $2/e$ (c) e (d) $1/e$
- Let $f(x) = (1 + b^2)x^2 + 2bx + 1$ and $m(b)$ be the minimum value of $f(x)$. As b varies, the range of $m(b)$ is
(a) $[0, 2]$ (b) $[0, \frac{1}{2}]$ (c) $[\frac{1}{2}, 1]$ (d) $(0, 1]$
- Divide 20 into two parts such that the product of one part and the cube of the other is maximum, then the two parts are
(a) $(10, 10)$ (b) $(12, 8)$ (c) $(15, 5)$ (d) $(5, 10)$
- The rate of change of the surface area of a sphere of radius r , when the radius is increasing at the rate of 2 cm/s is proportional to
(a) $\frac{1}{r}$ (b) $\frac{1}{r^2}$ (c) r (d) r^2
- In the mean value theorem $\frac{f(b) - f(a)}{b - a} = f'(c)$, if $a = 0, b = \frac{1}{2}$ and $f(x) = x(x - 1)(x - 2)$, the value of c is
(a) $1 - \frac{\sqrt{15}}{6}$ (b) $1 + \sqrt{15}$ (c) $1 - \frac{\sqrt{21}}{6}$ (d) $1 + \sqrt{21}$
- The function $f(x) = k \sin x + \frac{1}{3} \sin 3x$ has maximum value at $x = \frac{\pi}{3}$, what is the value of k ?
(a) 3 (b) $1/3$ (c) 2 (d) $1/2$
- If $f(x) = x, -1 < x \leq 1$, then function $f(x)$ will be
(a) increasing (b) decreasing
(c) constant (d) discontinuous
- Given two squares of sides x and y such that $y = x + x^2$. What is the rate of change of area of the second square with respect to the area of the first square?
(a) $1 + 3x + 2x^2$ (b) $1 + 2x + 3x^2$
(c) $1 - 2x + 3x^2$ (d) $1 - 2x - 3x^2$
- The velocity of telegraphic communication is given by $v = x^2 \log\left(\frac{1}{x}\right)$, where x is the displacement. For maximum velocity, x equals to
(a) $e^{1/2}$ (b) $e^{-\frac{1}{2}}$ (c) $(2e)^{-1}$ (d) $2e^{-1/2}$
- The growth of a quantity $N(t)$ at any instant t is given by $\frac{dN(t)}{dt} = \alpha N(t)$. If $N(t) = ce^{kt}$, c is a constant, then what is the value of α ?
(a) c (b) k (c) $c + k$ (d) $c - k$
- If $f(x) = 3x^2 + 6x - 9$, then
(a) $f(x)$ is increasing in $(-1, 3)$ (b) $f(x)$ is decreasing in $(3, \infty)$
(c) $f(x)$ is increasing in $(-\infty, -1)$
(d) $f(x)$ is decreasing in $(-\infty, -1)$
- A stone thrown vertically upward satisfies the equation $s = 64t - 16t^2$, where s is in metre and t is in second. What is the time required to reach the maximum height by the stone?
(a) 1 s (b) 2 s (c) 3 s (d) 4 s
- In $(0, \pi/2)$, function $f(x) = \frac{x}{1 + x \tan x}$, have
(a) one minimum point (b) one maximum point
(c) no extreme point (d) two maximum points.
- We have three real roots of cubic equation $x^3 - px + q$, where $p > 0$ and $q > 0$, then which of the below given statement is correct?
(a) At both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$ cubic equation will have maximum value
(b) Cubic equation is minimum at $\sqrt{\frac{p}{3}}$ and maximum at $-\sqrt{\frac{p}{3}}$
(c) Cubic equation is maximum at $-\sqrt{\frac{p}{3}}$ and minimum at $\sqrt{\frac{p}{3}}$
(d) At both $\sqrt{\frac{p}{3}}$ and $-\sqrt{\frac{p}{3}}$ cubic equation will have minimum value

- 19.** If $y = \frac{\sin(x+a)}{\sin(x+b)}$; $a \neq b$, then y has
 I. maximum at $x=0$
 II. minimum at $x=0$
 III. neither maximum nor minimum.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Only III (d) None of these

- 20.** Let $f(x) = \sin x + \frac{1}{2} \cos 2x$, Then
 I. $\min_{x \in [0, \frac{\pi}{2}]} f(x) < \frac{4}{3}$ II. $\min_{x \in [0, \frac{\pi}{2}]} f(x) > \frac{3}{4}$
 III. $\min_{x \in [0, \frac{\pi}{2}]} f(x) > \frac{2}{3}$
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Only III (d) None of these

- 21.** Two automobiles start from a point A at the same time one travels towards West at the speed of 60 miles per hour while the other travels towards North at 35 miles per hour. Their distance apart after 3 h later is increasing at the rate (in miles per hour)
 I. $5\sqrt{193}$ II. $5/\sqrt{193}$ III. $\sqrt{193}$
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Only III (d) None of these

Directions (Q. Nos. 22-23) Let $f : [0, 1] \rightarrow R$ (the set of all real numbers) be a function. Suppose the function f is twice differentiable, $f(0) = f(1) = 0$ and satisfies $f'(x) - 2f''(x) + f(x) \geq e^x$, $x \in [0, 1]$.

- 22.** Which of the following is true for $0 < x < 1$?
 (a) $0 < f(x) < \infty$ (b) $-\frac{1}{2} < f(x) < \frac{1}{2}$
 (c) $-\frac{1}{4} < f(x) < 1$ (d) $-\infty < f(x) < 0$
- 23.** If the function $e^{-x}f(x)$ assumes its minimum in the interval $[0, 1]$ at $x = 1/4$, which of the following is true?
 (a) $f'(x) < f(x)$, $\frac{1}{4} < x < \frac{3}{4}$ (b) $f'(x) > f(x)$, $0 < x < \frac{1}{4}$
 (c) $f'(x) < f(x)$, $0 < x < \frac{1}{4}$ (d) $f'(x) < f(x)$, $\frac{3}{4} < x < 1$

Directions (Q. Nos. 24-25) $f'(\sin x) < 0$ and $f''(\sin x) > 0, \forall x \in (0, \frac{\pi}{2})$ and $g(x) = f(\sin x) + f(\cos x)$.

- 24.** Which of the following is true?
 (a) g' is increasing (b) g' is decreasing
 (c) g' has a point of minima (d) g' has a point of maxima

- 25.** Which of the following is true?
 (a) $g(x)$ is decreasing in $(\frac{\pi}{4}, \frac{\pi}{2})$
 (b) $g(x)$ is increasing in $(0, \frac{\pi}{4})$
 (c) $g(x)$ is monotonically increasing
 (d) None of the above

Directions (Q. Nos. 26-27) In a circle of radius ' r ', a right circular cone is drawn.

- 26.** What will be the maximum height of cone having maximum volume?
 (a) $\frac{4r}{3}$ (b) $\frac{3r}{4}$ (c) $\frac{\sqrt{3}}{3}r$ (d) $\frac{2}{3}r$
- 27.** What will be the radius of cone having maximum volume?
 (a) $\frac{2\sqrt{3}}{9}r$ (b) $\frac{2\sqrt{3}}{3}r$ (c) $\frac{\sqrt{3}}{2}r$ (d) $\sqrt{3}r$

Directions (Q. Nos. 28-30)

Let $f(x) = x^3 - 3(7-a)x^2 - 3(9-a^2)x + 2$

- 28.** The value of parameter a , if $f(x)$ has a negative point of local minima is
 (a) ϕ (b) $(-3, 3)$
 (c) $(-\infty, \frac{58}{14})$ (d) None of these
- 29.** The values of parameter a , if $f(x)$ has a positive point of local minima are
 (a) ϕ (b) $(-\infty, 3) \cup (\frac{58}{14}, \infty)$
 (c) $(-\infty, \frac{58}{14})$ (d) None of these
- 30.** The values of parameter a , if $f(x)$ has points of extrema which are opposite in sign are
 (a) ϕ (b) $(-3, 3)$
 (c) $(-\infty, \frac{58}{14})$ (d) None of these

Directions (Q. Nos. 31-33) Consider the curve $x = 1 - 3t^2, y = t - 3t^3$. A tangent at point $(1 - 3t^2, t - 3t^3)$ is inclined at an angle θ to the positive X -axis and another tangent at point $P(-2, 2)$ cuts the curve again at Q .

- 31.** The value of $\tan \theta + \sec \theta$ is equal to
 (a) $3t$ (b) t (c) $t - t^2$ (d) $t^2 - 2t$
- 32.** The point Q will be
 (a) $(1, -2)$ (b) $(\frac{-1}{3}, \frac{-2}{3})$ (c) $(-2, 1)$ (d) None of these
- 33.** The equation of tangent at point $P(-2, 2)$ is
 (a) $4x - 3y + 2 = 0$ (b) $-4x - 3y - 2 = 0$
 (c) $3x + 4y - 2 = 0$ (d) None of these

Directions (Q. Nos. 34-36) Consider the graph of $y = g(x) = f'(x)$, given that $f(c) = 0$, where $y = f(x)$ is a polynomial function.

- 34.** The equation $f(x) = 0$, $a \leq x \leq b$, has
 (a) four real roots
 (b) no real roots
 (c) two distinct real roots
 (d) atleast three repeated roots
- 35.** The graph of $y = f(x)$, $a \leq x \leq b$, has
 (a) two points of inflection (b) one point of inflection
 (c) no points of inflection (d) None of these
- 36.** The function $y = f(x)$, $a < x < b$, has
 (a) exactly one local maxima
 (b) one local minima and one maxima
 (c) exactly one local minima
 (d) None of the above

PREVIOUS YEARS' QUESTIONS

- 37.** How many tangents are parallel to X-axis for the curve $y = x^2 - 4x + 3$? ☑ 2012 I
 (a) 1 (b) 2 (c) 3
 (d) No tangent is parallel to X-axis
- 38.** Which one of the following statements is correct? ☑ 2012 I
 (a) e^x is an increasing function
 (b) e^x is a decreasing function
 (c) e^x is neither an increasing nor a decreasing function
 (d) e^x is a constant function
- 39.** What is the slope of the tangent to the curve $x = t^2 + 3t - 8$, $y = 2t^2 - 2t - 5$ at $t = 2$? ☑ 2012 I
 (a) 7/6 (b) 6/7 (c) 1 (d) 5/6
- 40.** Which one of the following statements is correct? ☑ 2012 I
 (a) The derivative of a function $f(x)$ at a point will exist, if there is one tangent to the curve $y = f(x)$ at that point and the tangent is parallel to Y-axis.
 (b) The derivative of a function $f(x)$ at a point will exist, if there is one tangent to the curve $y = f(x)$ at that point and the tangent must be parallel to X-axis.
 (c) The derivative of a function $f(x)$ at a point will exist, if there is one and only one tangent to the curve $y = f(x)$ at that point and the tangent is not parallel to Y-axis.
 (d) None of the above
- 41.** What is the minimum value of $|x|$? ☑ 2012 II
 (a) -1 (b) 0 (c) 1 (d) 2

- 42.** The function $f(x) = x^3 - 3x^2 + 6$ is an increasing function for ☑ 2012 II
 (a) $0 < x < 2$ (b) $x < 2$
 (c) $x > 2$ or $x < 0$ (d) all x
- 43.** The radius of a circle is uniformly increasing at the rate of 3 cm/s. What is the rate of increase in area, when the radius is 10 cm? ☑ 2012 II
 (a) $6\pi \text{ cm}^2/\text{s}$ (b) $10\pi \text{ cm}^2/\text{s}$ (c) $30\pi \text{ cm}^2/\text{s}$ (d) $60\pi \text{ cm}^2/\text{s}$
- 44.** The function $f(x) = x^2 - 4x$, $x \in [0, 4]$ attains minimum value at ☑ 2013 I
 (a) $x = 0$ (b) $x = 1$ (c) $x = 2$ (d) $x = 4$
- 45.** The curve $y = xe^x$ has minimum value equal to ☑ 2013 I
 (a) $-\frac{1}{e}$ (b) $\frac{1}{e}$ (c) $-e$ (d) e
- 46.** Consider the following statements
 I. The derivative, where the function attains maxima or minima be zero.
 II. If a function is differentiable at a point, then it must be continuous at that point.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II ☑ 2013 I
 (c) Both I and II (d) Neither I nor II
- 47.** The maximum value of the function $f(x) = x^3 + 2x^2 - 4x + 6$ exists at ☑ 2013 II
 (a) $x = -2$ (b) $x = 1$ (c) $x = 2$ (d) $x = -1$
- 48.** The minimum value of the function $f(x) = |x - 4|$ exists at ☑ 2013 II
 (a) $x = 0$ (b) $x = 2$ (c) $x = 4$ (d) $x = -4$

Directions (Q. Nos. 49-50) Consider an ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

☑ 2014 I

- 49.** What is the area of the greatest rectangle that can be inscribed in the ellipse?
 (a) ab (b) $2ab$ (c) $ab/2$ (d) \sqrt{ab}
- 50.** What is the area included between the ellipse and the greatest rectangle inscribed in the ellipse?
 (a) $ab(\pi - 1)$ (b) $2ab(\pi - 1)$ (c) $ab(\pi - 2)$ (d) None of these

Directions (Q. Nos. 51-52) Consider the function

$$f(x) = \frac{x^2 - x + 1}{x^2 + x + 1}.$$

☑ 2014 I

- 51.** What is the maximum value of the function?
 (a) 1/2 (b) 1/3 (c) 2 (d) 3
- 52.** What is the minimum value of the function?
 (a) 1/2 (b) 1/3 (c) 2 (d) 3
- 53.** What is the slope of the tangent to the curve $y = \sin^{-1}(\sin^2 x)$ at $x = 0$? ☑ 2014 I
 (a) 0 (b) 1
 (c) 2 (d) None of these

Directions (Q. Nos. 54-55) Consider the curve $y = e^{2x}$.

☑ 2014 I

54. What is the slope of the tangent to the curve at (0, 1)?
 (a) 0 (b) 1 (c) 2 (d) 4

55. Where does the tangent to the curve at (0, 1) meet the X-axis?
 (a) (1, 0) (b) (2, 0) (c) (-1/2, 0) (d) (1/2, 0)

56. Consider the following statements
 I. The function $f(x) = \sin x$ decreases on the interval $(0, \pi/2)$.
 II. The function $f(x) = \cos x$ increases on the interval $(0, \pi/2)$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II (c) Both I and II (d) Neither I nor II

☑ 2014 I

Directions (Q. Nos. 57-58) Read the following information carefully and answer the questions given below.

A cylinder is inscribed in a sphere of radius r . ☑ 2014 II

57. What is the height of the cylinder of maximum volume?
 (a) $\frac{2r}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{3}}$ (c) $2r$ (d) $\sqrt{3} r$

58. What is the radius of the cylinder of maximum volume?
 (a) $\frac{2r}{\sqrt{3}}$ (b) $\frac{\sqrt{2}}{\sqrt{3}} r$ (c) r (d) $\sqrt{3} r$

Directions (Q. Nos. 59-60) Read the following information carefully and answer these questions given below.

A rectangular box is to be made from a sheet of cutting out identical squares of side length x from the four corners and turning up the sides. ☑ 2014 II

59. What is the value of x for which the volume is maximum?
 (a) 1 inch (b) 1.5 inch (c) 2 inch (d) 2.5 inch

60. What is the maximum volume of the box?
 (a) 200 cubic inch (b) 400 cubic inch
 (c) 100 cubic inch (d) None of these

Directions (Q. Nos. 61-62) Consider the function

$$f(x) = 0.75x^4 - x^3 - 9x^2 + 7$$

☑ 2015 I

61. What is the maximum value of the function?
 (a) 1 (b) 3 (c) 7 (d) 9

62. Consider the following statements
 I. The function attains local minima at $x = -2$ and $x = 3$.
 II. The function increases in the interval $(-2, 0)$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

63. Consider the following statements

- I. $y = \frac{e^x + e^{-x}}{2}$ is an increasing function on $[0, \infty)$.
 II. $y = \frac{e^x - e^{-x}}{2}$ is an increasing function on $(-\infty, \infty)$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

☑ 2015 I

Directions (Q. Nos. 64-66) Consider the function

$$f(x) = \frac{x^2 - 1}{x^2 + 1}, \text{ where } x \in R.$$

☑ 2015 I

64. At what value of x does $f(x)$ attain minimum value?
 (a) -1 (b) 0 (c) 1 (d) 2

65. What is the minimum value of $f(x)$?
 (a) 0 (b) 1/2
 (c) -1 (d) 2

66. Consider the following functions
 I. $f(x) = x^3, x \in R$ II. $f(x) = \sin x, 0 < x < 2\pi$
 III. $f(x) = e^x, x \in R$

Which of the above functions have inverse defined on their ranges?

- (a) I and II (b) II and III
 (c) I and III (d) I, II and III

☑ 2015 I

67. The function $f(x) = x^2/e^x$ is monotonically increasing, if
 (a) Only $x < 0$ (b) Only $x > 2$
 (c) $0 < x < 2$ (d) $x \in (-\infty, 0) \cup (2, \infty)$

☑ 2015 II

68. Consider the following statements
 I. The function $f(x) = x^2 + 2 \cos x$ is increasing in the interval $(0, \pi)$.
 II. The function $f(x) = \ln(\sqrt{1+x^2} - x)$ is decreasing in the interval $(-\infty, \infty)$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

☑ 2015 II

69. Consider the following statements

- I. $f(x) = \ln x$ is an increasing function on $(0, \infty)$.
 II. $f(x) = e^x - x(\ln x)$ is an increasing function on $(1, \infty)$.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II (c) Both I and II (d) Neither I nor II

☑ 2015 II

Directions (Q. Nos. 70-71) Consider the function

$$f(x) = \left(\frac{1}{x}\right)^{2x^2}, \text{ where } x > 0.$$

☞ 2015 II

70. At what value of x does the function attain maximum value?

- (a) e (b) \sqrt{e} (c) $1/\sqrt{e}$ (d) $1/e$

71. The maximum value of the function is

- (a) e (b) $e^{2/e}$
(c) $e^{1/e}$ (d) $1/e$

Directions (Q. Nos. 72-73) Consider the function

$$f(x) = -2x^3 - 9x^2 - 12x + 1$$

☞ 2015 II

72. The function $f(x)$ is an increasing function in the interval

- (a) $(-2, -1)$ (b) $(-\infty, -2)$
(c) $(-1, 2)$ (d) $(-1, \infty)$

73. The function $f(x)$ is a decreasing function in the interval

- (a) $(-2, -1)$ (b) $(-\infty, -2)$
(c) $(-1, \infty)$ (d) $(-\infty, -2) \cup (-1, \infty)$

Directions (Q. Nos. 74-75) Consider the equation

$$x + |y| = 2y.$$

☞ 2016 I

74. Which of the following statements are not correct?

- I. y as a function of x is not defined for all real x .
II. y as a function of x is not continuous at $x=0$.
III. y as a function of x is differentiable for all x .

Select the correct answer using the codes given below.

- (a) I and II (b) II and III
(c) I and III (d) I, II and III

75. What is the derivative of y as a function of x with respect to x for $x < 0$?

- (a) 2 (b) 1 (c) $1/2$ (d) $1/3$

Directions (Q. Nos. 76-77) Consider the function

$$f(x) = (x-1)^2(x+1)(x-2)^3.$$

☞ 2016 I

76. What is the number of points of local minima of the function $f(x)$?

- (a) None (b) One (c) Two (d) Three

77. What is the number of points of local maxima of the function $f(x)$?

- (a) None (b) One (c) Two (d) Three

Directions (Q. Nos. 78-80) Consider the function

$$f(x) = |x-1| + x^2, \text{ where } x \in R.$$

☞ 2016 I

78. Which one of the following statements is correct?

- (a) $f(x)$ is continuous but not differentiable at $x=0$
(b) $f(x)$ is continuous but not differentiable at $x=1$
(c) $f(x)$ is differentiable at $x=1$
(d) $f(x)$ is not differentiable at $x=0$ and $x=1$

79. Which one of the following statements is correct?

- (a) $f(x)$ is increasing in $(-\infty, \frac{1}{2})$ and decreasing in $(\frac{1}{2}, \infty)$
(b) $f(x)$ is decreasing in $(-\infty, \frac{1}{2})$ and increasing in $(\frac{1}{2}, \infty)$
(c) $f(x)$ is increasing in $(-\infty, 1)$ and decreasing in $(1, \infty)$
(d) $f(x)$ is decreasing in $(-\infty, 1)$ and increasing in $(1, \infty)$

80. Which one of the following statements is correct?

- (a) $f(x)$ has local minima at more than one point in $(-\infty, \infty)$
(b) $f(x)$ has local maxima at more than one point in $(-\infty, \infty)$
(c) $f(x)$ has local maxima at one point only in $(-\infty, \infty)$
(d) $f(x)$ has neither maxima nor minima in $(-\infty, \infty)$

HINTS AND SOLUTIONS

1. (d) $\frac{dy}{dx} = 1 - e^x$ is positive, if $e^x < 1$
 $\Rightarrow x < 0 \Rightarrow x \in (-\infty, 0)$
 So, the interval $(-\infty, -1)$ is part of interval $(-\infty, 0)$.

2. (a) $f'(x) = e^{x(1-x)} \cdot 1 + x \cdot e^{x(1-x)}(1-2x)$
 $\Rightarrow f'(x) = e^{x(1-x)}(1+x-2x^2)$
 $\Rightarrow f'(x) = -e^{x(1-x)}(x-1)(2x+1)$
 $\Rightarrow f'(x) = -2e^{x(1-x)}\left(x + \frac{1}{2}\right)(x-1)$
 $\Rightarrow f'(x) = -2e^{x(1-x)}A$
 Now, exponential function is always positive and the sign of $f'(x)$ will be opposite to the sign of A which is negative in $\left[-\frac{1}{2}, 1\right]$.

Hence, $f'(x)$ is positive in $\left[-\frac{1}{2}, 1\right]$, so that $f(x)$ is an increasing function in this interval.

3. (b) Given equation is $y = 2x^2 - x + 1$.
 On differentiating w.r.t. x , we get
 $\frac{dy}{dx} = 4x - 1$

Since, this is parallel to the given line $y = 3x + 9$

Slope of second line = $\frac{du}{dx} = 3$

Therefore, these slopes are equal.

$$\Rightarrow 4x - 1 = 3 \Rightarrow x = 1$$

$$\text{At } x = 1, y = 2(1)^2 - 1 + 1 \Rightarrow y = 2$$

Thus, the point is $(1, 2)$.

4. (b) $f(x) = \log\{\sqrt{x^6 + 1} + x^3\}$
 $f(-x) = \log\{\sqrt{x^6 + 1} - x^3\}$
 $\therefore f(-x) + f(x) = \log\{x^6 + 1 - x^6\}$
 $= \log 1 = 0$

$$\therefore f(-x) = -f(x)$$

Hence, $f(x)$ is odd.

Again,

$$\frac{dy}{dx} = \frac{1}{\sqrt{x^6 + 1} + x^3} \left[3x^2 + \frac{6x^5}{2\sqrt{x^6 + 1}} \right]$$

$$= \frac{3x^2}{\sqrt{x^6 + 1}} = \text{Positive, } \forall x \in R$$

Hence, $f(x)$ is an increasing function.

5. (d) $y = \frac{\log x}{x}$
 $\frac{dy}{dx} = -\frac{1}{x^2} \log x + \frac{1}{x} \cdot \frac{1}{x}$
 $= \frac{1}{x^2}(1 - \log x) = 0 \Rightarrow x = e$

At $x = e, \frac{d^2y}{dx^2} < 0$, [maxima]

$$\therefore y = \frac{1}{e}$$

6. (d) $f'(x) = 2x(1 + b^2) + 2b = 0$

$$\therefore x = -\frac{b}{(1 + b^2)}$$

$f''(x) = 2(1 + b^2)$ is always positive, so that $f(x)$ is minimum when

$$x = -\frac{b}{1 + b^2}$$

$$\therefore \min f(x) = (1 + b^2) \frac{b^2}{(1 + b^2)^2}$$

$$= \frac{2b^2}{(1 + b^2)} + 1$$

$$= \frac{(1 + b^2) - b^2}{1 + b^2} = \frac{1}{(1 + b^2)}$$

$$\therefore m(b) = \frac{1}{1 + b^2} = +ve$$

Clearly, $m(b)$ is always greater than zero and less than or equal to 1.

So, the range of $m(b)$ is $(0, 1]$.

7. (c) $x + y = 20$ and $z = xy^3$ is maximum.

$$z = y^3(20 - y) = 20y^3 - y^4$$

$$\frac{dz}{dy} = 60y^2 - 4y^3 = 0$$

$$\therefore 4y^2(15 - y) = 0$$

$$\therefore y = 0, 15$$

$$\text{Now, } \frac{d^2z}{dy^2} = 120y - 12y^2$$

$$= 12y(10 - y)$$

$$\text{At } y = 15,$$

$$\frac{d^2z}{dy^2} = 12 \times 15(10 - 15) < 0$$

i.e. maximum when $y = 15$

8. (c) Surface area of sphere, $S = 4\pi r^2$

$$\text{and } \frac{dr}{dt} = 2$$

$$\therefore \frac{dS}{dt} = 4\pi \times 2r \frac{dr}{dt} = 8\pi r \times 2 = 16\pi r$$

$$\Rightarrow \frac{dS}{dt} \propto r$$

9. (c) From mean value theorem,

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\text{Given, } a = 0 \Rightarrow f(a) = 0$$

$$\text{and } b = \frac{1}{2} \Rightarrow f(b) = \frac{3}{8}$$

$$\text{Now, } f'(x) = (x - 1)(x - 2) + x(x - 2) + x(x - 1)$$

$$\therefore f'(c) = (c - 1)(c - 2) + c(c - 2) + c(c - 1)$$

$$= c^2 - 3c + 2 + c^2 - 2c + c^2 - c$$

$$\Rightarrow f'(c) = 3c^2 - 6c + 2$$

By definition of mean value theorem,

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\Rightarrow 3c^2 - 6c + 2 = \frac{\left(\frac{3}{8}\right) - 0}{\left(\frac{1}{2}\right) - 0} = \frac{3}{4}$$

$$\Rightarrow 3c^2 - 6c + \frac{5}{4} = 0$$

Since, this is a quadratic equation in c .

$$\therefore c = \frac{6 \pm \sqrt{36 - 15}}{2 \times 3}$$

$$= \frac{6 \pm \sqrt{21}}{6} = 1 \pm \frac{\sqrt{21}}{6}$$

Since, c lies between $\left[0, \frac{1}{2}\right]$.

$$\therefore c = 1 - \frac{\sqrt{21}}{6}$$

$$\left[\text{neglecting } c = 1 + \frac{\sqrt{21}}{6} \right]$$

10. (c) Given function is,

$$f(x) = k \sin x + \frac{1}{3} \sin 3x$$

$$f'(x) = k \cos x + \cos 3x \quad \dots(i)$$

But given that, $f(x)$ is maximum at $x = \pi/3$.

From Eq. (i),

$$k \cos \frac{\pi}{3} + \cos \pi = 0 \Rightarrow \frac{k}{2} - 1 = 0$$

$$\Rightarrow k = 2$$

11. (a) It is always an increasing function.

12. (a) \therefore Area of first square, $A_1 = x^2$
 and area of second square,

$$A_2 = y^2 = (x + x^2)^2$$

$$= x^2 + x^4 + 2x^3$$

$$\text{Now, } \frac{dA_1}{dx} = 2x$$

and $\frac{dA_2}{dx} = 2x + 4x^3 + 6x^2$
 Hence, $\frac{dA_2}{dA_1} = \frac{2x + 4x^3 + 6x^2}{2x} = 1 + 2x^2 + 3x$

13. (b)

14. (b) $\because N(t) = ce^{kt}$
 $\therefore \frac{dN(t)}{dt} = \frac{d}{dt} ce^{kt} = k(ce^{kt}) = k[N(t)]$
 But $\frac{dN(t)}{dt} = \alpha N(t)$
 $\therefore \alpha = k$

15. (d) $\because f(x) = 3x^2 + 6x - 9$
 On differentiating w.r.t. x , we get
 $f'(x) = 6x + 6 \Rightarrow f'(x) < 0, \forall (-\infty, -1)$
 $\therefore f(x)$ is decreasing in $(-\infty, -1)$.

16. (b)

17. (b)

Here in $(0, \pi/2)$ we have only 1 point.
 Let the point be x , at which $\frac{dy}{dx} = 0$

Thus, $\left(\frac{dy}{dx}\right)_{x,-b} > 0, \left(\frac{dy}{dx}\right)_{x,+b} < 0$

Therefore, in $(0, \pi/2)$ we have only one critical point on which $f(x)$ will be local maxima.

18. (b) $f(x) = x^3 - px + q, p > 0, q > 0$
 As there are three real roots of cubic equation $f(x)$, therefore, there will be one maximum and one minimum point.

$f'(x) = 0 \Rightarrow 3x^2 - p = 0$
 $x = \pm \sqrt{\frac{p}{3}}$
 $f''(x) = 6x$
 $\Rightarrow f''\left(-\sqrt{\frac{p}{3}}\right) < 0$ and $f''\left(\sqrt{\frac{p}{3}}\right) > 0$

19. (c) We have, $y = \frac{\sin(x+a)}{\sin(x+b)}$
 $\frac{dy}{dx} = \frac{[\sin(x+b) \cdot \cos(x+a) \cdot 1 - \sin(x+a) \cdot \cos(x+b) \cdot 1]}{\sin^2(x+b)}$
 $= \frac{\sin(b-a)}{\sin^2(x+b)} \neq 0$ for any x as $a \neq b$

Thus, y has neither maximum nor minimum.

20. (a) We have, $f(x) = \sin x + \frac{1}{2} \cos 2x$
 $\Rightarrow f'(x) = \cos x - \sin 2x = \cos x(1 - 2 \sin x)$
 $\therefore f'(x) = 0$
 $\cos(1 - 2 \sin x) = 0 \Rightarrow \cos x = 0$
 or $\sin x = \frac{1}{2}$
 $\Rightarrow x = \frac{\pi}{2}$ or $x = \frac{\pi}{6}$ $\left[\because 0 \leq x \leq \frac{\pi}{2} \right]$
 Now, $f(0) = \frac{1}{2}, f\left(\frac{\pi}{6}\right) = \frac{3}{4}$
 and $\left(\frac{\pi}{2}\right) = \frac{1}{2}$
 Out of these values, the minimum value is $\frac{1}{2} < \frac{4}{3} < \frac{3}{2}$.

21. (a) Let $AB = x, AC = y$
 After 3 hours, $x = 105, y = 180$
 distance between them $r = \sqrt{x^2 + y^2}$
 $\frac{dr}{dt} = \frac{1}{2\sqrt{x^2 + y^2}} \left[2x \frac{dx}{dt} + 2y \frac{dy}{dt} \right]$

 $= \frac{1}{\sqrt{x^2 + y^2}} \left[x \frac{dx}{dt} + y \frac{dy}{dt} \right]$
 $= \frac{1}{\sqrt{(105)^2 + (180)^2}} [105 \times 35 + 180 \times 180]$
 $= \frac{14475}{\sqrt{43425}} = \frac{1895}{\sqrt{1737}} = \frac{965}{\sqrt{193}}$
 $= \frac{5 \times 193}{\sqrt{193}} = 5\sqrt{193}$

22. (d) Here $f''(x) - 2f'(x) + f(x) \geq e^x$
 $\Rightarrow f''(x)e^{-x} - f'(x)e^{-x} - f'(x)e^{-x} + f(x)e^{-x} \geq 0$
 $\Rightarrow \frac{d}{dx} (f'(x)e^{-x}) - \frac{d}{dx} (f(x)(e^{-x})) \geq 1$
 $\Rightarrow \frac{d}{dx} (f'(x)e^{-x} - f(x)e^{-x}) \geq 1$
 $\Rightarrow \frac{d^2}{dx^2} (e^{-x} f(x)) \geq 1$ for all $x \in [0, 1]$
 $\therefore \phi(x) = e^{-x} f(x)$ is concave up.
 $f(0) = f(1) = 0 \Rightarrow \phi(0) = 0 = \phi(1)$
 $\Rightarrow \phi(x) < 0 \Rightarrow e^{-x} f(x) < 0$
 $\therefore f(x) < 0$

23. (c) Here $\phi'(x) < 0, x \in \left(0, \frac{1}{4}\right)$
 and $\phi'(x) > 0, x \in \left(\frac{1}{4}, 1\right)$

$\Rightarrow e^{-x} f'(\phi) - e^{-x} f(x) < 0, x \in \left(0, \frac{1}{4}\right)$
 $\Rightarrow f'(x) < f(x), 0 < x < \frac{1}{4}$

24. (a) $g(x) = f(\sin x) + f(\cos x)$
 $\Rightarrow g'(x) = f'(\sin x) \cos x - f'(\cos x) \sin x$
 or $g''(x) = -f''(\sin x) \sin x + \cos^2 x f''(\sin x) + f''(\cos x) \sin^2 x - f''(\cos x) \cos x > 0, \forall x \in \left(0, \frac{\pi}{2}\right)$
 [as it is given
 $f'(\sin x) = f'\left(\cos x \left(\frac{\pi}{2} - x\right)\right) < 0$ and
 $f''(\sin x) = f''\left(\cos x \left(\frac{\pi}{2} - x\right)\right) > 0$]

Thus, $g'(x)$ is increasing in $\left(0, \frac{\pi}{2}\right)$.

25. (d) $g'\left(\frac{\pi}{4}\right) = 0$
 or $g'(x) > 0 \forall x \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$
 and $g'(x) < 0 \forall x \in \left(0, \frac{\pi}{4}\right)$
 Thus, $g(x)$ is decreasing in $\left(0, \frac{\pi}{4}\right)$.

Sol. (Q. Nos. 26-27) Let the radius of the cone be 'R' and height be 'h'.

Now, in $\triangle OAB, r^2 = R^2 + (h-r)^2$
 $\Rightarrow r^2 = R^2 + h^2 + r^2 - 2rh$
 $\Rightarrow R^2 = 2rh - h^2$
 Volume of cone, $V = \frac{1}{3} \pi R^2 h$
 $= \frac{1}{3} \pi h(2rh - h^2) = \frac{1}{3} \pi(2rh^2 - h^3)$

Or differentiate with respect to 'h'.
 $\frac{dV}{dh} = \frac{1}{3} \pi(4rh - 3h^2)$
 $\frac{dV}{dx} = 0$, for maximum and minimum value
 $\Rightarrow 4rh = 3h^2 \Rightarrow 4r = 3h$
 $\therefore h = \frac{4r}{3}$ $[h \neq 0]$

Now, $\frac{d^2V}{dh^2} = \frac{1}{3} \pi(4r - 6h)$

$$\begin{aligned} \text{At } h = \frac{4r}{2}, \left(\frac{d^2V}{db^2} \right)_{h=\frac{4r}{3}} &= \frac{1}{3} \pi \left(4r - 6 \times \frac{4r}{3} \right) \\ &= \frac{\pi}{3} (4r - 8r) = \frac{-4\pi}{3} < 0 \end{aligned}$$

26. (a) When $h = \frac{4r}{3}$, then V will be maximum. Thus, volume of cone will be maximum at $h = \frac{4r}{3}$, which is the height of the cone.

27. (b) Now, $R^2 = 2rb - b^2$

$$\begin{aligned} R^2 &= 2r \left(\frac{4r}{3} \right) - \left(\frac{4r}{3} \right)^2 \quad \left[\because b = \frac{4r}{3} \right] \\ R^2 &= \frac{8r^2}{3} - \frac{16r^2}{9} = \frac{24r^2 - 16r^2}{9} = \frac{8r^2}{9} \\ r &= \frac{2\sqrt{2}r}{3} \quad [\because R > 0] \end{aligned}$$

Sol. (Q. Nos. 28-30)

$$\begin{aligned} f(x) &= x^3 - 3(7-a)x^2 - 3(9-a^2)x + 2 \\ \text{or } f'(x) &= 3x^2 - 6(7-a)x - 3(9-a^2) \end{aligned}$$

For real root, $D \geq 0$

$$\text{or } 49 + a^2 - 14a + 9 - a^2 \geq 0$$

$$\text{or } a \leq \frac{58}{14} \quad \dots(i)$$

When point of minima is negative, point of maxima is also negative.

Hence, equation $f'(x) = 3x^2 - 6(7-a)x - 3(9-a^2) = 0$, has both roots negative.

Sum of roots $= 2(7-a) < 0$ or $a > 0$, which is not possible as from (i), $a \leq \frac{58}{14}$.

When point of maxima is positive, point of minima is also positive.

Hence, equation $f'(x) = 3x^2 - 6(7-a)x - 3(9-a^2) = 0$ has both roots positive.

Also, some of roots

$$= 2(7-a) > a \text{ or, } a < 7 \quad \dots(ii)$$

product of roots is positive

$$\text{or } -(9-a^2) > 0 \text{ or } a^2 > 9$$

$$\text{or } a \in (-\infty, -3) \cup (3, \infty) \quad \dots(iii)$$

From Eqs. (i), (ii) and (iii),

$$a \in (-\infty, -3) \cup \left(5, \frac{58}{14} \right)$$

For points of extreme of opposite sign, Eq. (i) has roots of opposite sign.

Thus, $a \in (-3, 3)$

28. (a) 29. (b) 30. (b)

31. (a) $\frac{dy}{dx} = \frac{1-9t^2}{-6t} = \tan \theta$

$$\begin{aligned} \Rightarrow 9t^2 - 6 \tan \theta - t - 1 &= 0 \\ \Rightarrow 3t &= \tan \theta \pm \sec \theta \\ \Rightarrow \tan \theta + \sec \theta &= 3t \end{aligned}$$

32. (b) $P \equiv (-2, 2)$ or $t = -1$

or $\left(\frac{dy}{dx} \right)_{t=-1} = -\frac{4}{3}$

Equation of tangent is

$$f - 2 = \frac{-4}{3} (x + 2)$$

Therefore,

$$\begin{aligned} t - 3t^3 - 2 &= \frac{-4}{3} (1 - 3t^2 + 2) \\ \Rightarrow 9t^3 + 12t^2 - 3t - 6 &= 0 \\ \Rightarrow 3t^3 + 4t^2 - t - 2 &= 0 \\ \Rightarrow (3t - 2)(t + 1)^2 &= 0 \\ \Rightarrow t = \frac{2}{3} \text{ or } Q &= \left(\frac{-1}{3}, \frac{-2}{3} \right) \end{aligned}$$

33. (a) The equation of tangent

$$y - 2 = -\frac{4}{3}(x - 2)$$

$$\begin{aligned} \Rightarrow 3y - 6 &= -4x - 8 \\ \Rightarrow 4x - 3y - 6 + 8 &= 0 \\ \Rightarrow 4x - 3y + 2 &= 0 \end{aligned}$$

34. (d) We note that $f(c) = 0, f'(c) = 0$. Also, tangent to $f'(x)$ at $x = c$ is $y = 0$. So $f''(c) = 0$

Thus, $x = c$ is the repeated root of third order that is, the equation $f(x) = 0$ has atleast three repeated roots.

35. (b) We have $f''(c) = 0$. So, the graph of $y = f(x)$ has one point of inflection at $x = c$.

36. (d) As $f(x)$ is a decreasing function for all $x \in (a, b)$, $f(x)$ has no local maxima or minima.

37. (a) Given curve is $y = x^2 - 4x + 3$

Now, differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 2x - 4 = 2(x - 2) \quad \dots(i)$$

Here, at $x = 2, \frac{dy}{dx} = 0$

i.e. for the the given curve only one tangent is possible because slope of tangent parallel to X -axis is zero.

Now, on differentiating w.r.t. x ,

$$f'(x) = e^x > 0, \forall x \in R$$

So, $f(x) = e^x$ is an increasing function.

39. (b) Given that,

$$\begin{aligned} x &= t^2 + 3t - 8 \\ \text{and } y &= 2t^2 - 2t - 5 \end{aligned}$$

Now, $\frac{dx}{dt} = 2t + 3$

and $\frac{dy}{dt} = 4t - 2$

\therefore Slope of the tangent to the curve

$$\begin{aligned} &= \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{4t - 2}{2t + 3} \\ \left(\frac{dy}{dx} \right)_{t=2} &= \frac{4(2) - 2}{2(2) + 3} = \frac{8 - 2}{4 + 3} = \frac{6}{7} \end{aligned}$$

40. (d) For options (a) and (b) by graph, Here, $\sin x$ is differentiable.

at $x = \frac{\pi}{2}, \frac{3\pi}{4}$

For option (c), $y^2 = 4ax$ which is differentiable at origin.

41. (b) Let $y = |x|$

$$y = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

So, the minimum value of $|x|$ is zero.

42. (c) $f(x) = x^3 - 3x^2 + 6$

On differentiating it w.r.t. x , we get

$$f'(x) = 3x^2 - 6x = 3x(x - 2)$$

For increasing,

$$f'(x) > 0 \Rightarrow 3x(x - 2) > 0$$

$\therefore x \in (-\infty, 0) \cup (2, \infty)$

$\Rightarrow x > 2$ or $x < 0$

43. (d) Given, $\frac{dr}{dt} = 3 \text{ cm/s}$
 Since, area of circle (A) = πr^2
 On differentiating w.r.t. t , we get
 $\frac{dA}{dt} = 2\pi r \frac{dr}{dt} = 2\pi \times 10 \times 3 = 60\pi \text{ cm}^2/\text{s}$ [$\because r = 10 \text{ cm}$]

44. (c) Given function, $f(x) = x^2 - 4x, x \in [0, 4]$.
 On differentiating w.r.t. x , we get $f'(x) = 2x - 4$
 For max or min of $f(x)$, $f'(x) = 0$
 $\Rightarrow 2x - 4 = 0 \Rightarrow x = 2$
 Again, on differentiating w.r.t. x , we get
 $f''(x) = 2 > 0$ [minimum]
 Hence, $f(x)$ is minimum at $x = 2$.

45. (a) Given curve, $y = xe^x$
 On differentiating w.r.t. x , we get
 $\frac{dy}{dx} = x \cdot e^x + e^x \cdot 1 = xe^x + e^x$
 For max and min of y , $\frac{dy}{dx} = 0 \Rightarrow e^x(x + 1) = 0 \Rightarrow x = -1$ [$\because e^x \neq 0$]
 Again, on differentiating w.r.t. x , we get,
 $\frac{d^2y}{dx^2} = x \cdot e^x + e^x \cdot 1 + e^x = xe^x + 2e^x$
 $\left(\frac{d^2y}{dx^2}\right)_{\text{at } x=-1} = (-1)e^{-1} + 2e^{-1} = \frac{1}{e} > 0$ [minimum]
 $\therefore f(x)$ have minimum value at $x = -1$.
 Hence, its minimum value is $y(-1) = (-1)e^{-1} = -\frac{1}{e}$

46. (c) I. The derivative where the function attains maxima or minima must be zero.
 II. If a function is differentiable at a point, then it must be continuous at that point but if a function is continuous at a point, then it is not necessarily that function is differentiable at that point. So, both statements are correct.

47. (a) Given functions, $f(x) = x^3 + 2x^2 - 4x + 6$
 and $f'(x) = 3x^2 + 4x - 4$
 Now, for maximum or minimum of $f(x)$, put $f'(x) = 0$.
 $\Rightarrow 3x^2 + 4x - 4 = 0 \Rightarrow 3x^2 + 6x - 2x - 4 = 0$
 $\Rightarrow (x + 2)(3x - 2) = 0 \Rightarrow x = -2, \frac{2}{3}$
 Now, $f''(x) = 6x + 4$, At $x = -2$,
 $f''(-2) = 6(-2) + 4 = -12 + 4 = -8 < 0$ [maximum]
 So, maximum value of the function $f(x)$ exists at $x = -2$.

48. (c) Given function, $f(x) = |x - 4|$
 Graph of $f(x)$,
 From graph, we observe that $f(x)$ has minimum value at $x = 4$.

49. (b) Let $A(a \cos \theta, b \sin \theta)$ be any point on an ellipse. (Ist quadrant)

Coordinate of $B = \{a \cos(\pi - \theta), b \sin(\pi - \theta)\}$
 $= (-a \cos \theta, b \sin \theta)$ (IIrd quadrant)
 and coordinate of $C = \{a \cos(\pi + \theta), b \sin(\pi + \theta)\}$
 $= (-a \cos \theta, -b \sin \theta)$ (IIIrd quadrant)
 and coordinate of $D = \{a \cos(2\pi - \theta), b \sin(2\pi - \theta)\}$
 $= (a \cos \theta, -b \sin \theta)$ (IV quadrant)
 Now, area of rectangle $ABCD$, $\Delta = CD \times AD = (a \cos \theta + a \cos \theta) \times (b \sin \theta + b \sin \theta)$
 $= 2a \cos \theta \times 2b \sin \theta = 2ab \sin 2\theta$

Here, area of rectangle will be greatest, when $\sin 2\theta$ have its maximum value i.e. $\sin 2\theta = 1$.
 $\therefore \Delta = 2ab \times 1 = 2ab$
 Hence, area of greatest rectangle is equal to $2ab$, when $\sin 2\theta = 1$.

50. (c) We know that, $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is, $\Delta' = \pi ab$
 Area of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is, $\Delta' = \pi ab$
 \therefore Required area = Area of shaded region
 $=$ Area of an ellipse - Area of greatest rectangle
 $= \pi ab - 2ab = ab(\pi - 2)$

Sol. (Q. Nos. 51-52) Given function, $f(x) = \frac{x^2 - x + 1}{x^2 + x + 1}$
 Now, $f'(x) = \frac{[(x^2 + x + 1) \frac{d}{dx}(x^2 - x + 1) - (x^2 - x + 1) \frac{d}{dx}(x^2 + x + 1)]}{(x^2 + x + 1)^2}$
 $\Rightarrow f'(x) = \frac{[(x^2 + x + 1)(2x - 1) - (x^2 - x + 1)(2x + 1)]}{(x^2 + x + 1)^2}$
 $\Rightarrow \frac{f'(x)}{f(x)} = \frac{[2x^3 + 2x^2 + 2x - x^2 - x - 1 - 2x^3 + 2x^2 - 2x - x^2 + x - 1]}{(x^2 + x + 1)^2}$
 $\Rightarrow f'(x) = \frac{2x^2 - 2}{(x^2 + x + 1)^2}$
 For maximum or minimum value of $f(x)$, put $f'(x) = 0$
 $\Rightarrow \frac{2(x^2 - 1)}{(x^2 + x + 1)^2} = 0 \Rightarrow x^2 - 1 = 0 \Rightarrow x = \pm 1$
 Again, $f''(x) = \frac{(x^2 + x + 1)(4x) - (2x^2 - 2)2(x^2 + x + 1)(2x + 1)}{(x^2 + x + 1)^4}$
 $= \frac{4(x^2 + x + 1)[x - (x^2 - 1)(2x + 1)]}{(x^2 + x + 1)^4}$
 $= \frac{4}{(x^2 + x + 1)^3} \times (x - 2x^3 + 2x - x^2 + 1)$
 $= \frac{4 \times (-2x^3 - x^2 + 3x + 1)}{(x^2 + x + 1)^3}$
 At $x = 1$, $f''(1) = \frac{4(-2 - 1 + 3 + 1)}{(1 + 1 + 1)^3} = \frac{4}{27} > 0$ [minimum]
 So, function $f(x)$ is minimum at $x = 1$.
 At $x = -1$, $f''(-1) = \frac{4(2 - 1 - 3 + 1)}{(1 - 1 + 1)^3} = \frac{4 \times (-1)}{(1)^3} = -4 < 0$ [maximum]
 So, function $f(x)$ is maximum at $x = -1$.

51. (d) Now, maximum value of the function.

At $x = -1$, $f(-1) = \frac{1+1+1}{1-1+1} = 3$

52. (b) Now, minimum value of the function

At $x = 1$, $f(1) = \frac{1-1+1}{1+1+1} = \frac{1}{3}$

53. (a) Given curve, $y = \sin^{-1}(\sin^2 x)$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \frac{1}{\sqrt{1-(\sin^2 x)^2}} \cdot \frac{d}{dx}(\sin^2 x)$$

$$\Rightarrow \frac{dy}{dx} = \frac{2 \sin x \cdot \cos x}{\sqrt{1-\sin^4 x}}$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sin 2x}{\sqrt{1-\sin^4 x}}$$

$$\left(\frac{dy}{dx}\right)_{x=0} = \frac{\sin 0}{\sqrt{1-\sin^2 0}} = \frac{0}{\sqrt{1-0}} = 0$$

\therefore Slope of the curve = 0

Hence, slope of the tangent to the given curve = Slope of that curve = 0

54. (c) We know that, slope of the tangent to the given curve

$$= \text{Slope of the given curve} \quad \dots(i)$$

Given curve, $y = e^{2x}$

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = 2e^{2x}$$

$$\Rightarrow \left(\frac{dy}{dx}\right)_{(0,1)} = 2 \cdot e^0 = 2 \times 1 = 2$$

Hence, slope of the given curve = 2

which is also the slope of the tangent to the given curve at $(0, 1)$.

55. (c) Now, equation of tangent to the curve $y = e^{2x}$ at $(0, 1)$ is

$$(y - 1) = \left(\frac{dy}{dx}\right)_{(0,1)} (x - 0)$$

$$\Rightarrow (y - 1) = 2(x - 0) \Rightarrow y - 1 = 2x$$

$$\therefore y = 2x + 1$$

Since, the tangent meet X -axis.

So, put $y = 0$ in equation of tangent, we get

$$0 = 2x + 1 \Rightarrow x = -1/2$$

Hence, $A\left(-\frac{1}{2}, 0\right)$ the tangent to the curve at $(0, 1)$ meet the X -axis.

56. (a) I. Given, function $f(x) = \sin x$

Graph of $\sin x$

From the graph of $\sin x$, we observe that $f(x)$ increases on the interval $(0, \pi/2)$.

II. Given function is $f(x) = \cos x$.
Graph of $\cos x$

From the graph of $\cos x$, we observe that, $f(x)$ decreases on the interval $(0, \pi/2)$.

57. (a) Let b be the height, R be the radius and V be the volume of cylinder. Now, in $\triangle OAB$, we have

$$r^2 = R^2 + \left(\frac{b}{2}\right)^2 \quad \dots(i)$$

$$\left[\because OA = \frac{b}{2} \text{ as } \triangle OAB \cong \triangle OCD\right]$$

Clearly, $V = \pi R^2 b$

$$\Rightarrow V(b) = \pi \left(r^2 - \frac{b^2}{4}\right) b$$

$$V(b) = \pi \left(r^2 b - \frac{b^3}{4}\right) \quad [\text{using Eq. (i)}]$$

$$\Rightarrow V'(b) = \pi \left(r^2 - \frac{3b^2}{4}\right) \quad \dots(ii)$$

For maximum, put $V'(b) = 0$

$$\Rightarrow r^2 = \frac{3b^2}{4} \Rightarrow b^2 = \frac{4r^2}{3}$$

$$\Rightarrow b = \frac{2r}{\sqrt{3}} \quad [\because b > 0]$$

Again, on differentiating Eq. (ii) w.r.t. b , we get

$$V''(b) = \pi \left(\frac{-6b}{4}\right)$$

$$\Rightarrow V''\left(\frac{2r}{\sqrt{3}}\right) = \pi \left(\frac{-6}{4} \times \frac{2r}{\sqrt{3}}\right) < 0$$

Thus, the volume is maximum when,

$$b = \frac{2r}{\sqrt{3}}$$

58. (b) Clearly, volume of cylinder is maximum when, $b = \frac{2r}{\sqrt{3}}$.

Now, by using the relation

$$r^2 = R^2 + \left(\frac{b}{2}\right)^2, \text{ we have}$$

$$R^2 = r^2 - \frac{b^2}{4} = r^2 - \frac{4r^2}{12}$$

$$= \frac{8r^2}{12} = \frac{2r^2}{3}$$

$$\Rightarrow R = \sqrt{\frac{2r^2}{3}} = \frac{\sqrt{2}r}{\sqrt{3}} \quad [\because R > 0]$$

59. (c) Given a rectangular box is to be made from a sheet of size $24'' \times 9''$ by cutting out identical square of side length x from the four corners

Clearly, the length of rectangular box = $24 - 2x$

and the width of rectangular box = $9 - 2x$

Let V be the volume of the box,

$$\therefore V = (24 - 2x) \cdot (9 - 2x) \cdot x$$

$[\because \text{height of box} = x \text{ inch}]$

$$= (216 - 48x - 18x + 4x^2) \cdot x$$

$$V(x) = 4x^3 - 66x^2 + 216x$$

$$\Rightarrow V'(x) = 12x^2 - 132x + 216$$

For maximum, put $V'(x) = 0$

$$\Rightarrow 12x^2 - 132x + 216 = 0$$

$$\Rightarrow x^2 - 11x + 18 = 0$$

$$\Rightarrow (x - 9)(x - 2) = 0$$

$$\Rightarrow x = 9 \text{ or } x = 2$$

Now, $V''(x) = 24x - 132$

$$V''(9) = 216 - 132 = 84 > 0$$

$$V''(2) = 48 - 132 = -84 < 0$$

Thus, volume is maximum, when $x = 2$ inch

60. (a) Volume of box = $(24 - 4)(9 - 4) \cdot 2 = 20 \times 5 \times 2 = 200$ cubic inch

Sol. (Q. Nos. 61-62) We have,

$$f(x) = 0.75x^4 - x^3 - 9x^2 + 7$$

$$\Rightarrow f'(x) = 3x^3 - 3x^2 - 18x$$

$$\Rightarrow f''(x) = 3x(x^2 - x - 6)$$

$$= 3x(x - 3)(x + 2)$$

For critical points, put $f'(x) = 0$

$$\Rightarrow 3x(x - 3)(x + 2) = 0$$

$$\Rightarrow x = 0, x = 3 \text{ or } x = -2$$

Thus, there are only three critical points which could possibly be the point of local maxima or local minima.

Now, the sign of $f'(x)$ is given by

Clearly, -2 and 3 are the points of local minima and 0 is the point of local maxima.

61. (c) The maximum value of the function is given by $f(0) = 7$.

62. (c) Hence, both statements are true.

63. (c) I. Let $f(x) = \frac{e^x + e^{-x}}{2}$
 $\Rightarrow f'(x) = \frac{e^x - e^{-x}}{2} = \frac{1}{2} \left(e^x - \frac{1}{e^x} \right)$
 $= \frac{1}{2} \left(\frac{e^{2x} - 1}{e^x} \right) \dots(i)$

Now, for $x \geq 0$, we have $2x \geq 0$

$$= e^{2x} \geq e^0$$

[$\because e^x$ is an increasing function]

$$= e^{2x} \geq 1$$

Also, for $x \geq 0 \Rightarrow e^x \geq 1$

\therefore From Eq. (i), we have

$$f'(x) = \frac{1}{2} \left(\frac{e^{2x} - 1}{e^x} \right) \geq 0$$

So, $f(x)$ is increasing function on $(0, \infty)$.

II. Let $g(x) = \frac{e^x - e^{-x}}{2}$

$$\Rightarrow g'(x) = \frac{e^x + e^{-x}}{2} > 0$$

[$\because e^x$ and e^{-x} both are greater than zero in $(-\infty, \infty)$]

So, $g(x)$ is an increasing function on $(-\infty, \infty)$.

Hence, both the statements are true.

64. (b) We have, $f(x) = \frac{x^2 - 1}{x^2 + 1}$
 $\Rightarrow f'(x) = \frac{(x^2 + 1)(2x) - (x^2 - 1)(2x)}{(x^2 + 1)^2}$
 $= \frac{2x(x^2 + 1 - x^2 + 1)}{(x^2 + 1)^2}$
 $= \frac{2x(2)}{(x^2 + 1)^2} = \frac{4x}{(x^2 + 1)^2}$

For critical points, put $f'(x) = 0$

$$\Rightarrow \frac{4x}{(x^2 + 1)^2} = 0 \Rightarrow 4x = 0$$

$$\therefore x = 0$$

65. (c) Thus, $x = 0$ is the only critical point which could possibly be the point of minima.

Note that for values close to 0 and to the right of 0, $f'(x) > 0$ and for values close to 0 and to the left of 0, $f'(x) < 0$.

Therefore, by first derivative test, $x = 1$ is a point of minima and the minimum value of $f(x)$ is given by

$$f(0) = \frac{0 - 1}{0 + 1} = -1$$

66. (c) I. We have, $f(x) = x^3, x \in R$

$$\Rightarrow f'(x) = 3x^2 \geq 0$$

$\Rightarrow f$ is increasing function.

So, f is one-one.

Hence, f is invertible on their range.

II. We have, $f(x) = \sin x, 0 < x < 2\pi$

$$\text{Clearly, } f\left(\frac{\pi}{3}\right) = \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2}$$

$$\text{and } f\left(\frac{2\pi}{3}\right) = \sin\left(\pi - \frac{\pi}{3}\right)$$

$$= \sin\left(\frac{\pi}{3}\right) = \frac{\sqrt{3}}{2}$$

So, f is not one-one.

Hence, f is not invertible on their range.

III. We have, $f(x) = e^x, x \in IR$

$$\Rightarrow f'(x) = e^x > 0$$

So, f is increasing function.

$\Rightarrow f$ is one-one.

Hence, f is invertible on their range.

67. (c) We have, $f(x) = x^2 e^{-x}$

$$\Rightarrow f'(x) = x^2 e^{-x} (-1) + e^{-x} \cdot 2x$$

$$= e^{-x} (-x^2 + 2x)$$

$$= e^{-x} (2 - x)x$$

Since, $f(x)$ is monotonically increasing.

$$\therefore f'(x) > 0$$

$$\Rightarrow e^{-x} x(2 - x) > 0 \text{ or } x(x - 2) < 0$$

Hence, $0 < x < 2$

68. (c) I. We have,

$$f(x) = x^2 + 2 \cos x$$

On differentiating w.r.t. x , we get

$$f'(x) = 2x - 2 \sin x$$

Here, $f'(x) > 0$ in the interval $(0, \pi)$.

$\therefore f(x)$ is increasing function.

II. We have, $f(x) = \ln(\sqrt{1+x^2} - x)$

On differentiating w.r.t. x , we get

$$f'(x) = \frac{1}{(\sqrt{1+x^2} - x)} \times \left(\frac{x}{\sqrt{1+x^2}} - 1 \right)$$

Here, $f'(x) < 0$ in the interval $(-\infty, \infty)$.

$\therefore f(x)$ is decreasing function.

69. (c) I. We have, $f(x) = \ln x$

$$\therefore f'(x) = \frac{1}{x}$$

Here, $f'(x) > 0$ in the interval $(0, \infty)$.

$\therefore f(x)$ is increasing function in $(0, \infty)$.

II. We have, $f(x) = e^x - x(\ln x)$

$$\therefore f'(x) = e^x - \ln x - x \cdot \frac{1}{x}$$

$$= e^x - \ln x - 1$$

Here, $f'(x) > 0$ in the interval $(1, \infty)$.

$\therefore f(x)$ is increasing function in $(1, \infty)$.

70. (c) We have,

$$f(x) = \left(\frac{1}{x}\right)^{2x^2} = x^{-2x^2}$$

$$= e^{-2x^2 \log x}$$

$$\therefore f'(x) = e^{-2x^2 \log x}$$

$$\left[-2x^2 \cdot \frac{1}{x} + \log x(-4x) \right]$$

$$\Rightarrow f'(x) = f(x)(-2x - 4x \log x)$$

For maxima or minima,

put $f'(x) = 0$.

$$\Rightarrow e^{-2x^2} (-2x - 4x \log x) = 0$$

$$\Rightarrow -2x(1 + 2 \log x) = 0$$

$$\Rightarrow x = 0 \text{ or } \log x = -\frac{1}{2}$$

$$\Rightarrow x = e^{-\frac{1}{2}} = \frac{1}{\sqrt{e}}$$

Now, $y''(x) = f'(x)(-2x - 4x \log x)$

$$+ f(x) \left(-2 - 4x \cdot \frac{1}{x} - 4 \log x \right)$$

$$= -6 - 4 \log x$$

$$\therefore y''(x) \text{ is negative at } x = \frac{1}{\sqrt{e}}$$

Hence, $x = \frac{1}{\sqrt{e}}$ is the point of maxima.

71. (c) Given, $y = \left(\frac{1}{x}\right)^{2x^2}, x > 0$

Taking log on both sides, we get

$$\log y = 2x^2 \log \left(\frac{1}{x}\right), x > 0$$

$$\Rightarrow \log y = -2x^2 \log x, x > 0$$

$$\Rightarrow \frac{y'}{y} = - \left(4x \log x + \frac{2x^2}{x} \right)$$

$$\Rightarrow \frac{y'}{y} = -(4x \log x + 2x)$$

$$\Rightarrow \frac{y'}{y} = -2x(2 \log x + 1)$$

$$\Rightarrow y' = -xy(2 \log x + 1)$$

For maximum or minimum, put $y' = 0$

$$\Rightarrow -xy(2 \log x + 1) = 0$$

$$\Rightarrow -x(2 \log x + 1) = 0$$

$\Rightarrow \log x = -\frac{1}{2}$ [$\because y > 0, x > 0$]
 $\Rightarrow x = e^{-1/2}$
 Now,
 $y'' = -\left[xy\left(\frac{2}{x}\right) + (2\log x + 1)(y + xy')\right]$
 $\Rightarrow y'' = -[2y + (2\log x + 1)(y + xy')]$
 Now, $(y'')_{x=e^{-1/2}} = -2y$
 $= -2\left(\frac{1}{e^{-1/2}}\right)^{2/e}$
 $= -2(e^{1/2})^{2/e} < 0$
 $\therefore f(x)$ is maximum, when $x = e^{-1/2}$.

Maximum value of the function

$$= \left(\frac{1}{1/\sqrt{e}}\right)^2 \left(\frac{1}{\sqrt{e}}\right)^2 = (\sqrt{e})^{2/e}$$

$$= [(\sqrt{e})^2]^{1/e} = (e)^{1/e}$$

72. (a) Given, $f(x) = -2x^3 - 9x^2 - 12x + 1$

On differentiating both sides w.r.t. x , we get $f'(x) = -6x^2 - 18x - 12$

For $f(x)$ to be increasing function, $f'(x) > 0$

$$\therefore -6x^2 - 18x - 12 > 0$$

$$\Rightarrow x^2 + 3x + 2 < 0$$

$$\Rightarrow (x + 2)(x + 1) < 0$$

$$\therefore -2 < x < -1$$

73. (d) Given, $f(x) = -2x^3 - 9x^2 - 12x + 1$

$\Rightarrow f'(x) = -6x^2 - 18x - 12$

For $f(x)$ to be decreasing function, $f'(x) < 0$

$$\therefore -6x^2 - 18x - 12 < 0$$

$$\Rightarrow x^2 + 3x + 2 > 0$$

$$\Rightarrow (x + 2)(x + 1) > 0$$

$$\therefore x \in (-\infty, -2) \cup (-1, \infty)$$

74. (c) Given, $x + |y| = 2y$

$$x + y = 2y, \text{ for } y > 0$$

$$\Rightarrow y = x$$

and $x - y = 2y, \text{ for } y < 0$

$$\Rightarrow y = \frac{1}{3}x$$

Graph of $x + |y| = 2y$

From the graph, y as a function of x defined for all real x and y as function of x is not differentiable at $x = 0$.

Hence, Statements I and III are incorrect.

75. (d) Given, $x + |y| = 2y$

When, $x < 0, y < 0$

$$\therefore y = \frac{1}{3}x$$

\therefore Derivative of y as a function of x w.r.t. x for $x < 0$ is $\frac{1}{3}$

$$\left[\therefore \frac{dy}{dx} = \frac{1}{3}(1) = \frac{1}{3} \right]$$

Sol. (Q. Nos. 76-77) Given,

$$f(x) = (x - 1)^2 (x + 1) (x - 2)^3$$

On differentiating both sides w.r.t. x , we get

$$f'(x) = (x - 1)^2 \frac{d}{dx} [(x + 1)(x - 2)^3]$$

$$+ (x + 1)(x - 2)^3 \frac{d}{dx} (x - 1)^2$$

$$= (x - 1)^2 [(x + 1)3(x - 2)^2 + (x - 2)^3]$$

$$+ (x + 1)(x - 2)^3 \cdot 2(x - 1)$$

$$= 3(x - 1)^2 (x + 1)(x - 2)^2 + (x - 1)^2 (x - 2)^3 + 2(x + 1)(x - 2)^3 (x - 1)$$

$$= (x - 2)^2 (x - 1) [3(x - 1)(x + 1) + (x - 1)(x - 2) + 2(x + 1)(x - 2)]$$

$$= (x - 2)^2 (x - 1) [(3x^2 - 3) + (x^2 - 3x + 2) + 2x^2 - 2x - 4]$$

$$= (x - 2)^2 (x - 1) (6x^2 - 5x - 5)$$

Put $f'(x) = 0$

$$\Rightarrow x = 2, 1, \frac{5 - \sqrt{145}}{12}, \frac{5 + \sqrt{145}}{12}$$

Now,

$$f''(x) = 2(x - 2)(3x - 5)(5x^2 - 5x - 1)$$

For $x = 2, f''(x) = 0$

For $x = 1, f''(x) < 0$

Hence, at $x = 1$, there is local maxima.

$$\text{For } x = \frac{5 \pm \sqrt{145}}{12}, f''(x) > 0$$

Hence, at $x = \frac{5 \pm \sqrt{145}}{12}$, there is local minima.

76. (c) 77. (b)

Sol. (Q. Nos. 78-80)

Given, $f(x) = |x - 1| + x^2$

$$\therefore f(x) = \begin{cases} x^2 + x - 1, & \text{for } x > 1 \\ x^2 - x + 1, & \text{for } x < 1 \end{cases}$$

78. (b) \therefore There is a sharp edge at point $(1, 1)$ in the graph of $y = |x - 1| + x^2$.

$\therefore f(x)$ is continuous but not differentiable at $x = 1$.

79. (b) From the graph between $(-\infty, \frac{1}{2})$,

$f(x)$ decreases, when x increases.

$\therefore f(x)$ is decreasing in $(-\infty, \frac{1}{2})$.

and from the graph between $(\frac{1}{2}, \infty)$,

$f(x)$ increases, when x increases.

$\therefore f(x)$ is increasing in $(\frac{1}{2}, \infty)$.

80. (c) From the graph, there is only one minimum point which is at point $(\frac{1}{2}, \frac{3}{4})$.

$$\left[\therefore \text{when } x = \frac{1}{2}, \text{ then } y = \left| \frac{1}{2} - 1 \right| + \frac{1}{4} = \frac{3}{4} \right]$$

$\therefore f(x)$ has local maxima at one point only in $(-\infty, \infty)$.

23

INDEFINITE INTEGRALS

In NDA exam, generally 3-4 questions are asked from this chapter, which are based on integration by substitution, by parts.

Integration is the inverse process of differentiation and is therefore also called anti-differentiation. The function thus obtained is known as anti-derivative or primitive or integral of given function.

INDEFINITE INTEGRALS

Let $f(x)$ be a function. Then, the collection of all its primitives is called the indefinite integral of $f(x)$ and is denoted by $\int f(x)dx$. Integration as inverse operation of differentiation. If $\frac{d}{dx}\{\phi(x)\} = f(x)$, then $\int f(x)dx = \phi(x) + C$, where C is called the constant of integration or arbitrary constant.

Symbols $f(x) \rightarrow$ Integrand

$f(x)dx \rightarrow$ Element of integration

$\int \rightarrow$ Sign of integral

$\phi(x) \rightarrow$ Anti-derivative or primitive or integral of function $f(x)$

The process of finding functions whose derivative is given, is called anti-differentiation or integration.

Integration of Some Elementary Functions

$$(i) \frac{d}{dx}(x) = 1; \int dx = x + C$$

$$(ii) \frac{d}{dx}\left(\frac{x^{n+1}}{n+1}\right) = x^n; \int x^n dx = \frac{x^{n+1}}{n+1} + C, n \neq -1$$

$$(iii) \frac{d}{dx}(\log|x|) = \frac{1}{x}; \int \frac{1}{x} dx = \log|x| + C$$

$$(iv) \frac{d}{dx}(e^x) = e^x; \int e^x dx = e^x + C$$

$$(v) \frac{d}{dx}\left(\frac{a^x}{\log a}\right) = a^x; \int a^x dx = \frac{a^x}{\log a} + C$$

$$(vi) \frac{d}{dx}(\cos x) = -\sin x; \int \sin x dx = -\cos x + C$$

$$(vii) \frac{d}{dx}(\sin x) = \cos x; \int \cos x dx = \sin x + C$$

$$(viii) \frac{d}{dx}(\sec x) = \sec x \tan x; \int \sec x \tan x dx = \sec x + C$$

- (ix) $\frac{d}{dx}(\operatorname{cosec} x) = -\operatorname{cosec} x \cot x$;
 $\int \operatorname{cosec} x \cot x \, dx = -\operatorname{cosec} x + C$
- (x) $\frac{d}{dx}(\tan x) = \sec^2 x$; $\int \sec^2 x \, dx = \tan x + C$
- (xi) $\frac{d}{dx}(\cot x) = -\operatorname{cosec}^2 x$; $\int \operatorname{cosec}^2 x \, dx = -\cot x + C$
- (xii) $\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$; $\int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x + C$
- (xiii) $\frac{d}{dx}(\cos^{-1} x) = \frac{-1}{\sqrt{1-x^2}}$; $\int \frac{dx}{\sqrt{1-x^2}} = -\cos^{-1} x + C$
- (xiv) $\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$; $\int \frac{dx}{1+x^2} = \tan^{-1} x + C$
- (xv) $\frac{d}{dx}(\cot^{-1} x) = -\frac{1}{1+x^2}$; $\int \frac{dx}{1+x^2} = -\cot^{-1} x + C$
- (xvi) $\frac{d}{dx}(\sec^{-1} x) = \frac{-1}{|x|\sqrt{x^2-1}}$; $\int \frac{dx}{|x|\sqrt{x^2-1}} = \sec^{-1} x + C$
- (xvii) $\frac{d}{dx}(\operatorname{cosec}^{-1} x) = \frac{-1}{|x|\sqrt{x^2-1}}$; $\int \frac{-dx}{|x|\sqrt{x^2-1}} = \operatorname{cosec}^{-1} x + C$
- (xviii) $\int \tan x \, dx = \log |\sec x| + C = -\log |\cos x| + C$
- (xix) $\int \cot x \, dx = \log |\sin x| + C$
- (xx) $\int \sec x \, dx = \log |\sec x + \tan x| + C = \log \tan\left(\frac{\pi}{4} + \frac{x}{2}\right) + C$
- (xxi) $\int \operatorname{cosec} x \, dx = \log |\operatorname{cosec} x - \cot x| + C$

EXAMPLE 1. Evaluate $\int \frac{x^{1/3} - x^{1/2} + 1}{\sqrt{x}} \, dx$.

- a. $\frac{5}{6}x^{5/6} - x + 2x^{1/2} + C$
- b. $\frac{6}{5}x^{5/6} - x + 2x^{1/2} + C$
- c. $\frac{6}{5}x^{5/6} - x + \frac{1}{2}x^{1/2} + C$
- d. None of these

Sol. b. We have,

$$\begin{aligned} \int \frac{x^{1/3} - x^{1/2} + 1}{x^{1/2}} \, dx &= \int \frac{x^{1/3}}{x^{1/2}} \, dx - \int \frac{x^{1/2}}{x^{1/2}} \, dx + \int \frac{1}{x^{1/2}} \, dx \\ &= \int x^{-1/6} \, dx - \int dx + \int x^{-1/2} \, dx = \frac{x^{5/6}}{(5/6)} - x + \frac{x^{1/2}}{(1/2)} + C \\ &= \frac{6}{5}x^{5/6} - x + 2x^{1/2} + C \end{aligned}$$

EXAMPLE 2. Evaluate $\int \sqrt{1 + \sin 2x} \, dx$.

- a. $\sin x + C$
- b. $\cos x + C$
- c. $\sin x - \cos x + C$
- d. $\sin x + \cos x + C$

Sol. c. $\int \sqrt{1 + \sin 2x} \, dx = \int \sqrt{(\cos^2 x + \sin^2 x + 2\sin x \cos x)} \, dx$
 $= \int \sqrt{(\cos x + \sin x)^2} \, dx = \int \cos x \, dx + \int \sin x \, dx$
 $= \sin x - \cos x + C$

Properties of Integration

- (i) $\int \alpha f(x) \, dx = \alpha \int f(x) \, dx$, where α is any arbitrary constant.
- (ii) $\int [f(x) \pm g(x)] \, dx = \int f(x) \, dx \pm \int g(x) \, dx$, this can be generalised for n integrable function.
- (iii) $\frac{d}{dx} \int [f(x) \, dx] = f(x)$
- (iv) $\int f(x) \, dx = g(x) + C \Rightarrow \int f(ax + b) \, dx = \frac{g(ax + b)}{a} + C$

Integration by Substitution

Sometimes, a given integral can be reduced to a standard form by using a suitable substitution. Consider the integral

$$I = \int f(g(x)) \cdot g'(x) \, dx$$

Here, we substitute $g(x) = t$ and $g'(x) \, dx = dt$

Then, given integral reduces to $I = \int f(t) \, dt$

In standard form, we can easily simplify it.

Important Substitution

Expression	Substitution
1. $a^2 + x^2, \sqrt{x^2 + a^2}, \frac{1}{\sqrt{x^2 + a^2}}$	$x = a \tan \theta$ or $a \cot \theta$
2. $a^2 - x^2, \sqrt{a^2 - x^2}, \frac{1}{\sqrt{a^2 - x^2}}$	$x = a \sin \theta$ or $a \cos \theta$
3. $x^2 - a^2, \sqrt{x^2 - a^2}$	$x = a \sec \theta$ or $a \operatorname{cosec} \theta$
4. $\frac{\sqrt{a-x}}{\sqrt{a+x}}$ or $\frac{\sqrt{a+x}}{\sqrt{a-x}}$	$x = a \cos 2\theta$
5. $\frac{\sqrt{x-\alpha}}{\sqrt{\beta-x}}$ or $\sqrt{(x-\alpha)(\beta-x)}$, ($\beta > \alpha$)	$x = \alpha \cos^2 \theta + \beta \sin^2 \theta$

EXAMPLE 3. What is the value of $\int \frac{\sin x}{\sqrt{\sin^2 x - \sin^2 \alpha}} \, dx$?

- a. $\sin^{-1}(\sec \alpha \cos x) + C$
- b. $\cos^{-1}(\sec \alpha \cos x) + C$
- c. $\sinh^{-1}(\sec \alpha \cos x) + C$
- d. $\cosh^{-1}(\sec \alpha \cos x) + C$

Sol. b. Let $I = \int \frac{\sin x}{\sqrt{\sin^2 x - \sin^2 \alpha}} \, dx$

$$= \int \frac{\sin x}{\sqrt{1 - \cos^2 x - \sin^2 \alpha}} \, dx = \int \frac{\sin x}{\sqrt{\cos^2 \alpha - \cos^2 x}} \, dx$$

Put $\cos x = t \Rightarrow -\sin x \, dx = dt$

$$I = -\int \frac{1}{\sqrt{\cos^2 \alpha - t^2}} \, dt = \cos^{-1}\left(\frac{t}{\cos \alpha}\right) + C$$

$$= \cos^{-1}(\sec \alpha \cos x) + C$$

EXAMPLE 4. Evaluate the integral $\int \frac{dx}{x \cos^2(1 + \log x)}$.

- a. $\log |1 + \tan x| + C$ b. $\log |1 - \tan x| + C$
 c. $\tan(1 + \log x) + C$ d. $\tan(1 - \log x) + C$

Sol. c. On substituting $1 + \log x = y$, we get $\frac{dx}{x} = dy$
 $\therefore I = \int \frac{dy}{\cos^2 y} = \int \sec^2 y \, dy = \tan y + C = \tan(1 + \log x) + C$

Integrals of the Form

$$\int \sin^p x \cos^q x \, dx$$

To evaluate the integrals of the form $\int \sin^p x \cos^q x \, dx$, we use the following procedure.

- (i) If p is an odd integer and q is any real number, then substitute $\cos x = y$.
- (ii) If q is an odd integer and p is any real number, then substitute $\sin x = y$.
- (iii) If p and q are both even integers, then expression $\sin^p x$ and $\cos^q x$ in terms of cosines of multiple angles.

EXAMPLE 5. Evaluate the integral $\int \sin^3 x \sqrt{\cos x} \, dx$.

- a. $\frac{2}{3} \cos^{3/2} x + \frac{2}{7} \cos^{7/2} x + C$ b. $-\frac{2}{3} \cos^{3/2} x + \frac{2}{7} \cos^{7/2} x + C$
 c. $\frac{1}{3} \sin^3 x - \frac{1}{5} \sin^5 x + C$ d. $\frac{1}{3} \sin^3 x + \frac{1}{5} \sin^5 x + C$

Sol. b. $I = \int \sin^3 x \sqrt{\cos x} \, dx = \int (\sin x)(\sin^2 x) \sqrt{\cos x} \, dx$
 $= \int \sin x (1 - \cos^2 x) \sqrt{\cos x} \, dx$
 $= - \int (1 - y^2) \sqrt{y} \, dy$ [put $\cos x = y \Rightarrow -\sin x \, dx = dy$]
 $= - \int y^{1/2} \, dy + \int y^{5/2} \, dy = -\frac{2}{3} y^{3/2} + \frac{2}{7} y^{7/2} + C$
 $= -\frac{2}{3} (\cos x)^{3/2} + \frac{2}{7} (\cos x)^{7/2} + C$

Integrals of Some Particular Functions

- (i) $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) + C$
- (ii) $\int \frac{dx}{a^2 - x^2} = \frac{1}{2a} \log \left| \frac{a+x}{a-x} \right| + C$
- (iii) $\int \frac{dx}{x^2 - a^2} = \frac{1}{2a} \log \left| \frac{x-a}{x+a} \right| + C$
- (iv) $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \left(\frac{x}{a} \right) + C$ or $-\cos^{-1} \left(\frac{x}{a} \right) + C$

$$(v) \int \frac{dx}{\sqrt{x^2 - a^2}} = \log |x + \sqrt{x^2 - a^2}| + C$$

$$(vi) \int \frac{dx}{\sqrt{x^2 + a^2}} = \log |x + \sqrt{x^2 + a^2}| + C$$

$$(vii) \int \sqrt{a^2 - x^2} \, dx = \frac{x\sqrt{a^2 - x^2}}{2} + \frac{a^2}{2} \sin^{-1} \left(\frac{x}{a} \right) + C$$

$$(viii) \int \sqrt{a^2 + x^2} \, dx = \frac{1}{2} x \sqrt{a^2 + x^2} + \frac{1}{2} a^2 \log |x + \sqrt{a^2 + x^2}| + C$$

$$(ix) \int \sqrt{x^2 - a^2} \, dx = \frac{1}{2} x \sqrt{x^2 - a^2} - \frac{1}{2} a^2 \log |x + \sqrt{x^2 - a^2}| + C$$

$$(x) \int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{a} \sec^{-1} \left(\frac{x}{a} \right) + C \text{ or } -\frac{1}{a} \operatorname{cosec}^{-1} \left(\frac{x}{a} \right) + C$$

Integration of Hyperbolic Functions

Some important hyperbolic functions are as follows

- (i) $\int \sinh x \, dx = \cosh x + C$ (ii) $\int \cosh x \, dx = \sinh x + C$
- (iii) $\int \operatorname{sech}^2 x \, dx = \tanh bx + C$
- (iv) $\int \operatorname{cosech}^2 x \, dx = -\cot hx + C$
- (v) $\int \sec hx \tan hx \, dx = -\operatorname{sech} x + C$
- (vi) $\int \operatorname{cosech} x \coth x \, dx = -\operatorname{cosech} x + C$

EXAMPLE 6. Evaluate $\int \frac{x+1}{\sqrt{9-4x^2}} \, dx$.

- a. $\frac{1}{4} \sqrt{9-4x^2} + \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C$
- b. $\frac{1}{4} \sqrt{9-4x^2} - \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C$
- c. $-\frac{1}{4} \sqrt{9-4x^2} + \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C$
- d. $-\frac{1}{4} \sqrt{9-4x^2} - \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C$

Sol. c. Let $I = \int \frac{x \, dx}{\sqrt{9-4x^2}} + \int \frac{dx}{\sqrt{9-4x^2}} = I_1 + I_2$ [say]

Now, $I_1 = \int \frac{x \, dx}{\sqrt{9-4x^2}}$. Put $9-4x^2 = y^2 \Rightarrow x \, dx = -\left(\frac{1}{4}\right) y \, dy$

$$I_1 = -\frac{1}{4} \int \frac{y \, dy}{\sqrt{y^2}} = -\frac{1}{4} \int dy = -\frac{1}{4} y + C_1 = -\frac{1}{4} \sqrt{9-4x^2} + C_1$$

$$I_2 = \int \frac{dx}{\sqrt{9-4x^2}} = \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C_2$$

$$\therefore I = -\frac{1}{4} \sqrt{9-4x^2} + \frac{1}{2} \sin^{-1} \left(\frac{2}{3} x \right) + C$$

where, $C = C_1 + C_2$ is another arbitrary constant.

Integration by Parts

This method is mainly used when the integral is the product of two functions. Let $f(x)$ and $g(x)$ be two differentiable functions of x . Then,

$$\int f(x)g(x)dx = f(x)\left[\int g(x)dx\right] - \int \left[\frac{d}{dx} f(x) \cdot \int g(x)dx\right] dx$$

While integrating by parts we use the order ILATE, i.e. inverse trigonometric function, logarithmic function, algebraic function, trigonometric function, exponent function.

EXAMPLE 7. Evaluate $\int \tan^{-1}x dx$.

- a. $x \tan^{-1}x + \frac{1}{2} \log(1+x^2) + C$
- b. $x \tan^{-1}x - \frac{1}{2} \log(1+x^2) + C$
- c. $x \tan^{-1}x + \frac{1}{2} \log(1-x^2) + C$
- d. None of these

Sol. b. Taking $\tan^{-1}x$ as the first function and 1 as the second function.

$$\therefore \int 1 \cdot \tan^{-1}x dx \Rightarrow I = x \tan^{-1}x - \int \frac{x}{1+x^2} dx$$

Put $1+x^2 = y \Rightarrow x dx = \frac{dy}{2}$

$$\begin{aligned} \therefore I &= x \tan^{-1}x - \frac{1}{2} \int \frac{dy}{y} = x \tan^{-1}x - \frac{1}{2} \log y + C \\ &= x \tan^{-1}x - \frac{1}{2} \log(1+x^2) + C \end{aligned}$$

Evaluation of Various Forms of Integral using Standard Results

- $\int \frac{dx}{ax^2 + bx + c}$ express $ax^2 + bx + c$ as sum or difference of two squares, i.e.

$$ax^2 + bx + c = a \left[\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a^2} \right]$$

Integration of Rational Functions

If the integrand of $f(x)$ is a rational function of the form $f(x) = P(x)/Q(x)$, where $P(x)$ and $Q(x)$ are polynomials in x , then it is sometimes possible to express the integrals in terms of elementary functions by partial fraction etc.

The following table represents how a rational fraction should be broken into partial fractions

S. No.	Rational Function	Partial Function
1.	$\frac{(x + \alpha_1)(x + \alpha_2) \dots (x + \alpha_m)}{(x + \beta_1)(x + \beta_2) \dots (x + \beta_n)}$ (for $m > n$ or $m = n$)	$A + \frac{B}{(x + \beta_1)} + \frac{C}{(x + \beta_2)} + \frac{D}{(x + \beta_3)} + \dots$ where, A is the quotient obtained on dividing numerator by denominator
2.	$\frac{(x + \alpha_1)(x + \alpha_2) \dots (x + \alpha_m)}{(x + \beta_1)(x + \beta_2) \dots (x + \beta_n)}$ ($m < n$)	$\frac{A}{x + \beta_1} + \frac{B}{x + \beta_3} + \frac{C}{x + \beta_2} + \dots$
3.	$\frac{(x + \alpha_1)(x + \alpha_2) \dots (x + \alpha_m)}{(x + \beta_1)^2(x + \beta_2)^3 \dots (x + \beta_n)}$ ($m < n$)	$\frac{A_1}{(x + \beta_1)} + \frac{A_2}{(x + \beta_1)^2} + \frac{B_1}{(x + \beta_2)} + \frac{B_2}{(x + \beta_2)^2} + \frac{B_3}{(x + \beta_3)^3}$
4.	$\frac{(x + \alpha_1)(x + \alpha_2) \dots (x + \alpha_m)}{(x + \beta_1x + \gamma_1)(x^2 + \beta_1x + \gamma_2) \dots (x^2 + \beta_nx + \gamma_n)}$ when denominator has quadratic terms	$\frac{Ax + B}{x^2 + \beta_1x + \gamma_1} + \frac{Cx + D}{x^2 + \beta_2x + \gamma_2} + \dots$

2. $\int \frac{dx}{\sqrt{ax^2 + bx + c}}$ can be reduced to one of the forms

of $\int \frac{dx}{\sqrt{a^2 - x^2}}$, $\int \frac{dx}{\sqrt{x^2 - a^2}}$ or $\int \frac{dx}{\sqrt{x^2 + a^2}}$

3. $\int \frac{(px + q)}{ax^2 + bx + c} dx$, $\int \frac{(px + q)}{\sqrt{ax^2 + bx + c}} dx$, $\int (px + q)\sqrt{ax^2 + bx + c} dx$

Put, $px + q = A \{ \text{differentiation of } (ax^2 + bx + c) \} + B$.

Now, find A and B by comparing the coefficients of x on both sides.

Integrals of Some Special Functions

- (i) $\int e^x \{f(x) + f'(x)\} dx = e^x f(x) + C$
- (ii) $\int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) + C$
- (iii) $\int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx) + C$
- (iv) $\int \frac{f'(x)}{f(x)} dx = \log |f(x)| + C$

EXAMPLE 8. $\int e^x(1 + \tan x + \tan^2 x) dx$ equals

- a. $e^x \sin x + C$
- b. $e^x \cos x + C$
- c. $e^x \tan x + C$
- d. $e^x \sec x + C$

Sol. c. $I = \int e^x(1 + \tan x + \tan^2 x) dx$

$$= \int e^x(\tan x + \sec^2 x) dx$$

$$= e^x \tan x + C \quad [\because \int e^x [f(x) + f'(x)] = e^x f(x) + C]$$

EXAMPLE 9. Evaluate $\int \frac{\sin x dx}{(1 + \cos x)(2 + \cos x)}$.

- a. $\log \frac{(1 + \cos x)}{(2 + \cos x)} + C$ b. $\log \frac{(2 + \cos x)}{(1 + \cos x)} + C$
 c. $\log \frac{(1 + \sin x)}{(2 + \sin x)} + C$ d. $\log \frac{(2 + \sin x)}{(1 + \sin x)} + C$

Sol. b. Put, $\cos x = y$

$$\Rightarrow -\sin x dx = dy$$

$$\therefore I = -\int \frac{dy}{(1+y)(2+y)} \Rightarrow I = -\int \left[\frac{1}{1+y} - \frac{1}{2+y} \right] dy$$

$$= -[\log(1+y) - \log(2+y)] + C$$

$$\Rightarrow I = \log \left(\frac{2+y}{1+y} \right) + C \Rightarrow I = \log \frac{(2 + \cos x)}{(1 + \cos x)} + C$$

EXAMPLE 10. $\int \frac{x^2 dx}{(x^2 + 2)(x^2 + 3)}$ equals

- a. $-\sqrt{2} \tan^{-1} x + \sqrt{3} + \tan^{-1} x + C$
 b. $\sqrt{2} \tan^{-1} \frac{x}{\sqrt{2}} + \sqrt{3} \tan^{-1} \frac{x}{\sqrt{3}} + C$
 c. $-\sqrt{2} \tan^{-1} \frac{x}{\sqrt{2}} + \sqrt{3} \tan^{-1} \frac{x}{\sqrt{3}} + C$
 d. None of the above

Sol. c. We have, $\int \frac{x^2 dx}{(x^2 + 2)(x^2 + 3)} = \int \left[\frac{3}{x^2 + 3} - \frac{2}{x^2 + 2} \right] dx$

$$= \frac{3}{\sqrt{3}} \tan^{-1} \left(\frac{x}{\sqrt{3}} \right) - \frac{2}{\sqrt{2}} \tan^{-1} \left(\frac{x}{\sqrt{2}} \right) + C$$

$$= \sqrt{3} \tan^{-1} \left(\frac{x}{\sqrt{3}} \right) - \sqrt{2} \tan^{-1} \left(\frac{x}{\sqrt{2}} \right) + C$$

> PRACTICE EXERCISE

1. $\int x \sqrt{\frac{1-x}{1+x}} dx$ is equal to

- (a) $\left(\frac{x}{2} - 1\right) \sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x + C$
 (b) $\left(\frac{x}{2} - 1\right) \sqrt{1-x^2} - \frac{1}{2} \sin^{-1} x + C$
 (c) $\sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x + C$
 (d) None of the above

2. $\int \frac{\sin x - \cos x}{\sqrt{\sin 2x}} dx$ is equal to

- (a) $\log [(\sin x + \cos x) + \sqrt{\sin 2x}] + C$
 (b) $-\log [\sin x + \cos x + \sqrt{\sin 2x}] + C$
 (c) $\log [\sin x - \cos x + \sqrt{\sin 2x}] + C$
 (d) $-\log [\sin x - \cos x + \sqrt{\sin 2x}] + C$

3. $\int \frac{dx}{(1 + \sqrt{x})\sqrt{x-x^2}}$ is equal to

- (a) $\frac{1-\sqrt{x}}{(1-x)^2} + C$ (b) $\frac{2(\sqrt{x}-1)}{\sqrt{1-x}} + C$ (c) $\frac{1+\sqrt{x}}{(1+x)^2} + C$ (d) $\frac{1+\sqrt{x}}{(1-x)^2} + C$

4. What is $\int \frac{e^x(1+x)}{\cos^2(xe^x)} dx$ equal to?

- (a) $xe^x + C$ (b) $\cos(xe^x) + C$
 (c) $\tan(xe^x) + C$ (d) $x \operatorname{cosec}(xe^x) + C$

5. If $\int \frac{dx}{(x-2)^3(x-3)} = \frac{C_1}{x-2} + C_2 \log \left(\frac{x-2}{x-3} \right) + C_3$ is constant of integration, then

- (a) $C_1 = 1, C_2 = 1$ (b) $C_1 = 1, C_2 = -1$
 (c) $C_1 = -1, C_2 = 1$ (d) $C_1 = -1, C_2 = -1$

6. $\int \frac{(x^4 - x)^{1/4}}{x^5} dx$ is equal to

- (a) $\frac{4}{15} \left(1 - \frac{1}{x^3}\right)^{5/4} + C$ (b) $\frac{4}{5} \left(1 - \frac{1}{x^3}\right)^{5/4} + C$
 (c) $\frac{4}{15} \left(1 + \frac{1}{x^3}\right)^{5/4} + C$ (d) None of these

7. $\int \frac{e^{\log(1+1/x^2)}}{x^2 + \frac{1}{x^2}} dx$ is equal to

- (a) $\frac{1}{\sqrt{2}} \tan^{-1} \left(x - \frac{1}{x}\right)$ (b) $-\frac{1}{\sqrt{2}} \tan^{-1} \left(x - \frac{1}{x}\right)$
 (c) $\frac{1}{\sqrt{2}} \log \left(\frac{x^2+1}{x\sqrt{2}}\right)$ (d) $\frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{x^2-1}{x\sqrt{2}}\right)$

8. What is $\int e^x \left(\sqrt{x} + \frac{1}{2\sqrt{x}} \right) dx$ is equal to?

- (a) $xe^x + C$ (b) $e^x(\sqrt{x}) + C$
 (c) $2e^x(\sqrt{x}) + C$ (d) $2xe^x + C$

9. What is $\int e^{\log x} \sin x dx$ equal to?

- (a) $e^{\log x}(\sin x - \cos x) + C$ (b) $(\sin x - x \cos x) + C$
 (c) $(x \sin x + \cos x) + C$ (d) $(\sin x + x \cos x) - C$

10. $\int \frac{\sqrt{x}}{\sqrt{(a^3 - x^3)}} dx$ is equal to

- (a) $\frac{2}{3} \left(\frac{x}{a}\right)^{3/2} + C$ (b) $\frac{2}{3} \sin^{-1} \left(\frac{x}{a}\right)^{3/2} + C$
 (c) $\frac{2}{3} \cos^{-1} \left(\frac{x}{a}\right)^{3/2} + C$ (d) None of these

- 11.** What is $\int \frac{\log x}{(1 + \log x)^2} dx$ equal to?
 (a) $\frac{1}{(1 + \log x)^3} + C$ (b) $\frac{1}{(1 + \log x)^2} + C$
 (c) $\frac{x}{(1 + \log x)} + C$ (d) $\frac{x}{(1 + \log x)^2} + C$
- 12.** What is $\int \tan^2 x \sec^4 x dx$ equal to?
 (a) $\frac{\sec^5 x}{5} + \frac{\sec^3 x}{3} + C$ (b) $\frac{\tan^5 x}{5} + \frac{\tan^3 x}{3} + C$
 (c) $\frac{\tan^5 x}{5} + \frac{\sec^3 x}{3} + C$ (d) $\frac{\sec^5 x}{5} + \frac{\tan^3 x}{3} + C$
- 13.** Let $g(x) = x^3 - 4x + 6$. If $f'(x) = g'(x)$ and $f(1) = 2$, then what is $f(x)$ equal to?
 (a) $x^3 - 4x + 3$ (b) $x^3 - 4x + 6$
 (c) $x^3 - 4x + 1$ (d) $x^3 - 4x + 5$
- 14.** What is $\int \sec x^\circ dx$ equal to?
 (a) $\log(\sec x^\circ + \tan x^\circ) + C$ (b) $\frac{\pi \log \tan\left(\frac{\pi}{4} + \frac{\pi}{2}\right)}{180^\circ} + C$
 (c) $\frac{180^\circ \log \tan\left(\frac{\pi}{4} + \frac{\pi}{2}\right)}{\pi} + C$ (d) $\frac{180^\circ \log \tan\left(\frac{\pi}{4} + \frac{\pi x}{360^\circ}\right)}{\pi} + C$
- 15.** What is $\int (e^x + 1)^{-1} dx$ equal to?
 (a) $\log(e^x + 1) + C$ (b) $\log(e^{-x} + 1) + C$
 (c) $-\log(e^{-x} + 1) + C$ (d) $-(e^x + 1) + C$
- 16.** What is $\int \frac{d\theta}{\sin^2 \theta + 2 \cos^2 \theta - 1}$ equal to?
 (a) $\tan \theta + C$ (b) $\cot \theta + C$ (c) $\frac{1}{2} \tan \theta + C$ (d) $\frac{1}{2} \cot \theta + C$
- 17.** What is $\int \log(x + 1) dx$ equal to?
 (a) $x \log(x + 1) - x + C$ (b) $(x + 1) \log(x + 1) - (x + 1) + C$
 (c) $\frac{1}{x + 1} + C$ (d) $\frac{\log(x + 1)}{x + 1} + C$
- 18.** If $\int \frac{dx}{f(x)} = \log \{f(x)\}^2 + C$, then what is $f(x)$ equal to?
 (a) $2x + \alpha$ (b) $x + \alpha$ (c) $\frac{x}{2} + \alpha$ (d) $x^2 + \alpha$
- 19.** What is $\int \sqrt{x} e^{\sqrt{x}} dx$ equal to?
 (a) $2e^{\sqrt{x}}(x - 2\sqrt{x} + 2) + C$ (b) $2e^{\sqrt{x}}(x + 2\sqrt{x} + 2) + C$
 (c) $2e^{\sqrt{x}}(x + 2\sqrt{x} + 2) + C$ (d) $2e^{\sqrt{x}}(x - 2\sqrt{x} - 2) + C$
- 20.** What is $\int \frac{x^4 + 1}{x^2 + 1} dx$ equal to?
 (a) $\frac{x^3}{3} - x + 4 \tan^{-1} x + C$ (b) $\frac{x^3}{3} + x + 4 \tan^{-1} x + C$
 (c) $\frac{x^3}{3} - x + 2 \tan^{-1} x + C$ (d) $\frac{x^3}{3} - x - 4 \tan^{-1} x + C$

- 21.** What is $\int \frac{\sin \sqrt{x}}{\sqrt{x}} dx$ is equal to?
 (a) $\frac{\cos \sqrt{x}}{2} + C$ (b) $2 \cos \sqrt{x} + C$
 (c) $\frac{-\cos \sqrt{x}}{2} + C$ (d) $-2 \cos \sqrt{x} + C$
- 22.** I. $\int \frac{d(x^2 + 1)}{x^2 + 2}$ is equal to $2\sqrt{x^2 + 2} + C$
 II. $\int \frac{x^{\alpha/2}}{\sqrt{1 + x^{11}}} dx$ is $\frac{2}{11} \ln|x + \sqrt{1 + x^{11}}| + C$
 Which of the following is/are correct?
 (a) Only II (b) Both I and II (c) Only I (d) None of these
- 23.** I. $\int \left(\frac{1}{1 + x^4}\right) dx = \tan^{-1}(x^2) + C$
 II. $\int \left(\frac{1}{1 + x^2}\right) dx = \tan^{-1} x + C$
 Which of the following is/are correct?
 (a) Only II (b) Both I and II (c) Only I (d) None of these

Directions (Q. Nos. 24-25)

If $\int \frac{1}{\sin x (2 \cos^2 x - 1)} dx = -\frac{1}{2} A - B$, then

- 24.** Find the value of A .
 (a) $\log \left| \frac{1 + \cos x}{1 - \cos x} \right|$ (b) $-\log \left| \frac{1 + \cos x}{1 - \cos x} \right|$
 (c) $\log \left| \frac{1 - \cos x}{1 + \cos x} \right|$ (d) $-\log \left| \frac{1 - \cos x}{1 + \cos x} \right|$
- 25.** Find the value of B .
 (a) $\frac{1}{\sqrt{2}} \log \left| \frac{\sqrt{2} \cos x - 1}{\sqrt{2} \cos x + 1} \right| + C$ (b) $\frac{\sqrt{2}}{2} \log \left| \frac{\sqrt{2} \sin x - 1}{\sqrt{2} \sin x + 1} \right| + C$
 (c) $\sqrt{2} \log \left| \frac{\sqrt{2} \cos x - 1}{\sqrt{2} \sin x + 1} \right| + C$ (d) None of these

Directions (Q. Nos. 26-27)

If $\int \frac{1}{a^2 \sin^2 x + b^2 \cos^2 x} dx = \frac{1}{12} \tan^{-1}(3 \tan x) + C$

- 26.** The values of a and b are respectively.
 (a) $\pm 6, \pm 2$ (b) $\pm 7, \pm 3$ (c) $\pm 4, \pm 8$ (d) $\pm 1, \pm 8$
- 27.** Maximum value of $a \sin x + b \cos x$ is
 (a) $\sqrt{41}$ (b) $\sqrt{40}$ (c) $\sqrt{39}$ (d) $\sqrt{38}$

Directions (Q. Nos. 28-29) If

$\int \frac{1}{\sqrt{2ax - x^2}} dx = f \circ g(x) + C$, then

- 28.** The value of $f(x)$ is
 (a) $\cos^{-1} x$ (b) $\tan^{-1} x$ (c) $\sin^{-1} x$ (d) $\cot^{-1} x$

29. The value of $g(x)$ is
 (a) $\frac{x+a}{a}$ (b) $\frac{x-a}{a}$ (c) $\frac{a}{x+a}$ (d) $\frac{a}{x-a}$

Directions (Q. Nos. 30-32)

$$\text{If } \int x^2 e^{-2x} dx = e^{-2x} (ax^2 + bx + c) + D$$

30. The value of a is
 (a) 1 (b) 2 (c) 4 (d) -2
31. The value of c is
 (a) 0 (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{8}$
32. The value of b is
 (a) 4 (b) $\frac{4}{3}$ (c) 1 (d) None of these

PREVIOUS YEARS' QUESTIONS

33. Consider the following
 I. $\int \log 10 dx = x + C$ II. $\int 10^x dx = 10^x + C$
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II (c) Both I and II (d) Neither I nor II
34. What is the value of $\int (x^2 + 1)^{5/2} x dx$?
 (a) $(x^2 + 1)^{7/2} + C$ (b) $\frac{2}{7}(x^2 + 1)^{7/2} + C$
 (c) $\frac{1}{7}(x^2 + 1)^{7/2} + C$ (d) None of these
35. What is the value of $\int \left(\frac{1}{\cos^2 x} - \frac{1}{\sin^2 x} \right) dx$?
 (a) $2 \operatorname{cosec} 2x + C$ (b) $-2 \cot 2x + C$
 (c) $2 \sec 2x + C$ (d) $-2 \tan 2x + C$
36. What is the value of $\int a^x e^x dx$?
 (a) $\frac{a^x e^x}{\ln a} + C$ (b) $a^x e^x + C$
 (c) $\frac{a^x e^x}{\ln(ae)} + C$ (d) None of these
37. What is the value of $\int \frac{\ln x}{x} dx$?
 (a) $\frac{(\ln x)^2}{2} + C$ (b) $\frac{(\ln x)}{2} + C$ (c) $(\ln x)^2 + C$ (d) None of these
38. What is $\int \frac{dx}{x \ln x}$ equal to?
 (a) $\ln(\ln x) + C$ (b) $\ln x + C$ (c) $(\ln x)^2 + C$ (d) None of these
39. What is $\int e^{\ln x} dx$ equal to?
 (a) $xe^{\ln x} + C$ (b) $-xe^{-\ln x} + C$ (c) $x + C$ (d) $\frac{x^2}{2} + C$
40. What is $\int \sin^2 x dx + \int \cos^2 x dx$ equal to?
 (a) $x + C$ (b) $\frac{x^2}{2} + C$ (c) $x^2 + C$ (d) None of these

41. What is $\int \frac{dx}{\sqrt{4+x^2}}$ equal to?
 (a) $\log|\sqrt{4+x^2} + x| + C$ (b) $\log|\sqrt{4+x^2} - x| + C$
 (c) $\sin^{-1}(x/2) + C$ (d) None of these
42. What is $\int (x \cos x + \sin x) dx$ equal to?
 (a) $x \sin x + C$ (b) $x \cos x + C$
 (c) $-x \sin x + C$ (d) $-x \cos x + C$
43. What is $\int e^{e^x} e^x dx$ equal to?
 (a) $e^{e^x} + C$ (b) $2e^{e^x} + C$ (c) $e^{e^x} e^x + C$ (d) $2e^{e^x} e^x + C$

Directions (Q. Nos. 44-45) Read the following information carefully and answer the question given below.

$$\text{Consider } \int x \tan^{-1} x dx = A(x^2 + 1) \tan^{-1} x + Bx + C$$

where, C is the constant of integration.

44. What is the value of A ?
 (a) 1 (b) $\frac{1}{2}$ (c) $-\frac{1}{2}$ (d) $\frac{1}{4}$
45. What is the value of B ?
 (a) 1 (b) $\frac{1}{2}$ (c) $-\frac{1}{2}$ (d) $\frac{1}{4}$

Directions (Q. Nos. 46-47) Read the following information carefully and answer the question given below.

Consider the function $f''(x) = \sec^4 x + 4$ with $f(0) = 0$ and $f'(0) = 0$.

46. What is $f'(x)$ equal to?
 (a) $\tan x - \frac{\tan^3 x}{3} + 4x$ (b) $\tan x + \frac{\tan^3 x}{3} + 4x$
 (c) $\tan x + \frac{\sec^3 x}{3} + 4x$ (d) $-\tan x - \frac{\tan^3 x}{3} + 4x$
47. What is $f(x)$ equal to?
 (a) $\frac{2 \ln \sec x}{3} + \frac{\tan^2 x}{6} + 2x^2$ (b) $\frac{3 \ln \sec x}{2} + \frac{\cot^2 x}{6} + 2x^2$
 (c) $\frac{4 \ln \sec x}{3} + \frac{\sec^2 x}{6} + 2x^2$ (d) $\ln \sec x + \frac{\tan^4 x}{12} + 2x^2$
48. What is $\int \frac{dx}{\sqrt{x^2 + a^2}}$ equal to?
 (a) $\ln \left| \frac{x + \sqrt{x^2 + a^2}}{a} \right| + C$ (b) $\ln \left| \frac{x - \sqrt{x^2 + a^2}}{a} \right| + C$
 (c) $\ln \left| \frac{x^2 + \sqrt{x^2 + a^2}}{a} \right| + C$ (d) None of these

where, C is the constant of integration.

- 49.** What is $\int \frac{xe^x dx}{(x+1)^2}$ equal to? ☑ 2015 I
 (a) $(x+1)^2 e^x + C$ (b) $(x+1)e^x + C$ (c) $\frac{e^x}{x+1} + C$ (d) $\frac{e^x}{(x+1)^2} + C$
 where, C is the constant of integration.

Directions (Q. Nos. 50-51) *The integral*
 $\int \frac{dx}{a \cos x + b \sin x}$ ☑ 2015 I
 is of the form
 $\frac{1}{r} \ln \left[\tan \left(\frac{x+\alpha}{2} \right) \right]$.

- 50.** What is r equal to?
 (a) $a^2 + b^2$ (b) $\sqrt{a^2 + b^2}$
 (c) $a + b$ (d) $\sqrt{a^2 - b^2}$
- 51.** What is α equal to?
 (a) $\tan^{-1} \left(\frac{a}{b} \right)$ (b) $\tan^{-1} \left(\frac{b}{a} \right)$
 (c) $\tan^{-1} \left(\frac{a+b}{a-b} \right)$ (d) $\tan^{-1} \left(\frac{a-b}{a+b} \right)$

Directions (Q. Nos. 52-53) Consider $f'(x) = \frac{x^2}{2} - kx + 1$
 such that $f(0) = 0$ and $f(3) = 15$. ☑ 2015 II

- 52.** The value of k is
 (a) $\frac{5}{3}$ (b) $\frac{3}{5}$ (c) $-\frac{5}{3}$ (d) $-\frac{3}{5}$
- 53.** $f'' \left(-\frac{2}{3} \right)$ is equal to
 (a) -1 (b) $\frac{1}{3}$ (c) $\frac{1}{2}$ (d) 1
- 54.** $\int \frac{dx}{1+e^{-x}}$ is equal to ☑ 2015 II
 (a) $1 + e^x + C$ (b) $\ln(1 + e^{-x}) + C$
 (c) $\ln(1 + e^x) + C$ (d) $2 \ln(1 + e^{-x}) + C$
 where, C is the constant of integration.
- 55.** Let $f(x)$ and $g(x)$ be twice differentiable functions on $[0, 2]$ satisfying $f''(x) = g'(x)$, $f'(1) = 4$, $g'(1) = 6$, $f(2) = 3$ and $g(2) = 9$.
 Then, what is $f(x) - g(x)$ at $x = 4$ equal to? ☑ 2016 I
 (a) -10 (b) -6 (c) -4 (d) 2

> HINTS AND SOLUTIONS

1. (b) $I = \int \frac{x(1-x)}{\sqrt{(1-x^2)}} dx$
 $= \int \frac{x}{\sqrt{(1-x^2)}} dx + \int \frac{-x^2}{\sqrt{(1-x^2)}} dx$
 $= \frac{1}{2} \int \frac{2x}{\sqrt{(1-x^2)}} dx + \int \frac{1-x^2-1}{\sqrt{(1-x^2)}} dx$
 $= -\frac{1}{2} \cdot 2\sqrt{(1-x^2)} + \int \sqrt{(1-x^2)} dx$
 $\quad - \int \frac{1}{\sqrt{(1-x^2)}} dx$
 $= \left(\frac{x}{2} - 1 \right) \sqrt{1-x^2} - \frac{1}{2} \sin^{-1} x + C$

2. (b) N° function $\sin x - \cos x$ is differential coefficient of $-\cos x - \sin x$.
 Hence, we put $\sin x + \cos x = t$
 $\therefore (\cos x - \sin x) dx = dt$
 Also, $1 + \sin 2x = t^2 \Rightarrow \sin 2x = t^2 - 1$
 $\therefore I = - \int \frac{dt}{\sqrt{t^2 - 1}} = - \log [t + \sqrt{t^2 - 1}]$
 $= - \log [\sin x + \cos x + \sqrt{\sin 2x}] + C$

3. (b) $I = \int \frac{dx}{(1+\sqrt{x})\sqrt{x}(\sqrt{1-x})}$
 Put $\sqrt{x} = t \Rightarrow \frac{1}{2\sqrt{x}} dx = dt$
 $I = 2 \int \frac{dt}{(1+t)\sqrt{1-t^2}}$

Put $1+t = \frac{1}{z}$
 $\therefore t = \frac{1-z}{z}$ and $dt = -\frac{1}{z^2} dz$
 $\therefore I = -2 \int \frac{dz}{\sqrt{(2z-1)}} = -2\sqrt{(2z-1)} + C$
 $= -2\sqrt{\frac{2}{1+\sqrt{x}}} - 1 + C$
 $= -2\sqrt{\frac{1-\sqrt{x}}{1+\sqrt{x}}} + C$
 $= -2\sqrt{\frac{(1-\sqrt{x})}{(1-x)}} + C$
 $= \frac{2(\sqrt{x}-1)}{\sqrt{(1-x)}} + C$

4. (c) Hint Let $xe^x = t$

$$\Rightarrow e^x(1+x)dx = dt.$$

5. (b) Breaking the given integral into partial fractions, we get

$$\frac{1}{(x-2)^2(x-3)} = \frac{1}{(x-2)^2} - \frac{1}{x-2} + \frac{1}{x-3}$$

$$\therefore \int \frac{dx}{(x-2)^2(x-3)} = -\int (x-2)^{-2} dx - \int \frac{dx}{x-2} + \int \frac{dx}{x-3}$$

$$= -\frac{(x-2)^{-1}}{-1} - \log(x-2) + \log(x-3) + C_3$$

$$= \frac{1}{x-2} - \log \frac{x-2}{x-3} + C_3$$

$$\therefore C_1 = 1, C_2 = -1$$

6. (a) $I = \int \frac{x \left(1 - \frac{1}{x^3}\right)^{1/4}}{x^5} dx$

$$\text{Put } 1 - \frac{1}{x^3} = t \Rightarrow \frac{3}{x^4} dx = dt$$

$$\therefore 1 = \frac{1}{3} \int t^{1/4} dt = \frac{4}{15} \left(1 - \frac{1}{x^3}\right)^{5/4} + C$$

7. (d) We have, $\int \frac{e^{\log\left(1 + \frac{1}{x^2}\right)}}{x^2 + \frac{1}{x^2}} dx$

$$= \int \frac{\left(1 + \frac{1}{x^2}\right)}{\left(x - \frac{1}{x}\right)^2 + 2} dx$$

$$\text{Take, } x - \frac{1}{x} = t \Rightarrow \left(1 + \frac{1}{x^2}\right) dx = dt$$

$$= \int \frac{dt}{t^2 + 2} = \frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{t}{\sqrt{2}}\right) + C$$

$$= \frac{1}{\sqrt{2}} \tan^{-1} \left(\frac{x^2 - 1}{\sqrt{2}x}\right) + C$$

8. (b) $\int e^x \left(\sqrt{x} + \frac{1}{2\sqrt{x}}\right) dx$

$$= \int e^x \sqrt{x} dx + \frac{1}{2} \int \frac{e^x}{\sqrt{x}} dx$$

$$= e^x \sqrt{x} - \int \frac{1}{2\sqrt{x}} e^x dx + \frac{1}{2} \int \frac{e^x}{\sqrt{x}} dx + C$$

$$= e^x \sqrt{x} + C$$

9. (b) $\int e^{\log x} \sin x dx = \int x \sin x dx$

Now, integrate by parts

$$\Rightarrow -x \cos x + \sin x + C$$

10. (b) We have, $\int \frac{\sqrt{x}}{\sqrt{a^3 - x^3}} dx$

$$\text{Let, } x^{3/2} = t, \frac{3}{2} \sqrt{x} dx = dt$$

$$\text{Now, } \int \frac{2/3 dt}{\sqrt{a^3 - t^2}}$$

$$= \frac{2}{3} \int \frac{dt}{\sqrt{\left(\frac{a^3}{2}\right)^2 - t^2}} = \frac{2}{3} \sin^{-1} \frac{t}{\frac{a^3}{2}} + C$$

$$= \frac{2}{3} \sin^{-1} \left(\frac{x}{a}\right)^{3/2} + C$$

11. (c) Put $\log x = t \Rightarrow \frac{1}{x} dx = dt$

$$\Rightarrow dx = x dt = e^{t-1} dt.$$

$$\text{then, } \int \frac{(t-1)e^{t-1}}{t^2} dt = \int e^{t-1} \left(\frac{1}{t} - \frac{1}{t^2}\right) dt$$

$$= \frac{e^{t-1}}{t} = \frac{x}{(\log x) + 1} + C$$

12. (b) Let $I = \int \tan^2 x (1 + \tan^2 x) \sec^2 x dx$

$$\text{Put } \tan x = t \Rightarrow \sec^2 x dx = dt$$

$$\therefore I = \int (t^2 + t^4) dt = \frac{t^3}{3} + \frac{t^5}{5} + C$$

$$= \frac{\tan^3 x}{5} + \frac{\tan^5 x}{3} + C$$

13. (d) Given, $f'(x) = g'(x)$

On integrating both sides, we get

$$f(x) = g(x) + C$$

$$\Rightarrow f(x) = x^3 - 4x + 6 + C$$

$$\therefore f(1) = 2$$

$$\therefore 2 = 1 - 4 + 6 + C \Rightarrow C = -1$$

$$\therefore f(x) = x^3 - 4x + 5$$

14. (d) Let $I = \int \sec x^\circ dx = \int \sec \frac{\pi x}{180^\circ} dx$

$$\text{Put } \frac{\pi x}{180^\circ} = t \Rightarrow dx = \frac{180^\circ}{\pi} dt$$

$$\therefore I = \int \sec t \cdot \frac{180^\circ}{\pi} dt$$

$$= \frac{180^\circ}{\pi} \log \tan \left(\frac{\pi}{4} + \frac{\pi x}{360^\circ}\right) + C$$

15. (c) Let $I = \int (e^x + 1)^{-1} dx$

$$= \int \frac{1}{e^x + 1} dx = \int \frac{e^{-x}}{1 + e^{-x}} dx$$

$$\text{Put } 1 + e^{-x} = t \Rightarrow -e^{-x} dx = dt$$

$$\therefore I = -\int \frac{1}{t} dt = -\log t + C$$

$$= -\log(1 + e^{-x}) + C$$

16. (a)

17. (b) We have, $\int \log(x+1) dx$

$$\text{Let } u = (1+x) \Rightarrow du = dx$$

$$\int \log(1+x) dx = \int \log u \cdot du$$

$$= \int 1 \cdot \log u \cdot du$$

$$= u \log u - \int \left(\frac{u}{u}\right) du$$

$$= u(\log u - 1) + C$$

$$= (x+1) \{\log(x+1) - 1\} + C$$

18. (c) Let $f(x) = \frac{x}{2} + \alpha$

$$\therefore \int \frac{dx}{(x-2) + \alpha} = \int \frac{2dx}{(x+2\alpha)}$$

$$= 2 \log(x+2\alpha) + C_1$$

$$= \log(x+2\alpha)^2 + C_1$$

$$= \log\left(\frac{x}{2} + \alpha\right)^2 + \log 2^2 + C_1$$

$$= \log\left(\frac{x}{2} + \alpha\right)^2 + C$$

$$= \log\{f(x)\}^2 + C$$

19. (a) Let $\sqrt{x} = t \Rightarrow dx = (2\sqrt{x}) dt$

$$I = \int e^t (\sqrt{x}) \times (2\sqrt{x}) dt$$

$$= 2 \int e^t \cdot t^2 dt$$

$$= 2(t^2 \cdot e^t - \int 2t \cdot e^t dt)$$

$$= 2(t^2 \cdot e^t - 2(t \cdot e^t - \int 1 \cdot e^t dt))$$

$$= 2(t^2 e^t - 2t \cdot e^t + 2e^t) + C$$

$$= 2e^{\sqrt{x}} (x - 2\sqrt{x} + 2) + C$$

20. (c) $\int \frac{x^4 + 1}{x^2 + 1} dx = \int \left(\frac{x^4 - 1}{x^2 + 1} + \frac{2}{x^2 + 1}\right) dx$

$$= \int \left(x^2 - 1 + \frac{2}{x^2 + 1}\right) dx$$

$$= \frac{x^3}{3} - x + 2 \tan^{-1} x + C$$

21. (d) Let $I = \int \frac{\sin \sqrt{x}}{\sqrt{x}} dx$

$$\text{Put } t = \sqrt{x} \Rightarrow dt = \frac{1}{2\sqrt{x}} dx$$

$$I = \int 2 \sin t dt = -2 \cos t + C$$

$$= -2 \cos \sqrt{x} + C$$

22. (c) $I = \int \frac{dt}{\sqrt{1+y}}$, where $x^2 + 1 = t$

$$= 2\sqrt{1+t} + C = 2\sqrt{x^2+2} + C$$

Thus, Statement I is true.

$$I = \int \frac{x^{\alpha/2}}{\sqrt{1+x^{11}}} dx$$

$$\text{Put } x^{11/2} = t, \text{ then}$$

$$I = \frac{2}{11} \ln(x^{11/2} + \sqrt{1+x^{11}}) + C$$

Thus, Statement II is false.

23. (a) $\frac{1}{2} \int \frac{2 dx}{x^2 + \frac{1}{x^2}} = \frac{1}{2} \int \frac{\left(1 + \frac{1}{x^2}\right) dx}{\left(x - \frac{1}{x}\right)^2 + 2}$
- $$= \frac{1}{2} \int \frac{\left(1 - \frac{1}{x^2}\right) dx}{\left(x + \frac{1}{x}\right)^2} - 2$$

Thus, Statement I is false.

$$I = \int \frac{1}{1+x^2} dx = \tan^{-1} x + C$$

Thus, Statement II is true.

Sol. (Q. Nos. 24-25)

$$I = \int \frac{1}{\sin x(2\cos^2 x - 1)} dx$$

Put $\cos x = t$

$$\Rightarrow -\sin x dx = dt$$

$$= \int \frac{1}{\sin x(2t^2 - 1)} \times \left(-\frac{dt}{\sin x}\right)$$

$$= -\int \frac{1}{(1-t^2)(2t^2 - 1)} dt$$

$$\therefore I = -\int \left(\frac{1}{1-t^2} + \frac{2}{2t^2 - 1}\right) dt$$

$$= -\int \frac{1}{1-t^2} dt - 2\int \frac{1}{2t^2 - 1} dt$$

$$= -\int \frac{1}{1-t^2} dt - \sqrt{2} \int \frac{1}{(\sqrt{2}t)^2 - 1^2} d(\sqrt{2}t)$$

$$= -\frac{1}{2} \log \left| \frac{1+t}{1-t} \right| - \frac{\sqrt{2}}{2} \log \left| \frac{\sqrt{2}t-1}{\sqrt{2}t+1} \right| + C$$

$$= -\frac{1}{2} \log \left| \frac{1+\cos x}{1-\cos x} \right| - \frac{1}{\sqrt{2}} \log \left| \frac{\sqrt{2}\cos x - 1}{\sqrt{2}\cos x + 1} \right| + C$$

24. (a) 25. (a)

Sol. (Q. Nos. 26-27) We know that

$$\int \frac{1}{a^2 \sin^2 x + b^2 \cos^2 x} dx$$

$$= \frac{1}{12} \tan^{-1}(3 \tan x) + C$$

26. (a) We have,

$$I = \int \frac{1}{a^2 \sin^2 x + b^2 \cos^2 x} dx$$

$$\Rightarrow I = \int \frac{\sec^2 x}{b^2 + a^2 \tan^2 x} dx$$

$$\Rightarrow I = \frac{1}{a} \int \frac{1}{b^2 + (a \tan x)^2} d(a \tan x)$$

$$\Rightarrow I = \frac{1}{ab} \tan^{-1} \left(\frac{a}{b} \tan x \right) + C$$

Given that, $\frac{1}{12} \tan^{-1}(3 \tan x) + C$

$$= \frac{1}{10} \tan^{-1} \left(\frac{a}{b} \tan x \right) + C$$

$$\therefore ab = 12 \text{ and } \frac{a}{b} = 3$$

$$\Rightarrow a^2 = 36 \Rightarrow a = \pm 6$$

$$\therefore ab = 12 \Rightarrow b = \pm 2$$

27. (b) $a \sin x + b \cos x$

$$= \pm (6 \sin x + 2 \cos x)$$

We know that,

$$-\sqrt{a^2 + b^2} \leq a \sin x + b \cos x$$

$$\leq \sqrt{a^2 + b^2}$$

$$\therefore -\sqrt{40} \leq 6 \sin x + 2 \cos x \leq \sqrt{40}$$

Sol. (Q. Nos. 28-29)

We have,

$$\int \frac{1}{\sqrt{2ax - x^2}} dx$$

$$= \int \frac{1}{\sqrt{a^2 - (x-a)^2}} d(x-a)$$

$$= \sin^{-1} \left(\frac{x-a}{a} \right) + C$$

$$f \circ g(x) + C = \sin^{-1} \left(\frac{x-a}{a} \right) + C$$

$$\Rightarrow f[g(x)] = \sin^{-1} \left(\frac{x-a}{a} \right)$$

$$\Rightarrow f(x) = \sin^{-1} x \text{ and } g(x) = \frac{x-a}{a}$$

28. (c) 29. (b)

Sol. (Q. Nos. 30-32)

$$\int x^2 e^{-2x} dx = e^{-2x}(ax^2 + bx + c) + D$$

On differentiating both sides, we get

$$x^2 e^{-2x} = e^{-2x}(2ax + b) +$$

$$(ax^2 + bx + c)(-2e^{-2x})$$

$$= e^{-2x}[-2ax^2 + 2(a-b)x + b - 2c]$$

$$\Rightarrow a = 1, 2(a-b) = 0, b - 2c = 0$$

$$\Rightarrow a = 1, b = 1 \text{ and } c = 1/2$$

30. (a) 31. (b) 32. (c)

33. (a) I. $\int \log 10 dx = \int 1 \cdot dx = x + C$

II. $\int 10^x dx = \frac{10^x}{\log_e 10} + C$

34. (c) Let $I = \int (x^2 + 1)^{5/2} x dx$

Let $\begin{cases} t = x^2 + 1 \\ dt = 2x dx \end{cases}, I = \int t^{5/2} \cdot \frac{dt}{2}$

$$I = \frac{1}{2} \left[\frac{t^{7/2}}{7/2} \right] + C, I = \frac{1}{7} (x^2 + 1)^{7/2} + C$$

$$I = a^x \cdot e^x - \log a \int a^x \cdot e^x dx$$

$$I = a^x \cdot e^x - \log a \cdot I,$$

$$I(1 + \log a) = a^x e^x$$

$$I(\log e + \log a) = a^x e^x$$

$$\Rightarrow I \cdot \log ae = a^x e^x + C$$

$$\Rightarrow I = \frac{a^x e^x}{\log(ae)} + C$$

37. (a) 38. (a) 39. (d)

40. (a) 41. (a)

42. (a) Let $I = \int (x \cos x + \sin x) dx$

$$= \int x \cos x dx + \int \sin x dx$$

$$= (x \sin x - \int \sin x dx) + \int \sin x dx$$

$$= x \sin x + C$$

43. (a) We have, $\int e^{e^x} e^x dx$

Let $e^x = t$

$$\Rightarrow e^x dx = dt = \int e^t dt$$

$$= e^t + C = e^{e^x} + C$$

Sol. (Q. Nos. 44-45)

Given, $\int x \tan^{-1} x dx$

$$= A(x^2 + 1) \tan^{-1} x + Bx + C$$

where, C is the constant of integration

Consider, $\int x \tan^{-1} x dx$

$$= \tan^{-1} x \cdot \frac{x^2}{2} - \int \frac{d}{dx} (\tan^{-1} x) \cdot \frac{x^2}{2} dx$$

[using integration by parts]

$$= \frac{x^2 \cdot \tan^{-1} x}{2} - \frac{1}{2} \int \frac{x^2}{1+x^2} dx$$

$$= \frac{x^2 \tan^{-1} x}{2} - \frac{1}{2} \left(\int \left(\frac{1+x^2-1}{1+x^2} \right) dx \right)$$

$$= \frac{x^2 \tan^{-1} x}{2} - \frac{1}{2} \left(\int dx - \int \frac{dx}{1+x^2} \right)$$

$$= \frac{x^2 \tan^{-1} x}{2} - \frac{1}{2} (x - \tan^{-1} x) + C$$

$$= \frac{x^2 \tan^{-1} x}{2} - \frac{x}{2} + \frac{\tan^{-1} x}{2} + C$$

$$= \frac{1}{2} (x^2 + 1) \tan^{-1} x - \frac{x}{2} + C$$

44. (b) Clearly, $A = 1/2$, hence option (b) is correct.

45. (c) Clearly, $B = -1/2$, hence option (c) is correct.

46. (b) Clearly, $f'(x) = \int f''(x) dx + C_1$

$$= \int (\sec^4 x + 4) dx + C_1$$

$$= \int \sec^2 x \sec^2 x dx + \int 4 dx + C_1$$

$$= \int (1 + \tan^2 x) \sec^2 x dx + 4x + C_1$$

$$= I_1 + 4x + C_1$$

Now, put $\tan x = t$ in the integral I_1 , then

$$\Rightarrow \sec^2 x \, dx = dt$$

$$\therefore I_1 = \int (1 + t^2) \, dt = t + t^3 / 3 + C'$$

$$= \tan x + \frac{\tan^3 x}{3} + C'$$

$$\therefore f'(x) = \tan x + \frac{\tan^3 x}{3} + 4x + C$$

where, $C = C_1 + C'$
 $\therefore f'(0) = 0 \Rightarrow C = 0$

Thus, $f'(x) = \tan x + \frac{\tan^3 x}{3} + 4x$

47. (a) Clearly, $f(x) = \int f'(x) \, dx + C_2$

$$= \int \left(\tan x + \frac{\tan^3 x}{3} + 4x \right) dx + C_2$$

$$= \int \tan x \, dx + \frac{1}{3} \int \tan^3 x \, dx + 4 \int x \, dx + C_2$$

$$= \int \tan x \, dx + \frac{1}{3} \int \tan x (\sec^2 x - 1) \, dx + 4 \frac{x^2}{2} + C_2$$

$$= \frac{2}{3} \int \tan x \, dx + \frac{1}{3} \int \tan x \cdot \sec^2 x \, dx + 2x^2 + C_2$$

Now, consider, $I_2 = \int \tan x \sec^2 x \, dx$
 Now, put $\tan x = t$

$$\sec^2 x \, dx = dt$$

$$\Rightarrow I_2 = \int t \, dt = \frac{t^2}{2} + C_3 = \frac{\tan^2 x}{2} + C_3$$

$$\therefore f(x) = \frac{2}{3} \ln(\sec x) + \frac{1}{3} \ln(1 + \tan^2 x) + 2x^2 + C_4$$

where, $C_4 = C_2 + \left(\frac{C_3}{3}\right) \Rightarrow f(0) = 0$

$$\Rightarrow 0 = \frac{2}{3} \ln(1) + 0 + 0 + C_4 \Rightarrow C_4 = 0$$

Thus, $f(x) = \frac{2}{3} \ln(\sec x) + \frac{1}{3} \tan^2 x + 2x^2$

Hence, option (a) is correct.

48. (d) Let $I = \int \frac{dx}{\sqrt{x^2 + a^2}}$

$$= \ln|x + \sqrt{x^2 + a^2}| + C,$$

where, C is the constant of integration.

49. (c) Let $I = \int \frac{xe^x}{(x+1)^2} \, dx$

$$= \int e^x \left(\frac{(x+1) - 1}{(x+1)^2} \right) dx$$

$$= \int e^x \left(\frac{1}{x+1} + \left(\frac{-1}{(x+1)^2} \right) \right) dx$$

$$= e^x \left(\frac{1}{x+1} \right) + C$$

$$[\therefore \int e^x (f(x) + f'(x)) \, dx = e^x f(x) + C]$$

Sol. (Q. Nos. 50-51)

Let $I = \int \frac{dx}{a \cos x + b \sin x}$

Put $a = r \sin \alpha$ and $b = r \cos \alpha$

$$\therefore I = \frac{1}{r} \int \frac{dx}{\sin \alpha \cos x + \cos \alpha \sin x}$$

$$= \frac{1}{r} \int \frac{dx}{\sin(x + \alpha)} = \frac{1}{r} \int \operatorname{cosec}(x + \alpha) \, dx$$

$$= \frac{1}{r} \ln \{ \operatorname{cosec}(x + \alpha) - \cot(x + \alpha) \} + C$$

$$= \frac{1}{r} \ln \left(\frac{1}{\sin(x + \alpha)} - \frac{\cos(x + \alpha)}{\sin(x + \alpha)} \right) + C$$

$$= \frac{1}{r} \ln \left(\frac{1 - \cos(x + \alpha)}{\sin(x + \alpha)} \right) + C$$

$$= \frac{1}{r} \ln \left(\frac{2 \sin^2 \left(\frac{x + \alpha}{2} \right)}{2 \sin \left(\frac{x + \alpha}{2} \right) \cos \left(\frac{x + \alpha}{2} \right)} \right) + C$$

$$= \frac{1}{r} \ln \left[\tan \left(\frac{x + \alpha}{2} \right) \right] + C$$

50. (b) $r = \sqrt{a^2 + b^2}$

51. (a) $\alpha = \tan^{-1} \left(\frac{a}{b} \right)$

52. (c) Given, $f'(x) = \frac{x^2}{2} - kx + 1$

On integrating, we get

$$\int f'(x) \, dx = \int \left(\frac{x^2}{2} - kx + 1 \right) dx$$

$$\Rightarrow f(x) = \frac{x^3}{6} - \frac{kx^2}{2} + x + C \quad \dots(i)$$

Given, $f(0) = 0$
 $\therefore 0 = 0 - 0 + 0 + C$
 $\Rightarrow C = 0$

$$\therefore f(x) = \frac{x^3}{6} - \frac{kx^2}{2} + x$$

Given, $f(3) = 15$

$$\therefore 15 = \frac{(3)^3}{6} - \frac{k(3)^2}{2} + 3$$

$$\Rightarrow 15 = \frac{27}{6} - \frac{9}{2}k + 3$$

$$\Rightarrow k = -\frac{5}{3}$$

53. (d) $\therefore f'(x) = \frac{x^2}{2} - k(x) + 1$

$$\Rightarrow f'(x) = \frac{x^2}{2} - \left(\frac{-5}{3} \right)x + 1 \left[\because k = -\frac{5}{3} \right]$$

$$= \frac{x^2}{2} + \frac{5}{3}x + 1$$

Now, differentiating both sides w.r.t. x , we get

$$f''(x) = \frac{2x}{2} + \frac{5}{3} = x + \frac{5}{3}$$

$$\therefore f'' \left(-\frac{2}{3} \right) = -\frac{2}{3} + \frac{5}{3} = 1$$

54. (c) Let $I = \int \frac{dx}{1 + e^{-x}} = \int \frac{dx}{1 + (1/e^x)}$

$$= \int \frac{e^x \, dx}{1 + e^x}$$

Put $t = 1 + e^x$
 $\Rightarrow dt = e^x \, dx$

Now, $I = \int \frac{dt}{t} = \ln(t) + C$
 $= \ln(1 + e^x) + C \quad [\because t = 1 + e^x]$

55. (a) Given, $f''(x) = g'(x)$

On integrating both sides, we get

$$f'(x) = g'(x) + C$$

$$\Rightarrow f'(1) = g'(1) + C$$

$$\Rightarrow 4 = 6 + C$$

$$\Rightarrow C = -2$$

$$\therefore f'(x) = g'(x) - 2$$

Again, on integrating both sides, we get

$$f(x) = g(x) - 2x + C_1$$

$$\Rightarrow f(2) = g(2) - 2 \times 2 + C_1$$

$$\Rightarrow 3 = 9 - 4 + C_1$$

$$\Rightarrow C_1 = -2$$

$$\therefore f(x) - g(x) = -2x - 2$$

At $x = 4$,
 $[f(x) - g(x)] = -8 - 2 = -10$

24

DEFINITE INTEGRALS

In NDA exam, generally 3-4 questions are based from this chapter, which are based on properties of definite integrals.

The definite integral of a function $f(x)$ between the limits a to b , i.e. in the interval $[a, b]$ is denoted by $\int_a^b f(x) dx$ and is defined as follows $\int_a^b f(x) dx = [F(x)]_a^b = F(b) - F(a)$, where $\int f(x) dx = F(x)$.

This is also called Newton-Leibnitz formula. The numbers a and b are called the limits of integration, where a is called lower limit and b is called upper limit. The interval $[a, b]$ is called the interval of integration. The interval $[a, b]$ is also known as range of integration.

Fundamental Theorem of Integral Calculus

If $f(x)$ is continuous on $[a, b]$ and if $F(x)$ be anti-derivative of $f(x)$, then $\int_a^b f(x) dx = F(b) - F(a)$

Note The anti-derivative $F(x)$ must be continuous on the interval $[a, b]$.

PROPERTIES OF DEFINITE INTEGRALS

- (i) $\int_a^a f(x) dx = 0$
- (ii) $\int_a^b f(x) dx = \int_a^b f(t) dt$
- (iii) $\int_a^b f(x) dx = -\int_b^a f(x) dx$
- (iv) $\int_0^a f(x) dx = \int_0^a f(a-x) dx$
- (v) $\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx, a < c < b$
- (vi) $\int_0^{2a} f(x) dx = \int_0^a f(x) dx + \int_0^a f(2a-x) dx$
- (vii) $\int_a^b f(x) dx = \int_a^b f(a+b-x) dx$
- (viii) $\int_{-a}^a f(x) dx = 2\int_0^a f(x) dx$, if $f(x)$ is an even function of x and $\int_{-a}^a f(x) dx = 0$, if $f(x)$ is an odd function of x .
- (ix) $\int_0^{2a} f(x) dx = \begin{cases} 0, & \text{if } f(2a-x) = -f(x) \\ 2\int_0^a f(x) dx, & \text{if } f(2a-x) = f(x) \end{cases}$
- (x) If $f(x)$ is a periodic function of period T , then $\int_0^{nT} f(x) dx = n\int_0^T f(x) dx$
- (xi) If $f(x) \leq g(x), a \leq x \leq b$, then $\int_a^b f(x) dx \leq \int_a^b g(x) dx$
- (xii) $\frac{d}{dt} \left[\int_{f(t)}^{\phi(t)} f(x) dx \right] = f[\phi(t)] \phi'(t) - f[f(t)] f'(t)$ [Leibnitz's rule]

where, $f(t)$ and $\phi(t)$ are defined on the interval $[a, b]$ and are differentiable at any point $t \in (a, b)$ and $f(x)$ is continuous for $f(a) \leq x \leq \phi(b)$.

- (xiii) $\int_0^{\pi/2} \log \sin x \, dx = \int_0^{\pi/2} \log \cos x \, dx = \frac{1}{2} \pi \log \left(\frac{1}{2} \right)$
- (xiv) $\int_0^{2a} f(x) \, dx = \int_0^a \{f(a-x) + f(a+x)\} \, dx$
- (xv) $\int_a^b f(x) \, dx = (b-a) \int_0^1 f((b-a)x+a) \, dx$
- (xvi) $\int_a^{a+nT} f(x) \, dx = n \int_0^T f(x) \, dx$
- (xvii) $\int_{mT}^{nT} f(x) \, dx = (n-m) \int_0^T f(x) \, dx$, where T is the period of the function and $m, n \in I$.
- (xviii) $\int_{a+nT}^{b+nT} f(x) \, dx = \int_a^b f(x) \, dx$, where T is the period of the function and $n \in I$.

EXAMPLE 1. $\int_{-\pi/2}^{\pi/2} \sin |x| \, dx$ is equal to

- a. 1 b. 2 c. 3 d. 4

Sol. b. Let $I = \int_{-\pi/2}^{\pi/2} \sin |x| \, dx = \int_{-\pi/2}^0 (-\sin x) \, dx + \int_0^{\pi/2} \sin x \, dx$
 $= [\cos x]_{-\pi/2}^0 + [-\cos x]_{0}^{\pi/2} = [1+0] + [-0+1] = 2$

EXAMPLE 2. The value of $\lim_{x \rightarrow \infty} \frac{(\int_0^x e^{x^2} \, dx)^2}{\int_0^x e^{2x^2} \, dx}$ is

- a. 0 b. 1 c. 2 d. $\sqrt{2}$

Sol. a. We have, $\lim_{x \rightarrow \infty} \frac{(\int_0^x e^{x^2})^2}{\int_0^x e^{2x^2}} \left[\frac{\infty}{\infty} \text{ form} \right]$
 $= \lim_{x \rightarrow \infty} \frac{2e^{x^2} \int_0^x e^{x^2} \, dx}{e^{2x^2}}$ [using L'Hospital's rule]
 $= 2 \lim_{x \rightarrow \infty} \int_0^x \frac{e^{x^2} \, dx}{e^{x^2}} = 2 \lim_{x \rightarrow \infty} \frac{e^{x^2}}{2xe^{x^2}} = 0$

EXAMPLE 3. What will be the value of

$$\int_{-\pi/4}^{n\pi-\pi/4} |\sin x + \cos x| \, dx?$$

- a. $\sqrt{2}n$ b. $2\sqrt{2}n$ c. $3\sqrt{2}n$ d. $4n$

Sol. b. $I = \int_{-\pi/4}^{n\pi-\pi/4} |\sin x + \cos x| \, dx$
 $= \int_{-\pi/4}^{n\pi-\pi/4} \sqrt{2} |\sin(x + \pi/4)| \, dx$
 $= \sqrt{2}n \int_0^\pi |\sin(x + \pi/4)| \, dx$
 [as $|\sin(x + \pi/4)|$ is periodic with period π]
 $= \sqrt{2}n \left[\int_0^{3\pi/4} \sin(x + \pi/4) \, dx + \int_{3\pi/4}^\pi -\sin(x + \pi/4) \, dx \right]$
 $= 2\sqrt{2}n \left[\because \sin\left(x + \frac{\pi}{4}\right) > 0 \text{ for } x \in \left(0, \frac{3\pi}{4}\right) \right]$

EXAMPLE 4. To find out the numerical value of $\int_{-2}^2 (px^2 + qx + s) \, dx$, it is necessary to know the value/values of which of the following?

- a. Only p b. Only q c. p and s d. p, q and s

Sol. c. Let $I = \int_{-2}^2 (px^2 + qx + s) \, dx = \left[\frac{px^3}{3} + \frac{qx^2}{2} + sx \right]_{-2}^2$
 $= \frac{p}{3}[8+8] + \frac{q}{2}[4-4] + s[2+2] = \frac{16p}{3} + 4s$

Walli's Formula

$$\int_0^{\pi/2} \sin^n x \, dx = \int_0^{\pi/2} \cos^n x \, dx$$

$$= \begin{cases} \frac{(n-1)(n-3)\dots 2}{n(n-2)\dots 3 \cdot 1}, & \text{if } n \text{ is odd positive integer} \\ \frac{(n-1)(n-3)\dots 1}{n(n-2)\dots 2} \cdot \left(\frac{\pi}{2}\right), & \text{if } n \text{ is even positive integer} \end{cases}$$

EXAMPLE 5. Evaluate $\int_0^\pi |\sin^4 x| \, dx$ is

- a. $\frac{8\pi}{3}$ b. $\frac{2\pi}{3}$ c. $\frac{4\pi}{3}$ d. $\frac{3\pi}{8}$

Sol. d. $\int_0^\pi |\sin^4 x| \, dx = 2 \int_0^{\pi/2} \sin^4 x \, dx$

Using walli's formula, $2 \left[\frac{3 \cdot 1}{4 \cdot 2} \right] \frac{\pi}{2} = \frac{3\pi}{8}$

Limit of Sum by Definite Integral

Let $f(x)$ be a continuous real valued function defined on the closed interval $[a, b]$ which is divided into n parts.

The point of division on X -axis are $a, a+h, a+2h, \dots, a+(n-1)h, a+nh$, where $h = \frac{b-a}{n}$.

Hence, $\int_a^b f(x) \, dx = \lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \sum_{r=0}^{n-1} hf(a+rh)$
 $= \lim_{n \rightarrow \infty} \sum_{r=0}^{n-1} \left(\frac{b-a}{n} \right) f\left(a + \frac{(b-a)r}{n} \right)$

In particular, if $a=0$ and $b=1$, then

$$\int_0^1 f(x) \, dx = \lim_{n \rightarrow \infty} \sum_{r=0}^{n-1} \frac{1}{n} f\left(\frac{r}{n}\right)$$

EXAMPLE 6. $\lim_{n \rightarrow \infty} \frac{1^{99} + 2^{99} + 3^{99} + \dots + n^{99}}{n^{100}}$ is equal to

- a. $\frac{9}{100}$ b. $\frac{1}{100}$ c. $\frac{1}{99}$ d. $\frac{1}{101}$

Sol. b. $\lim_{n \rightarrow \infty} \frac{1^{99} + 2^{99} + \dots + n^{99}}{n^{100}} = \lim_{n \rightarrow \infty} \sum_{r=1}^n \left(\frac{r^{99}}{n^{100}} \right) = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{r=1}^n \left(\frac{r}{n} \right)^{99}$
 $= \int_0^1 x^{99} \, dx = \left(\frac{x^{100}}{100} \right)_0^1 = \frac{1}{100}$

PRACTICE EXERCISE

- 1.** If $\int_{-1}^4 f(x) dx = 4$ and $\int_2^4 [3 - f(x)] dx = 7$, then the value of $\int_2^{-1} f(x) dx$ is
 (a) 2 (b) -3
 (c) -5 (d) None of these
- 2.** If $I_1 = \int_0^{3\pi} f(\cos^2 x) dx$ and $I_2 = \int_0^{\pi} f(\cos^2 x) dx$, then
 (a) $I_1 = I_2$ (b) $I_1 = 2I_2$ (c) $I_1 = 5I_2$ (d) $I_1 = 3I_2$
- 3.** $\frac{1}{c} \int_{ac}^{bc} f\left(\frac{x}{c}\right) dx$ is equal to
 (a) $\frac{1}{c} \int_a^b f(x) dx$ (b) $\int_a^b f(x) dx$
 (c) $c \int_a^b f(x) dx$ (d) $\int_{ac^2}^{bc^2} f(x) dx$
- 4.** $\int_0^{\pi/2n} \frac{dx}{1 + \cot^n nx}$ is equal to
 (a) 0 (b) $\frac{\pi}{4n}$ (c) $\frac{\pi}{2n}$ (d) $\frac{\pi}{2}$
- 5.** $\int_0^1 \frac{\log(1+x)}{1+x^2} dx$ is equal to
 (a) $\frac{\pi}{8}$ (b) $\frac{\pi}{8} \log 2$ (c) $\log 2$ (d) $\frac{\pi}{8} \log_e 10$
- 6.** $\int_0^a \frac{dx}{x + \sqrt{a^2 - x^2}}$ is equal to
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) π (d) $\frac{\pi}{3}$
- 7.** $\int_0^{\pi/2} \frac{\sin 2\theta}{\sin 2\theta + \cos 2\theta} d\theta$ is equal to
 (a) $\frac{\pi}{2}$ (b) $\frac{2\pi}{3}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{6}$
- 8.** The value of $\int_{-1}^1 \frac{d}{dx} \left(\tan^{-1} \frac{1}{x} \right) dx$ is
 (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$ (c) $-\frac{\pi}{2}$ (d) π
- 9.** The value of $\int_{-1}^3 \left[\tan^{-1} \left(\frac{x}{x^2+1} \right) + \tan^{-1} \left(\frac{x^2+1}{x} \right) \right] dx$ is
 (a) π (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{2}$ (d) 2π
- 10.** If $f(x)$ is an even function, then what is $\int_0^{\pi} f(\cos x) dx$ equal to?
 (a) 0 (b) $\int_0^{\pi/2} f(\cos x) dx$
 (c) $2 \int_0^{\pi/2} f(\cos x) dx$ (d) 1
- 11.** The value of $\int_{-\pi/2}^{\pi/2} \frac{dx}{e^{\sin x} + 1}$ is equal to
 (a) 0 (b) 1 (c) $-\frac{\pi}{2}$ (d) $\frac{\pi}{2}$
- 12.** What is the value of the integral $\int_{-1}^1 |x| dx$?
 (a) 1 (b) 0 (c) 2 (d) -1
- 13.** What is $\int_0^{\pi/2} \frac{\sin^3 x}{\sin^3 x + \cos^3 x} dx$?
 (a) π (b) $\frac{\pi}{2}$ (c) $\frac{\pi}{4}$ (d) 0
- 14.** If $I_n = \int_0^{\pi/4} \tan^n x dx$, then what is $I_n + I_{n-2}$ equal to?
 (a) $\frac{1}{n}$ (b) $\frac{1}{(n-1)}$ (c) $\frac{n}{(n-1)}$ (d) $\frac{1}{(n-2)}$
- 15.** What is the value of $\int_{\pi/6}^{\pi/4} \frac{dx}{\sin x \cos x}$?
 (a) $2 \log \sqrt{3}$ (b) $\log \sqrt{3}$ (c) $2 \log 3$ (d) $4 \log 3$
- 16.** If $\int_{\ln 2}^x (e^x - 1)^{-1} dx = \ln \frac{3}{2}$, then what is the value of x ?
 (a) e^2 (b) $\frac{1}{e}$ (c) $\ln 4$ (d) 1
- 17.** If $\int_{-3}^2 f(x) dx = \frac{7}{3}$ and $\int_{-3}^9 f(x) dx = -\frac{5}{6}$, then what is the value of $\int_2^9 f(x) dx$?
 (a) $-\frac{19}{6}$ (b) $\frac{19}{6}$ (c) $\frac{3}{2}$ (d) $-\frac{3}{2}$
- 18.** If $\int_0^1 x^m (1-x)^n dx = K \int_0^1 x^n (1-x)^m dx$, then what is the value of K ?
 (a) 0 (b) 1 (c) -1 (d) 2
- 19.** If $f(x) = A \sin\left(\frac{\pi x}{2}\right) + B$ and $f'\left(\frac{1}{2}\right) = \sqrt{2}$ and $\int_0^1 f(x) dx = \frac{2A}{\pi}$, then what is the value of B ?
 (a) $\frac{2}{\pi}$ (b) $\frac{4}{\pi}$ (c) 0 (d) 1
- 20.** Let $f(x)$ and $\phi(x)$ be two continuous functions on R satisfying $\phi(x) = \int_a^x f(t) dt$, $a \neq 0$ and another continuous function $g(x)$ satisfying $g(x + \alpha) + g(x) = 0, \forall x \in R, \alpha > 0$ and $\int_b^{2b} g(t) dt$ is independent of b , then
 I. If $f(x)$ is an even function, then $\phi(x)$ is also even.

II. If $f(x)$ is an even function, then $\phi(x)$ is an odd function.

III. $f(x)$ and $\phi(x)$ are independent.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
(c) Only III (d) None of these

21. The value of $\int_0^1 \frac{2x^2 + 3x + 3}{(x+1)(x^2 + 2x + 2)} dx$

- I. $\frac{\pi}{4} + 2 \log 2 - \tan^{-1} 2$ II. $-\frac{\pi}{4} + \log 4 + \cot^{-1} 2$

III. $2 \log 2 - \cot^{-1} 3$

Which of the above statement(s) is/are correct?

- (a) I and II (b) II and III (c) I and III (d) I, II and III

Directions (Q. Nos. 22-23)

If $\int_{-2}^2 [x^2] dx = A + 2B + \sqrt{2} C$. Then,

22. Find the value of A.

- (a) 10 (b) -10 (c) $\frac{1}{10}$ (d) ± 10

23. Find the value of B.

- (a) $\sqrt{3}$ (b) $-\sqrt{3}$ (c) $\frac{1}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{2}$

Directions (Q. Nos. 24-25) If $f(-x) = -f(x)$, then $f(x)$ is odd function and if $f(-x) = f(x)$, then $f(x)$ is even function.

Also, $\int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ is even} \\ 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ is odd} \end{cases}$

24. The value of the integral $\int_{-\pi/2}^{\pi/2} \sin^7 x dx$ is

- (a) 0 (b) $-\frac{\pi}{2}$ (c) $\frac{\pi}{2}$ (d) 1

25. The value of $\int_{-\pi/2}^{\pi/2} \sin^2 x dx$ is equal to

- (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) 0 (d) $-\frac{\pi}{2}$

Directions (Q. Nos. 26-28) Using integral

$\int_0^{\pi/2} \log(\sin x) dx = -\int_0^{\pi} \log(\sec x) dx = -\frac{\pi}{2} \log 2$

and $\int_0^{\pi/2} \log(\tan x) dx = 0$

and $\int_0^{\pi/4} \log(1 + \tan x) dx = \frac{\pi}{8} \log 2$

26. Evaluate $\int_{-\pi/4}^{\pi/4} \log\left(\frac{\sin x + \cos x}{\cos x - \sin x}\right) dx$.

- (a) $\pi \log 2$ (b) $\frac{\pi \log 2}{2}$ (c) 0 (d) $-\pi \log 2$

27. Evaluate $\int_{-\pi/4}^{\pi/4} \log(\sin x + \cos x) dx$.

- (a) $\frac{\pi \log 2}{2}$ (b) $-\frac{\pi \log 2}{4}$ (c) $\pi \log 2$ (d) 0

28. Evaluate $\int_0^{\pi/4} \log(\sin 2x)x dx$.

- (a) $-\frac{\pi}{2} \log 2$ (b) $\pi \log 2$
(c) $\frac{\pi \log 2}{4}$ (d) $-\frac{\pi \log 2}{4}$

PREVIOUS YEARS' QUESTIONS

29. What is the value of $\int_{-\pi/2}^{\pi/2} |\sin x| dx$?

- (a) 2 (b) 1 (c) π (d) 0 ☑ 2012 I

30. What is the value of $\int_0^{\pi/2} \sin 2x \ln(\cot x) dx$?

- (a) 0 (b) $\pi \ln 2$ (c) $-\pi \ln 2$ (d) $\frac{\pi \ln 2}{2}$ ☑ 2012 II

31. What is the value of $\int_0^1 \frac{\tan^{-1} x}{1+x^2} dx$?

- (a) $\frac{\pi^2}{8}$ (b) $\frac{\pi^2}{32}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{8}$ ☑ 2012 II

32. What is $\int_{-a}^a (x^3 + \sin x) dx$ equal to?

- (a) a (b) 2a (c) 0 (d) 1 ☑ 2013 I

33. What is $\int_0^2 \frac{dx}{x^2 + 4}$ equal to?

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{8}$ (d) $\frac{\pi}{3}$ ☑ 2013 II

34. What is $\int_0^1 x e^x dx$ equal to?

- (a) 1 (b) -1 (c) 0 (d) e ☑ 2013 II

35. What is $\int_0^2 e^{\log x} dx$ equal to?

- (a) 1 (b) 2 (c) 4 (d) None of these ☑ 2013 II

36. What is $\int_1^2 \log x dx$ equal to?

- (a) $\log_e 2$ (b) 1 (c) $\log_e\left(\frac{4}{e}\right)$ (d) $\log_e\left(\frac{e}{4}\right)$ ☑ 2013 II

37. What is $\int_{-\pi/6}^{\pi/6} \frac{\sin^5 x \cos^3 x}{x^4} dx$ equal to?

- (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{8}$ (d) 0 ☑ 2013 II

38. What is $\int_0^{\pi/2} \ln(\tan x) dx$ equal to?

- (a) $\ln 2$ (b) $-\ln 2$ (c) 0 (d) None of these ☑ 2014 I

39. What is $\int_{-\pi/2}^{\pi/2} x \sin x dx$ equal to?

- (a) 0 (b) 2 (c) -2 (d) π ☑ 2014 I

- 40.** What is $\int_0^1 \frac{e^{\tan^{-1} x} dx}{1+x^2}$ equal to? ☑ 2014 I
 (a) $e^{\frac{\pi}{4}} - 1$ (b) $e^{\frac{\pi}{4}} + 1$ (c) $e - 1$ (d) e
- 41.** What is $\int_0^{\pi/2} \frac{dx}{a^2 \cos^2 x + b^2 \sin^2 x}$ equal to? ☑ 2014 I
 (a) $2ab$ (b) $2\pi ab$ (c) $\frac{\pi}{2ab}$ (d) $\frac{\pi}{ab}$

Directions (Q. Nos. 42-43) Consider the integrals

$$I_1 = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \text{ and } I_2 = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x} dx}{\sqrt{\sin x} + \sqrt{\cos x}}.$$

☑ 2014 I

- 42.** What is $I_1 - I_2$ equal to?
 (a) 0 (b) $2I_1$ (c) π (d) None of these
- 43.** What is I_1 equal to?
 (a) $\pi/24$ (b) $\pi/18$ (c) $\pi/12$ (d) $\pi/6$

Directions (Q. Nos. 44-45) Read the following information carefully and answer the questions given below. Consider the integral $I = \int_0^{\pi} \ln(\sin x) dx$ ☑ 2014 II

- 44.** What is $\int_0^{\pi/2} \ln(\sin x) dx$ equal to?
 (a) $4I$ (b) $2I$ (c) I (d) $\frac{I}{2}$
- 45.** What is $\int_0^{\pi/2} \ln(\cos x) dx$ equal to?
 (a) $\frac{I}{2}$ (b) I (c) $2I$ (d) $4I$

Directions (Q. Nos. 46-48) Read the following information carefully and answer the questions given below.

For the next three solutions consider $I = \int_0^{\pi} \frac{x dx}{1 + \sin x}$. ☑ 2014 II

- 46.** What is I equal to?
 (a) $-\pi$ (b) 0 (c) π (d) 2π
- 47.** What is $\int_0^{\pi} \frac{(\pi - x) dx}{1 + \sin x}$ equal to?
 (a) π (b) $\frac{\pi}{2}$ (c) 0 (d) 2π
- 48.** What is $\int_0^{\pi} \frac{dx}{1 + \sin x}$ equal to?
 (a) 1 (b) 2 (c) 4 (d) -2

Directions (Q. Nos. 49-52) Consider the integral

$$I_m = \int_0^{\pi} \frac{\sin 2mx}{\sin x} dx, \text{ where } m \text{ is a positive integer.}$$

☑ 2015 I

- 49.** What is I_1 equal to?
 (a) 0 (b) $1/2$ (c) 1 (d) 2

- 50.** What $I_2 + I_3$ equal to?
 (a) 4 (b) 2 (c) 1 (d) 0
- 51.** What is I_m equal to?
 (a) 0 (b) 1 (c) m (d) $2m$

- 52.** Consider the following
 I. $I_m - I_{m-1}$ is equal to 0. II. $I_{2m} > I_m$.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

- 53.** The value of $\int_a^{b} \frac{x^7 + \sin x}{\cos x} dx$, where $a + b = 0$, is ☑ 2015 II
 (a) $2b - a \sin(b - a)$ (b) $a + 3b \cos(b - a)$
 (c) $\sin a - (b - a) \cos b$ (d) 0

- 54.** $\int_{-1}^1 x|x| dx$ is equal to ☑ 2015 II
 (a) 0 (b) $\frac{2}{3}$ (c) 2 (d) -2

- 55.** If $0 < a < b$, then $\int_a^{b} \frac{|x|}{x} dx$ is equal to ☑ 2015 II
 (a) $|b| - |a|$ (b) $|a| - |b|$ (c) $\frac{|b|}{|a|}$ (d) 0

- 56.** $\int_0^{2\pi} \sin^5\left(\frac{x}{4}\right) dx$ is equal to ☑ 2015 II
 (a) $8/15$ (b) $16/15$ (c) $32/15$ (d) 0

Directions (Q. Nos. 57-58) Consider the integrals

$$A = \int_0^{\pi} \frac{\sin x dx}{\sin x + \cos x} \text{ and } B = \int_0^{\pi} \frac{\sin x dx}{\sin x - \cos x}$$

☑ 2015 II

- 57.** Which one of the following is correct?
 (a) $A = 2B$ (b) $B = 2A$ (c) $A = B$ (d) $A = 3B$
- 58.** What is the value of B ?
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) $\frac{3\pi}{4}$ (d) π

Directions (Q. Nos. 59-60) Given that,

$$a_n = \int_0^{\pi} \frac{\sin^2\{(n+1)x\}}{\sin 2x} dx$$

☑ 2016 I

- 59.** Consider the following statements
 I. The sequence $\{a_{2n}\}$ is in AP with common difference zero.
 II. The sequence $\{a_{2n+1}\}$ is in AP with common difference zero.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 60.** What is $a_{n-1} - a_{n-4}$ equal to?
 (a) -1 (b) 0 (c) 1 (d) 2

- 61.** What is $\int_{-2}^2 x dx - \int_{-2}^2 [x] dx$ equal to, where $[]$ is the greatest integer function? ☑ 2016 I
 (a) 0 (b) 1 (c) 2 (d) 4
- 62.** What is $\int_0^{4\pi} |\cos x| dx$ equal to? ☑ 2016 I
 (a) 0 (b) 2 (c) 4 (d) 8
- 63.** If $\int_{-2}^5 f(x) dx = 4$ and $\int_0^5 \{1 + f(x)\} dx = 7$, then what is $\int_{-2}^0 f(x) dx$ equal to? ☑ 2016 I
 (a) -3 (b) 2 (c) 3 (d) 5

Directions (Q. Nos. 64-65) Consider the functions $f(x) = xg(x)$ and $g(x) = \left[\frac{1}{x} \right]$, where $[]$ is the greatest integer function. ☑ 2016 I

- 64.** What is $\int_{1/3}^{1/2} g(x) dx$ equal to?
 (a) $\frac{1}{6}$ (b) $\frac{1}{3}$ (c) $\frac{5}{18}$ (d) $\frac{5}{36}$
- 65.** What is $\int_{1/3}^1 f(x) dx$ equal to?
 (a) $\frac{37}{72}$ (b) $\frac{2}{3}$ (c) $\frac{17}{72}$ (d) $\frac{37}{144}$

HINTS AND SOLUTIONS

- 1.** (c)
- 2.** (d) $\cos^2(\pi + x) = \cos^2 x$
 $\therefore I_1 = \int_0^{3\pi} f(\cos^2 x) dx$
 $= 3 \int_0^{\pi} f(\cos^2 x) dx = 3I_2$
 $\therefore I_1 = 3I_2$
- 3.** (b) Let $I = \frac{1}{c} \int_{ac}^{bc} f\left(\frac{x}{c}\right) dx$
 Put $\frac{x}{c} = t$
 At $x = ac, t = \frac{ac}{c} = a$
 At $x = bc, t = \frac{bc}{c} = b$ and $\frac{dx}{c} = dt$
 $\therefore I = \int_a^b f(t) dt$ [replace t by x]
 $= \int_a^b f(x) dx$
- 4.** (b) Put $nx = t$ and adjust the limits and change into sin and cos.
 $\therefore I = \frac{1}{n} \int_0^{\pi/2} \frac{\sin^n t}{\sin^n t + \cos^n t} dt$
 On applying property (vii) and then adding, we get
 $2I = \frac{1}{n} \int_0^{\pi/2} dt = \frac{1}{n} \cdot \frac{\pi}{2} \Rightarrow I = \frac{\pi}{4n}$

- 5.** (b) Put $x = \tan \theta$ and adjust the limits
 $I = \int_0^{\pi/4} \log(1 + \tan \theta) d\theta$
 $\Rightarrow I = \int_0^{\pi/4} \log\left(1 + \frac{1 - \tan \theta}{1 + \tan \theta}\right) d\theta$
 [apply property]
 $\Rightarrow I = \int_0^{\pi/4} \log 2 d\theta - I$
 $\therefore 2I = \frac{\pi}{4} \log 2 \Rightarrow I = \frac{\pi}{8} \log 2$
- 6.** (a) Put $x = a \sin \theta$
 $\Rightarrow dx = a \cos \theta d\theta$ and adjust the limits
 $\therefore I = \int_0^{\pi/2} \frac{\cos \theta d\theta}{\sin \theta + \cos \theta} = \frac{\pi}{4}$
- 7.** (c) $I = \int_0^{\pi/2} \frac{\sin 2\theta}{\sin 2\theta + \cos 2\theta} d\theta$
 Put $x = 2\theta, dx = 2 d\theta$
 $\therefore I = \frac{1}{2} \int_0^{\pi} \frac{\sin x}{\sin x + \cos x} dx$
 $= \frac{1}{2\sqrt{2}} \int_0^{\pi} \frac{\sin x}{\cos\left(x - \frac{\pi}{4}\right)} dx$
 Put $x - \frac{\pi}{4} = z$
 $\Rightarrow dx = dz$

$$\therefore I = \frac{1}{2\sqrt{2}} \int_{-\pi/4}^{3\pi/4} \frac{\sin\left(z - \frac{\pi}{4}\right)}{\cos z} dz$$

$$= \frac{1}{2\sqrt{2}} \int_{-\pi/4}^{3\pi/4} \left(\frac{1}{\sqrt{2}} \tan z + \frac{1}{\sqrt{2}}\right) dz = \frac{\pi}{4}$$

- 8.** (c)
- 9.** (d) $I = \int_{-1}^3 \left(\tan^{-1} y + \tan^{-1} \frac{1}{y}\right) dy$
 where, $y = \frac{x}{x^2 + 1}$
 $= \int_{-1}^3 (\tan^{-1} y + \cot^{-1} y) dx$
 $= \int_{-1}^3 \frac{\pi}{2} dx = \frac{\pi}{2} [x]_{-1}^3 = 4 \cdot \frac{\pi}{2} = 2\pi$
- 10.** (c) Given, $f(x) =$ even function
 $\Rightarrow f(-x) = f(x)$
 Now, $I = \int_0^{\pi} f(\cos x) dx$
 Here, $f(\cos x)$ is also an even function, then $I = 2 \int_0^{\pi/2} f(\cos x) dx$
 [by definite integral property]
- 11.** (d) $I = \int_{-\pi/2}^0 \frac{dx}{e^{\sin x} + 1} + \int_0^{\pi/2} \frac{dx}{e^{\sin x} + 1}$
 or $I = I_1 + I_2$
 On putting $x = -y$ in I_1 , we get

$$I = -\int_{\pi/2}^0 \frac{dy}{e^{-\sin y} + 1} + \int_0^{\pi/2} \frac{dx}{1 + e^{\sin x}}$$

$$= \int_0^{\pi/2} \frac{e^{\sin x} dx}{e^{\sin x} + 1} + \int_0^{\pi/2} \frac{dx}{e^{\sin x} + 1}$$

$$= \int_0^{\pi/2} 1 dx = [x]_0^{\pi/2} = \left[\frac{\pi}{2} - 0\right] = \frac{\pi}{2}$$

12. (a) $\int_{-1}^1 |x| dx = -\int_{-1}^0 x dx + \int_0^1 x dx$

$$= -\left[\frac{x^2}{2}\right]_{-1}^0 + \left[\frac{x^2}{2}\right]_0^1 = 1$$

13. (c)

14. (b) $I_n = \int_0^{\pi/4} \tan^n x dx$

$$= \int_0^{\pi/4} \tan^{n-2} x \tan^2 x dx$$

$$= \int_0^{\pi/4} \tan^{n-2} x (\sec^2 x - 1) dx$$

$$= \int_0^{\pi/4} \tan^{n-2} x \sec^2 x dx - \int_0^{\pi/4} \tan^{n-2} x dx$$

Put $t = \tan x \Rightarrow dt = \sec^2 x dx$

$$\therefore I_n = \int_0^1 t^{n-2} dt - I_{n-2}$$

$$= \left[\frac{t^{n-1}}{n-1}\right]_0^1 - I_{n-2} = \frac{1}{n-1} - I_{n-2}$$

$$\Rightarrow I_n + I_{n-2} = \frac{1}{n-1}$$

15. (b)

16. (c) $\int_{\ln 2}^x \frac{1}{e^x - 1} dx = \ln \frac{3}{2}$

Let $I = \int_{\ln 2}^x \frac{1}{e^x - 1} dx$

Put $e^x - 1 = t \Rightarrow dx = \frac{dt}{1+t}$

$$\therefore I = \int_{\ln 2}^x \frac{1}{t(1+t)} dt$$

$$= \int_{\ln 2}^x \left[\frac{1}{t} - \frac{1}{1+t}\right] dt$$

$$= [\ln t - \ln(1+t)]_{\ln 2}^x$$

$$= [\ln(e^x - 1) - \ln e^x]_{\ln 2}^x$$

$$= \left[\ln\left(\frac{e^x - 1}{e^x}\right)\right]_{\ln 2}^x = \ln\left(\frac{e^x - 1}{e^x}\right) - \ln \frac{1}{2}$$

$$= \ln 2 \left(\frac{e^x - 1}{e^x}\right) \Rightarrow 2\left(\frac{e^x - 1}{e^x}\right) = \frac{3}{2} \text{ [given]}$$

$$\Rightarrow e^x = 4$$

$$\Rightarrow x = \ln 4$$

17. (a) $\therefore \int_{-3}^9 f(x) dx$

$$= \int_{-3}^2 f(x) dx + \int_2^9 f(x) dx \quad \dots(i)$$

But $\int_{-3}^9 f(x) dx = -\frac{5}{6}$

and $\int_{-3}^2 f(x) dx = \frac{7}{3}$

From Eq. (i), $-\frac{5}{6} = \frac{7}{3} + \int_2^9 f(x) dx$

$$\Rightarrow \int_2^9 f(x) dx = -\frac{5}{6} - \frac{7}{3} = \frac{-19}{6}$$

18. (b)

19. (c) $f(x) = A \sin\left(\frac{\pi x}{2}\right) + B$

$$\therefore f'(x) = A \cos\left(\frac{\pi x}{2}\right) \cdot \frac{\pi}{2}$$

At $x = \frac{1}{2}, \sqrt{2} = A \left(\cos \frac{\pi}{4}\right) \frac{\pi}{2}$

$$\Rightarrow A = \frac{(\sqrt{2} \times \sqrt{2}) \times 2}{\pi} = \frac{4}{\pi}$$

Also, $\int_0^1 f(x) dx = \frac{2A}{\pi}$

$$\therefore \int_0^1 \left\{A \sin\left(\frac{\pi x}{2}\right) + B\right\} dx = \frac{2 \times 4}{\pi^2}$$

$$\Rightarrow \left(-A \cos \frac{\pi x}{2} \cdot \frac{2}{\pi} + Bx\right)_0^1 = \frac{8}{\pi^2}$$

$$\Rightarrow -\frac{4}{\pi} \cdot \frac{2}{\pi} \left(\cos \frac{\pi}{2}\right) + B = \frac{8}{\pi^2}$$

$$+ \frac{4}{\pi} \cdot \frac{2}{\pi} \cos 0 = \frac{8}{\pi^2}$$

$$\therefore B = 0$$

20. (b) If $f(x)$ is an even function, then

$$\phi(-x) = -\int_{-a}^x f(t) dt$$

$$= -\int_{-a}^x f(t) dt - \int_a^x f(t) dt$$

$$= -2 \int_0^x f(t) dt - \int_a^x f(t) dt$$

As, $f(x)$ is an even function.

Now, $\int_0^a f(t) dt = \int_0^a f(a-t) dt$

$$= \int_0^a -f(t) dt$$

[using $f(a-x) = -f(x)$]

$$\Rightarrow \int_0^a f(t) dt = 0$$

$$\Rightarrow \phi(-x) = -\int_a^x f(t) dt = -f(x)$$

$$\Rightarrow \phi(x) \text{ is an odd function.}$$

21. (d) $I = \int_0^1 \frac{2x^2 + 3x + 3}{(x+1)(x^2 + 2x + 2)} dx$

$$= \int_0^1 \frac{2(x^2 + 2x + 2) - (x+1)}{(x+1)(x^2 + 2x + 2)} dx$$

$$= \int_0^1 \left(\frac{2}{x+1} - \frac{1}{x^2 + 2x + 2}\right) dx$$

$$= [2 \log(x+1) - \tan^{-1}(x+1)]_0^1$$

$$= 2 \log 2 - \tan^{-1} 2 + \tan^{-1} 1 \quad \dots(i)$$

$$= \log 4 - \left(\frac{\pi}{2} - \cot^{-1} 2\right) + \frac{\pi}{4}$$

$$= -\frac{\pi}{4} + \log 4 + \cot^{-1} 2$$

From Eq. (i),

$$I = 2 \log 2 - \tan^{-1} \frac{2-1}{1+2 \times 1}$$

$$= 2 \log 2 - \tan^{-1} 1/3$$

$$= 2 \log 2 - \cot^{-1} 3$$

Sol. (Q. Nos. 22-23)

$$\int_{-2}^2 [x^2] dx = 2 \int_0^2 [x^2] dx$$

[since, integrand is an even function]

$$= 2 \left[\int_0^1 [x^2] dx + \int_1^{\sqrt{2}} [x^2] dx \right. \\ \left. + \int_{\sqrt{2}}^2 [x^2] dx + \int_{\sqrt{3}}^2 [x^2] dx \right]$$

$$\therefore [x]^2 = \begin{cases} 0, & 0 \leq x < 1 \\ 1, & 1 \leq x < \sqrt{2} \\ 2, & \sqrt{2} \leq x < \sqrt{3} \\ 3, & \sqrt{3} \leq x < 2 \end{cases}$$

$$= 2 \left(\int_0^1 0 dx + \int_1^{\sqrt{2}} 1 dx \right. \\ \left. + \int_{\sqrt{2}}^2 2 dx + \int_{\sqrt{3}}^2 3 dx \right)$$

$$= 2 [x]_1^{\sqrt{2}} + 4 [x]_{\sqrt{2}}^{\sqrt{3}} + 6 [x]_{\sqrt{3}}^2$$

$$= (10 - 2\sqrt{3} - 2\sqrt{2})$$

Comparing it with given equation, we get $A = 10, B = \sqrt{3}$

22. (a) 23. (b)

24. (a) $I = \int_{-\pi/2}^{\pi/2} \sin^7 x dx$

Here, $f(x) = \sin^7 x$

$$f(-x) = \sin^7(-x) = [-\sin x]^7 = -\sin^7 x$$

$$\therefore f(-x) = -f(x)$$

So, $f(x)$ is an odd function.

$$\int_{-\pi/2}^{\pi/2} \sin^7 x dx = 0$$

25. (b) Let $I = \int_{-\pi/2}^{\pi/2} \sin^2 x dx$

Here, $f(x) = \sin^2 x$

$$f(-x) = \sin^2(-x) = [\sin(-x)]^2 = [-\sin x]^2 = \sin^2 x = f(x)$$

$\therefore f(x)$ is an even function.

$$I = \int_{-\pi/2}^{\pi/2} \sin^2 x dx = 2 \int_0^{\pi/2} \sin^2 x dx$$

$$= 2 \int_0^{\pi/2} \left[\frac{1 - \cos 2x}{2} \right] dx$$

$$= \left[x - \frac{\sin 2x}{2} \right]_0^{\pi/2} = \frac{\pi}{2} - 0 = \frac{\pi}{2}$$

26. (c) $I = \int_{-\pi/4}^{\pi/4} \left(\frac{\sin x + \cos x}{\cos x - \sin x} \right) dx$

$$\Rightarrow I = 0 \quad [\because f(x) = -f(-x)]$$

27. (b) $I = \int_{-\pi/4}^{\pi/4} \log(\sin x + \cos x) dx$
 $= \int_{-\pi/4}^{\pi/4} \log(\cos x + \sin x) dx$
 $\therefore 2I = \int_{-\pi/4}^{\pi/4} \log(\cos^2 x - \sin^2 x) dx$
 $= \int_{-\pi/4}^{\pi/4} \log(\cos 2x) dx$
 $= 2 \int_0^{\pi/4} \log(\cos 2x) dx$
 $\therefore I = \int_0^{\pi/4} \log(\cos 2x) dx = \frac{1}{2}$

$\int_0^{\pi/2} \log(\cos t) dx$
 $= \frac{1}{2} \left(\frac{-\pi}{2} \log 2 \right) = \frac{-\pi}{4} \log 2$

28. (d) Let $I = \int_0^{\pi/4} \log(\sin 2x) dx$
 Put $2x = t \Rightarrow 2dx = dt$
 $\therefore I = \frac{1}{2} \int_0^{\pi/2} \log(\sin t) dt$
 $= \frac{1}{2} \left(\frac{-\pi}{2} \log 2 \right) = \frac{-\pi \log 2}{4}$

29. (a) $\int_{-\pi/2}^{\pi/2} |\sin x| dx$
 $= \int_{-\pi/2}^0 (-\sin x) dx + \int_0^{\pi/2} (\sin x) dx$
 $= -[-\cos x]_0^{\pi/2} - [\cos x]_0^{\pi/2}$
 $= [\cos 0 - \cos(\pi/2)] - (\cos \pi/2 - \cos 0)$
 $= (1 - 0) - (0 - 1) = 2$

30. (a) Let $I = \int_0^{\pi/2} \sin 2x \ln(\cot x) dx \dots(i)$
 $\therefore \int_0^a f(x) dx = \int_0^a f(a-x) dx$
 $= \int_0^{\pi/2} \sin 2\left(\frac{\pi}{2} - x\right) \ln \cot\left(\frac{\pi}{2} - x\right) dx$
 $I = \int_0^{\pi/2} \sin 2x \ln(\tan x) dx \dots(ii)$
 On adding Eqs.(i) and (ii), we get
 $2I = \int_0^{\pi/2} \sin 2x [\ln(\cot x \cdot \tan x)] dx$
 $= \int_0^{\pi/2} \sin 2x \cdot \ln 1 \cdot dx = 0$
 $\therefore I = 0$

31. (b)

32. (c) Let $I = \int_{-a}^a (x^3 + \sin x) dx$
 As, $f(x) = -f(x)$
 i.e. $f(x)$ is an odd function.
 $\therefore \int_{-a}^a (x^3 + \sin x) dx = 0$

33. (c) Let $I = \int_0^2 \frac{dx}{x^2 + 4}$
 $\left[\because \int \frac{dx}{x^2 + a^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right]$
 $= \left[\frac{1}{2} \tan^{-1} \frac{x}{2} \right]_0^2 = \frac{1}{2} \left(\frac{\pi}{4} - 0 \right) = \frac{\pi}{8}$

34. (a) Let $I = \int_0^1 x e^x dx$
 Using integration by parts,
 $I = [x \cdot e^x]_0^1 - \int_0^1 1 \cdot e^x dx$
 $= (1 \cdot e - 0) - [e^x]_0^1$
 $= 1$

35. (b) Let $I = \int_0^2 e^{\log x} dx$
 $I = \int_0^2 x dx = \left[\frac{x^2}{2} \right]_0^2 = \frac{1}{2}(4 - 0) = 2$

36. (c) Let $I = \int_1^2 \log x dx$
 $I = \int_1^2 \log x \cdot 1 dx = \left(\log x \cdot x - \int \frac{1}{x} \cdot x dx \right)_1^2$
 $(x \log x - x)_1^2 = 2 \log 2 - 2 - 1 \cdot \log 1 + 1$
 $= \log_e 4 - \log_e e = \log_e \left(\frac{4}{e} \right)$

37. (d) Let $I = \int_{-\pi/6}^{\pi/6} \frac{\sin^5 x \cdot \cos^3 x}{x^4} dx$

As, $f(x) = -f(x)$
 i.e. $f(x)$ is an odd function.

$\therefore \int_{-\pi/6}^{\pi/6} \frac{\sin^5 x \cdot \cos^3 x}{x^4} dx = 0$

$\left[\because \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ even function} \\ 0, & \text{if } f(x) \text{ is an odd function} \end{cases} \right]$

38. (c) Let $I = \int_0^{\pi/2} \log(\tan x) dx \dots(i)$

$\Rightarrow I = \int_0^{\pi/2} \log \tan \left(\frac{\pi}{2} - x \right) dx$

$\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$= \int_0^{\pi/2} \log \cot x dx$

$\Rightarrow I = \int_0^{\pi/2} \log(\tan x)^{-1} dx$

$\Rightarrow I = \int_0^{\pi/2} -\log(\tan x) dx$

$\Rightarrow I = -\int_0^{\pi/2} \log(\tan x) dx = -I$

[from Eq. (i)]

$\Rightarrow 2I = 0 \Rightarrow I = 0$

or $\int_0^{\pi/2} \log(\tan x) dx = 0$

39. (b) Let $I = \int_{-\pi/2}^{\pi/2} x \sin x dx$

$\Rightarrow I = 2 \int_0^{\pi/2} x \sin x dx$

$\left[\because \int_{-a}^a f(x) dx = \begin{cases} 2 \int_0^a f(x) dx, & \text{if } f(x) \text{ even function} \\ 0, & \text{if } f(x) \text{ is an odd function} \end{cases} \right]$

$I = 2 [x(-\cos x) + \int \cos x dx]_0^{\pi/2}$
 [by parts]
 $= 2(-x \cos x + \sin x)_0^{\pi/2}$
 $= 2(-\pi/2 \cdot \cos \pi/2 + \sin \pi/2 + 0 - 0)$
 $= 2(-\pi/2 \times 0 + 1) = 2$

40. (a) Let $I = \int_0^1 \frac{e^{\tan^{-1} x}}{1+x^2} dx$

Put $t = \tan^{-1} x \Rightarrow dt = \frac{1}{1+x^2} dx$

Lower limit $\rightarrow t = \tan^{-1} 0 = 0$

Upper limit $\rightarrow t = \tan^{-1} 1 = \frac{\pi}{4}$

$\therefore I = \int_0^{\pi/4} e^t = [e^t]_0^{\pi/4}$
 $= [e^{\pi/4} - e^0] = e^{\pi/4} - 1$

41. (c) Let $I = \int_0^{\pi/2} \frac{dx}{a^2 \cos^2 x + b^2 \sin^2 x}$
 $= \int_0^{\pi/2} \frac{\sec^2 x dx}{a^2 + b^2 \tan^2 x}$
 [divide numerator and denominator by $\cos^2 x$]

Put $\tan x = t \Rightarrow \sec^2 x dx = dt$

When $x = 0$, then $t = 0$ and when $x = \frac{\pi}{2}$, then $t = \infty$

$\therefore I = \int_0^{\infty} \frac{dt}{a^2 + b^2 t^2} = \frac{1}{b^2} \int_0^{\infty} \frac{dt}{\left(\frac{a}{b}\right)^2 + t^2}$

$= \frac{1}{b^2} \frac{1}{\left(\frac{a}{b}\right)} \left[\tan^{-1} \left(\frac{bt}{a} \right) \right]_0^{\infty}$

$\left[\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \left(\frac{x}{a} \right) + C \right]$

$= \frac{1}{ab} [\tan^{-1}(\infty) - \tan^{-1}(0)]$

$= \frac{1}{ab} \left[\frac{\pi}{2} - 0 \right] = \frac{\pi}{2ab}$

Sol. (Q. Nos. 42-43) Given that,

$I_1 = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}}$

and $I_2 = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx \dots(ii)$

I_1 can be written as

$I_1 = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \frac{\sqrt{\sin x}}{\sqrt{\cos x}}}$

$I_1 = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx \dots(ii)$

42. (a) We have,

$I_1 - I_2 = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx$
 $- \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx$

$= \int_{\pi/6}^{\pi/3} \left(\frac{\sqrt{\cos x} - \sqrt{\sin x}}{\sqrt{\cos x} + \sqrt{\sin x}} \right) dx$

$$\begin{aligned}
 &= \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)} - \sqrt{\sin\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)}}{\sqrt{\cos\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)} + \sqrt{\sin\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)}} dx \\
 &\quad \left[\because \int_a^b f(x) dx = \int_a^b f(a+b-x) dx \right] \\
 &= \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x} - \sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx = - \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos x} - \sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx \\
 &= -(I_1 - I_2) \Rightarrow 2(I_1 - I_2) = 0 \Rightarrow I_1 - I_2 = 0
 \end{aligned}$$

43. (c) From Eq. (i), $I_1 = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} dx$... (iii)

$$\begin{aligned}
 &= \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)}}{\sqrt{\sin\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)} + \sqrt{\cos\left(\frac{\pi}{3} + \frac{\pi}{6} - x\right)}} dx \\
 &= \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x}}{\sqrt{\cos x} + \sqrt{\sin x}} dx \quad \dots \text{(iv)}
 \end{aligned}$$

On adding Eqs. (iii) and (iv), we get

$$\begin{aligned}
 2I_1 &= \int_{\pi/6}^{\pi/3} \frac{(\sqrt{\cos x} + \sqrt{\sin x})}{(\sqrt{\cos x} + \sqrt{\sin x})} dx \\
 2I_1 &= \int_{\pi/6}^{\pi/3} (1) dx = [x]_{\pi/6}^{\pi/3} = \left(\frac{\pi}{3} - \frac{\pi}{6}\right) = \frac{\pi}{6} \Rightarrow I_1 = \frac{\pi}{12}
 \end{aligned}$$

Sol. (Q. Nos. 44-45) Consider $I = \int_0^{\pi} \ln(\sin x) dx$,

$$I = \int_0^{\pi/2} \ln(\sin x) dx = 2 \int_0^{\pi/2} \ln(\sin x) dx \quad \dots \text{(i)}$$

$$\begin{aligned}
 &\left[\because \int_0^a f(x) dx = 2 \int_0^a f(x) dx \text{ if } f(2a-x) = f(x) \right] \\
 &= 2 \int_0^{\pi/2} \ln\left(\sin\left(\frac{\pi}{2} - x\right)\right) dx \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right] \\
 &= 2 \int_0^{\pi/2} \ln(\cos x) dx \quad \dots \text{(ii)}
 \end{aligned}$$

From Eq. (i), $I = 2 \int_0^{\pi/2} \ln(\sin x) dx \Rightarrow \int_0^{\pi/2} \ln(\sin x) dx = \frac{1}{2} I$

From Eq. (ii), we have $I = 2 \int_0^{\pi/2} \ln(\cos x) dx$

$$\Rightarrow \int_0^{\pi/2} \ln(\cos x) dx = \frac{1}{2} I$$

44. (d) 45. (a)

Sol. (Q. Nos. 46-48) Given, $I = \int_0^{\pi} \frac{xdx}{1 + \sin x}$... (i)

$$\begin{aligned}
 &= \int_0^{\pi} \frac{(\pi-x)}{1 + \sin(\pi-x)} dx \left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right] \\
 &= \int_0^{\pi} \frac{(\pi-x)}{1 + \sin x} dx \quad \left[\because \sin(\pi-x) = \sin x \right] \dots \text{(ii)}
 \end{aligned}$$

On adding Eqs. (i) and (ii), we get

$$\begin{aligned}
 2I &= \pi \int_0^{\pi} \frac{dx}{1 + \sin x} \quad \dots \text{(iii)} \Rightarrow 2I = 2\pi \int_0^{\pi/2} \frac{dx}{1 + \sin x} \\
 &\left[\because \int_0^a f(x) dx = 2 \int_0^a f(x) dx, \text{ if } f(2a-x) = f(x) \right]
 \end{aligned}$$

$$\Rightarrow I = \pi \int_0^{\pi/2} \frac{dx}{1 + \left(\frac{2 \tan \frac{x}{2}}{1 + \tan^2 \frac{x}{2}}\right)}$$

$$\Rightarrow I = \pi \int_0^{\pi/2} \frac{\sec^2 \frac{x}{2} dx}{\tan^2 \frac{x}{2} + 1 + 2 \tan \frac{x}{2}} \Rightarrow I = \pi \int_0^{\pi/2} \frac{\left(\sec^2 \frac{x}{2}\right) dx}{\left(\tan \frac{x}{2} + 1\right)^2}$$

Put $\tan \frac{x}{2} + 1 = t \Rightarrow \sec^2 \frac{x}{2} \cdot \frac{1}{2} dx = dt \Rightarrow \sec^2 \frac{x}{2} dx = 2 dt$

Now, when $x = 0$, then $t = 1$ and when $x = \frac{\pi}{2}$, then $t = 2$

$$\therefore I = 2\pi \int_1^2 \frac{dt}{t^2} = -2\pi \left[\frac{1}{t}\right]_1^2 = -2\pi \left[\frac{1}{2} - 1\right] = \pi$$

46. (c) According to the explanation, $I = \pi$

47. (a) Let $I_1 = \int_0^{\pi} \frac{(\pi-x)dx}{1 + \sin x} = \int_0^{\pi} \frac{[\pi - (\pi-x)] dx}{1 + \sin(\pi-x)}$
 $\left[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx \right]$

$$\therefore I_1 = \int_0^{\pi} \frac{x dx}{1 + \sin x} = I = \pi \quad \left[\because \sin(\pi-x) = \sin x \right]$$

48. (b) From Eq. (iii), $2I = \pi \int_0^{\pi} \frac{dx}{1 + \sin x}$

$$\Rightarrow \int_0^{\pi} \frac{dx}{1 + \sin x} = \frac{2}{\pi} I \Rightarrow \int_0^{\pi} \frac{dx}{1 + \sin x} = \frac{2}{\pi} \times \pi = 2 \quad \left[\because I = \pi \right]$$

Sol. (Q. Nos. 49-52) We have,

$$I_m = \int_0^{\pi} \frac{\sin 2mx}{\sin x} dx, \text{ where } m \text{ is a positive integer.}$$

We know that, if m is a positive integer, then $\frac{\sin 2mx}{\sin x} = 2$

$$\left[\cos x + \cos 3x + \dots + \cos(2m-1)x \right]$$

$$\therefore I_m = \int_0^{\pi} 2 [\cos x + \cos 3x + \dots + \cos(2m-1)x] dx$$

$$= 2 \left(\sin x + \frac{\sin 3x}{3} + \dots + \frac{\sin(2m-1)x}{(2m-1)} \right)_0^{\pi}$$

$$= 2 \left(\sin \pi + \frac{\sin 3\pi}{3} + \dots + \frac{\sin(2m-1)\pi}{(2m-1)} \right) - \left(\sin 0 + \frac{\sin 0}{3} + \dots + \frac{\sin 0}{(2m-1)} \right)$$

$$= 2 [0 - 0] \quad \left[\because \sin n\pi = 0, \forall n \in \mathbb{Z} \right]$$

$$\Rightarrow I_m = 0$$

49. (a) $\because I_m = 0 \therefore I_1 = 0$

50. (d) $\because I_m = 0 \therefore I_2 + I_3 = 0 + 0 = 0$

51. (a) $\because I_m = 0 \therefore I_m = 0$

52. (a) I. $\because I_m = 0$

$$\therefore I_m - I_{m-1} = 0 - 0 = 0$$

II. $\because I_m = 0 \Rightarrow I_{2m} = 0$

$$\therefore I_{2m} \neq I_m \Rightarrow I_1 = 0; \quad I_2 + I_3 = 0;$$

$$I_m - I_{m-1} = 0 \text{ and } I_{2m} = I_m$$

53. (d) We have, $a + b = 0 \Rightarrow a = -b$

$$\therefore \int_a^b \frac{x^7 + \sin x}{\cos x} dx = \int_{-b}^b (x^7 \cdot \sec x + \tan x) dx$$

The given integrand is an odd function. Hence, its answer is 0.

54. (b) $\int_{-1}^1 x|x| dx = \int_{-1}^0 x(-x) dx + \int_0^1 x(x) dx$

$$\left[\text{when } a < c < b, \text{ then } \int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx \right]$$

$$= \int_{-1}^0 -x^2 dx + \int_0^1 x^2 dx = \left[-\frac{x^3}{3} \right]_{-1}^0 + \left[\frac{x^3}{3} \right]_0^1 = \frac{2}{3}$$

$$55. (a) \int_a^b \frac{|x|}{x} dx = \int_a^b 1 dx \quad [\because 0 < a < b]$$

$$= [x]_a^b = |b| - |a|$$

$$56. (c) \text{ We have, } \int_0^{2\pi} \sin^5 \left(\frac{x}{4} \right) dx$$

$$\text{Put } \frac{x}{4} = t \Rightarrow dx = 4 dt$$

$$\therefore \int_0^{\pi/2} \sin^5 t \cdot 4 dt = 4 \int_0^{\pi/2} \sin^5 t dt$$

$$\text{By Walli's formula,}$$

$$\int_0^{\pi/2} \sin^n x dx = \int_0^{\pi/2} \cos^n x dx$$

$$= 4 \cdot \frac{4 \cdot 2}{5 \cdot 3} = \frac{32}{15}$$

$$57. (c) \text{ Given, } A = \int_0^\pi \frac{\sin x dx}{\sin x + \cos x}$$

$$\text{and } B = \int_0^\pi \frac{\sin x}{\sin x - \cos x} dx$$

$$\text{Now, } A = \int_0^\pi \frac{\sin(\pi - x) dx}{\sin(\pi - x) + \cos(\pi - x)}$$

$$[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx]$$

$$= \int_0^\pi \frac{\sin x dx}{\sin x - \cos x} = B$$

Thus, $A = B$

$$58. (b) \text{ Let } I = A = \int_0^\pi \frac{\sin x dx}{\sin x + \cos x} \quad \dots(i)$$

$$\text{and } I = B = \int_0^\pi \frac{\sin x}{\sin x - \cos x} dx \quad \dots(ii)$$

$$[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx]$$

$$\text{On adding Eqs. (i) and (ii), we get}$$

$$2I = \int_0^\pi \left(\frac{\sin x}{\sin x + \cos x} + \frac{\sin x}{\sin x - \cos x} \right) dx$$

$$\Rightarrow 2I = \int_0^\pi \frac{2 \sin^2 x}{\sin^2 x - \cos^2 x} dx$$

$$\Rightarrow 2I = 4 \int_0^{\pi/2} \frac{\sin^2 x}{\sin^2 x - \cos^2 x} dx \quad \dots(iii)$$

$$\left[\because \int_0^{2a} f(x) dx = 2 \int_0^a f(x) dx \right]$$

$$\left[\text{is } f(2a-x) = f(x) \right]$$

$$\Rightarrow 2I = 4 \int_0^{\pi/2} \frac{\cos^2 x}{\cos^2 x - \sin^2 x} dx \quad \dots(iv)$$

$$[\because \int_0^a f(x) dx = \int_0^a f(a-x) dx]$$

$$\Rightarrow 4I = 4 \int_0^{\pi/2} \left(\frac{\sin^2 x - \cos^2 x}{\sin^2 x - \cos^2 x} \right) dx$$

On adding Eqs. (iii) and (iv),

$$4I = 4 [x]_0^{\pi/2} \Rightarrow I = \frac{\pi}{2}$$

$$59. (c) \because a_{2n} = \int_0^\pi \frac{\sin^2 \{(2n+1)x\}}{\sin 2x} dx \quad \dots(i)$$

By applying property

$$\int_0^\pi f(x) dx = \int_0^\pi f(\pi - x) dx$$

$$\therefore a_{2n} = \int_0^\pi \frac{\sin^2 \{(2n+1)(\pi - x)\}}{\sin 2(\pi - x)} dx$$

$$= \int_0^\pi \frac{\sin^2 \{(2n+1)x\}}{-\sin 2x} dx \quad \dots(ii)$$

$$[\because \text{for any value of } n, \sin^2 \{(2n+1)(\pi - x)\} = \sin^2 \{(2n+1)x\}]$$

On adding Eqs. (i) and (ii), we get

$$2a_{2n} = \int_0^\pi \frac{\sin^2 \{(2n+1)x\}}{\sin 2x} dx$$

$$- \int_0^\pi \frac{\sin^2 \{(2n+1)x\}}{\sin 2x} dx$$

$$\Rightarrow 2a_{2n} = 0 \Rightarrow a_{2n} = 0$$

Similarly, value $a_{2n+1} = 0$

\therefore Both sequence $\{a_{2n}\}$ and $\{a_{2n+1}\}$ are in AP with common difference zero.

$$60. (b) \because a_{n-1} = \int_0^\pi \frac{\sin^2 \{(n-1+1)x\}}{\sin 2x} dx$$

$$= \int_0^\pi \frac{\sin^2 \{nx\}}{\sin 2x} dx \quad \dots(i)$$

By applying property

$$\int_0^\pi f(x) dx = \int_0^\pi f(\pi - x) dx$$

$$\therefore a_{n-1} = \int_0^\pi \frac{\sin^2 \{n(\pi - x)\}}{\sin 2(\pi - x)} dx$$

$$= \int_0^\pi \frac{\sin^2 \{nx\}}{-\sin 2x} dx \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$2a_{n-1} = 0, a_{n-1} = 0$$

Similarly, $a_{n-4} = 0$

$$\therefore a_{n-1} - a_{n-4} = 0 - 0 = 0$$

$$61. (c) \int_{-2}^2 x dx - \int_{-2}^2 [x] dx$$

$$= \left[-2, -2 \leq x < -1 \right]$$

$$\left[-1, -1 \leq x < 0 \right]$$

$$\left[0, 0 \leq x < 1 \right]$$

$$\left[1, 1 \leq x < 2 \right]$$

$$\text{We have, } [x] = \begin{cases} -2, & -2 \leq x < -1 \\ -1, & -1 \leq x < 0 \\ 0, & 0 \leq x < 1 \\ 1, & 1 \leq x < 2 \end{cases}$$

$$\therefore \int_{-2}^2 x dx - \left[\int_{-2}^{-1} (-2) dx + \int_{-1}^0 (-1) dx + \int_0^1 0 dx + \int_1^2 1 dx \right]$$

$$= 0 - [-2[x]_{-2}^{-1} + [-x]_{-1}^0 + [x]_1^2]$$

$$[\because \int_{-a}^a f(x) dx = 0, \text{ if } f(x) \text{ is odd}]$$

$$= -[-2(-1+2) + (0-1) + (2-1)]$$

$$= -[-2-1+1] = 2$$

$$62. (d) \text{ Let } I = \int_0^{4\pi} |\cos x| dx$$

$$= 2 \int_0^{2\pi} |\cos x| dx$$

$$[\because \int_0^{2a} f(x) dx = 2 \int_0^a f(x) dx, \text{ if}$$

$$f(2a-x) = f(x), \text{ where}$$

$$|\cos(4\pi - x)| = |\cos x|]$$

$$= 2 \cdot 2 \int_0^\pi |\cos x| dx$$

$$[\because |\cos(2\pi - x)| = |\cos x|]$$

$$= 2 \cdot 2 \cdot 2 \int_0^{\pi/2} |\cos x| dx$$

$$[\because |\cos(\pi - x)| = |-\cos x| = |\cos x|]$$

$$= 8 \int_0^{\pi/2} \cos x dx = 8 [\sin x]_0^{\pi/2}$$

$$\left[\because \cos x > 0, \forall x \in \left(0, \frac{\pi}{2} \right) \right]$$

$$= 8 \left[\sin \frac{\pi}{2} - \sin 0 \right] = 8$$

$$63. (b) \text{ Given, } \int_{-2}^5 f(x) dx = 4,$$

$$\int_0^5 \{1 + f(x)\} dx = 7$$

$$\text{Let } I = \int_{-2}^5 f(x) dx$$

$$= \int_{-2}^0 f(x) dx + \int_0^5 f(x) dx$$

$$\Rightarrow 4 = \int_{-2}^0 f(x) dx + \int_0^5 \{1 + f(x)\} dx$$

$$\Rightarrow 4 = \int_{-2}^0 f(x) dx + \int_0^5 [1 + f(x)] dx$$

$$- \int_0^5 1 dx$$

$$\Rightarrow 4 = \int_{-2}^0 f(x) dx + 7 - [x]_0^5$$

$$\Rightarrow \int_{-2}^0 f(x) dx = 2$$

$$64. (b) \text{ Given, } g(x) = \left[\frac{1}{x} \right]$$

$$\text{When } \frac{1}{3} < x < \frac{1}{2} \Rightarrow 2 < \frac{1}{x} < 3$$

$$\therefore \left[\frac{1}{x} \right] = 2$$

Now, we can find $\int_{1/3}^{1/2} g(x) dx$

$$\therefore \int_{1/3}^{1/2} g(x) dx = \int_{1/3}^{1/2} \left[\frac{1}{x} \right] dx$$

$$= \int_{1/3}^{1/2} 2 dx = 2 [x]_{1/3}^{1/2} = \frac{1}{3}$$

$$65. (a) \text{ Given, } f(x) = x g(x)$$

$$\text{and } g(x) = \left[\frac{1}{x} \right]$$

We have to split given limit into two parts as in above questions.

$$\therefore f(x) = x g(x) = 2x$$

$$\text{When } \frac{1}{2} < x < 1$$

$$\Rightarrow 1 < \frac{1}{x} < 2 \Rightarrow \left[\frac{1}{x} \right] = 1$$

$$\therefore f(x) = x g(x) = x$$

$$\text{Now, } \int_{1/3}^1 f(x) dx$$

$$= \int_{1/3}^{1/2} 2x dx + \int_{1/2}^1 x dx$$

$$= \frac{2}{2} \left[\left(\frac{1}{2} \right)^2 - \left(\frac{1}{3} \right)^2 \right] + \frac{1}{2} \left[(1)^2 - \left(\frac{1}{2} \right)^2 \right]$$

$$= \left[\frac{1}{4} - \frac{1}{9} \right] + \frac{1}{2} \left[1 - \frac{1}{4} \right] = \frac{37}{72}$$

25

AREAS BOUNDED BY REGIONS

In NDA exam, generally 2-3 questions are asked from this chapter, which are based on area between curve and axes.

The area bounded by a continuous curve with certain limit is known as the area of that curve.

Area between a Curve and Axes

- (i) The area of the region bounded by the curve $y = f(x)$, X -axis and the lines $x = a$, $x = b$ is given by

$$\text{Area} = \int_a^b y \, dx = \int_a^b f(x) \, dx$$

- (ii) The area of the region bounded by the curve $x = \phi(y)$, Y -axis and the lines $y = c$, $y = d$ is given by

$$\text{Area} = \int_c^d x \, dy = \int_c^d \phi(y) \, dy$$

- (iii) The area of the region enclosed between the two curves $y = g(x)$, $y = f(x)$ and the lines $x = a$, $x = b$ is given by

$$\begin{aligned} \text{Area} &= \int_a^b f(x) \, dx - \int_a^b g(x) \, dx \\ &= \int_a^b [f(x) - g(x)] \, dx \end{aligned}$$

where, $f(x) \geq g(x)$ in $[a, b]$.

- (iv) The area of the region enclosed between the two curves $x = g(y)$, $x = f(y)$ and the lines $y = c$, $y = d$ is given by

$$\begin{aligned} \text{Area} &= \int_c^d f(y) \, dy - \int_c^d g(y) \, dy \\ &= \int_c^d [f(y) - g(y)] \, dy, \end{aligned}$$

where, $f(y) \geq g(y)$ in $[c, d]$.

Note If some part of curves lies below the X-axis, then its area lies in negative side but area cannot be negative. Therefore, we take its modulus.

EXAMPLE 1. Sketch a rough graph of the curve and find the area of the region bounded by $y^2 = x$, $x = 1$, $x = 4$ and the X-axis.

- a. $\frac{14}{3}$ sq units b. $\frac{7}{3}$ sq units c. $\frac{28}{3}$ sq units d. $\frac{21}{3}$ sq units

Sol. The region is plotted in the following figure.

The required region is ADCBA.

$$\text{Area} = \int_1^4 \sqrt{x} \, dx = \frac{2}{3} [x^{3/2}]_1^4 = \frac{2}{3} [4^{3/2} - 1] = \frac{14}{3} \text{ sq units}$$

EXAMPLE 2. Find the area of the region bounded by $y = x(x-1)(x-2)$, $x = 0$, $x = 2$ and the X-axis.

- a. $\frac{1}{4}$ sq unit b. $\frac{1}{2}$ sq unit c. $\frac{3}{4}$ sq unit d. $1\frac{1}{4}$ sq units

Sol. The curve $y = x(x-1)(x-2)$ cuts the X-axis at

$x = 0$, $x = 1$ and $x = 2$. For $0 < x < 1$, $y > 0$. For

$1 < x < 2$, $y < 0$. For $x > 2$, $y > 0$.

The region $0 \leq x \leq 2$ is plotted in the figure.

The required region is OABCD.

$$\begin{aligned} \text{Area} &= \int_0^1 x(x-1)(x-2) \, dx + \left| \int_1^2 x(x-1)(x-2) \, dx \right| \\ &= \int_0^1 (x^3 - 3x^2 + 2x) \, dx + \left| \int_1^2 (x^3 - 3x^2 + 2x) \, dx \right| \\ &= \left[\frac{1}{4}x^4 - x^3 + x^2 \right]_0^1 + \left| \left[\frac{1}{4}x^4 - x^3 + x^2 \right]_1^2 \right| \\ &= \left[\left(\frac{1}{4} - 1 + 1 \right) - 0 \right] + \left| \left[(4 - 8 + 4) - \left(\frac{1}{4} - 1 + 1 \right) \right] \right| \\ &= \frac{1}{4} + \frac{1}{4} = \frac{1}{2} \text{ sq unit} \end{aligned}$$

Some Standard Curves

(i) Exponential Curves

(ii) Logarithmic Curves (iii) Modulus Function

EXAMPLE 3. The area bounded by $y = \tan x$, $y = \cot x$, X-axis in $0 \leq x \leq \pi/2$ is

- a. $3 \log 2$ b. $2 \log 2$ c. $\log 2$ d. $1/\log 2$

Sol. Clearly the two curves meet at the point $\left(\frac{\pi}{4}, 1\right)$.

\therefore Required area

$$\begin{aligned} &= \int_0^{\pi/4} \tan x \, dx + \int_{\pi/4}^{\pi/2} \cot x \, dx \\ &= [\log \sec x]_0^{\pi/4} + [\log \sin x]_{\pi/4}^{\pi/2} \\ &= \log \sqrt{2} - \log \frac{1}{\sqrt{2}} = \log 2 \end{aligned}$$

EXAMPLE 4. The area of the curve bounded by the parabola $(y-2)^2 = x-1$, the tangent to it at the point with the ordinate $x = 3$ and the X-axis is

- a. 9 sq units b. 7 sq units c. 5 sq units d. 6 sq units

Sol.

Given parabola is $(y-2)^2 = x-1$, $\frac{dy}{dx} = \frac{1}{2(y-2)}$

When $y = 3$, $x = 2$, then $\frac{dy}{dx} = \frac{1}{2(3-2)} = \frac{1}{2}$

Tangent at $(2, 3)$ is $y - 3 = \frac{1}{2}(x - 2) \Rightarrow x - 2y + 4 = 0$

$$\begin{aligned} \therefore \text{Required area} &= \int_0^3 ((y-2)^2 + 1) \, dy - \int_0^3 (2y - 4) \, dy \\ &= \left[\frac{(y-2)^3}{3} + y \right]_0^3 - [y^2 - 4y]_0^3 = 9 \text{ sq units} \end{aligned}$$

> PRACTICE EXERCISE

- Area lying in the first quadrant and bounded by the circle $x^2 + y^2 = 4$ and the line $x = y\sqrt{3}$ equals to
 (a) π (b) $\pi/2$ (c) $\pi/3$ (d) $\pi/4$
- Area bounded by the curves $y = x \sin x$ and X -axis between $x = 0$ and $x = 2\pi$ is
 (a) 2π (b) 3π (c) 4π (d) 6π
- What is the area of the triangle formed by the lines joining the vertex of the parabola $x^2 = 12y$ to the latusrectum?
 (a) 9 sq units (b) 12 sq units (c) 14 sq units (d) 18 sq units
- What is the area bounded by the curve $\sqrt{x} + \sqrt{y} = \sqrt{a}$ ($x, y \geq 0$) and the coordinate axes?
 (a) $\frac{5a^2}{6}$ (b) $\frac{a^2}{3}$ (c) $\frac{a^2}{2}$ (d) $\frac{a^2}{6}$
- What is the area bounded by the regions $y = e^x$, $y = e^{-x}$ and the straight line $x = 1$?
 (a) $\left(e + \frac{1}{e}\right)$ sq units (b) $\left(e - \frac{1}{e}\right)$ sq units
 (c) $\left(e + \frac{1}{e} - 2\right)$ sq units (d) $\left(e - \frac{1}{e} - 2\right)$ sq units
- Area bounded by the curve $xy^2 = a^2(a - x)$ and the Y -axis is
 (a) $\pi a^2/2$ sq units (b) $3\pi a^2$ sq units
 (c) πa^2 sq units (d) None of these
- Find the area of the region bounded by $x^2 = 4y$, $x = 4y - 2$.
 (a) $\frac{3}{8}$ sq unit (b) $\frac{5}{8}$ sq unit
 (c) $\frac{7}{8}$ sq unit (d) None of these
- The area enclosed by the curves $y = \sin x + \cos x$ and $y = |\cos x - \sin x|$ over the interval $\left(0, \frac{\pi}{2}\right)$ is
 I. $2\sqrt{2}(2 - \sqrt{2})$ II. $2\sqrt{2}(\sqrt{2} - 1)$ III. $2(\sqrt{2} - 1)$
 (a) Only I (b) Only II
 (c) Only III (d) None of these
- The area bounded by the circle $x^2 + y^2 = 8$, the parabola $x^2 = 2y$ and the line $y = x$ in $y \geq 0$
 I. Has area = $\left(2\pi + \frac{4}{3}\right)$ sq units
 II. Has area = $\left(2\pi + \frac{2}{3}\right)$ sq units
 III. The point of intersection of circle, parabola and line in 1st quadrant is (2,2).
 (a) Only I (b) Only II (c) I and III (d) II and III

Directions (Q. Nos. 10-12) Consider $L: x - y - 1 = 0$ be a line and $C: y^2 = 2x + 1$ be a parabola, then

- What is the area enclosed by L and C in upper half plane?
 (a) $\frac{9}{2}$ sq units (b) $\frac{5}{6}$ sq units
 (c) $\frac{16}{3}$ sq units (d) None of these
- What is the area enclosed by L and C in the lower half plane?
 (a) $\frac{9}{2}$ sq units (b) $\frac{5}{6}$ sq units (c) $\frac{16}{3}$ sq units (d) None of these
- What is the area enclosed by L and C lying in the plane?
 (a) $\frac{9}{2}$ sq units (b) $\frac{5}{6}$ sq unit (c) $\frac{16}{3}$ sq units (d) None of these

 (a) $\log 2$ sq units (b) $\frac{\log 2}{2}$ sq units
 (c) $2(\log 2)$ sq units (d) None of these

HINTS AND SOLUTIONS

1. (c) Line and the curve meet at $P(\sqrt{3}, 1)$ in Ist quadrant. Draw perpendicular PM .

$$\therefore \text{Area} = \Delta OPM + \int_{\sqrt{3}}^2 y \, dx$$

Now, $x = 2 \cos \theta$, $y = 2 \sin \theta$, then the limits changes

$$\begin{aligned} &= \frac{1}{2} \cdot \sqrt{3} \cdot 1 + \int_{\pi/6}^0 (2 \sin \theta) (-2 \sin \theta) \, d\theta \\ &= \frac{\sqrt{3}}{2} + 4 \int_0^{\pi/6} \frac{(1 - \cos 2\theta)}{2} \, d\theta \\ &= \frac{\sqrt{3}}{2} + 2 \left[\theta - \frac{\sin 2\theta}{2} \right]_0^{\pi/6} \\ &= \frac{\sqrt{3}}{2} + 2 \left[\frac{\pi}{6} - \frac{1}{2} \cdot \frac{\sqrt{3}}{2} \right] = \frac{\pi}{3} \end{aligned}$$

2. (c) Area = $\int_0^\pi y \, dx + \int_\pi^{2\pi} y \, dx$

$$\begin{aligned} &= \left| \int_0^\pi x \sin x \, dx \right| + \left| \int_\pi^{2\pi} x \sin x \, dx \right| \\ &= \left| [x(-\cos x) + \sin x]_0^\pi \right| \\ &\quad + \left| [x(-\cos x) + \sin x]_\pi^{2\pi} \right| \\ &= | -(\pi - 0) + (0 - 0) | \\ &\quad + | [-2\pi + \pi(-1)] + (0 - 0) | \\ &= \pi + 3\pi = 4\pi \end{aligned}$$

3. (d) Equation of parabola is $x^2 = 12y$

$$\begin{aligned} \therefore \text{Area of } \Delta ABC &= \frac{1}{2} \begin{vmatrix} 0 & 0 & 1 \\ 6 & 3 & 1 \\ -6 & 3 & 1 \end{vmatrix} \\ &= \frac{1}{2} (18 + 18) = \frac{1}{2} \times 36 = 18 \text{ sq units} \end{aligned}$$

4. (d) The given equation of curve

$$\sqrt{x} + \sqrt{y} = \sqrt{a} \quad (x, y \geq 0)$$

$$\Rightarrow (\sqrt{y})^2 = (\sqrt{a} - \sqrt{x})^2$$

$$\Rightarrow y = (\sqrt{a} - \sqrt{x})^2$$

$$\text{At } x = 0, \sqrt{y} = \sqrt{a} \Rightarrow y = a$$

$$\text{At } y = 0, \sqrt{x} = \sqrt{a} \Rightarrow x = a$$

So, curve cuts the axes at $(a, 0)$ and $(0, a)$, respectively.

$$\therefore \text{Required area} = \int_0^a y \, dx$$

$$= \int_0^a (\sqrt{a} - \sqrt{x})^2 \, dx$$

$$= \int_0^a (a + x - 2\sqrt{a}\sqrt{x}) \, dx$$

$$= \left[ax + \frac{x^2}{2} - \frac{4}{3} \sqrt{ax} \right]_0^a$$

$$= a^2 + \frac{a^2}{2} - \frac{4}{3} \sqrt{a} \cdot a^{3/2}$$

$$\frac{3a^2}{2} - \frac{4}{3} a^2 = \frac{(9-8)}{6} a^2 = \frac{a^2}{6}$$

5. (c) The given curves, $y = e^x$, $y = e^{-x}$ and $x = 1$

$$\text{Area of } EACOE = \int_0^1 y \, dx$$

$$= \int_0^1 e^x \, dx = [e^x]_0^1 = (e - 1)$$

$$\text{Area of } EBCOE = \int_0^1 e^{-x} \, dx$$

$$= [-e^{-x}]_0^1 = -[e^{-1} - 1] = (1 - 1/e)$$

So, the area of $EABE = \text{Area of } EACOE - \text{Area of } EBCOE$

$$= (e - 1) - (1 - 1/e)$$

$$= \left(e + \frac{1}{e} - 2 \right) \text{ sq units}$$

6. (c) $xy^2 = a^2(a - x)$, $x = \frac{a^3}{y^2 + a^2}$

The given curve is symmetrical about X -axis and meets it at $(a, 0)$.

The line $x = 0$ i.e., Y -axis is an asymptote (tangent at infinity).

$$\text{Area} = \int_0^\infty x \, dy = 2 \int_0^\infty \frac{a^3}{y^2 + a^2} \, dx$$

$$= 2a^3 \cdot \frac{1}{a} \left[\tan^{-1} \frac{y}{a} \right]_0^\infty = 2a^2 \cdot \frac{\pi}{2} = \pi a^2$$

7. (d) The curves intersect each other, if

$$\frac{x^2}{4} = \frac{x+2}{4} \Rightarrow x^2 - x - 2 = 0$$

$$\Rightarrow x = -1, 2$$

Hence, the points of intersection are $(-1, 1/4)$ and $(2, 1)$. The region is plotted in following figure.

Since, the straight line $x = 4y - 2$ is always above the parabola $x^2 = 4y$ in the interval $[-1, 2]$. The required area is given by

$$= \int_{-1}^2 \left[\frac{x+2}{4} - \frac{x^2}{4} \right] \, dx$$

$$= \frac{1}{4} \left[\frac{1}{2} x^2 + 2x - \frac{1}{3} x^3 \right]_{-1}^2$$

$$= \frac{1}{4} \left[\left(2 + 4 - \frac{8}{3} \right) - \left(\frac{1}{2} - 2 + \frac{1}{3} \right) \right]$$

$$= \frac{9}{8} \text{ sq units}$$

8. (b) Given, $y = \sin x + \cos x$

$$\frac{dy}{dx} = \cos x - \sin x,$$

$$y = |\cos - \sin x|$$

$$= \begin{cases} \cos x - \sin x & x \in [0, \pi/4] \\ \sin x - \cos x & x \in [\pi/4, \pi/2] \end{cases}$$

$$\frac{-}{0} \quad \frac{+}{\pi/4} \quad \frac{+}{\pi/2}$$

Thus, required area

$$\begin{aligned}
 &= \int_0^{\pi/4} [(\sin x + \cos x) - (\cos x - \sin x)] dx \\
 &\quad + \int_{\pi/4}^{\pi/2} 2 \cos x dx \\
 &= \int_0^{\pi/4} 2 \sin x dx + \int_{\pi/4}^{\pi/2} 2 \cos x dx \\
 &= 2[-\cos x]_0^{\pi/4} + 2[\sin x]_{\pi/4}^{\pi/2} \\
 &= 2\left[\frac{-1}{\sqrt{2}} + 1 + 1 - \frac{1}{\sqrt{2}}\right] \\
 &= 2(2 - \sqrt{2}) = 2\sqrt{2}(\sqrt{2} - 1)
 \end{aligned}$$

9. (d) The required area

$$\begin{aligned}
 &= \int_{-2}^2 \sqrt{8-x^2} dx - \int_{-2}^2 \frac{1}{2} x^2 dx - \int_0^2 x dx \\
 &= 2 \int_0^2 \sqrt{8-x^2} dx - \left[\frac{x^3}{6}\right]_{-2}^2 - \left[\frac{x^2}{2}\right]_0^2 \\
 &= 2 \left[\frac{x}{2} \sqrt{8-x^2} + \frac{8}{2} \sin^{-1} \frac{x}{2\sqrt{2}}\right]_0^2 - \frac{4}{3} - 2 \\
 &= 2 \left[2 + 4 \cdot \frac{\pi}{4}\right] - \frac{10}{3} = \frac{2}{3} + 2\pi
 \end{aligned}$$

10. (a) Area above the upper half plane is

$$\int_{-1}^4 (\sqrt{2x+1}) dx - \int_1^4 (x-1) dx = 9/2 \text{ sq units}$$

11. (b) Area below the lower half plane is

$$\left| \int_{-1}^0 -\sqrt{2x+1} dx \right| + \left| \int_0^1 (x-1) dx \right| = 5/6 \text{ sq units}$$

12. (c) Total area = $\frac{9}{2} + \frac{5}{6} = \frac{16}{3}$ sq units

13. (c) Required area = $\int_a^b x dy$

14. (b)

15. (c)

Required area (OBAB'C)

$$\begin{aligned}
 &= \int_0^{\pi} \sin x dx + \int_{\pi}^{2\pi} -\sin x dx \\
 &= [-\cos x]_0^{\pi} + [\cos x]_{\pi}^{2\pi} \\
 &= -(\cos \pi - \cos 0) + (\cos 2\pi - \cos \pi) \\
 &= -(-1 - 1) + (1 + 1) = 4 \text{ sq units}
 \end{aligned}$$

16. (c)

17. (b)

18. (c) Given equation of lines

$$x=0, y=0 \text{ and } x+y+2=0$$

∴ Required area = Area of ΔOAB

$$= \frac{1}{2} \times OA \times OB = \frac{1}{2} \times 2 \times 2 = 2 \text{ sq units}$$

19. (b) Given equation of curves are

$$y = \tan x \quad \dots(i)$$

$$\text{and } y = 0 \text{ and } x = \frac{\pi}{4} \quad \dots(ii)$$

∴ Required area = $\int_0^{\pi/4} y dx$

$$= \int_0^{\pi/4} \tan x dx = [\log |\sec x|]_0^{\pi/4}$$

$$\begin{aligned}
 &= \log \left| \sec \frac{\pi}{4} \right| - \log |\sec 0| \\
 &= \log |\sqrt{2}| - \log |1| \\
 &= \log \sqrt{2} - 0 = \frac{1}{2} \log 2 \text{ sq units}
 \end{aligned}$$

20. (c) Given equation of parabola and line are

$$x^2 = y \quad \dots(i)$$

$$\text{and } y = 1 \quad \dots(ii)$$

On solving Eqs. (i) and (ii), we get

$$x^2 = 1$$

$$\Rightarrow x = \pm 1$$

∴ Required area = 2 × Area of OPBO

$$= 2 \int_0^1 x dy = \int_0^1 \sqrt{y} dy$$

$$= 2 \left[\frac{2y^{2/3}}{3} \right]_0^1 = \frac{4}{3} (1-0) = \frac{4}{3} \text{ sq units}$$

21. (d) Equation of parabola is $y^2 = 4bx$.

Area of parabola bounded by its latusrectum

$$\begin{aligned}
 &= 2 \int_0^b \sqrt{4bx} dx = 4\sqrt{b} \times \frac{2}{3} [x^{3/2}]_0^b \\
 &= \frac{8\sqrt{b}}{3} [b^{3/2} - 0] = \frac{8b^2}{3} \text{ sq units}
 \end{aligned}$$

22. (c) Equation of line is $2y = 3x + 12$... (i)

Equation of parabola is $4y = 3x^2$... (ii)

On putting the value of y from Eq. (i) to Eq. (ii), we get $2(3x + 12) = 3x^2$

$$\Rightarrow 3x^2 - 6x - 24 = 0$$

$$\Rightarrow x^2 - 2x - 8 = 0$$

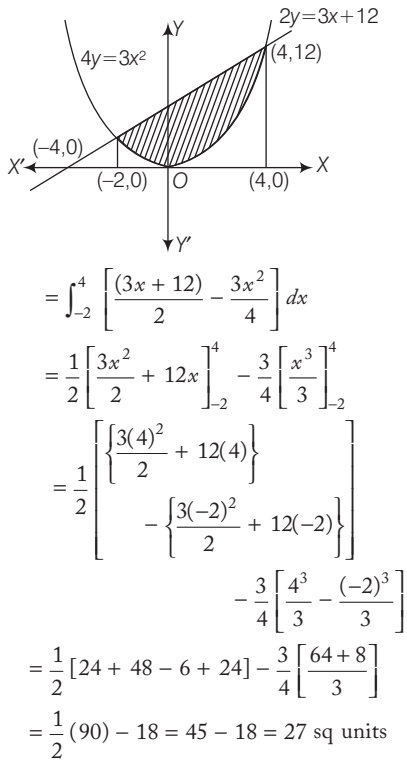

$$\Rightarrow (x-4)(x+2) = 0$$

$$\Rightarrow x = 4 \text{ and } x = -2$$

On putting these values in Eq. (ii), we get $y = 12$ and $y = 3$

Hence, points are $(-2, 3)$ and $(4, 12)$.

23. (a) Area enclosed by the parabola and the line

24. (c) Area enclosed by the parabola, the line and the Y-axis in the first quadrant is

$$\int_0^4 \left(\frac{3x+12}{2} - \frac{3x^2}{4} \right) dx$$

$$= \left[\frac{3}{4} x^2 + 6x - \frac{x^3}{4} \right]_0^4$$

$$= 3 \times 4 + 24 - 16$$

$$= 12 + 24 - 16 = 20 \text{ sq units}$$

Sol. (Qs Nos. 25-26) Given equation of curves are

$y = \sin x$... (i)
and $y = \cos x$... (ii)

The graph of above curves between 0 to $\frac{\pi}{2}$ is

25. (a) Required area = Area of region OABO

$$= \int_0^{\pi/4} (\cos x - \sin x) dx$$

$$= [\sin x + \cos x]_0^{\pi/4}$$

$$= \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - 0 - 1 = \sqrt{2} - 1$$

26. (a) Required area = Area of region ACDA

$$= \int_{\pi/4}^{\pi/2} (\sin x - \cos x) dx$$

$$= [-\cos x - \sin x]_{\pi/4}^{\pi/2}$$

$$= -[\cos x + \sin x]_{\pi/4}^{\pi/2}$$

$$= -\left[0 + 1 - \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right) \right] = \sqrt{2} - 1$$

27. (a) Required area is shaded as shown in the figure given below

∴ Required area = $\int_{\sqrt{3}}^2 \sqrt{4-x^2} dx$

$$= \frac{1}{2} \left[x\sqrt{4-x^2} + 4 \sin^{-1} \left(\frac{x}{2} \right) \right]_{\sqrt{3}}^2$$

$$= \frac{1}{2} \left[4 \sin^{-1} (1) - \sqrt{3} \sqrt{1} - 4 \sin^{-1} \left(\frac{\sqrt{3}}{2} \right) \right]$$

$$= \frac{1}{2} \left[4 \cdot \frac{\pi}{2} - \sqrt{3} - 4 \times \frac{\pi}{3} \right]$$

$$= \frac{\pi}{3} - \frac{\sqrt{3}}{2}$$

28. (a) Required area is the shaded area represented in the following figure

Let us first find the intersection of line $x = \sqrt{3}y$ and circle $x^2 + y^2 = 4$

On solving these two, we get $x = \pm \sqrt{3}$ and $y = \pm 1$

∴ Required area = Area of region OBCO = Area of ΔOAC

+ Area of region ABCA

$$= \frac{1}{2} \times \sqrt{3} \times 1 + \frac{\pi}{3} - \frac{\sqrt{3}}{2} = \frac{\pi}{3}$$

29. (d)

∴ Required area = $\int_0^1 (1 - \sqrt{x})^2 dx$

$$= \int_0^1 (1 + x - 2\sqrt{x}) dx$$

$$= \left[x + \frac{x^2}{2} - 2 \cdot \frac{x^{3/2}}{3/2} \right]_0^1$$

$$= 1 + \frac{1}{2} - 2 \times \frac{2}{3} (1)$$

$$= 1 + \frac{1}{2} - \frac{4}{3} = \frac{1}{6} \text{ sq unit}$$

30. (c) Given curves,

$y = |x-1|$ and $|x|=2$

$$\Rightarrow y = \begin{cases} x-1, & x \geq 1 \text{ and } x = \pm 2 \\ -(x-1), & x < 1 \end{cases}$$

Case I When $x \geq 1$

$\Rightarrow y = x-1$ and $x = 2$

$\Rightarrow y = 2-1 = 1$

Case II When $x < 1$

$\Rightarrow y = -(x-1)$ and $x = -2$

∴ $y = -(-2-1) = 3$

So, points of intersection are (2, 1) and (-2, 3).

31. (c) Given curves $y = |x-1|$ and $|x|=2$

$$\Rightarrow y = \begin{cases} (x-1), & x \geq 1 \\ -(x-1), & x < 1 \text{ and } x = \pm 2 \end{cases}$$

Now, plot the graph of above curves, we get

∴ Required area

$$= \int_{-2}^1 -(x-1) dx + \int_1^2 (x-1) dx$$

$$= \int_{-2}^1 (1-x) dx + \int_1^2 (x-1) dx$$

$$= \left[x - \frac{x^2}{2} \right]_{-2}^1 + \left[\frac{x^2}{2} - x \right]_1^2$$

$$= \left[\left(1 - \frac{1}{2} \right) - \left(-2 - \frac{4}{2} \right) \right] + \left[\left(\frac{4}{2} - 2 \right) - \left(\frac{1}{2} - 1 \right) \right]$$

= 5 sq units

32. (c) Given curves are $f(x) = x|x| - 1$

and $g(x) = \begin{cases} \frac{3x}{2}, & x > 0 \\ 2x, & x \leq 0 \end{cases}$

When $x > 0$, $f(x) = x^2 - 1$

and $g(x) = \frac{3x}{2}$

Both curves having common points, if they intersect each other.

$$\therefore f(x) = g(x) \Rightarrow x^2 - 1 = \frac{3x}{2}$$

$$\Rightarrow 2(x^2 - 1) = 3x \Rightarrow 2x^2 - 3x - 2 = 0$$

$$\Rightarrow 2x^2 - 4x + x - 2 = 0$$

$$\Rightarrow 2x(x - 2) + 1(x - 2) = 0$$

$$\Rightarrow (2x + 1)(x - 2) = 0$$

$$\Rightarrow 2x + 1 = 0 \text{ or } x - 2 = 0$$

$$\Rightarrow x = -1/2 \text{ or } x = 2$$

Since, $x > 0$

$$\therefore x = 2 \text{ and } f(x) = g(x) = 3$$

When $x \leq 0$, $f(x) = -x^2 - 1$ and

$$g(x) = 2x$$

Both curves having common points, if they intersect each other.

$$\therefore f(x) = g(x) \Rightarrow -x^2 - 1 = 2x$$

$$\Rightarrow -x^2 - 2x - 1 = 0$$

$$\Rightarrow x^2 + 2x + 1 = 0$$

$$\Rightarrow (x + 1)^2 = 0$$

$$\Rightarrow (x + 1)(x + 1) = 0 \Rightarrow x = -1$$

Since, $x \leq 0$

$$\therefore x = -1 \text{ and } f(x) = g(x) = -2$$

So, both curves intersect at (2, 3) and (-1, -2).

Hence, correct option is (c).

33. (b) When $x > 0$,

$$f(x) = x^2 - 1, g(x) = \frac{3x}{2}$$

and when $x < 0$,

$$f(x) = -x^2 - 1, g(x) = 2x$$

Now, plot the graph of above curve

Required area bounded by curves $f(x)$ and $g(x)$

$$= \left| \int_0^2 \left[\frac{3x}{2} - (x^2 - 1) \right] dx \right|$$

$$+ \left| \int_{-1}^0 [(-x^2 - 1) - 2x] dx \right|$$

$$= \left[\frac{3}{2} \cdot \frac{x^2}{2} - \frac{x^3}{3} + x \right]_0^2$$

$$+ \left[\frac{x^3}{3} + \frac{2x^2}{2} + x \right]_{-1}^0$$

$$= \left[\left(\frac{3}{2} \times \frac{4}{2} - \frac{8}{3} + 2 \right) - (0) \right]$$

$$+ \left[0 - \left(-\frac{1}{3} + 1 - 1 \right) \right]$$

$$= \frac{8}{3} \text{ sq units}$$

34. (a) $f(x) = |x - 1| + x^2$

When $\frac{1}{2} < x < 1$, $f(x) = x^2 - x + 1$

\therefore Area of required region will be

$$\int_{1/2}^1 f(x) dx = \int_{1/2}^1 (x^2 - x + 1) dx$$

$$= \left[\frac{x^3}{3} - \frac{x^2}{2} + x \right]_{1/2}^1$$

$$= \left[\frac{(1)^3}{3} - \frac{(1)^2}{2} + (1) \right] - \left[\frac{\left(\frac{1}{2}\right)^3}{3} - \frac{\left(\frac{1}{2}\right)^2}{2} + \frac{1}{2} \right]$$

$$= \left(\frac{1}{3} - \frac{1}{2} + 1 \right) - \left(\frac{1}{24} - \frac{1}{8} + \frac{1}{2} \right)$$

$$= \left(\frac{2-3+6}{6} \right) - \left(\frac{1-3+12}{24} \right)$$

$$= \frac{5}{12} \text{ sq unit}$$

35. (d) $f(x) = |x - 1| + x^2$

When $1 < x < \frac{3}{2}$,

$$f(x) = x^2 + x - 1$$

\therefore Area of required region will be

$$\int_1^{3/2} f(x) dx = \int_1^{3/2} (x^2 + x - 1) dx$$

$$= \left[\frac{x^3}{3} + \frac{x^2}{2} - x \right]_1^{3/2}$$

$$= \left[\frac{\left(\frac{3}{2}\right)^3}{3} + \frac{\left(\frac{3}{2}\right)^2}{2} - \frac{3}{2} \right]$$

$$- \left[\frac{(1)^3}{3} + \frac{(1)^2}{2} - 1 \right]$$

$$= \left(\frac{27}{24} + \frac{9}{8} - \frac{3}{2} \right) - \left(\frac{1}{3} + \frac{1}{2} - 1 \right)$$

$$= \frac{11}{12} \text{ sq unit}$$

26

DIFFERENTIAL EQUATIONS

In NDA exam, generally 4-5 questions are asked from this chapter, which are based on order and degree, formation and solution of differential equation.

An equation which involves derivatives or differential coefficients or differentials is known as differential equation.

e.g. $\frac{dy}{dx} + 5y = e^x$

ORDINARY DIFFERENTIAL EQUATIONS

A differential equations involving derivative or derivatives of the dependent variable with respect of only one independent variable is called ordinary differential equation. e.g. $2\frac{d^2y}{dx^2} + 5\left(\frac{dy}{dx}\right)^3 = 0$

Order and Degree of a Differential Equation

The highest order derivative occurring in a differential equation is called the order of a differential equation. The power of the highest order derivative which occurs in it, after it is made free from radicals and fractions is called the **degree of a differential equation**.

Note We cannot determine the degree of a transcendental differential equation.

EXAMPLE 1. What is the degree and order of the equation $\left[\frac{d^2y}{dx^2}\right] = \left[y + \left(\frac{dy}{dx}\right)^2\right]^{1/4}$?

a. 1, 2

b. 2, 1

c. 3, 2

d. 4, 2

Sol. d. The given differential equation can be rewritten as $\left[\frac{d^2y}{dx^2}\right]^4 = y + \left(\frac{dy}{dx}\right)^2$

Here, highest derivative is of order 2 and the power of highest order derivative (i.e. $\frac{d^2y}{dx^2}$) is 4.

So, the degree and order of the equation are 4 and 2 respectively.

Formation of a Differential Equation

While making a differential equation from a given equation, differentiate it as many times as the number of arbitrary constants present in it.

EXAMPLE 2. Which one of the following differential equations represents the system of circles touching Y-axis at the origin?

- a. $\frac{dy}{dx} = x^2 - y^2$ b. $2xy \frac{dy}{dx} = y^2 - x^2$
 c. $2xy \frac{dy}{dx} = x^2 - y^2$ d. $\frac{dy}{dx} = y^2 - x^2$

Sol. b. The equation of circle is $(x - a)^2 + y^2 = a^2$

$$\Rightarrow x^2 + a^2 - 2ax + y^2 = a^2 \Rightarrow x^2 + y^2 - 2ax = 0 \quad \dots(i)$$

$$\therefore a = \frac{x^2 + y^2}{2x} \quad \dots(ii)$$

On differentiating Eq. (i) w.r.t. x , we get

$$2x + 2y \frac{dy}{dx} - 2a = 0$$

$$\Rightarrow 2x + 2y \frac{dy}{dx} - \frac{x^2 + y^2}{x} = 0 \quad [\text{from Eq. (ii)}]$$

$$\Rightarrow 2x^2 + 2xy \frac{dy}{dx} - x^2 - y^2 = 0 \Rightarrow 2xy \frac{dy}{dx} = y^2 - x^2$$

EXAMPLE 3. A radioactive element disintegrates at a rate proportional to the quantity of substance Q present at any time t . What is the differential equation of the disintegration?

- a. $\frac{dQ}{dt} = -Q$ b. $\frac{dQ}{dt} = -kQ, k < 0$
 c. $\frac{dQ}{dt} = -kQ, k > 0$ d. $\frac{dQ}{dt} = Q$

Sol. c. Since, a radioactive element disintegrates at a rate proportional to the quantity of substance Q present at any time t .

$$\therefore \frac{dQ}{dt} \propto -Q \Rightarrow \frac{dQ}{dt} = -kQ, k > 0$$

which is required differential equation.

Solution of a Differential Equation

The relation between the variables of a differential equation which satisfies the given differential equation is known as the solution of a differential equation.

The process of finding all the solutions of a differential equation is called integrating the differential equation.

- (i) **General Solution** The general solution of a differential equation is the equation in which number of arbitrary constants are same as the order of given differential equation.

- (ii) **Particular Solution** When some particular value is assigned to arbitrary constant present in general solution of a differential equation on the basis of given conditions, then it is known as particular solution.

Differential Equation with Variable Separable Form

If it is possible to write a differential equation by the transposition of the terms, in the form

$$f(x) dx = \phi(y) dy$$

where, $f(x)$ is a function of x and $\phi(y)$ is a function of y , then we say that the variables are separable. Such equations can be solved by integrating both sides.

The solution is given by $\int f(x) dx = \int \phi(y) dy + C$

where, C is the constant of integration.

EXAMPLE 4. Solve $(1 + x^2) dy = (1 + y^2) dx$.

- a. $\frac{x+y}{1-xy} = C$ b. $\frac{x-y}{1+xy} = C$ c. $\frac{xy}{x+y} = C$ d. $\frac{xy}{x-y} = C$

Sol. b. By separating the variables, $\frac{dx}{1+x^2} = \frac{dy}{1+y^2}$

On integrating both sides, we get

$$\int \frac{dx}{1+x^2} = \int \frac{dy}{1+y^2} \Rightarrow \tan^{-1} x = \tan^{-1} y + \tan^{-1} C$$

$$\Rightarrow \tan^{-1} x - \tan^{-1} y = \tan^{-1} C \Rightarrow \tan^{-1} \left(\frac{x-y}{1+xy} \right) = \tan^{-1} C$$

$$\therefore \frac{x-y}{1+xy} = C$$

Reducible to Variable Separable Form

Sometimes, the given differential equation is not in the variable separable form directly but by using some substitution, we convert it into variable separable form.

EXAMPLE 5. What is the solution of the differential equation $\frac{dy}{dx} = \sec(x+y)$?

a. $y + \tan(x+y) = C$ b. $y - \tan \left\{ \frac{(x+y)}{2} \right\} = C$

c. $y + \tan \left\{ \frac{(x+y)}{2} \right\} = C$ d. $y + \tan \left\{ \frac{(x-y)}{2} \right\} = C$

Sol. b. The given differential equation is $\frac{dy}{dx} = \sec(x+y)$

$$\text{Let } x+y = u \text{ and } 1 + \frac{dy}{dx} = \frac{du}{dx} \Rightarrow \frac{dy}{dx} = \frac{du}{dx} - 1$$

$$\therefore \frac{du}{dx} - 1 = \sec u \Rightarrow \int \frac{1}{1 + \sec u} du = \int 1 dx$$

$$\begin{aligned} \Rightarrow \int \frac{\cos u}{1 + \cos u} du &= \int 1 dx \Rightarrow \int \left(1 - \frac{1}{2 \cos^2 \frac{u}{2}} \right) du = \int dx \\ \Rightarrow \int \left(2 - \sec^2 \frac{u}{2} \right) du &= 2x + C_1 \Rightarrow 2u - 2 \tan \frac{u}{2} = 2x + C_1 \\ \Rightarrow 2y + 2x - 2 \tan \left(\frac{x+y}{2} \right) &= 2x + C_1 \\ \therefore y - \tan \left(\frac{x+y}{2} \right) &= C \quad [\because C = C_1/2] \end{aligned}$$

Homogeneous Differential Equation

Any differential equation of the type $\frac{dy}{dx} = \frac{f_1(x, y)}{f_2(x, y)}$ where $f_1(x, y)$ and $f_2(x, y)$ are homogeneous functions of x and y of the same degree, is called homogeneous differential equation.

To solve such a homogeneous equation, put $y = vx$

$$\Rightarrow \frac{dy}{dx} = v + x \frac{dv}{dx}$$

Making these substitutions given equation becomes

$$x \frac{dv}{dx} = f(v) - v$$

By separating the variables and integrating both sides, we get

$$\int \frac{dv}{f(v) - v} = \log x + C$$

Now, substitute v by (y/x) , we get the required solution of the differential equation.

EXAMPLE 6. What is the solution of the differential equation $(x + y)(dx - dy) = dx + dy$?

- a. $2 \log(x + y) = C(y - x)$ b. $(y - x) + \log(x + y) = C$
 c. $\left(\frac{y}{x}\right) + \left[\log\left(\frac{y}{x}\right)\right] = C$ d. None of these

Sol. b. The given differential equation is

$$\begin{aligned} (x + y)(dx - dy) &= dx + dy \\ \Rightarrow (x + y) dx - (x + y) dy &= dx + dy \\ \Rightarrow (x + y - 1) dx &= (x + y + 1) dy \Rightarrow \frac{dy}{dx} = \frac{x + y - 1}{x + y + 1} \end{aligned}$$

Let $x + y = v$ and $\frac{dy}{dx} = \frac{dv}{dx} - 1$

$$\begin{aligned} \therefore \frac{dv}{dx} - 1 &= \frac{v - 1}{v + 1} \Rightarrow \frac{dv}{dx} = \frac{v - 1 + v + 1}{v + 1} \\ \Rightarrow \frac{v + 1}{2v} dv &= dx \Rightarrow \frac{1}{2} \int \frac{1}{v} dv + \frac{1}{2} \int \frac{1}{v} dv = \int 1 dx \\ \Rightarrow \frac{1}{2} v + \frac{1}{2} \log v &= x + C_1 \\ \Rightarrow x + y + \log(x + y) &= 2x + C \quad [\because C = 2C_1] \\ \therefore (y - x) + \log(x + y) &= C \end{aligned}$$

Differential Equations Reducible to Homogeneous Form

Let the differential equation be $\frac{dy}{dx} = \frac{ax + by + c}{a_1x + b_1y + c_1}$.

Case I When $a/a_1 \neq b/b_1$, then put $x = X + h$, $y = Y + k$, where h and k are constants to be chosen to make the given equation homogeneous.

Now, $dx = dX$ and $dy = dY$

$$\therefore \frac{dy}{dx} = dY/dX$$

Making the above substitutions, the given equation becomes

$$\begin{aligned} \frac{dY}{dX} &= \frac{a(X + h) + b(Y + k) + c}{a_1(X + h) + b_1(Y + k) + c_1} \\ &= \frac{aX + bY + (ah + bk + c)}{(a_1X + b_1Y) + (a_1h + b_1k + c_1)} \end{aligned}$$

Now, find h and k such that $ah + bk + c = 0$

and $a_1h + b_1k + c_1 = 0$

The given equation becomes $\frac{dY}{dX} = \frac{aX + bY}{a_1X + b_1Y}$

which is homogeneous. To solve it proceed with the previous procedure.

Case II When $\frac{a}{a_1} = \frac{b}{b_1}$ To solve such differential equation

put $a_1x + b_1y = u$, this reduces the differential equation to the variable separable type.

And, if $a + b = 0$, then a simple cross multiplication and substitution $d(xy)$ for $xdy + ydx$ and integrate term by term for find the result without much efforts.

EXAMPLE 7. Solve $\frac{dy}{dx} = \frac{y - x + 1}{y + x + 5}$.

a. $\log \left\{ \frac{(x+2)^2 - (y+3)^2}{c^2} \right\} = 2 \tan^{-1} \left(\frac{y+3}{x+2} \right)$

b. $\log \left\{ \frac{(x-2)^2 + (y-3)^2}{c^2} \right\} = -2 \tan^{-1} \left(\frac{y-3}{x-2} \right)$

c. $\log \left\{ \frac{(x+2)^2 + (y+3)^2}{c^2} \right\} = -2 \tan^{-1} \left(\frac{y+3}{x+2} \right)$

d. None of the above

Sol. c. Here, $a/a_1 = -1$ and $b/b_1 = 1$

$$\therefore a/a_1 \neq b/b_1$$

Putting $x = X + h$, $y = Y + k$

and $dx = dX$, $dy = dY$, we get

$$\frac{dy}{dx} = \frac{dY}{dX}$$

Making these substitutions, given differential equation becomes

$$\frac{dY}{dX} = \frac{Y+k-X-h+1}{Y+k+X+h+5} = \frac{Y-X+k-h+1}{Y+X+k+h+5} \quad \dots(i)$$

Now, choose h and k such that

$$k-h+1=0 \quad \text{and} \quad k+h+5=0$$

On solving the above equations, we get

$$h=-2, k=-3$$

Eq. (i) becomes $\frac{dY}{dX} = \frac{Y-X}{Y+X}$

which is homogeneous in X and Y .

Putting $Y=vX \Rightarrow \frac{dY}{dX} = v + X \frac{dv}{dX}$

Making these substitutions, we get

$$v + X \frac{dv}{dX} = \frac{vX-X}{vX+X} = \frac{v-1}{v+1} \Rightarrow X \frac{dv}{dX} = \frac{v-1}{v+1} - v$$

$$\Rightarrow X \frac{dv}{dX} = -\frac{(1+v^2)}{v+1} \Rightarrow \left(\frac{v+1}{1+v^2} \right) dv = -\frac{dX}{X}$$

$$\Rightarrow \frac{v}{1+v^2} dv + \frac{1}{1+v^2} dv = -\frac{dX}{X}$$

On integrating both sides, we get

$$\frac{1}{2} \log(1+v^2) + \tan^{-1}(v) = -\log X + \log C$$

$$\Rightarrow \log(1+v^2) + 2 \tan^{-1} v = 2 \log \left(\frac{C}{X} \right)$$

$$\Rightarrow \log \left(\frac{(1+v^2) X^2}{C^2} \right) = -2 \tan^{-1} v$$

$$\Rightarrow \log \left[\frac{1 + \left(\frac{Y^2}{X^2} \right)}{C^2} \right] X^2 = -2 \tan^{-1} \left(\frac{Y}{X} \right)$$

$$\Rightarrow \log \left(\frac{X^2 + Y^2}{C^2} \right) = -2 \tan^{-1} \left(\frac{Y}{X} \right)$$

$$\Rightarrow \log \left(\frac{(x-h)^2 + (y-k)^2}{C^2} \right) = -2 \tan^{-1} \left(\frac{y-k}{x-h} \right)$$

$$\therefore \log \left(\frac{(x+2)^2 + (y+3)^2}{C^2} \right) = -2 \tan^{-1} \left(\frac{y+3}{x+2} \right)$$

Linear Differential Equation

Any differential equation which is of the form

$$\frac{dy}{dx} + Py = Q, \text{ where } P \text{ and } Q \text{ are the functions of } x \text{ alone}$$

is called a linear differential equation of first order with y as dependent variable.

Solution of linear differential equation

$$\frac{dy}{dx} + Py = Q$$

On multiplying both sides by $e^{\int P dx}$, we get

$$e^{\int P dx} \frac{dy}{dx} + Py e^{\int P dx} = Q e^{\int P dx}$$

or

$$\frac{d}{dx} (y e^{\int P dx}) = Q e^{\int P dx}$$

On integrating both sides w.r.t. x , we get

$$y e^{\int P dx} = \int Q e^{\int P dx} dx + C$$

which is the solution of the linear differential equation.

Note The factor $e^{\int P dx}$ is called the Integrating Factor (IF) of the differential equation.

A differential equation which is of the form

$$\frac{dx}{dy} + P'y = Q', \text{ where } P' \text{ and } Q' \text{ are functions of } y \text{ alone}$$

is called a linear differential equation of first order with x as dependent variable.

Solution of such differential equation is

$$x \cdot e^{\int P' dy} = \int Q' e^{\int P' dy} dy + C.$$

Differential Equation Reducible to the Linear Form

Equations of the form $f'(y) \frac{dy}{du} + f(y)P(x) = Q(x) \quad \dots(i)$

Put $f(y) = u \Rightarrow f'(y) \frac{dy}{du} = \frac{du}{du}$

Then, Eq. (i) reduces to $\frac{du}{du} + uP(x) = Q(x)$

which is of the linear differential equation form.

EXAMPLE 8. What is the equation of the curve passing through the origin and satisfying the differential equation $dy = (y \tan x + \sec x) dx$?

a. $y = x \cos x$

b. $y \cos x = x$

c. $xy = \cos x$

d. $y \sin x = x$

Sol. b. Given differential equation is

$$dy = (y \tan x + \sec x) dx \Rightarrow \frac{dy}{dx} - y \tan x = \sec x$$

This is a linear equation of the form $\frac{dy}{dx} + Py = Q$.

Therefore, $P = -\tan x, Q = \sec x$

and $IF = e^{\int P dx} = e^{\int -\tan x dx} = \cos x$

\therefore The solution is $y \cos x = \int \cos x \cdot \sec x dx + C$

$$\Rightarrow y \cos x = \int 1 dx + C \Rightarrow y \cos x = x + C$$

Since, this curve passes through $(0, 0)$.

$$\therefore 0 = 0 + C \Rightarrow C = 0$$

Hence, the required equation of curve is $y \cos x = x$.

SOME IMPORTANT IDENTITIES

- (i) $d(x + y) = dx + dy$
- (ii) $d(xy) = y dx + x dy$
- (iii) $d\left(\frac{x}{y}\right) = \frac{y dx - x dy}{y^2}$
- (iv) $d\left(\frac{y}{x}\right) = \frac{x dy - y dx}{x^2}$
- (v) $d[\log(xy)] = \frac{x dy + y dx}{xy}$
- (vi) $d\left[\log\left(\frac{y}{x}\right)\right] = \frac{x dy - y dx}{xy} = \frac{dy}{y} - \frac{dx}{x}$
- (vii) $d\left[\tan^{-1}\left(\frac{y}{x}\right)\right] = \frac{x dy - y dx}{x^2 + y^2}$
- (viii) $d(x^2 + y^2) = 2x dx + 2y dy$
- (ix) $d\left(\frac{1}{2}\log(x^2 + y^2)\right) = \frac{xdx + ydy}{x^2 + y^2}$
- (x) $d\left(\frac{1}{2}\log\frac{x+y}{x-y}\right) = \frac{xdy - ydx}{x^2 - y^2}$
- (xi) $d\sqrt{x^2 + y^2} = \frac{xdx + ydy}{\sqrt{x^2 + y^2}}$
- (xii) $d(x^m y^n) = x^{m-1} y^{n-1} (m y dx + n x dy)$

Bernoulli's Equation

$$\frac{dy}{du} + Py = Qy^n \quad \dots(i)$$

where P and Q are functions of x alone or are constants
On dividing each term of Eq. (i) by y^n , we get

$$\frac{1}{y^n} \frac{dy}{du} + \frac{P}{y^{n-1}} = Q \quad \dots(ii)$$

Let $\frac{1}{y^{n-1}} = v$ so that, $\frac{1}{y^n} \frac{dy}{du} = \frac{1}{1-n} \frac{dv}{du}$

On substituting in Eq. (ii), we get

$$\frac{dv}{du} + (1-n)v \cdot P = Q(1-n)$$

The equation obtained is linear differential equation.

EXAMPLE 9. What does the solution of the differential equation $x dy - y dx = 0$ represent?

- a. Rectangular hyperbola
- b. Straight line passing through (0, 0)
- c. Parabola with vertex at (0, 0)
- d. Circle with centre at (0, 0)

Sol. b. $\because x dy - y dx = 0$

$$\Rightarrow \frac{x dy - y dx}{x^2} = 0 \Rightarrow d\left(\frac{y}{x}\right) = 0 \Rightarrow \frac{y}{x} = C \quad \therefore y = Cx$$

Thus, straight line passing through (0, 0).

> PRACTICE EXERCISE

1. The differential equation of the family of curves $y = Ae^{3x} + Be^{5x}$, where A and B are arbitrary constants, is

- (a) $\frac{d^2y}{dx^2} + 8 \frac{dy}{dx} + 15y = 0$
- (b) $\frac{d^2y}{dx^2} - 8 \frac{dy}{dx} + 15y = 0$
- (c) $\frac{d^2y}{dx^2} - \frac{dy}{dx} + y = 0$
- (d) None of these

2. The differential equation of all parabolas having their axis of symmetry coinciding with the axis of x , is

- (a) $y \frac{d^2y}{dx^2} + \left(\frac{dy}{dx}\right)^2 = 0$
- (b) $x \frac{d^2x}{dy^2} + \left(\frac{dx}{dy}\right)^2 = 0$
- (c) $y \frac{d^2y}{dx^2} + \frac{dy}{dx} = 0$
- (d) None of these

3. Equation of the curve passing through (3, 9) which satisfies the differential equation $dy/dx = x + 1/x^2$ is

- (a) $6xy = 3x^2 - 6x + 29$
- (b) $6xy = 3x^2 + 29x - 6$
- (c) $6xy = 3x^3 + 29x - 6$
- (d) None of these

4. The solution of the equation $\log\left(\frac{dy}{dx}\right) = ax + by$ is

- (a) $\frac{e^{by}}{b} = \frac{e^{ax}}{a} + C$
- (b) $\frac{e^{-by}}{-b} = \frac{e^{ax}}{a} + C$
- (c) $\frac{e^{-by}}{a} = \frac{e^{ax}}{b} + C$
- (d) None of these

5. The solution of the equation $x^2 \frac{dy}{dx} = x^2 + xy + y^2$ is

- (a) $\tan^{-1}\left(\frac{y}{x}\right) = \log x + C$
- (b) $\tan^{-1}\left(\frac{x}{y}\right) = \log x + C$
- (c) $\tan^{-1}\left(\frac{x}{y}\right) = \log y + C$
- (d) $\tan^{-1}\left(\frac{y}{x}\right) = \log y + C$

6. The solution of the equation $(x^2 + xy) dy = (x^2 + y^2) dx$ is

- (a) $\log x = \log(x - y) + \frac{y}{x} + C$
- (b) $\log x = 2 \log(x - y) + \frac{y}{x} + C$
- (c) $\log x = \log(x - y) + \frac{x}{y} + C$
- (d) None of the above

- 7.** If $x \frac{dy}{dx} = y(\log y - \log x + 1)$, then the solution of the equation is
 (a) $\log \frac{x}{y} = Cy$ (b) $\log \frac{y}{x} = Cy$ (c) $\log \frac{x}{y} = Cx$ (d) $\log \frac{y}{x} = Cx$
- 8.** Solution of the differential equation $y_3 - 8y_2 = 0$, where $y(0) = \frac{1}{8}$, $y_1(0) = 0$, $y_2(0) = 1$ is equal to
 (a) $y = \frac{1}{8} \left(\frac{e^{8x}}{8} + x - \frac{7}{8} \right)$ (b) $y = \frac{1}{8} \left(\frac{e^{8x}}{8} + x + \frac{7}{8} \right)$
 (c) $y = \frac{1}{8} \left(\frac{e^{8x}}{8} - x + \frac{7}{8} \right)$ (d) None of these
- 9.** If $y + x \frac{dy}{dx} = x \frac{\phi(xy)}{\phi'(xy)}$, then $\phi(xy)$ is equal to
 (a) $ke^{x^2/2}$ (b) $ke^{y^2/2}$ (c) $ke^{xy/2}$ (d) ke^{xy}
- 10.** The solution of the equation $\frac{dy}{dx} = \frac{y^2 - y - 2}{x^2 + 2x - 3}$ is
 (a) $\frac{1}{3} \log \left| \frac{y-2}{y+1} \right| = \frac{1}{4} \log \left| \frac{x-1}{x+3} \right| + C$
 (b) $\frac{1}{3} \log \left| \frac{y+1}{y-2} \right| = \frac{1}{4} \log \left| \frac{x+3}{x-1} \right| + C$
 (c) $\frac{1}{4} \log \left| \frac{y+1}{y-2} \right| = \frac{1}{3} \log \left| \frac{x+3}{x-1} \right| + C$
 (d) None of the above
- 11.** Solution of differential equation $\frac{dy}{dx} = \sin(x+y) + \cos(x+y)$ is equal to
 (a) $\log \left(2 + \sec \frac{x+y}{2} \right) = x + C$
 (b) $\log(1 + \tan(x+y)) = y + C$
 (c) $\log \left(1 + \tan \frac{x+y}{2} \right) = y + C$
 (d) $\log \left(1 + \tan \frac{x+y}{2} \right) = x + C$
- 12.** Solution of the differential equation $\sin 2x \frac{dy}{dx} - y = \tan x$ is
 (a) $y = \tan x + C \sqrt{\tan x}$ (b) $x - y \sin x = C$
 (c) $xy \tan x = C$ (d) None of these
- 13.** Solution of differential equation $y dx - x dy + y^2 x^2 dx = 0$ is equal to
 (a) $3x + x^3 y = ky$ (b) $3y + y^3 x = ky$
 (c) $3y + y^3 x = kx$ (d) None of these
- 14.** Solution of differential equation $\frac{x+y \frac{dy}{dx}}{y-x \frac{dy}{dx}} = \frac{x \cos^2(x^2+y^2)}{y^3}$ is equal to
 (a) $\tan(x^2+y^2) = \frac{x^2}{y^2} + C$ (b) $\cot(x^2+y^2) = \frac{x^2}{y^2} + C$
 (c) $\tan(x^2+y^2) = \frac{y^2}{x^2} + C$ (d) $\cot(x^2+y^2) = \frac{y^2}{x^2} + C$
- 15.** Solve $\frac{1}{\sin x} \cdot \frac{d^2 y}{dx^2} = \operatorname{cosec} x - 2 \sin x$.
 (a) $y = \frac{\cos 2x}{4} + C_1 x + C_2$ (b) $2y^2 = \frac{\cos 2x}{4} + C_1 x + C_2$
 (c) $y = \frac{-\cos 2x}{4} + C_1 x + C_2$ (d) None of these
- 16.** The solution of the differential equation $x^4 \frac{dy}{dx} + x^3 y + \operatorname{cosec}(xy) = 0$, is equal to
 (a) $2 \cos(xy) + x^{-2} = C$ (b) $2 \cos(xy) + y^{-2} = C$
 (c) $2 \sin(xy) + x^{-2} = C$ (d) $2 \sin(xy) + y^{-2} = C$
- 17.** The solution of the differential equation $\frac{dy}{dx} = \frac{y^2}{1-3xy}$ is given by
 (a) $y^3 x = \frac{y^2}{2} + C$ (b) $y^3 = \frac{xy^2}{2} + C$
 (c) $x = \frac{(1+2Cy)}{y^3}$ (d) $x = \frac{C}{y^3}$
- 18.** The solution of the differential equation $x^2 y dy - (x dy - y dx) = 0$ is
 (a) $x^2 y - 2x = 2Cy$ (b) $xy^2 - 2y = 2Cx$
 (c) $xy^2 + 2x = 2Cy$ (d) $xy^2 + 2y = 2Cx$
- 19.** Rate of growth of bacteria is proportional to the number of bacteria present at that time. If x is the number of bacteria present at any instant t , then which one of the following is correct? (take proportional constant equal to 1)
 (a) $x = \log t$ (b) $x = Ce^t$ (c) $e^x = t$ (d) $x = \sqrt{t}$
- 20.** The degree of the differential equation which satisfies $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$ is
 I. degree = 1 II. degree = 2 III. degree = 3
 (a) Only I (b) Only II (c) Only III (d) None of these
- 21.** Solution of differential equation will be $\frac{dt}{du} = t \frac{\left(\frac{dg(x)}{du} \right) - t^2}{g(x)}$ is
 I. $t = \frac{g(x)+C}{x}$ II. $t = g(x)x + C$
 (a) Only I (b) Only II
 (c) Both I and II (d) None of these
- 22.** The normal to a curve at $P(x, y)$ meets the X -axis at G . If the distance of G from the origin is twice the abscissa of P , then the curve is a
 I. Parabola II. Circle III. Hyperbola
 (a) Only I (b) Only II (c) Only III (d) None of these

Directions (Q. Nos. 23-24) The velocity v of a particle at any instant t moving in a straight line is given by $v = s + 1$, where s m is the distance travelled in t s.

- 23.** What is the differential equation in distance and time?
 (a) $\frac{dt}{ds} = s + 1$ (b) $\frac{ds}{dt} = s + 1$
 (c) $ds = sdt + 1$ (d) None of these
- 24.** What is the time taken by the particle to cover a distance of 9 m?
 (a) 1 s (b) $(\log 10)$ s
 (c) $2(\log 10)$ s (d) 10 s

Directions (Q. Nos. 25-27) The rate at which a certain substance decomposes in a certain solution at any instant is proportional to the amount of it present at that instant. Initially, there are 27g and 3 h later, it was found that 8g are left.

- 25.** The order and degree of the differential equation is, respectively
 (a) 1, 1 (b) 1, 2 (c) 2, 1 (d) 2, 2
- 26.** How many grams will be left after one more hours?
 (a) $4\frac{2}{3}$ g (b) $5\frac{1}{3}$ g (c) $6\frac{2}{3}$ g (d) $2\frac{2}{3}$ g
- 27.** $2\frac{10}{27}$ g will be left after _____ hours.
 (a) 5 (b) 7 (c) 6 (d) 8

Directions (Q. Nos. 28-31) The family of curves $y = Ae^{3x} + Be^{5x}$, where A and B are parameters.

- 28.** What is the differential equation of the given family of curves?
 (a) $\frac{d^2y}{dx^2} - 8\frac{dy}{dx} + 15y = 0$ (b) $\frac{d^2y}{dx^2} + 8\frac{dy}{dx} + 15y = 0$
 (c) $\frac{d^2y}{dx^2} + 8\frac{dy}{dx} - 15y = 0$ (d) None of these
- 29.** The order of differential equation is
 (a) 1 (b) 2
 (c) 3 (d) None of these
- 30.** The degree of differential equation is
 (a) 3 (b) 2
 (c) 1 (d) None of these
- 31.** The value of $A - B$ is equal to
 (a) $\frac{y_1 - 3y}{2e^{5x}} - \frac{5y - y_1}{2e^{3x}}$ (b) $\frac{y_1 - 3y}{2e^{3x}} - \frac{5y - y_1}{2e^{5x}}$
 (c) $\frac{5y - y_1}{2e^{3x}} - \frac{y_1 - 3y}{2e^{5x}}$ (d) None of these

Directions (Q. Nos. 32-35) A differential equation of the form $\frac{dy}{dx} + Py = Q \dots$ (i)

where P and Q are functions of x . The number $e^{\int Pdx}$ when multiplied to RHS of Eq. (i) make it differential coefficient of a function of x and y is called the integrating factor of the differential equation given by Eq. (i). Further the equation $\frac{dy}{dx} + Py = Qy^n$, where P, Q are functions of x is reducible to linear form by substituting y^{-n+1} as new dependent variable. On the basis of above information answer the following questions.

- 32.** The integrating factor of the differential equation is $x^2(x^2 - 1)\frac{dy}{dx} + x(x^2 + 1)y = x^2 - 1$
 (a) $\frac{x^2 - 1}{x}$ (b) $\frac{x^2 + 1}{x(x^2 - 1)}$
 (c) $\log\left(\frac{x^2 - 1}{x}\right)$ (d) None of these
- 33.** The integrating factor of the differential equation $(x + 2y^3)\frac{dy}{dx} = y$ is
 (a) $\frac{-1}{y}$ (b) $\frac{1}{y}$ (c) $\frac{1}{x}$ (d) $\frac{-1}{x}$
- 34.** The integrating factor of the differential equation $x\frac{dy}{dx} + y = x^3y^6$ is
 (a) $-\frac{5}{x^5}$ (b) $\frac{5}{y^5}$ (c) $-\frac{1}{x^5}$ (d) $\frac{1}{x^5}$
- 35.** The integrating factor of differential equation $\cos x dy = y(\sin x - y) dx$ is
 (a) $\tan x$ (b) $\sec x$ (c) $e^{\tan x}$ (d) $e^{\sec x}$

- 47.** The general solution of the differential equation $\log\left(\frac{dy}{dx}\right) + x = 0$ is ☑ 2013 I
 (a) $y = e^{-x} + C$ (b) $y = -e^{-x} + C$
 (c) $y = e^x + C$ (d) $y = -e^x + C$
- 48.** What is the order of the differential equation $\left(\frac{dy}{dx}\right)^2 + \frac{dy}{dx} - \sin^2 y = 0$? ☑ 2013 II
 (a) 1 (b) 2 (c) 3 (d) Undefined
- 49.** $y = 2 \cos x + 3 \sin x$ satisfies which of the following differential equations? ☑ 2013 II
 I. $\frac{d^2y}{dx^2} + y = 0$ II. $\left(\frac{dy}{dx}\right)^2 + \frac{dy}{dx} = 0$
 Select the correct answer using the codes given below.
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 50.** The solution of $\frac{dy}{dx} = |x|$ is ☑ 2014 I
 (a) $y = \frac{x|x|}{2} + C$ (b) $y = \frac{|x|}{2} + C$
 (c) $y = \frac{x^2}{2} + C$ (d) $y = \frac{x^3}{2} + C$
 where, C is an arbitrary constant.
- 51.** What is the solution of $\frac{dy}{dx} + 2y = 1$ satisfying $y(0) = 0$? ☑ 2014 I
 (a) $y = \frac{1 - e^{-2x}}{2}$ (b) $y = \frac{1 + e^{-2x}}{2}$
 (c) $y = 1 + e^x$ (d) $y = \frac{1 + e^x}{2}$
- 52.** What is the number of arbitrary constants in the particular solution of differential equation of third order? ☑ 2014 I
 (a) 0 (b) 1 (c) 2 (d) 3
- 53.** What is the general solution of the differential equation $x dy - y dx = y^2$? ☑ 2014 I
 (a) $x = Cy$ (b) $y^2 = Cx$
 (c) $x + xy - Cy = 0$ (d) None of these
 where, C is an arbitrary constant.
- Directions** (Q. Nos. 54-56) *The general solution of the differential equation $(x^2 + x + 1) dy + (y^2 + y + 1) dx = 0$ is $(x + y + 1) = A(1 + Bx + Cy + Dxy)$, where B, C and D are constants and A is parameter.* ☑ 2014 I
- 54.** What is B equal to?
 (a) -1 (b) 1
 (c) 2 (d) None of these
- 55.** What is C equal to?
 (a) 1 (b) -1
 (c) 2 (d) None of these
- 56.** What is D equal to?
 (a) -1 (b) 1
 (c) -2 (d) None of these
- 57.** What is the equation of a curve passing through $(0, 1)$ and whose differential equation is given by $dy = y \tan x dx$? ☑ 2014 I
 (a) $y = \cos x$ (b) $y = \sin x$
 (c) $y = \sec x$ (d) $y = \operatorname{cosec} x$

58. Consider the following statements in respect of the differential equation $\frac{d^2y}{dx^2} + \cos\left(\frac{dy}{dx}\right) = 0$

I. The degree of the differential equation is not defined.

II. The order of the differential equation is 2.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II **☑ 2014 I**
 (c) Both I and II (d) Neither I nor II

59. What is the degree of the differential equation

$$\left(\frac{d^3y}{dx^3}\right)^{3/2} = \left(\frac{d^2y}{dx^2}\right)^2? \quad \text{☑ 2014 I}$$

- (a) 1 (b) 2 (c) 3 (d) 4

60. What is the solution of the equation

$$\ln\left(\frac{dy}{dx}\right) + x = 0? \quad \text{☑ 2014 II}$$

- (a) $y + e^x = C$ (b) $y - e^{-x} = C$
 (c) $y + e^{-x} = C$ (d) $y - e^x = C$
 where C is an arbitrary constant.

61. What is the solution of the differential equation

$$\sin\left(\frac{dy}{dx}\right) - a = 0? \quad \text{☑ 2015 I}$$

- (a) $y = x \sin^{-1} a + C$ (b) $x = y \sin^{-1} a + C$
 (c) $y = x + x \sin^{-1} a + C$ (d) $y = \sin^{-1} a + C$
 where, C is an arbitrary constant.

62. What is the solution of the differential equation

$$\frac{ydx - xdy}{y^2} = 0? \quad \text{☑ 2015 I}$$

- (a) $xy = C$ (b) $y = Cx$ (c) $x + y = C$ (d) $x - y = C$
 where, C is an arbitrary constant.

63. What is the solution of the differential equation

$$\frac{dx}{dy} + \frac{x}{y} - y^2 = 0? \quad \text{☑ 2015 I}$$

- (a) $xy = x^4 + C$ (b) $xy = y^4 + C$
 (c) $4xy = y^4 + C$ (d) $3xy = y^3 + C$
 where, C is an arbitrary constant.

64. Consider the following statements

I. The general solution of $\frac{dy}{dx} = f(x) + x$ is of the form $y = g(x) + C$, where C is an arbitrary constant.

II. The degree of $\left(\frac{dy}{dx}\right)^2 = f(x)$ is 2.

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II **☑ 2015 I**
 (c) Both I and II (d) Neither I nor II

65. The degree of the differential equation

$$\frac{dy}{dx} - x = \left(y - x \frac{dy}{dx}\right)^{-4} \text{ is } \quad \text{☑ 2015 II}$$

- (a) 2 (b) 3 (c) 4 (d) 5

66. The order and degree of the differential equation of parabolas having vertex at the origin and focus at $(a, 0)$, where $a > 0$, are respectively **☑ 2015 II**

- (a) 1, 1 (b) 2, 1 (c) 1, 2 (d) 2, 2

67. The solution of $\frac{dy}{dx} = \sqrt{1 - x^2 - y^2 + x^2y^2}$ is **☑ 2015 II**

- (a) $\sin^{-1} y = \sin^{-1} x + C$
 (b) $2\sin^{-1} y = \sqrt{1 - x^2} + \sin^{-1} x + C$
 (c) $2\sin^{-1} y = x\sqrt{1 - x^2} + \sin^{-1} x + C$
 (d) $2\sin^{-1} y = x\sqrt{1 - x^2} + \cos^{-1} x + C$
 where, C is an arbitrary constant.

68. The differential equation of the family of circles passing through the origin and having centres on the X-axis is **☑ 2015 II**

- (a) $2xy \frac{dy}{dx} = x^2 - y^2$ (b) $2xy \frac{dy}{dx} = y^2 - x^2$
 (c) $2xy \frac{dy}{dx} = x^2 + y^2$ (d) $2xy \frac{dy}{dx} + x^2 + y^2 = 0$

69. Let $f(x)$ and $g(x)$ be twice differentiable functions on $[0, 2]$ satisfying $f''(x) = g''(x)$, $f'(1) = 4$, $g'(1) = 6$, $f(2) = 3$ and $g(2) = 9$. Then, what is $f(x) - g(x)$ at $x = 4$ equal to? **☑ 2016 I**

- (a) -10 (b) -6 (c) -4 (d) 2

70. What are the order and degree respectively of the differential equation whose solution is $y = cx + c^2 - 3c^{3/2} + 2$, where c is a parameter? **☑ 2016 I**

- (a) 1, 2 (b) 2, 2 (c) 1, 3 (d) 1, 4

HINTS AND SOLUTIONS

1. (b) $y = Ae^{3x} + Be^{5x}$... (i)
 $\therefore y_1 = 3Ae^{3x} + 5Be^{5x}$... (ii)
 $y_2 = 9Ae^{3x} + 25Be^{5x}$... (iii)

Eliminating A and B from the above three equations, we get

$$\begin{vmatrix} e^{3x} & e^{5x} & -y \\ 3e^{3x} & 5e^{5x} & -y_1 \\ 9e^{3x} & 25e^{5x} & -y_2 \end{vmatrix} = 0$$

$$\Rightarrow -e^{3x} \cdot e^{5x} \begin{vmatrix} 1 & 1 & y \\ 3 & 5 & y_1 \\ 9 & 25 & y_2 \end{vmatrix} = 0$$

On expanding, we get

$$30y - 16y_1 + 2y_2 = 0$$

or $\frac{d^2y}{dx^2} - 8\frac{dy}{dx} + 15y = 0$

2. (a) General equation of parabola having X -axis as the axis of symmetry is
 $y^2 = 4a(x - b)$

Now, differentiate and eliminate a and b .

On differentiating

$$2y\frac{dy}{dx} = 4a \Rightarrow y\frac{dy}{dx} = 2a$$

Again, differentiate $\left(\frac{dy}{dx}\right)^2 + y\frac{d^2y}{dx^2} = 0$

3. (b) $y = \frac{x^2}{2} - \frac{1}{x} + C$... (i)

where $C = \frac{29}{6}$ as it passes through the point $(3, 9)$.

Put $C = \frac{29}{6}$ in Eq. (i)

$$y = \frac{x^2}{2} - \frac{1}{x} + \frac{29}{6}$$

$$\Rightarrow 6xy = 3x^2 - 6 + 29x$$

$$6xy = 3x^2 + 29x - 6$$

4. (b) 5. (a)

6. (b) Putting $y = vx$,

$$\frac{1+v}{1-v} dv = \frac{dx}{x}$$

$$\Rightarrow \left[-1 + \frac{2}{1-v}\right] dv = \frac{dx}{x}$$

$$\Rightarrow -v - 2 \log(1-v) = \log x + C$$

[integrate]

$$\Rightarrow -\frac{y}{x} - 2 \log\left(\frac{x-y}{x}\right) = \log x + C$$

$$\therefore \log x = 2 \log(x-y) + \frac{y}{x} + C$$

7. (d)

8. (c) $\frac{y_3}{y_2} = 8 \Rightarrow \log y_2 = 8x + C$

When $x = 0, y_2 = 1$;

$$\log 1 = 0 + C \Rightarrow C = 0$$

$$\therefore y_2 = e^{8x} \Rightarrow y_1 = \frac{e^{8x}}{8} + \lambda \text{ [integrate]}$$

When $x = 0, y_1(0) = 0$

$$\therefore \lambda = -\frac{1}{8} \Rightarrow y_1 = \frac{e^{8x}}{8} - \frac{1}{8}$$

$$\Rightarrow y = \frac{e^{8x}}{64} - \frac{x}{8} + k \text{ [integrate]}$$

When $x = 0, y = \frac{1}{8}$

$$\therefore k = \frac{7}{64} \Rightarrow y = \frac{1}{8} \left(\frac{e^{8x}}{8} - x + \frac{7}{8} \right)$$

9. (a) Put $xy = v \Rightarrow y + x\frac{dy}{dx} = \frac{dv}{dx}$

$$\therefore \frac{dv}{dx} = x \frac{\phi(v)}{\phi'(v)} \Rightarrow \frac{\phi'(v)}{\phi(v)} dv = x dx$$

$$\Rightarrow \log \phi(v) = \frac{x^2}{2} + \log k$$

$$\Rightarrow \log \frac{\phi(v)}{k} = \frac{x^2}{2} \text{ [on integrating]}$$

$$\Rightarrow \phi(v) = ke^{x^2/2} \Rightarrow \phi(xy) = ke^{x^2/2}$$

10. (a) $\frac{dy}{dx} = \frac{y^2 - y - 2}{x^2 + 2x - 3}$

$$\Rightarrow \frac{dy}{y^2 - y - 2} = \frac{dx}{x^2 + 2x - 3}$$

$$\Rightarrow \frac{1}{3} \left[\frac{1}{(y-2)} - \frac{1}{(y+1)} \right] dy$$

$$= \frac{1}{4} \left[\frac{1}{(x-1)} - \frac{1}{(x+3)} \right] dx$$

$$\therefore \frac{1}{3} \log \left| \frac{y-2}{y+1} \right| = \frac{1}{4} \log \left| \frac{x-1}{x+3} \right| + C$$

11. (d) Put $x + y = v \Rightarrow \frac{dv}{dx} - 1 = \frac{dy}{dx}$

$$\therefore \frac{dv}{dx} = 1 + \sin v + \cos v$$

$$\Rightarrow \frac{dv}{2 \cos^2 \frac{v}{2} + 2 \sin \frac{v}{2} \cdot \cos \frac{v}{2}} = dx$$

$$\Rightarrow \frac{1}{1 + \tan \frac{v}{2}} \sec^2 \frac{v}{2} dv = dx$$

$$\Rightarrow \log \left(1 + \tan \frac{x+y}{2} \right) = x + C$$

12. (a) $\frac{dy}{dx} = y \operatorname{cosec} 2x$

$$= \frac{\sin x}{\cos x} \cdot \frac{1}{2 \sin x \cdot \cos x} = \frac{\sec^2 x}{2}$$

Now, $\int P dx = \int -\operatorname{cosec} 2x dx$

$$= -\frac{1}{2} \log \tan x = \log (\tan x)^{-1/2}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\log (\tan x)^{-1/2}} = \frac{1}{\sqrt{(\tan x)}}$$

Hence, the solution is

$$y \cdot \frac{1}{\sqrt{\tan x}} = \int \frac{\sec^2 x}{2\sqrt{\tan x}} dx$$

$$\therefore y = \tan x + C \sqrt{\tan x}$$

13. (a) $\frac{y dx - x dy}{y^2} + x^2 dx = 0$

$$d\left(\frac{x}{y}\right) + d\left(\frac{x^3}{3}\right) = 0 \text{ [integrating]}$$

$$\frac{x}{y} + \frac{x^3}{3} = \frac{k}{3} \Rightarrow 3x + x^3 y = ky$$

14. (a) The given equation can be written as
 $\frac{x dx + y dy}{(y dx - x dy) / y^2}$

$$= y^2 \cdot \frac{x}{y^3} \cos^2(x^2 + y^2)$$

$$\Rightarrow \sec^2(x^2 + y^2) \frac{1}{2} d(x^2 + y^2) = \frac{x}{y} d\left(\frac{x}{y}\right)$$

$$\Rightarrow \frac{1}{2} \tan(x^2 + y^2) = \frac{1}{2} \left(\frac{x}{y}\right)^2 + \frac{C}{2}$$

[on integrating]

$$\therefore \tan(x^2 + y^2) = \frac{x^2}{y^2} + C$$

15. (c) Given,

$$\frac{1}{\sin x} \frac{d^2y}{dx^2} = \operatorname{cosec} x - 2 \sin x$$

$$\Rightarrow \frac{d^2y}{dx^2} = 1 - 2 \sin^2 x = \cos 2x$$

On integrating both sides w.r.t. x , we get

$$\frac{dy}{dx} = \frac{\sin 2x}{2} + C_1$$

Now, again integrating both sides w.r.t. x , we get

$$y = -\frac{\cos 2x}{4} + C_1 x + C_2$$

16. (a) We have,

$$x^4 \frac{dy}{dx} + x^3 y + \operatorname{cosec}(xy) = 0$$

$$\Rightarrow x^3 \left(x \frac{dy}{dx} + y \right) + \operatorname{cosec}(xy) = 0$$

Now, on putting $xy = v, y + x \frac{dy}{dx} = \frac{dv}{dx}$

∴ The differential equation becomes
 $x^3 \frac{dv}{dx} + \operatorname{cosec} v = 0 \Rightarrow \frac{dv}{-\operatorname{cosec} v} = \frac{dx}{x^3}$

$$\Rightarrow -\int \sin v \, dv = \int x^{-3} dx + C_1$$

$$\Rightarrow \cos v = \frac{x^{-2}}{-2} + C_1$$

$$\Rightarrow 2 \cos(xy) + x^{-2} = 2C_1$$

$$\therefore 2 \cos(xy) + x^{-2} = C^1$$

17. (a) We have, $\frac{dy}{dx} = \frac{y^2}{1-3xy}$

$$\Rightarrow \frac{dx}{dy} = \frac{1-3xy}{y^2} \Rightarrow \frac{dx}{dy} = \frac{1}{y^2} - \frac{3}{y} x$$

$$\therefore \frac{dx}{dy} + \frac{3}{y} x = \frac{1}{y^2} \quad \dots(i)$$

The above is a linear differential equation of the form

$$\frac{dx}{dy} + P(y)x = Q(y)$$

Here, $P = \frac{3}{y}$ and $Q = \frac{1}{y^2}$

$$\therefore \text{IF} = e^{\int \frac{3}{y} dy} = e^{3 \log y} = y^3$$

The solution of Eq. (i) is given by

$$xy^3 = \int \frac{1}{y^2} \cdot y^3 dy + C$$

$$\therefore xy^3 = \frac{y^2}{2} + C$$

18. (b) We have,
 $x^2 y \, dy - (x \, dy - y \, dx) = 0$
 or it can be rewritten as
 $y \, dx - x \, dy + x^2 y \, dy = 0 \quad \dots(i)$
 On dividing Eq. (i) by x^2 , we get
 $\frac{y \, dx - x \, dy}{x^2} + y \, dy = 0$

$$\Rightarrow -d\left(\frac{y}{x}\right) + y \, dy = 0$$

On integrating both sides, we get

$$-\frac{y}{x} + \frac{y^2}{2} = C$$

$$\therefore xy^2 - 2y = 2xC$$

19. (b)

20. (a) We have,
 $\sqrt{1-x^2} + \sqrt{1-y^2} = a(x-y)$
 Let $x = \sin A$ and $y = \sin B$,
 we get
 $\cos A + \cos B = a(\sin A - \sin B)$
 $A - B = 2 \cot^{-1} a$
 $\sin^{-1} x - \sin^{-1} y = 2 \cot^{-1} a$
 On differentiating w.r.t x , we get
 $\frac{1}{\sqrt{1-x^2}} - \frac{1}{\sqrt{1-y^2}} \frac{dy}{dx} = 0$

Hence, it is a differential equation of 1 degree.

21. (b) $\frac{dt}{du} - t \frac{g'(x)}{g(x)} = \frac{-t^2}{g(x)}$

$$\Rightarrow \frac{-1}{t^2} \frac{dt}{du} + \frac{1}{t} \frac{g'(x)}{g(x)} = \frac{1}{g(x)} \quad \dots(i)$$

Let $\frac{1}{t} = Z$

$$\therefore \frac{-1}{t^2} \frac{dt}{du} = \frac{dZ}{du}$$

Now by (i), we have
 $\frac{dZ}{du} + Z \frac{g'(x)}{g(x)} = \frac{1}{g(x)}$
 IF = $e^{\int \frac{g'(x)}{g(x)} dx} = g(x)$
 \therefore The solution is $g(x) = x + C$
 $\frac{1}{t} g(x) = x + C \Rightarrow t = \frac{g(x)}{x + C}$

22. (c) Slope of tangent = $\frac{dy}{dx}$
 \therefore Slope of normal = $-\frac{dx}{dy}$
 \therefore The equation of normal is
 $Y - y = -\frac{dx}{dy}(X - x)$

This means X -axis ($y = 0$), where
 $-y = -\frac{dx}{dy}(X - x) \Rightarrow X = x + y \frac{dy}{dx}$

$$\therefore G \text{ is } \left(x + y \frac{dy}{dx}, 0\right)$$

$$\therefore OG = 2x \Rightarrow x + y \frac{dy}{dx} = 2x$$

$$\Rightarrow y \frac{dy}{dx} = x \Rightarrow y \, dy = x \, dx$$

Integrating, we get $\frac{y^2}{2} = \frac{x^2}{2} + \frac{C}{2}$
 $\Rightarrow y^2 - x^2 = C$
 which is a hyperbola.

23. (b) Given, $v = s + 1$
 We know that, velocity (v) = $\frac{ds}{dt}$
 $\therefore \frac{ds}{dt} = s + 1$

24. (b) Given, $v = s + 1$
 $\Rightarrow \frac{ds}{dt} = s + 1 \quad \left[\because v = \frac{ds}{dt}\right]$
 $\Rightarrow \frac{ds}{s+1} = dt$
 [on separating the variables]

On integrating both sides, we get
 $\int \frac{ds}{s+1} = \int 1 dt \Rightarrow \log(s+1) = t$

As, $s = g, \log 10 = t$
 $\therefore t = (\log 10)s$

25. (a) According to the given statement, we get
 $\frac{dM}{dt} = -KM \quad \dots(i)$
 \therefore Order of this differential equation is 1 and degree of differential equation is 1.
 Hence, order and degree of Eq. (i) is, respectively (1, 1).

26. (b) $\frac{dM}{dt} = -KM \Rightarrow \frac{dM}{M} = -K dt$

[on separating the variables]

On integrating both sides, we get
 $\int \frac{dM}{M} = -K \int 1 dt$
 $\Rightarrow \log M = -Kt + c \quad \dots(ii)$
 When $t = 0$, then $M = 27$
 On putting $t = 0$ and $M = 27$ in Eq. (ii), we get $\log 27 = 0 + c, c = \log 27$
 $\therefore \log M = -Kt + \log 27 \quad \dots(iii)$
 [from Eq. (ii)]

When $t = 3$, then $M = 8$
 On putting $t = 3$ and $M = 8$ in Eq. (iii), we get

$$3K = \log\left(\frac{27}{8}\right) \Rightarrow K = \frac{1}{3} \log \frac{27}{8}$$

$$\Rightarrow K = \log\left(\frac{3}{2}\right)$$

$$\therefore t \log \frac{3}{2} = \log 27 - \log M \quad \dots(iv)$$

[from Eq. (iii)]

When $t = 4$, we get
 $\log M = \log 27 - 4 \log\left(\frac{3}{2}\right)$
 [from Eq. (iv)]
 $= \log 27 - \log\left(\frac{81}{16}\right) = \log\left(27 \times \frac{16}{81}\right)$
 $\Rightarrow \log M = \log\left(\frac{16}{3}\right) \Rightarrow M = 5\frac{1}{3} g$

27. (c) When $M = 2\frac{10}{27} = \frac{64}{27} g$, we get
 $t \log \frac{3}{2} = \log 27 - \log \frac{64}{27}$ [from Eq. (iv)]
 $\Rightarrow t \log \frac{3}{2} = \log\left(27 \times \frac{27}{64}\right) = \log\left(\frac{729}{64}\right)$
 $\Rightarrow t \log \frac{3}{2} = 6 \log\left(\frac{3}{2}\right) \Rightarrow t = 6 h$

28. (a) Given, $y = Ae^{3x} + Be^{5x} \quad \dots(i)$
 On differentiating both sides w.r.t x , we get $\frac{dy}{dx} = 3Ae^{3x} + 5Be^{5x}$
 $\Rightarrow y_1 = 3Ae^{3x} + 5Be^{5x} \quad \dots(ii)$
 $\left[\because \frac{dy}{dx} = y_1\right]$
 $\Rightarrow y_2 = 9Ae^{3x} + 25Be^{5x} \quad \dots(iii)$
 Eliminating A and B in Eqs. (i), (ii) and (iii), we get

$$\begin{vmatrix} e^{3x} & e^{5x} & -y \\ 3e^{3x} & 5e^{5x} & -y_1 \\ 9e^{3x} & 25e^{5x} & -y^2 \end{vmatrix} = 0$$

$$\Rightarrow (-1)e^{3x} \cdot e^{5x} \begin{vmatrix} 1 & 1 & y \\ 3 & 5 & y_1 \\ 9 & 25 & y_2 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 1 & 1 & y \\ 3 & 5 & y_1 \\ 9 & 25 & y_2 \end{vmatrix} = 0$$

$$\Rightarrow 1(2y_2 - 16y_1) + y(48 - 18) = 0$$

$$\Rightarrow y_2 - 8y_1 + 15y = 0 \quad \dots \text{(iv)}$$

29. (b) The order of differential Eq. (ii) is 2.

30. (c) The degree of differential Eq. (ii) is 1.

31. (c) On multiplying Eq. (i) by 3, then subtracting this equation from Eq. (ii), we get

$$y_1 - 3y = 3Ae^{3x} + 5Be^{5x} - 3Ae^{3x} - 3Be^{5x}$$

$$\Rightarrow y_1 - 3y = 2Be^{5x} \Rightarrow B = \frac{y_1 - 3y}{2e^{5x}}$$

On putting $B = \frac{y_1 - 3y}{2e^{5x}}$ in Eq. (i), we get

$$y = Ae^{3x} + \left(\frac{y_1 - 3y}{2e^{5x}} \right) e^{5x}$$

$$\Rightarrow 2y = 2Ae^{3x} + y_1 - 3y$$

$$\Rightarrow 2Ae^{3x} = 5y - y_1 \Rightarrow A = \frac{5y - y_1}{2e^{3x}}$$

$$\text{Now, } A - B = \frac{5y - y_1}{2e^{3x}} - \frac{y_1 - 3y}{2e^{5x}}$$

32. (a) Given differential equation is

$$x^2(x^2 - 1) \frac{dy}{dx} + x(x^2 + 1)y = x^2 - 1 \quad \dots \text{(i)}$$

On dividing Eq. (i) both sides by $x^2(x^2 - 1)$, we get

$$\frac{dy}{dx} + \frac{x(x^2 + 1)}{x^2(x^2 - 1)}y = \frac{x^2 - 1}{x^2(x^2 - 1)}$$

$$\Rightarrow \frac{dy}{dx} + \frac{x^2 + 1}{x(x^2 - 1)}y = \frac{1}{x^2} \quad \dots \text{(ii)}$$

On comparing Eq. (ii) with $\frac{dy}{dx} + Py = Q$, we get

$$P = \frac{x^2 + 1}{x(x^2 - 1)}, Q = \frac{1}{x^2}$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int \frac{x^2 + 1}{x(x^2 - 1)} dx}$$

$$= e^{\int \left(\frac{1}{x+1} + \frac{1}{x-1} - \frac{1}{x} \right) dx}$$

$$= e^{\log \left(\frac{x^2 - 1}{x} \right)} = \frac{x^2 - 1}{x}$$

33. (b) Given equation $(x + 2y^3) \frac{dy}{dx} = y$

involves the term y^3 which is not linear, if we take y as the dependent, so we can write the equation as $y \frac{dx}{dy} = x + 2y^3$

$$\Rightarrow y \frac{dx}{dy} - x = 2y^3, \text{ which is linear differential equation in } x.$$

$$\Rightarrow \frac{dx}{dy} - \frac{x}{y} = 2y^2$$

[dividing both sides by y]

On comparing this equation with $\frac{dx}{dy} + Px = Q$, we get

$$P = \frac{-1}{y}, Q = 2y^2$$

$$\therefore \text{IF} = e^{\int P dy} = e^{\int \left(\frac{-1}{y} \right) dy} = e^{-\log y}$$

$$= e^{\log \frac{1}{y}} = \frac{1}{y}$$

34. (d) Given differential equation is

$$x \frac{dy}{dx} + y = x^3 y^6$$

$$\Rightarrow \frac{1}{y^6} \frac{dy}{dx} + \frac{1}{y^5} \frac{1}{x} = x^2$$

[dividing both sides by $x y^6$]

$$\text{On putting } \frac{1}{y^5} = t$$

$$\text{and } \frac{1}{y^6} \frac{dy}{dx} = -\frac{1}{5} \frac{dt}{dx}, \text{ we get}$$

$$\frac{dt}{dx} - \frac{5}{x} t = -5x^2, \text{ which is linear in } t.$$

On comparing this with $\frac{dt}{dx} + Pt = Q$, we get

$$P = -\frac{5}{x} \text{ and } Q = -5x^2.$$

$$\therefore \text{IF} = e^{\int P dx} = e^{\int -\frac{5}{x} dx} = e^{-\log x^5}$$

$$\text{IF} = \frac{1}{x^5}$$

35. (b) Given differential equation is

$$\cos x \frac{dy}{dx} = y \sin x - y^2$$

$$\Rightarrow \cos x \frac{dy}{dx} - y \sin x = -y^2$$

$$\Rightarrow \frac{dy}{dx} - (\tan x)y = -y^2 \sec x$$

[dividing both sides by $\cos x$]

$$\Rightarrow \frac{1}{y^2} \frac{dy}{dx} - (\tan x) \frac{1}{y} = -\sec x$$

[dividing both sides by y^2]

$$\text{On putting } \frac{1}{y} = t \text{ and } \frac{-1}{y^2} \frac{dy}{dx} = \frac{dt}{dx}, \text{ we}$$

$$\text{get } \frac{dt}{dx} + t \tan x = \sec x, \text{ which is linear}$$

in t .

On comparing this equation with

$$\frac{dt}{dx} + Pt = Q_1, \text{ we get}$$

$$P = \tan x \text{ and } Q = \sec x$$

$$\therefore \text{IF} = e^{\int \tan x dx} = e^{\log(\sec x)} = \sec x$$

36. (b) Given differential equation is

$$y = x \frac{dy}{dx} + \left(\frac{dy}{dx} \right)^{-1} \Rightarrow y = x \frac{dy}{dx} + \frac{1}{(dy/dx)}$$

$$\Rightarrow y \left(\frac{dy}{dx} \right) = x \left(\frac{dy}{dx} \right)^2 + 1$$

\therefore Degree = Power of highest derivative = 2

37. (d) Given,

$$e^x \tan y dx + (1 - e^x) \sec^2 y dy = 0$$

$$\Rightarrow \frac{e^x}{1 - e^x} dx + \frac{\sec^2 y}{\tan y} dy = 0$$

On integrating, we get

$$\int \frac{e^x dx}{1 - e^x} + \int \frac{\sec^2 y}{\tan y} dy = 0$$

$$\Rightarrow -\log(1 - e^x) + \log \tan y = \log C$$

$$\Rightarrow \log \tan y = \log C + \log(1 - e^x)$$

$$= \log C(1 - e^x)$$

$$\therefore \tan y = C(1 - e^x)$$

38. (c) Given, $x^2 dy + y^2 dx = 0$

$$\Rightarrow \frac{dy}{y^2} + \frac{dx}{x^2} = 0$$

On integrating, we get

$$\int y^{-2} dy + \int x^{-2} dx = 0$$

$$\Rightarrow \frac{y^{-2+1}}{-2+1} + \frac{x^{-2+1}}{-2+1} = -C_1$$

$$\Rightarrow \frac{-1}{y} - \frac{1}{x} = C_1 \Rightarrow \frac{1}{x} + \frac{1}{y} = C_1$$

$$\Rightarrow x + y = C_1 xy \Rightarrow \frac{1}{C_1}(x + y) = xy$$

$$\therefore C(x + y) = xy, \text{ where } \frac{1}{C_1} = C$$

39. (d)

40. (b) The pairs $\left(2, \frac{3}{2} \right)$ is not feasible.

Because the degree of any differential equation cannot be rational type.

If so, then we use rationalisation and convert it into integer.

41. (a) Given, $y = a \sin(\lambda x + \alpha) \quad \dots \text{(i)}$

On differentiating it w.r.t. x , we get

$$\frac{dy}{dx} = \frac{d}{dx} a \sin(\lambda x + \alpha)$$

$$= a \cos(\lambda x + \alpha) \lambda$$

$$\therefore \frac{dy}{dx} = a \lambda \cos(\lambda x + \alpha)$$

Again, differentiating it w.r.t. x , we get

$$\frac{d^2 y}{dx^2} = a \lambda \frac{d}{dx} \cos(\lambda x + \alpha)$$

$$= a \lambda [-\sin(\lambda x + \alpha)] \times \lambda$$

$$= -a \lambda^2 \sin(\lambda x + \alpha)$$

$$\Rightarrow \frac{d^2 y}{dx^2} = -\lambda^2 y \quad [\text{from Eq. (i)}]$$

$$\therefore \frac{d^2 y}{dx^2} + \lambda^2 y = 0$$

42. (c) The given differential equation is

$$\left(\frac{dy}{dx} \right)^2 - x \left(\frac{dy}{dx} \right) + y = 0 \quad \dots \text{(i)}$$

(a) $y = x - 1 \Rightarrow \frac{dy}{dx} = 1$

From Eq. (i),

$$(1)^2 - x(1) + (x - 1) = 1 - x + x - 1 = 0$$

So, $y = x - 1$ is a solution of Eq. (i).

(b) $4y = x^2 \Rightarrow y = \frac{x^2}{4} \Rightarrow \frac{dy}{dx} = \frac{x}{2}$

From Eq. (i), $\left(\frac{x}{2}\right)^2 - x\left(\frac{x}{2}\right) + \left(\frac{x^2}{4}\right)$

$$= \frac{x^2}{4} - \frac{x^2}{2} + \frac{x^2}{4} = \frac{x^2}{2} - \frac{x^2}{2} = 0$$

So, $4y = x^2$ is a solution of Eq. (i).

(c) $y = x \Rightarrow \frac{dy}{dx} = 1$

From Eq. (i), $(1)^2 - x(1) + x = 1 - x + x = 1 \neq 0$

So, $y = x$ is not a solution of Eq. (i).

(d) $y = -x - 1 \Rightarrow \frac{dy}{dx} = -1$

From Eq. (i),

$$(-1)^2 - x(-1) + (-x - 1) = 1 + x - x - 1 = 0$$

So, $y = -x - 1$ is a solution of Eq. (i).

43. (a)

44. (b) Given curve is $y = \sin x$... (i)

On differentiating w.r.t. x , we get

$$\frac{dy}{dx} = \cos x \quad \dots \text{(ii)}$$

Again, differentiating w.r.t. x , we get

$$\frac{d^2y}{dx^2} = -\sin x = -y \quad [\text{from Eq. (i)}]$$

$$\Rightarrow y + \frac{d^2y}{dx^2} = 0 \Rightarrow \frac{d^2y}{dx^2} + y = 0$$

which is the required differential equation.

45. (a) Given differential equation is

$$x \frac{dy}{dx} + y = 0 \Rightarrow x \frac{dy}{dx} = -y$$

$$\Rightarrow \frac{-dy}{y} = \frac{dx}{x} \Rightarrow \int \frac{dx}{x} + \int \frac{dy}{y} = 0$$

On integrating both sides, we get

$$\log x + \log y = \log C \Rightarrow xy = C$$

Alternate Method

$$\frac{x dy}{dx} + y = 0$$

$$\Rightarrow x dy + y dx = 0 \Rightarrow d(xy) = 0$$

∴ $xy = C$

46. (c) Given differential equation is

$$\left(\frac{d^4y}{dx^4}\right)^{3/5} - 5\left(\frac{d^3y}{dx^3}\right) + 6\left(\frac{d^2y}{dx^2}\right) - 8\left(\frac{dy}{dx}\right) + 5 = 0$$

Since, the highest exponent of the highest derivative is called degree of a differential equation provided exponent

of each derivative and the unknown variable appearing in the differential equation is a non-negative integer.

$$\therefore \left(\frac{d^4y}{dx^4}\right)^{3/5} = 5\left(\frac{d^3y}{dx^3}\right) - 6\left(\frac{d^2y}{dx^2}\right) + 8\left(\frac{dy}{dx}\right) - 5$$

$$\Rightarrow \left(\frac{d^4y}{dx^4}\right)^3$$

$$= \left\{5\left(\frac{d^3y}{dx^3}\right) - 6\left(\frac{d^2y}{dx^2}\right) + 8\left(\frac{dy}{dx}\right) - 5\right\}^5$$

∴ Required degree = 3

47. (b) Given differential equation is

$$\log\left(\frac{dy}{dx}\right) + x = 0 \Rightarrow \log\left(\frac{dy}{dx}\right) = -x$$

$$\Rightarrow \frac{dy}{dx} = e^{-x} \Rightarrow \int dy = \int e^{-x} \cdot dx$$

On integrating both sides, we get

$$y = -e^{-x} + C$$

which is the required general solution.

48. (a) Given differential equation is

$$\left(\frac{dy}{dx}\right)^2 + \frac{dy}{dx} - \sin^2 y = 0$$

The highest order derivative, present in the differential equation is $\left(\frac{dy}{dx}\right)$.

Therefore, its order is one.

49. (a) Given differential equation is

$$y = 2 \cos x + 3 \sin x \quad \dots \text{(i)}$$

Now, $\frac{dy}{dx} = -2 \sin x + 3 \cos x$

Again, $\frac{d^2y}{dx^2} = -2 \cos x - 3 \sin x$

$$= -(2 \cos x + 3 \sin x) = -y \quad [\text{from Eq. (i)}]$$

$$\therefore \frac{d^2y}{dx^2} + y = 0$$

So, only Statement I is correct.

50. (a)

51. (a) Given differential equation,

$$\frac{dy}{dx} + 2y = 1$$

On comparing with $\frac{dy}{dx} + Py = Q$, we get $P = 2$ and $Q = 1$

Now, $IF = e^{\int P dx} = e^{\int 2 dx} = e^{2x}$

Then, complete solution $y \cdot IF = \int Q(IF) dx + C = \int 1 \cdot e^{2x} dx + C$

$$\Rightarrow y \cdot e^{2x} = \frac{1}{2} e^{2x} + C$$

$$\Rightarrow y = \frac{1}{2} + C \cdot e^{-2x} \quad \dots \text{(i)}$$

Now, at $x = 0 \Rightarrow y = 0$

From Eq. (i),

$$0 = \frac{1}{2} + C \cdot e^0 \Rightarrow \frac{1}{2} + C = 0 \Rightarrow C = -\frac{1}{2}$$

∴ Required solution is $y = \frac{1}{2} - \frac{1}{2} \cdot e^{-2x}$

$$\Rightarrow y = \frac{1 - e^{-2x}}{2}$$

52. (a)

53. (a)

Sol. (Qs Nos. 54-56) Given differential equation is

$$(x^2 + x + 1)dy + (y^2 + y + 1)dx = 0$$

$$\Rightarrow (x^2 + x + 1)dy = -(y^2 + y + 1)dx$$

$$\Rightarrow \frac{dy}{(1 + y + y^2)} = -\frac{dx}{(1 + x + x^2)}$$

$$\Rightarrow \frac{dx}{(1 + x + x^2)} + \frac{dy}{(1 + y + y^2)} = 0$$

$$\Rightarrow \int \frac{dx}{\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}}$$

$$+ \int \frac{dy}{\left(y + \frac{1}{2}\right)^2 + \frac{3}{4}} = 0$$

$$\Rightarrow \int \frac{dx}{\left(x + \frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2}$$

$$+ \int \frac{dy}{\left(y + \frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} = 0$$

[on integrating]

$$\Rightarrow \frac{1}{\left(\frac{\sqrt{3}}{2}\right)} \tan^{-1} \left\{ \frac{\left(x + \frac{1}{2}\right)}{\frac{\sqrt{3}}{2}} \right\}$$

$$+ \frac{1}{\frac{\sqrt{3}}{2}} \tan^{-1} \left\{ \frac{y + \frac{1}{2}}{\frac{\sqrt{3}}{2}} \right\} = \frac{2}{\sqrt{3}} \tan^{-1} C_1$$

$$\left[\because \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a} \right]$$

$$\Rightarrow \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{2x + 1}{\sqrt{3}} \right)$$

$$+ \frac{2}{\sqrt{3}} \tan^{-1} \left(\frac{2y + 1}{\sqrt{3}} \right) = \frac{2}{\sqrt{3}} \tan^{-1} C_1$$

$$\Rightarrow \tan^{-1} \left(\frac{2x + 1}{\sqrt{3}} \right) + \tan^{-1} \left(\frac{2y + 1}{\sqrt{3}} \right)$$

$$= \tan^{-1} C_1$$

$$\Rightarrow \tan^{-1} \left[\frac{\left(\frac{2x+1}{\sqrt{3}} \right) + \left(\frac{2y+1}{\sqrt{3}} \right)}{1 - \left(\frac{2x+1}{\sqrt{3}} \right) \left(\frac{2y+1}{\sqrt{3}} \right)} \right] = \tan^{-1} C_1$$

$$\left[\because \tan^{-1} x + \tan^{-1} y = \tan^{-1} \left(\frac{x+y}{1-xy} \right) \right]$$

$$\Rightarrow \frac{\sqrt{3}[(2x+1) + (2y+1)]}{3 - (2x+1)(2y+1)} = C_1$$

$$\Rightarrow 2\sqrt{3}(x+y+1) = 2C_1(1-x-y-2xy)$$

$$\Rightarrow (x+y+1) = \frac{C_1}{\sqrt{3}}(1-x-y-2xy)$$

On comparing with $(x+y+1) = A(1+Bx+Cy+Dxy)$

Here, A is parameter and B, C and D are constants.

54. (a) The value of $B = -1$ **55.** (b) The value of $C = -1$

56. (c) The value of $D = -2$

57. (c) The given differential equation of the curve is,

$$dy = y \tan x \cdot dx \Rightarrow \int \frac{dy}{y} = \int \tan x \cdot dx \quad [\text{on integrating}]$$

$$\Rightarrow \log y = \log \sec x + \log C \Rightarrow \log y = \log C \cdot \sec x$$

$$\Rightarrow y = C \cdot \sec x \quad \dots(i)$$

Since, the curve passes through the origin $(0, 1)$, then

$$1 = C \cdot \sec 0 \Rightarrow C = 1$$

\therefore Required equation of curve is, $y = \sec x$

58. (c) **59.** (c)

60. (c) Consider the given differential equation

$$\ln \left(\frac{dy}{dx} \right) + x = 0 \Rightarrow \ln \left(\frac{dy}{dx} \right) = -x \Rightarrow \frac{dy}{dx} = e^{-x}$$

On separating the variable, we get $\Rightarrow dy = e^{-x} dx$

On integrating both side, we get $\int dy = \int e^{-x} dx \Rightarrow y + e^{-x} = C$

61. (a) Consider the given differential equation,

$$\sin \left(\frac{dy}{dx} \right) - a = 0 \Rightarrow dy = (\sin^{-1} a) dx$$

On integrating both side w.r.t x , we get

$$\int dy = \int (\sin^{-1} a) dx \Rightarrow y = (\sin^{-1} a) \int dx \Rightarrow y = (\sin^{-1} a) \cdot x + C$$

62. (b) Consider the given differential equation,

$$\frac{y dx - x dy}{y^2} = 0 \Rightarrow d \left(\frac{x}{y} \right) = 0 \quad \left[\because d \left(\frac{u}{v} \right) = \frac{v \cdot du - u \cdot dv}{v^2} \right]$$

On integrating both side, we get

$$\Rightarrow \int d \left(\frac{x}{y} \right) = C_1 \Rightarrow \frac{x}{y} = C_1 \Rightarrow y = Cx, \text{ where } C = \frac{1}{C_1}$$

63. (c) Consider the given differential equation, $\frac{dx}{dy} + \frac{x}{y} = y^2$

On comparing with linear differential equation of the form $\frac{dx}{dy} + Px = Q$. Here, $P = \frac{1}{y}$ and $Q = y^2$

$$\therefore \text{IF} = e^{\int P dy} = e^{\int \frac{1}{y} dy} = e^{\ln(y)} = y$$

Now, the solution of given differential equation is

$$x \cdot y = \int (y \cdot y^2) dy + C_1 \Rightarrow x \cdot y = \int y^3 dy + C_1$$

$$\Rightarrow x \cdot y = \frac{y^4}{4} + C_1 \Rightarrow 4xy = y^4 + C,$$

where $C = 4C_1$

64. (c) I. We have, $\frac{dy}{dx} = f(x) + x \Rightarrow dy = [f(x) + x] dx$

On integrating both sides, we get

$$\int dy = \int [f(x) + x] dx \Rightarrow y = \int f(x) dx + \frac{x^2}{2} + C$$

$$\text{Let } g(x) = \int f(x) dx + \frac{x^2}{2}$$

Thus, general solution is of the form $y = g(x) + C$.

II. Consider the given differential equation, $\left(\frac{dy}{dx} \right)^2 = f(x)$

Clearly, the highest order derivative occurring in the differential equation is $\frac{dy}{dx}$ and its highest power is 2.

Also, given equation is polynomial in derivative. So, degree of differential equation is 2.

65. (d)

66. (b) Equation of parabola having vertex at the origin and focus at $(a, 0)$, where $a > 0$, is $y^2 = 4ax$

On differentiating the above equation, we get

$$2y \frac{dy}{dx} = 4a \Rightarrow y \frac{dy}{dx} = 2a \Rightarrow y \frac{d^2y}{dx^2} + \left(\frac{dy}{dx} \right)^2 = 0$$

Hence, the order and degree of differential equation are 2 and 1, respectively.

67. (c)

68. (b) Let equation of family of circles passing through origin and having centre $(a, 0)$ be $(x-a)^2 + (y-0)^2 = a^2$

$$\Rightarrow x^2 + a^2 - 2ax + y^2 = a^2 \Rightarrow x^2 + y^2 - 2ax = 0 \quad \dots(i)$$

On differentiating Eq. (i), we get

$$2x + 2y \frac{dy}{dx} - 2a = 0 \Rightarrow x + y \frac{dy}{dx} - \left[\frac{x^2 + y^2}{2x} \right] = 0 \quad [\text{from Eq. (i)}]$$

$$\Rightarrow 2x^2 + 2xy \frac{dy}{dx} - x^2 - y^2 = 0 \Rightarrow 2xy \frac{dy}{dx} = y^2 - x^2$$

69. (a) Given, $f''(x) = g''(x)$

On integrating both sides, we get

$$f'(x) = g'(x) + c \Rightarrow f'(1) = g'(1) + c \Rightarrow 4 = 6 + c \Rightarrow c = -2$$

$$\therefore f'(x) = g'(x) - 2$$

Again, on integrating both sides, we get

$$f(x) = g(x) - 2x + c_1 \Rightarrow f(2) = g(2) - 2 \times 2 + c_1$$

$$\Rightarrow 3 = 9 - 4 + c_1 \Rightarrow c_1 = -2$$

$$\therefore f(x) - g(x) = -2x - 2$$

$$\text{At } x = 4, [f(x) - g(x)] = -8 - 2 = -10$$

70. (d) Given, $y = cx + c^2 - 3c^{3/2} + 2$ $\dots(i)$

On differentiating both sides w.r.t. x , we get

$$\frac{dy}{dx} = c \quad \dots(ii)$$

From Eqs. (i) and (ii), we have

$$y = \frac{dy}{dx} \times x + \left(\frac{dy}{dx} \right)^2 - 3 \left(\frac{dy}{dx} \right)^{3/2} + 2$$

$$\Rightarrow y - x \frac{dy}{dx} - \left(\frac{dy}{dx} \right)^2 - 2 = -3 \left(\frac{dy}{dx} \right)^{3/2}$$

$$\Rightarrow \left[y - x \left(\frac{dy}{dx} \right) - \left(\frac{dy}{dx} \right)^2 - 2 \right]^2 = 9 \left(\frac{dy}{dx} \right)^3$$

Hence, order is 1 and degree is 4.

27

VECTOR ALGEBRA

In NDA exam, generally 4-6 questions are asked from this chapter, which are based on coplanarity of three points and product of two vectors.

VECTOR AND SCALAR

The physical quantities may be divided into two groups

- (i) **Scalar** quantity is a quantity having magnitude but no direction. e.g. work, volume, time, mass, length, etc.
- (ii) **Vector** quantity is a quantity having both direction and magnitude. e.g. displacement, force, velocity, momentum, etc.

Representation of Vectors

A vector is often denoted by two letters with an arrow over it, i.e. \vec{AB} . A is called the origin (initial point) and B the terminus. Its magnitude is given by the length AB and direction is from A to B as indicated by the arrow, we write vector quantities also in single letter notation like \mathbf{a} , \mathbf{b} , \mathbf{c} and the corresponding letters a , b and c shows their magnitude.

Thus, if $\vec{AB} = \mathbf{a}$, then $|\vec{AB}| = a$, where $|\vec{AB}|$ means the magnitude of vector \mathbf{a} .

Equality of Vectors

Two vectors \mathbf{a} and \mathbf{b} are said to be equal, written as $\mathbf{a} = \mathbf{b}$, if they have (i) same length and (ii) same direction.

Types of Vectors

1. **Zero or null vector** A vector, whose initial and terminal points coincides is called zero or null vector. Thus, the modulus of the null vector is zero and it is denoted by $\mathbf{0}$ or $\vec{0}$. Vectors other than the null vector are called proper vectors.

2. **Unit vector** A vector, whose magnitude is of unit length is called a unit vector. If \mathbf{a} is a vector whose magnitude is a , then unit vector in the direction of \mathbf{a} is denoted by $\hat{\mathbf{a}}$ and is obtained by dividing the vector \mathbf{a} by its magnitude $|\hat{\mathbf{a}}|$.

$$\text{Thus, } \hat{\mathbf{a}} = \frac{\mathbf{a}}{|\mathbf{a}|}$$

3. **Like and unlike vectors** Vectors are said to be like, when they have the same sense of direction but magnitudes may be different and unlike when they have opposite directions and but different magnitudes.
4. **Coinitial vectors** Vectors having the same initial point are called coinital vectors.
5. **Collinear or parallel vectors** The vectors which are parallel to the same straight line.
6. **Coplanar vectors** Three or more vectors are said to be coplanar when they are parallel to the same plane otherwise they are said to be non-coplanar vector whatever their magnitudes be.

Note Two vectors are always coplanar.

7. **Coterminous vectors** Vectors having the same terminal points are called coterminous vectors.
8. **Negative of a vector** The vector which has the same magnitude as the vector \mathbf{a} but opposite in direction, is called the negative of \mathbf{a} and is denoted by $-\mathbf{a}$. Thus, if $\mathbf{PR} = \mathbf{a}$, then $\mathbf{QP} = -\mathbf{a}$.
9. **Reciprocal of a vector** A vector having the same direction as that of a given vector \mathbf{a} but magnitude is equal to the reciprocal of the given vector, \mathbf{a} and is denoted by \mathbf{a}^{-1} .

$$\text{If } |\mathbf{a}| = a, \text{ then } |\mathbf{a}^{-1}| = \frac{1}{a}$$

10. **Localised and free vectors** Whose initial point or tail is not fixed. e.g. Velocity vector of a particular moving particle along a straight line.

Addition of Vectors

The addition of two vectors \mathbf{a} and \mathbf{b} is denoted by $\mathbf{a} + \mathbf{b}$ and it is known as resultant of \mathbf{a} and \mathbf{b} .

There are three methods of addition of vectors.

1. **Triangle Law** If \mathbf{a} and \mathbf{b} lies along two consecutive sides of a triangle, then third side represents the sum $\mathbf{a} + \mathbf{b}$.

Symbolically, we have $\mathbf{PQ} + \mathbf{QR} = \mathbf{PR}$
or $\mathbf{a} + \mathbf{b} = \mathbf{c}$

2. **Parallelogram Law** If two vectors \mathbf{a} and \mathbf{b} are represented in magnitude and direction by the two adjacent sides of a parallelogram, then their sum \mathbf{c} is represented by the diagonal of the parallelogram, which is coincident with the given vectors. Symbolically, we have

$$\mathbf{OP} + \mathbf{OR} = \mathbf{OQ} \text{ or } \mathbf{a} + \mathbf{b} = \mathbf{c}$$

3. **Polygon Law of Addition of Vectors** If a finite number of vectors be represented in magnitude as well as directions by consecutive sides of an open polygon then their sum or resultant is represented in magnitude as well as direction by the closing side of the polygon in reverse order.

$$\mathbf{OA} + \mathbf{AB} + \mathbf{BC} + \mathbf{CD} + \mathbf{DE} = \mathbf{OE}$$

$$\text{Also, } (\mathbf{a} + \mathbf{b}) + \mathbf{c} = \mathbf{a} + (\mathbf{b} + \mathbf{c}) = \mathbf{a} + \mathbf{b} + \mathbf{c}$$

Properties of Vector Addition

- (i) **Vector addition is commutative.**
i.e. $\mathbf{a} + \mathbf{b} = \mathbf{b} + \mathbf{a}$
- (ii) **Vector addition is associative.**
i.e. $(\mathbf{a} + \mathbf{b}) + \mathbf{c} = \mathbf{a} + (\mathbf{b} + \mathbf{c})$
- (iii) **Existence of additive identity** For every vector \mathbf{a} , we have,
 $\mathbf{a} + \mathbf{0} = \mathbf{a} = \mathbf{0} + \mathbf{a}$, where $\mathbf{0}$ is the null vector.
- (iv) **Existence of additive inverse** For every vector \mathbf{a} , there corresponds a vector $-\mathbf{a}$ such that
 $\mathbf{a} + (-\mathbf{a}) = \mathbf{0} = (-\mathbf{a}) + \mathbf{a}$

Subtraction of Vectors

If \mathbf{a} and \mathbf{b} are two vectors, then the subtraction of \mathbf{b} from \mathbf{a} is defined as the vector sum of \mathbf{a} and $-\mathbf{b}$ and is denoted by $\mathbf{a} - \mathbf{b}$, i.e.

$\mathbf{a} - \mathbf{b} = \mathbf{a} + (-\mathbf{b})$. Thus, to subtract \mathbf{b} from \mathbf{a} , reverse the direction of \mathbf{b} and add to \mathbf{a} as shown in figure.

Multiplication of Vector by a Scalar

Let m be a scalar and \mathbf{a} be a vector, then their product is defined by $m\mathbf{a}$ or $\mathbf{a}m$. This multiplication is called scalar multiplication.

Properties of Multiplication of Vectors by a Scalar

For vectors \mathbf{a} , \mathbf{b} and scalars m , n , we have

- (i) $m(-\mathbf{a}) = (-m)\mathbf{a} = -(m\mathbf{a})$ (ii) $(-m)(-\mathbf{a}) = m\mathbf{a}$
- (iii) $m(n\mathbf{a}) = (mn)\mathbf{a} = n(m\mathbf{a})$
- (iv) $(m+n)\mathbf{a} = m\mathbf{a} + n\mathbf{a}$ (v) $m(\mathbf{a} + \mathbf{b}) = m\mathbf{a} + m\mathbf{b}$
- (vi) $m(\mathbf{a} - \mathbf{b}) = m\mathbf{a} - m\mathbf{b}$ (vii) $1 \cdot \mathbf{a} = \mathbf{a}$
- (viii) If \mathbf{a} is a vector, then $5\mathbf{a}$ is a vector, whose magnitude is 5 times the magnitude of \mathbf{a} .

EXAMPLE 1. If $ABCDEF$ is a regular hexagon with $\mathbf{AB} = \mathbf{a}$ and $\mathbf{BC} = \mathbf{b}$, then \mathbf{CE} equals

- a. $\mathbf{b} - \mathbf{a}$ b. $-\mathbf{b}$ c. $\mathbf{b} - 2\mathbf{a}$ d. $2\mathbf{a} - \mathbf{b}$

Sol. c. In $\triangle ABC$, we have $\mathbf{AB} + \mathbf{BC} = \mathbf{AC} \Rightarrow \mathbf{AC} = \mathbf{a} + \mathbf{b}$... (i)

Since, \mathbf{AD} is parallel to \mathbf{BC} and $\mathbf{AD} = 2\mathbf{BC}$. Therefore, $\mathbf{AD} = 2\mathbf{b}$

In $\triangle ACD$, we have $\mathbf{AC} + \mathbf{CD} = \mathbf{AD}$,

$$\mathbf{CD} = 2\mathbf{b} - (\mathbf{a} + \mathbf{b}) = \mathbf{b} - \mathbf{a}$$

$$\therefore \mathbf{CE} = \mathbf{CD} + \mathbf{DE} = \mathbf{b} - \mathbf{a} + (-\mathbf{a}) = \mathbf{b} - 2\mathbf{a}$$

Position Vector

If a point O is fixed as the origin in space (or a plane) and P is any point, then \mathbf{OP} is called the position vector of P with respect to O .

If we say that P is the point \mathbf{r} , then we mean that the position vector of P is \mathbf{r} with respect to same origin O .

e.g. $\mathbf{AB} = \text{Position vector of } B - \text{Position vector of } A = \mathbf{OB} - \mathbf{OA}$

EXAMPLE 2. If the position vector \mathbf{a} of a point $(12, n)$ is such that $|\mathbf{a}| = 13$, then find the value of n .

- a. ± 4 b. ± 5 c. ± 6 d. ± 8

Sol. b. Since, the position vector of the point $(12, n)$ is $12\mathbf{i} + n\mathbf{j}$.

$$\therefore \mathbf{a} = 12\hat{\mathbf{i}} + n\hat{\mathbf{j}} \Rightarrow |\mathbf{a}| = \sqrt{12^2 + n^2}$$

$$\text{Now, } |\mathbf{a}| = 13 \Rightarrow 13 = \sqrt{12^2 + n^2} \Rightarrow 169 = 144 + n^2$$

$$\Rightarrow n^2 = 25 \Rightarrow n = \pm 5$$

Components of a Vector in Two Dimension

If a point P in a plane has coordinates (x, y) , then

$$(i) \mathbf{OP} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} \quad (ii) |\mathbf{OP}| = \sqrt{x^2 + y^2}$$

- (iii) The components of \mathbf{OP} along X -axis is a vector $x\hat{\mathbf{i}}$, whose magnitude is $|x|$ and whose direction is along OX or OX' according as x is positive or negative. Similarly, for Y -axis.

(iv) For any two vectors $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}}$ and $\mathbf{b} = b_1\hat{\mathbf{i}} + b_2\hat{\mathbf{j}}$, we define

$$(a) \mathbf{a} + \mathbf{b} = (a_1 + b_1)\hat{\mathbf{i}} + (a_2 + b_2)\hat{\mathbf{j}}$$

$$(b) \mathbf{a} - \mathbf{b} = (a_1 - b_1)\hat{\mathbf{i}} + (a_2 - b_2)\hat{\mathbf{j}}$$

$$(c) m\mathbf{a} = (ma_1)\hat{\mathbf{i}} + (ma_2)\hat{\mathbf{j}}, \text{ where } m \text{ is a scalar.}$$

$$(d) \mathbf{a} = \mathbf{b} \Leftrightarrow a_1 = b_1 \text{ and } a_2 = b_2$$

Components of a Vector in Space

Consider a point $P(x, y, z)$ in space.

The position vector of a point $P(x, y, z)$ in space is $\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$.

The vectors $x\hat{\mathbf{i}}$, $y\hat{\mathbf{j}}$ and $z\hat{\mathbf{k}}$ are known as the component vectors of \mathbf{r} along X, Y and Z -axes, respectively.

Coplanarity of Three Points

Three vectors are coplanar, if one of them is expressible as a linear combination of the other two.

If \mathbf{a} , \mathbf{b} and \mathbf{c} are non-coplanar vectors, then

$$x\mathbf{a} + y\mathbf{b} + z\mathbf{c} = \mathbf{0} \Rightarrow x = y = z = 0$$

Coplanarity of Four Points

Four points with position vectors \mathbf{a} , \mathbf{b} , \mathbf{c} and \mathbf{d} are coplanar, if and only if there exist scalars x, y, z, u not all zero such that

$$x\mathbf{a} + y\mathbf{b} + z\mathbf{c} + u\mathbf{d} = \mathbf{0}, \text{ where } x + y + z + u = 0.$$

Distance between Two Points

Let $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ be two points. Then, the distance between two points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$ is given by

$$PQ = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}.$$

EXAMPLE 3. The vectors $2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$ and

$\sqrt{3}\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - 4\hat{\mathbf{k}}$ are the sides of a triangle which is

- a. equilateral b. only isosceles
- c. only right angled d. right angled and isosceles

Sol. d. Let $\mathbf{AB} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $\mathbf{BC} = \hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$,

$$\text{and } \mathbf{CA} = \sqrt{3} \hat{i} - 4\hat{j} - 4\hat{k},$$

$$\Rightarrow \mathbf{AB} \cdot \mathbf{BC} = 2 + 3 - 5 = 0$$

So, ΔABC is right angled.

$$\text{Now, } |\mathbf{CA}| = \sqrt{3+16+16} = \sqrt{35}$$

$$|\mathbf{BC}| = \sqrt{1+9+25} = \sqrt{35}$$

$$\therefore |\mathbf{BC}| = |\mathbf{AC}|$$

So, ΔABC is isosceles.

Section Formulae

Let A and B be two points with position vectors \mathbf{a} and \mathbf{b} , respectively and let C be a point dividing

(i) AB internally in the ratio $m:n$. Then, the position vector of C is given by $\mathbf{OC} = \frac{m\mathbf{b} + n\mathbf{a}}{m+n}$.

(ii) AB externally in the ratio $m:n$. Then, the position vector of C is given by $\mathbf{OC} = \frac{m\mathbf{b} - n\mathbf{a}}{m-n}$.

Note If C is the mid-point of AB , then it divides AB in the ratio

$$1:1. \text{ Then, position vector of } C \text{ is } \frac{1 \cdot \mathbf{a} + 1 \cdot \mathbf{b}}{1+1} = \frac{\mathbf{a} + \mathbf{b}}{2}.$$

EXAMPLE 4. Find the position vectors of the points which divide the join of the points $2\mathbf{a} - 3\mathbf{b}$ and $3\mathbf{a} - 2\mathbf{b}$ internally and externally in the ratio $2:3$.

$$\mathbf{a.} \quad \frac{12\mathbf{a}}{5} + \frac{13\mathbf{b}}{5}, 5\mathbf{a} \qquad \mathbf{b.} \quad \frac{12\mathbf{a}}{5} - \frac{13\mathbf{b}}{5}, 5\mathbf{b}$$

$$\mathbf{c.} \quad \frac{12\mathbf{a}}{5} + \frac{13\mathbf{b}}{5}, -5\mathbf{b} \qquad \mathbf{d.} \quad \text{None of these}$$

Sol. **d.** Let A and B be the given points with position vectors $2\mathbf{a} - 3\mathbf{b}$ and $3\mathbf{a} - 2\mathbf{b}$, respectively. Let P and Q be the points dividing AB in the ratio $2:3$ internally and externally, respectively.

$$\text{Then, position vector of } P = \frac{3(2\mathbf{a} - 3\mathbf{b}) + 2(3\mathbf{a} - 2\mathbf{b})}{3+2}$$

$$= \frac{12\mathbf{a}}{5} - \frac{13\mathbf{b}}{5}$$

$$\text{and position vector of } Q = \frac{3(2\mathbf{a} - 3\mathbf{b}) - 2(3\mathbf{a} - 2\mathbf{b})}{3-2}$$

$$= -5\mathbf{b}$$

Centroid of a Triangle

If \mathbf{a} , \mathbf{b} and \mathbf{c} are the position vectors of the vertices A , B and C of a ΔABC , with respect to an origin O , then the position vector of the centroid G of ΔABC is given by

$$\mathbf{OG} = \frac{1}{3}(\mathbf{a} + \mathbf{b} + \mathbf{c}).$$

Product of Two Vectors

There are two methods of products of two vectors.

Scalar or Dot Product of Two Vectors

The scalar product (dot product) of two vectors \mathbf{a} and \mathbf{b} is given by $\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta \Rightarrow \mathbf{a} \cdot \mathbf{b} = ab \cos \theta \dots(i)$

where, a, b are the magnitude of the vectors \mathbf{a} and \mathbf{b} , respectively and θ is the angle between the vectors \mathbf{a} and \mathbf{b} .

Properties of Scalar Product

- (i) **Scalar product is commutative** If \mathbf{a} and \mathbf{b} are two non-zero vectors, then $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}$.
- (ii) **Scalar product is associative with respect to a Scalar** If \mathbf{a} and \mathbf{b} are any two non-zero vectors and n is a scalar, then $\mathbf{a} \cdot (n\mathbf{b}) = (n\mathbf{a}) \cdot \mathbf{b} = n(\mathbf{a} \cdot \mathbf{b})$
- (iii) **Scalar product is distributive with respect to vector addition** If \mathbf{a} , \mathbf{b} and \mathbf{c} are any three non-zero vectors, then $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = \mathbf{a} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{c}$
- (iv) Since, \hat{i} , \hat{j} and \hat{k} are three mutually perpendicular unit vectors.
 $\therefore \hat{i} \cdot \hat{i} = \hat{j} \cdot \hat{j} = \hat{k} \cdot \hat{k} = 1$ and $\hat{i} \cdot \hat{j} = \hat{j} \cdot \hat{k} = \hat{k} \cdot \hat{i} = 0$
- (v) If two vectors \mathbf{a} and \mathbf{b} can be expressed in terms of unit vectors \hat{i} , \hat{j} and \hat{k} as $\mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$ and $\mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$.
 Then, $\mathbf{a} \cdot \mathbf{b} = (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \cdot (b_1\hat{i} + b_2\hat{j} + b_3\hat{k})$
 $= a_1b_1 + a_2b_2 + a_3b_3$
 $[\because \hat{i}^2 = \hat{j}^2 = \hat{k}^2 = 1 \text{ and } \hat{i} \cdot \hat{j} = \hat{j} \cdot \hat{k} = \hat{k} \cdot \hat{i} = 0]$
- (vi) If θ is the angle between two vectors \mathbf{a} and \mathbf{b} with magnitude a and b respectively, then

$$\cos \theta = \frac{\mathbf{a} \cdot \mathbf{b}}{ab} \qquad [\because \mathbf{a} \cdot \mathbf{b} = ab \cos \theta]$$

$$\text{If } \mathbf{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k} \text{ and } \mathbf{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k}$$

$$\text{Then, } \cos \theta = \frac{a_1b_1 + a_2b_2 + a_3b_3}{\sqrt{a_1^2 + a_2^2 + a_3^2} \sqrt{b_1^2 + b_2^2 + b_3^2}}$$

- (a) If $\theta = 90^\circ$, then $a_1b_1 + a_2b_2 + a_3b_3 = 0$ which is the condition of perpendicularity of two vectors \mathbf{a} and \mathbf{b} .
- (b) If $\theta = 0^\circ$, then $\mathbf{a} \parallel \mathbf{b}$

$$\Rightarrow \mathbf{a} = m\mathbf{b}, \text{ where } m \text{ is a scalar.}$$

$$\text{or } a_1\hat{i} + a_2\hat{j} + a_3\hat{k} = m(b_1\hat{i} + b_2\hat{j} + b_3\hat{k})$$

On comparing the coefficients of \hat{i} , \hat{j} and \hat{k} from

$$\text{both sides, we get } \frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3} (= m)$$

This is the condition of parallelism of vectors \mathbf{a} and \mathbf{b} .

EXAMPLE 5. Let $\mathbf{a} = 2\hat{j} - 3\hat{k}$, $\mathbf{b} = \hat{j} + 3\hat{k}$ and $\mathbf{c} = -3\hat{i} + 3\hat{j} + \hat{k}$. If $\hat{\mathbf{n}}$ is a unit vector such that $\mathbf{a} \cdot \hat{\mathbf{n}} = \mathbf{b} \cdot \hat{\mathbf{n}} = 0$, then what is the value of $\mathbf{c} \cdot \hat{\mathbf{n}}$?

- a. 1 b. $\sqrt{19}$ c. 3 d. -3

Sol. d. Here, $\mathbf{a} = 2\hat{j} - 3\hat{k}$, $\mathbf{b} = \hat{j} + 3\hat{k}$ and $\mathbf{c} = -3\hat{i} + 3\hat{j} + \hat{k}$

Let $\hat{\mathbf{n}} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow \mathbf{a} \cdot \hat{\mathbf{n}} = 0$

$\Rightarrow (2\hat{j} - 3\hat{k}) \cdot (x\hat{i} + y\hat{j} + z\hat{k}) = 0 \Rightarrow 2y - 3z = 0 \dots(i)$

and $\mathbf{b} \cdot \hat{\mathbf{n}} = 0 \Rightarrow (\hat{j} + 3\hat{k}) \cdot (x\hat{i} + y\hat{j} + z\hat{k}) = 0 \Rightarrow y + 3z = 0 \dots(ii)$

On solving Eqs. (i) and (ii), we get, $y = z = 0$

Since, $\hat{\mathbf{n}}$ is a unit vector.

$\therefore x^2 + y^2 + z^2 = 1 \Rightarrow x = 1 \Rightarrow \hat{\mathbf{n}} = \hat{i}$

Now, $\mathbf{c} \cdot \hat{\mathbf{n}} = (-3\hat{i} + 3\hat{j} + \hat{k}) \cdot (\hat{i}) = -3$

Work Done by a Force

If a force \mathbf{F} acting at a point A of a body produces a displacement \mathbf{d} such that A moves to D , then the work done by the force \mathbf{F} is the scalar $Fd \cos \theta$, where θ is the angle between \mathbf{F} and \mathbf{d} .

$\therefore \text{Work} = Fd \cos \theta = \mathbf{F} \cdot \mathbf{d}$

Moment or Torque of a Force about a Point

Let F be a force acting in a given direction and \mathbf{r} be the position vector of a point P on the line of action of F with respect to an origin O .

The moment of the force about O is defined to be the vector,

$\mathbf{M} = \mathbf{r} \times \mathbf{F}$

where, $|\mathbf{M}| = rF \sin \theta$

EXAMPLE 6. Assume that a particle is displaced from the point $A = (2, -6, 1)$ to the point $B = (5, 9, 7)$. If the force applied to move the particle to $1/3$ of the distance from A to B is $\mathbf{F} = \hat{i} + 2\hat{j} - \hat{k}$ and for the remaining distance it is $\mathbf{F}/3$, then what is the work done in displacing the particle from A to B ?

- a. 9 units b. 12 units c. 15 units d. 27 units

Sol. c. $\mathbf{AB} = \mathbf{d} = (5\hat{i} + 9\hat{j} + 7\hat{k}) - (2\hat{i} - 6\hat{j} + \hat{k}) = 3\hat{i} + 15\hat{j} + 6\hat{k}$

$\mathbf{d}_1 = 1/3(3\hat{i} + 15\hat{j} + 6\hat{k}) = \hat{i} + 5\hat{j} + 2\hat{k}$

Work done $= \mathbf{F} \cdot \mathbf{d}_1 = (\hat{i} + 2\hat{j} - \hat{k}) \cdot (\hat{i} + 5\hat{j} + 2\hat{k})$
 $= 1 + 10 - 2 = 9$

$\mathbf{d}_2 = (3\hat{i} + 15\hat{j} + 6\hat{k}) - (\hat{i} + 5\hat{j} + 2\hat{k}) = 2\hat{i} + 10\hat{j} + 4\hat{k}$

Work done $= \mathbf{F} \cdot \mathbf{d}_2 = 1/3(\hat{i} + 2\hat{j} - \hat{k}) \cdot (2\hat{i} + 10\hat{j} + 4\hat{k})$
 $= 1/3(2 + 20 - 4) = 18/3 = 6$

Total work done $= \mathbf{F} \cdot \mathbf{d}_1 + \mathbf{F} \cdot \mathbf{d}_2 = 9 + 6 = 15$ units

Vector or Cross-product of Two Vectors

The vector product (cross-product) of two vectors \mathbf{a} and \mathbf{b} is given by

$\mathbf{a} \times \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \sin \theta \hat{\mathbf{n}}$

$\mathbf{a} \times \mathbf{b} = ab \sin \theta \hat{\mathbf{n}}$

where, a and b are the magnitudes of the vectors \mathbf{a} and \mathbf{b} respectively and θ is the angle between the vectors \mathbf{a} and \mathbf{b} . Here, $\hat{\mathbf{n}}$ is the unit vector perpendicular to both \mathbf{a} and \mathbf{b} .

Some special cases related to vector product are given below

- (i) If \mathbf{a} and \mathbf{b} are parallel, then $\theta = 0$
 $\therefore \mathbf{a} \times \mathbf{b} = 0$ [$\because \sin \theta = 0$]
 In particular, $\mathbf{a} \times \mathbf{a} = 0$
- (ii) If \mathbf{a} and \mathbf{b} are perpendicular, then $\theta = 90^\circ$
 $\therefore \mathbf{a} \times \mathbf{b} = ab \hat{\mathbf{n}}$ [$\because \sin \theta = 1$]
 and $|\mathbf{a} \times \mathbf{b}| = ab$
- (iii) If $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are unit vectors, then
 $\mathbf{a} \times \mathbf{b} = \sin \theta \hat{\mathbf{n}}$

Properties of Vector Product

- (i) **Vector (Cross) product is not commutative** If \mathbf{a} and \mathbf{b} are any two vectors and if $a = |\mathbf{a}|$, $b = |\mathbf{b}|$, then

$\mathbf{a} \times \mathbf{b} \neq \mathbf{b} \times \mathbf{a}$
 $\mathbf{a} \times \mathbf{b} = -(\mathbf{b} \times \mathbf{a})$

- (ii) **Vector (Cross) product is associative with respect to a Scalar.** If \mathbf{a} and \mathbf{b} are any two vectors and m is a scalar, then

$m(\mathbf{a} \times \mathbf{b}) = (m\mathbf{a}) \times \mathbf{b} = \mathbf{a} \times (m\mathbf{b})$

- (iii) **Vector (Cross) product is distributive with respect to vector addition** If \mathbf{a} , \mathbf{b} and \mathbf{c} are any three vectors, then

$\mathbf{a} \times (\mathbf{b} + \mathbf{c}) = (\mathbf{a} \times \mathbf{b}) + (\mathbf{a} \times \mathbf{c})$

- (iv) We know that, the unit vectors \hat{i} , \hat{j} , \hat{k} are mutually perpendicular, so we find that $\hat{i} \times \hat{j} = (\sin 90^\circ) \hat{\mathbf{n}}$, where $\hat{\mathbf{n}}$ is a unit vector perpendicular to both \hat{i} and \hat{j} and so $\hat{\mathbf{n}} = \hat{k}$

$\therefore \hat{i} \times \hat{j} = \hat{k}, \hat{j} \times \hat{k} = \hat{i}, \hat{k} \times \hat{i} = \hat{j}$
 $\hat{j} \times \hat{i} = -\hat{k}, \hat{k} \times \hat{j} = -\hat{i}, \hat{i} \times \hat{k} = -\hat{j}$
 Also, $\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = 0$

(v) If $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}$ and $\mathbf{b} = b_1\hat{\mathbf{i}} + b_2\hat{\mathbf{j}} + b_3\hat{\mathbf{k}}$ be two

$$\text{vectors, then } \mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

(vi) If \mathbf{a} and \mathbf{b} are the adjacent sides of a parallelogram, then area of parallelogram $= |\mathbf{a} \times \mathbf{b}|$

(vii) If \mathbf{a} and \mathbf{b} are the diagonals of a parallelogram, then area of parallelogram $= \frac{1}{2} |\mathbf{a} \times \mathbf{b}|$

(viii) If \mathbf{a} and \mathbf{b} are the adjacent sides of a triangle, then area of triangle $= \frac{1}{2} |\mathbf{a} \times \mathbf{b}|$

(ix) If \mathbf{a} and \mathbf{b} are non-zero, non-parallel vectors, then vector of magnitude λ normal to the plane \mathbf{a} and \mathbf{b} is

$$= \pm \lambda \left(\frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|} \right)$$

EXAMPLE 7. Find the area of the parallelogram determined by the vectors $\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ and $-3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$.

a. $\sqrt{33}$ sq units

b. $2\sqrt{33}$ sq units

c. $\sqrt{22}$ sq units

d. $6\sqrt{5}$ sq units

Sol. **d.** Since, the vector area of the parallelogram determined by two vectors is their cross-product.

So, vector area of the parallelogram

$$\begin{aligned} &= (\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) \times (-3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) \\ &= \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & -2 & 3 \\ -3 & -2 & 1 \end{vmatrix} = 4\hat{\mathbf{i}} - 10\hat{\mathbf{j}} - 8\hat{\mathbf{k}} \end{aligned}$$

$$\therefore \text{Area of the parallelogram} = |4\hat{\mathbf{i}} - 10\hat{\mathbf{j}} - 8\hat{\mathbf{k}}|$$

$$= \sqrt{4^2 + (-10)^2 + (-8)^2} = \sqrt{180} = 6\sqrt{5} \text{ sq units}$$

Scalar Triple Product

If $\mathbf{a} = a_1\hat{\mathbf{i}} + a_2\hat{\mathbf{j}} + a_3\hat{\mathbf{k}}$, $\mathbf{b} = b_1\hat{\mathbf{i}} + b_2\hat{\mathbf{j}} + b_3\hat{\mathbf{k}}$ and $\mathbf{c} = c_1\hat{\mathbf{i}} + c_2\hat{\mathbf{j}} + c_3\hat{\mathbf{k}}$, then their scalar triple product is defined as

$$\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = [\mathbf{a} \mathbf{b} \mathbf{c}]$$

Geometrically, this represents the volume of the parallelepiped, whose edges are along \mathbf{a} , \mathbf{b} and \mathbf{c} .

Properties of Scalar Triple Product

(i) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = (\mathbf{b} \times \mathbf{c}) \cdot \mathbf{a}$

$$\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}$$

(ii) $[\mathbf{a} \mathbf{b} \mathbf{c}] = [\mathbf{b} \mathbf{c} \mathbf{a}] = [\mathbf{c} \mathbf{a} \mathbf{b}]$

$$\text{and } [\mathbf{a} \mathbf{b} \mathbf{c}] = -[\mathbf{b} \mathbf{a} \mathbf{c}]$$

$$= -[\mathbf{c} \mathbf{b} \mathbf{a}]$$

$$= -[\mathbf{a} \mathbf{c} \mathbf{b}]$$

(iii) The scalar triple product of three vectors is zero, if any two of them are equal.

(iv) The scalar triple product of three vectors is zero, if two of them are parallel or collinear.

(v) Three non-zero vectors \mathbf{a} , \mathbf{b} and \mathbf{c} are coplanar, iff $[\mathbf{a} \mathbf{b} \mathbf{c}] = 0$.

Vector Triple Product

If \mathbf{a} , \mathbf{b} and \mathbf{c} are three vector quantities, then $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$, represents the vector triple product and is given by

$$\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{c}$$

$\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is coplanar with \mathbf{b} and \mathbf{c} and perpendicular to \mathbf{a} .

Properties of Vector Triple Product

(i) Vector triple product is a vector quantity.

(ii) $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) \neq (\mathbf{a} \times \mathbf{b}) \times \mathbf{c}$, i.e. Vector triple product is not associative.

(iii) The vector triple product $\mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is a linear combination of those two vectors which are within brackets.

(iv) The vector $\mathbf{r} = \mathbf{a} \times (\mathbf{b} \times \mathbf{c})$ is perpendicular to \mathbf{a} and lies in the plane of \mathbf{b} and \mathbf{c} .

(v) The formula $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = \{(\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{c}\}$ is true only when the vector outside the bracket is on the left most side. If it is not, we first shift on left by using the properties of cross product and then apply the same formula. Thus,

$$(\mathbf{b} \times \mathbf{c}) \times \mathbf{a} = -\{\mathbf{a} \times (\mathbf{b} \times \mathbf{c})\}$$

$$= -\{(\mathbf{a} \cdot \mathbf{c}) \mathbf{b} - (\mathbf{a} \cdot \mathbf{b}) \mathbf{c}\}$$

$$= (\mathbf{a} \cdot \mathbf{b}) \mathbf{c} - (\mathbf{a} \cdot \mathbf{c}) \mathbf{b}$$

> PRACTICE EXERCISE

- If position vectors of four points A, B, C and D are $\hat{i} + \hat{j} + \hat{k}$, $2\hat{i} + 3\hat{j}$, $3\hat{i} + 5\hat{j} - 2\hat{k}$ and $\hat{k} - \hat{j}$ respectively, then \overline{AB} and \overline{CD} are related as
 (a) perpendicular (b) parallel
 (c) independent (d) None of these
- If $(3\mathbf{a} - \mathbf{b}) \times (\mathbf{a} + 3\mathbf{b}) = k\mathbf{a} \times \mathbf{b}$, then what is the value of k ?
 (a) 10 (b) 5 (c) 8 (d) -8
- Point A is $a + 2b$, P is a and P divides AB in the ratio 2 : 3. The position vector of B is
 (a) $2a - b$ (b) $b - 2a$ (c) $a - 3b$ (d) b
- If $\mathbf{a} + \mathbf{b} + \mathbf{c} = p\mathbf{d}$, $\mathbf{b} + \mathbf{c} + \mathbf{d} = q\mathbf{a}$ and $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are non-coplanar, then $\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d}$ is equal to
 (a) 0 (b) $p\mathbf{a}$ (c) $q\mathbf{b}$ (d) $(p + q)\mathbf{c}$
- If \mathbf{a} is a non-zero vector of modulus a and λ is a non-zero scalar and $\hat{\mathbf{a}}$ is a unit vector, then
 (a) $\lambda = \pm 1$ (b) $\mathbf{a} = |\lambda|\hat{\mathbf{a}}$ (c) $\hat{\mathbf{a}} = \frac{1}{|\lambda|}\mathbf{a}$ (d) $\mathbf{a} = \frac{1}{\lambda}\hat{\mathbf{a}}$
- If \mathbf{a} and \mathbf{b} represent the sides \overline{AB} and \overline{BC} of a regular hexagon $ABCDEF$, then \overline{FA} is equal to
 (a) $\mathbf{b} - \mathbf{a}$ (b) $\mathbf{a} - \mathbf{b}$ (c) $\mathbf{a} + \mathbf{b}$ (d) None of these
- If two concurrent forces be represented by $n\overline{OP}$ and $m\overline{OQ}$ respectively, then their resultant is given by $(m + n)\overline{OR}$, where R is such that
 (a) $m : n = \overline{RQ} : \overline{PR}$ (b) $m : n = \overline{PR} : \overline{RQ}$
 (c) R is mid-point of \overline{PQ} (d) None of these
- In a $\triangle ABC$, D, E, F are the mid-points of the sides BC, CA and AB , respectively, the vector \overline{AD} is equal to
 (a) $\overline{BE} + \overline{CF}$ (b) $\overline{BE} - \overline{CF}$ (c) $\overline{CF} - \overline{BE}$ (d) $-\overline{BE} - \overline{CF}$
- If G is the centroid of a $\triangle ABC$, then $\overline{GA} + \overline{GB} + \overline{GC}$ is equal to
 (a) 0 (b) $3\overline{GA}$ (c) $3\overline{GB}$ (d) $3\overline{GC}$
- The area of parallelogram whose adjacent sides are $\mathbf{a} = \hat{i} + 2\hat{j} + 3\hat{k}$, $\mathbf{b} = 3\hat{i} - 2\hat{j} + \hat{k}$ is
 (a) $5\sqrt{2}$ (b) $8\sqrt{3}$ (c) 6 (d) None of these
- If \mathbf{a}, \mathbf{b} and \mathbf{c} are three mutually perpendicular vectors of equal magnitude, then the angle θ which $\mathbf{a} + \mathbf{b} + \mathbf{c}$ makes with any one of three given vectors is given by
 (a) $\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (b) $\cos^{-1}\left(\frac{1}{3}\right)$
 (c) $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$ (d) None of these
- If $|\mathbf{a}| = 3$, $|\mathbf{b}| = 4$ and $|\mathbf{c}| = 5$ such that each is perpendicular to sum of the other two, then $|\mathbf{a} + \mathbf{b} + \mathbf{c}|$ is
 (a) $5\sqrt{2}$ (b) $\frac{5}{\sqrt{2}}$ (c) $10\sqrt{2}$ (d) $5\sqrt{3}$
- If \mathbf{a}, \mathbf{b} and \mathbf{c} be non-zero vectors, then which of the following statements is correct?
 (a) $\mathbf{a} \times (\mathbf{b} - \mathbf{c}) = (\mathbf{c} - \mathbf{b}) \times \mathbf{a}$ (b) $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = -(\mathbf{b} + \mathbf{c}) \cdot \mathbf{a}$
 (c) $\mathbf{a} \times (\mathbf{b} + \mathbf{c}) = (\mathbf{c} + \mathbf{b}) \times \mathbf{a}$ (d) $\mathbf{a} \cdot (\mathbf{b} - \mathbf{c}) = (\mathbf{c} - \mathbf{b}) \cdot \mathbf{a}$
- If θ is the angle between vectors \mathbf{a} and \mathbf{b} and $|\mathbf{a} \times \mathbf{b}| = |\mathbf{a} \cdot \mathbf{b}|$, then θ is equal to
 (a) 0 (b) 180° (c) 135° (d) 60°
- If \mathbf{a} be any vector, then $|\mathbf{a} \times \hat{i}|^2 + |\mathbf{a} \times \hat{j}|^2 + |\mathbf{a} \times \hat{k}|^2$ is equal to
 (a) \mathbf{a}^2 (b) $2\mathbf{a}^2$ (c) $3\mathbf{a}^2$ (d) 0
- If $\mathbf{a} = \hat{i} + \hat{j} + p\hat{k}$ and $\mathbf{b} = \hat{i} + \hat{j} + \hat{k}$, then $|\mathbf{a} + \mathbf{b}| = |\mathbf{a}| + |\mathbf{b}|$, holds for
 (a) all real p (b) no real p (c) $p = -1$ (d) $p = 1$
- If \mathbf{a} and \mathbf{b} are unit vectors and θ is the angle between them, then $\sin \frac{\theta}{2}$ is equal to
 (a) $\frac{|\mathbf{a} - \mathbf{b}|}{2}$ (b) $\frac{|\mathbf{a} + \mathbf{b}|}{2}$ (c) $\frac{|\mathbf{a}| - |\mathbf{b}|}{2}$ (d) $\frac{|\mathbf{a}| + |\mathbf{b}|}{2}$
- Four points with position vectors $\mathbf{A} = 7\hat{i} - 4\hat{j} + 7\hat{k}$, $\mathbf{B} = \hat{i} - 6\hat{j} + 10\hat{k}$, $\mathbf{C} = -\hat{i} - 3\hat{j} + 4\hat{k}$ and $\mathbf{D} = 5\hat{i} - \hat{j} + \hat{k}$ form a
 (a) rhombus
 (b) parallelogram but not rhombus
 (c) rectangle (d) square
- If $\hat{\mathbf{a}}, \hat{\mathbf{b}}, \hat{\mathbf{c}}$ are non-coplanar unit vectors such that $\hat{\mathbf{a}} \times (\hat{\mathbf{b}} + \hat{\mathbf{c}}) = \frac{\hat{\mathbf{b}} + \hat{\mathbf{c}}}{\sqrt{2}}$, $\hat{\mathbf{b}}$ and $\hat{\mathbf{c}}$ are non-parallel, then the angle between $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ is
 (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$ (c) $\frac{2\pi}{3}$ (d) $\frac{3\pi}{4}$
- If $\mathbf{u} = \mathbf{a} - \mathbf{b}$, $\mathbf{v} = \mathbf{a} + \mathbf{b}$ and $|\mathbf{a}| = |\mathbf{b}| = 2$, then $|\mathbf{u} \times \mathbf{v}|$ is equal to
 (a) $2\sqrt{16 - (\mathbf{a} \cdot \mathbf{b})^2}$ (b) $2\sqrt{4 - (\mathbf{a} \cdot \mathbf{b})^2}$
 (c) $\sqrt{16 - (\mathbf{a} \cdot \mathbf{b})^2}$ (d) $\sqrt{4 - (\mathbf{a} \cdot \mathbf{b})^2}$
- Let \mathbf{a}, \mathbf{b} and \mathbf{c} be unit vectors such that $\mathbf{a} \cdot \mathbf{b} = 0 = \mathbf{a} \cdot \mathbf{c}$. If the angle between \mathbf{b} and \mathbf{c} is $\pi/6$, then \mathbf{a} equals to
 (a) $\pm 2(\mathbf{b} \times \mathbf{c})$ (b) $2(\mathbf{b} \times \mathbf{c})$
 (c) $\pm \frac{1}{2}(\mathbf{b} \times \mathbf{c})$ (d) $-\frac{1}{2}(\mathbf{b} \times \mathbf{c})$

- 22.** If \mathbf{c} is the unit vector perpendicular to both the vector \mathbf{a} and \mathbf{b} , then what is another unit vector perpendicular to both the vectors \mathbf{a} and \mathbf{b} ?
 (a) $\mathbf{c} \times \mathbf{a}$ (b) $\mathbf{c} \times \mathbf{d}$ (c) $-\frac{(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$ (d) $\frac{(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$
- 23.** For what value of m are the vector $2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$, $\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $m\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ are coplanar?
 (a) 0 (b) 5/3 (c) 1 (d) 8/5
- 24.** What is the projection of the vector $\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ on the vector $4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$?
 (a) $\sqrt{5}/2$ (b) 19/9 (c) $\sqrt{5}/4$ (d) 11/3
- 25.** If the vector \mathbf{a} lies in the plane of vectors \mathbf{b} and \mathbf{c} , then which one of the following is correct?
 (a) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 0$ (b) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 1$
 (c) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = -1$ (d) $\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 3$
- 26.** If p, q, r and s are respectively the magnitudes of the vectors $3\hat{\mathbf{i}} - 2\hat{\mathbf{j}}$, $2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$, $4\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$. Then, which one of the following is correct?
 (a) $r > s > q > p$ (b) $s > r > p > q$
 (c) $r > s > p > q$ (d) $s > r > q > p$
- 27.** If the position vector of a point P with respect to the origin O is $\hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ and that of a point Q is $3\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$, then what is the position vector of the bisector of the $\angle POQ$?
 (a) $\hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}}$ (b) $\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$
 (c) $\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$ (d) None of these
- 28.** Let a, b and c be the distinct non-negative numbers. If the vectors $a\hat{\mathbf{i}} + a\hat{\mathbf{j}} + c\hat{\mathbf{k}}$, $\hat{\mathbf{i}} + \hat{\mathbf{k}}$, $c\hat{\mathbf{i}} + c\hat{\mathbf{j}} + b\hat{\mathbf{k}}$ lie on a plane, then which one of the following is correct?
 (a) c is the arithmetic mean of a and b
 (b) c is the geometric mean of a and b
 (c) c is the harmonic mean of a and b
 (d) c is equal to zero
- 29.** $ABCD$ is a quadrilateral. Forces \mathbf{AB} , \mathbf{CB} , \mathbf{CD} and \mathbf{DA} act along its sides. What is their resultant?
 (a) $2\mathbf{CD}$ (b) $2\mathbf{DA}$ (c) $2\mathbf{BC}$ (d) $2\mathbf{CB}$
- 30.** What is the area of a triangle, whose vertices are at $(3, -1, 2)$, $(1, -1, -3)$ and $(4, -3, 1)$?
 (a) $\frac{\sqrt{165}}{2}$ sq units (b) $\frac{\sqrt{135}}{2}$ sq units
 (c) 4 sq units (d) 2 sq units
- 31.** If $(\mathbf{a} + \mathbf{b})$ is perpendicular to \mathbf{b} and $\mathbf{a} \cdot (\mathbf{a} + 2\mathbf{a}) = 0$ then
 (a) $2a = b$ (b) $a = 2\sqrt{b}$
 (c) $a = 2b$ (d) $a = b$
- 32.** If P, Q, R are the mid-points of the sides AB, BC, CA respectively of a $\triangle ABC$ and $\mathbf{a}, \mathbf{p}, \mathbf{q}$ are the position vector of A, P, Q respectively, then what is the position vector of R ?
 (a) $2\mathbf{a} - (\mathbf{p} - \mathbf{q})$ (b) $(\mathbf{p} - \mathbf{q}) - 2\mathbf{a}$
 (c) $\mathbf{a} - (\mathbf{p} - \mathbf{q})$ (d) $\frac{\mathbf{a}}{2} - \frac{(\mathbf{p} - \mathbf{q})}{2}$
- 33.** If $\mathbf{a} = 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$, then what is $(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b})$ is equal to?
 (a) $2(\mathbf{a} \times \mathbf{b})$ (b) $-2(\mathbf{a} \times \mathbf{b})$ (c) $(\mathbf{a} \times \mathbf{b})$ (d) $-(\mathbf{a} \times \mathbf{b})$
- 34.** Two vectors $2\hat{\mathbf{i}} + m\hat{\mathbf{j}} - 3n\hat{\mathbf{k}}$ and $5\hat{\mathbf{i}} + 3m\hat{\mathbf{j}} + n\hat{\mathbf{k}}$ are such that their magnitudes are respectively $\sqrt{14}$ and $\sqrt{35}$, where m and n are integers. Which one of the following is correct?
 (a) m takes 1 value, n takes 1 value
 (b) m takes 1 value, n takes 2 values
 (c) m takes 2 values, n takes 1 value
 (d) m takes 2 values, n takes 2 values
- 35.** A unit vector \mathbf{a} is making angle $\pi/3$ with $\hat{\mathbf{i}}$, $\pi/4$ with $\hat{\mathbf{j}}$ and an acute angle θ with $\hat{\mathbf{k}}$.
 I. The value of θ is $\pi/3$.
 II. The components of \mathbf{a} are $\frac{1}{2}, \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}$.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 36.** The line joining two points $P(2\mathbf{a} + \mathbf{b})$ and $Q(\mathbf{a} - 3\mathbf{b})$ externally in the ratio 1 : 2.
 I. The position vector of point R which divides the given line is $(3\mathbf{a} + 5\mathbf{b})$.
 II. P is the mid-point of the line-segment RQ .
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 37.** For any two vectors \mathbf{a} and \mathbf{b} , consider the following statements
 I. $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}| \Leftrightarrow \mathbf{a}, \mathbf{b}$ are orthogonal.
 II. $|\mathbf{a} + \mathbf{b}| = |\mathbf{a}| + |\mathbf{b}| \Leftrightarrow \mathbf{a}, \mathbf{b}$ are orthogonal
 III. $|\mathbf{a} + \mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2 \Leftrightarrow \mathbf{a}, \mathbf{b}$ are orthogonal.
 Which of the above statement(s) is/are correct?
 (a) I and II (b) I and III (c) II and III (d) I, II and III
- Directions** (Q.Nos. 38-39) Consider the regular hexagon $ABCDEF$ with centre at O (origin).
- 38.** $\mathbf{AD} + \mathbf{EB} + \mathbf{FC}$ is equal to
 (a) $2\mathbf{AB}$ (b) $3\mathbf{AB}$ (c) $4\mathbf{AB}$ (d) None of these
- 39.** Five forces $\mathbf{AB}, \mathbf{AC}, \mathbf{AD}, \mathbf{AE}, \mathbf{AF}$ act at the vertex A of a regular hexagon $ABCDEF$. Then, the resultant is
 (a) $3\mathbf{AO}$ (b) $2\mathbf{AO}$ (c) $4\mathbf{AO}$ (d) $6\mathbf{AO}$

Directions (Q. Nos. 40-42) $ABCD$ is a parallelogram. L is a point on BC which divides BC in the ratio 1:2. AL intersects BD at P . M is a point on DC which divides DC in the ratio 1:2 and AM intersects BD in Q .

- 40.** Point P divides AL in the ratio
 (a) 1:2 (b) 1:3 (c) 3:1 (d) 2:1
- 41.** Point Q divides DB in the ratio
 (a) 1:2 (b) 1:3 (c) 3:1 (d) 2:1
- 42.** $PQ : DB$ is equal to
 (a) $2/3$ (b) $1/3$ (c) $1/2$ (d) $3/4$

Directions (Q. Nos. 43-45) Consider four points P, Q, R and S with their position vectors $-(\hat{j} + \hat{k}), 4\hat{i} + 5\hat{j} + \lambda\hat{k}, 3\hat{i} + 9\hat{j} + 4\hat{k}$ and $-4\hat{i} + 4\hat{j} + 4\hat{k}$, respectively.

- 43.** Find RS .
 (a) $7\hat{i} + 5\hat{k}$ (b) $7\hat{i} + 5\hat{j}$ (c) $5\hat{i} - 7\hat{k}$ (d) $-7\hat{i} - 5\hat{j}$
- 44.** If $|PQ| = |QR|$, then λ is equal to
 (a) 1 (b) -1 (c) 2 (d) -2
- 45.** If P, Q, R and S are coplanar, then λ is equal to
 (a) 0 (b) 1 (c) -1 (d) $1/2$

> PREVIOUS YEARS' QUESTIONS

- 46.** If $|\mathbf{a}| = 10, |\mathbf{b}| = 2$ and $\mathbf{a} \cdot \mathbf{b} = 12$, then what is the value of $|\mathbf{a} \times \mathbf{b}|$? ☑ 2012 I
 (a) 12 (b) 16 (c) 20 (d) 24
- 47.** What is the area of the rectangle having vertices A, B, C and D with position vectors $-\hat{i} + \frac{1}{2}\hat{j} + 4\hat{k}, \hat{i} + \frac{1}{2}\hat{j} + 4\hat{k}, \hat{i} - \frac{1}{2}\hat{j} + 4\hat{k}$ and $-\hat{i} - \frac{1}{2}\hat{j} + 4\hat{k}$? ☑ 2012 I
 (a) $1/2$ sq unit (b) 1 sq unit (c) 2 sq units (d) 4 sq units
- 48.** If the vectors $\hat{i} - x\hat{j} - y\hat{k}$ and $\hat{i} + x\hat{j} + y\hat{k}$ are orthogonal to each other, then what is the locus of the point (x, y) ? ☑ 2012 I
 (a) A parabola (b) An ellipse
 (c) A circle (d) A straight line
- 49.** What is the value of m , if the vectors $2\hat{i} - \hat{j} + \hat{k}, \hat{i} + 2\hat{j} - 3\hat{k}$ and $3\hat{i} + m\hat{j} + 5\hat{k}$ are coplanar? ☑ 2012 I
 (a) -2 (b) 2 (c) -4 (d) 4
- 50.** If the magnitudes of two vectors \mathbf{a} and \mathbf{b} are equal, then which one of the following is correct? ☑ 2012 I
 (a) $(\mathbf{a} + \mathbf{b})$ is parallel to $(\mathbf{a} - \mathbf{b})$
 (b) $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b}) = 1$
 (c) $(\mathbf{a} + \mathbf{b})$ is perpendicular to $(\mathbf{a} - \mathbf{b})$
 (d) None of the above

- 51.** If $\mathbf{a} = (2, 1, -1), \mathbf{b} = (1, -1, 0), \mathbf{c} = (5, -1, 1)$, then what is the unit vector parallel to $\mathbf{a} + \mathbf{b} - \mathbf{c}$ in the opposite direction? ☑ 2012 I
 (a) $\frac{\hat{i} + \hat{j} - 2\hat{k}}{3}$ (b) $\frac{\hat{i} - 2\hat{j} + 2\hat{k}}{3}$
 (c) $\frac{2\hat{i} - \hat{j} + 2\hat{k}}{3}$ (d) None of these
- 52.** Let $ABCD$ is a parallelogram. If $\mathbf{AB} = \mathbf{a}$ and $\mathbf{BC} = \mathbf{b}$, then what is \mathbf{BD} equal to? ☑ 2012 I
 (a) $\mathbf{a} + \mathbf{b}$ (b) $\mathbf{a} - \mathbf{b}$ (c) $-\mathbf{a} - \mathbf{b}$ (d) $-\mathbf{a} + \mathbf{b}$
- 53.** The vector $2\hat{j} - \hat{k}$ lies ☑ 2012 II
 (a) in the plane of XY (b) in the plane of YZ
 (c) in the plane of XZ (d) along the X -axis
- 54.** The vector $\mathbf{a} \times (\mathbf{b} \times \mathbf{a})$ is coplanar with ☑ 2012 II
 (a) Only \mathbf{a} (b) Only \mathbf{b}
 (c) Both \mathbf{a} and \mathbf{b} (d) Neither \mathbf{a} nor \mathbf{b}
- 55.** If $\mathbf{a} \cdot \mathbf{b} = 0$ and $\mathbf{a} \times \mathbf{b} = 0$, then which one of the following is correct? ☑ 2012 II
 (a) \mathbf{a} is parallel to \mathbf{b} (b) \mathbf{a} is perpendicular to \mathbf{b}
 (c) $\mathbf{a} = 0$ or $\mathbf{b} = 0$ (d) None of these
- 56.** The magnitude of the scalar p for which the vector $p(-3\hat{i} - 2\hat{j} + 13\hat{k})$ is of unit length is ☑ 2012 II
 (a) $1/8$ (b) $1/64$ (c) $\sqrt{182}$ (d) $1/\sqrt{182}$
- 57.** What is the value of λ for which $(\lambda\hat{i} + \hat{j} - \hat{k}) \times (3\hat{i} - 2\hat{j} + 4\hat{k}) = (2\hat{i} - 11\hat{j} - 7\hat{k})$? ☑ 2012 II
 (a) 2 (b) -2 (c) 1 (d) 7
- 58.** Consider the following ☑ 2012 II
 I. $4\hat{i} \times 3\hat{i} = 0$ II. $\frac{4\hat{i}}{3\hat{i}} = \frac{4}{3}$
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 59.** If θ is the angle between the vectors $4(\hat{i} - \hat{k})$ and $\hat{i} + \hat{j} + \hat{k}$, then what is $(\sin\theta + \cos\theta)$ equal to? ☑ 2013 I
 (a) 0 (b) $1/2$ (c) 1 (d) 2
- 60.** Which one of the following vectors is normal to the vector $\hat{i} + \hat{j} + \hat{k}$? ☑ 2013 I
 (a) $\hat{i} + \hat{j} - \hat{k}$ (b) $\hat{i} - \hat{j} + \hat{k}$ (c) $\hat{i} - \hat{j} - \hat{k}$ (d) None of these
- 61.** If $|\mathbf{a}| = \sqrt{2}, |\mathbf{b}| = \sqrt{3}$ and $|\mathbf{a} + \mathbf{b}| = \sqrt{6}$, then what is $|\mathbf{a} - \mathbf{b}|$ equal to? ☑ 2013 I
 (a) 1 (b) 2 (c) 3 (d) 4
- 62.** If the magnitude of $\mathbf{a} \times \mathbf{b}$ equals to $\mathbf{a} \cdot \mathbf{b}$, then which one of the following is correct? ☑ 2013 I
 (a) $\mathbf{a} = \mathbf{b}$
 (b) The angle between \mathbf{a} and \mathbf{b} is 45°
 (c) \mathbf{a} is parallel to \mathbf{b}
 (d) \mathbf{a} is perpendicular to \mathbf{b}

- 63.** For any vector α , what is $(\alpha \cdot \hat{i})\hat{i} + (\alpha \cdot \hat{j})\hat{j} + (\alpha \cdot \hat{k})\hat{k}$ equal to? ☑ 2013 I
 (a) α (b) 3α (c) $-\alpha$ (d) 0
- 64.** If β is perpendicular to both α and γ , where $\alpha = \hat{k}$ and $\gamma = 2\hat{i} + 3\hat{j} + 4\hat{k}$, then what is β equal to? ☑ 2013 I
 (a) $3\hat{i} + 2\hat{j}$ (b) $-3\hat{i} + 2\hat{j}$ (c) $2\hat{i} - 3\hat{j}$ (d) $-2\hat{i} + 3\hat{j}$
- 65.** What is the vector perpendicular to both the vectors $\hat{i} - \hat{j}$ and \hat{i} ? ☑ 2013 II
 (a) \hat{i} (b) $-\hat{j}$ (c) \hat{j} (d) \hat{k}
- 66.** What is the value of p for which the vector $p(2\hat{i} - \hat{j} + 2\hat{k})$ is of 3 units length? ☑ 2013 II
 (a) 1 (b) 2 (c) 3 (d) 6
- 67.** If $\mathbf{a} = 2\hat{i} + 2\hat{j} + 3\hat{k}$, $\mathbf{b} = -\hat{i} + 2\hat{j} + \hat{k}$ and $\mathbf{c} = 3\hat{i} + \hat{j}$ are three vectors such that $\mathbf{a} + t\mathbf{b}$ is perpendicular to \mathbf{c} , then what is t equal to? ☑ 2013 II
 (a) 8 (b) 6 (c) 4 (d) 2
- 68.** The vectors $\hat{i} - 2x\hat{j} - 3y\hat{k}$ and $\hat{i} + 3x\hat{j} + 2y\hat{k}$ are orthogonal to each other. Then, the locus of the point (x, y) is ☑ 2013 II
 (a) hyperbola (b) ellipse (c) parabola (d) circle
- 69.** The position vectors of the points **A** and **B** are respectively, $3\hat{i} - 5\hat{j} + 2\hat{k}$ and $\hat{i} + \hat{j} - \hat{k}$. What is the length of **AB**? ☑ 2013 II
 (a) 11 (b) 9 (c) 7 (d) 6
- 70.** If the angle between the vectors $\mathbf{i} - m\mathbf{j}$ and $\mathbf{j} + \mathbf{k}$ is $\frac{\pi}{3}$, then what is the value of m ? ☑ 2013 II
 (a) 0 (b) 2 (c) -2 (d) None of these

Directions (Q. Nos. 71-72) Consider the vectors $\mathbf{a} = \hat{i} - 2\hat{j} + \hat{k}$ and $\mathbf{b} = 4\hat{i} - 4\hat{j} + 7\hat{k}$. ☑ 2014 I

- 71.** What is the scalar projection of \mathbf{a} on \mathbf{b} ?
 (a) 1 (b) 19/9 (c) 17/9 (d) 23/9
- 72.** What is the vector perpendicular to both the vectors?
 (a) $-10\hat{i} - 3\hat{j} + 4\hat{k}$ (b) $-10\hat{i} + 3\hat{j} + 4\hat{k}$
 (c) $10\hat{i} - 3\hat{j} + 4\hat{k}$ (d) None of these

Directions (Q. Nos. 73-74) Let a vector \mathbf{r} make angles 60° , 30° with X and Y -axes, respectively. ☑ 2014 I

- 73.** What angle does \mathbf{r} make the Z -axis?
 (a) 30° (b) 60° (c) 90° (d) 120°
- 74.** What are the direction cosines of \mathbf{r} ?
 (a) $\langle \frac{1}{2}, \frac{\sqrt{3}}{2}, 0 \rangle$ (b) $\langle \frac{1}{2}, -\frac{\sqrt{3}}{2}, 0 \rangle$
 (c) $\langle \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0 \rangle$ (d) $\langle -\frac{1}{2}, \frac{\sqrt{3}}{2}, 0 \rangle$

Directions (Q. Nos. 75-76) Let $|\mathbf{a}| = 7$, $|\mathbf{b}| = 11$ and $|\mathbf{a} + \mathbf{b}| = 10\sqrt{3}$. ☑ 2014 I

- 75.** What is $|\mathbf{a} - \mathbf{b}|$ equal to?
 (a) $2\sqrt{2}$ (b) $2\sqrt{10}$ (c) 5 (d) 10
- 76.** What is the angle between $(\mathbf{a} + \mathbf{b})$ and $(\mathbf{a} - \mathbf{b})$?
 (a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{6}$ (d) None of these
- 77.** What is the area of $\triangle OAB$, where O is the origin, $\mathbf{OA} = 3\hat{i} - \hat{j} + \hat{k}$ and $\mathbf{OB} = 2\hat{i} + \hat{j} - 3\hat{k}$? ☑ 2014 II
 (a) $5\sqrt{6}$ sq units (b) $\frac{5\sqrt{6}}{2}$ sq units
 (c) $\sqrt{6}$ sq units (d) $\sqrt{30}$ sq units
- 78.** Which one of the following is the unit vector perpendicular to both $\mathbf{a} = -\hat{i} + \hat{j} + \hat{k}$ and $\mathbf{b} = \hat{i} - \hat{j} + \hat{k}$? ☑ 2014 II
 (a) $\pm \frac{\hat{i} + \hat{j}}{\sqrt{2}}$ (b) \hat{k} (c) $\frac{\hat{j} + \hat{k}}{\sqrt{2}}$ (d) $\frac{\hat{i} - \hat{j}}{\sqrt{2}}$
- 79.** What is the interior acute angle of the parallelogram whose sides are represented by the vectors $\frac{1}{\sqrt{2}}\hat{i} + \frac{1}{\sqrt{2}}\hat{j} + \hat{k}$ and $\frac{1}{\sqrt{2}}\hat{i} - \frac{1}{\sqrt{2}}\hat{j} + \hat{k}$? ☑ 2014 II
 (a) 60° (b) 45° (c) 30° (d) 15°
- 80.** For what value of λ are the vectors $\lambda\hat{i} + (1 + \lambda)\hat{j} + (1 + 2\lambda)\hat{k}$ and $(1 - \lambda)\hat{i} + \lambda\hat{j} + 2\hat{k}$ perpendicular? ☑ 2014 II
 (a) $-\frac{1}{3}$ (b) $\frac{1}{3}$ (c) $\frac{2}{3}$ (d) 1
- 81.** If $|\mathbf{a}| = 2$, $|\mathbf{b}| = 5$ and $|\mathbf{a} \times \mathbf{b}| = 8$, then what is $\mathbf{a} \cdot \mathbf{b}$ equal to? ☑ 2014 II
 (a) 6 (b) 7 (c) 8 (d) 9
- 82.** If $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$, then which one of the following is correct? ☑ 2014 II
 (a) $|\mathbf{a}| = |\mathbf{b}|$ (b) \mathbf{a} is parallel to \mathbf{b}
 (c) \mathbf{a} is perpendicular to \mathbf{b} (d) $\hat{\mathbf{a}}$ is a unit vector

Directions (Q. Nos. 83-86) Read the following information carefully and answer these question given below.

$\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ such that $|\mathbf{a}| = 3$, $|\mathbf{b}| = 5$ and $|\mathbf{c}| = 7$. ☑ 2014 II

- 83.** What is the angle between \mathbf{a} and \mathbf{b} ?
 (a) $\frac{\pi}{6}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{2}$
- 84.** What is $\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}$ equal to?
 (a) -83 (b) $-\frac{83}{2}$ (c) 75 (d) $-\frac{75}{2}$
- 85.** What is cosine of the angle between \mathbf{b} and \mathbf{c} ?
 (a) $\frac{11}{12}$ (b) $\frac{13}{14}$ (c) $-\frac{11}{12}$ (d) $-\frac{13}{14}$
- 86.** What is $|\mathbf{a} + \mathbf{b}|$ equal to?

- (a) 7 (b) 8 (c) 10 (d) 11
- 87.** If $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$, then which one of the following is correct? ☑ 2015 I
 (a) $\mathbf{a} = \lambda\mathbf{b}$ for some scalar λ (b) \mathbf{a} is parallel to \mathbf{b}
 (c) \mathbf{a} is perpendicular to \mathbf{b} (d) $\mathbf{a} = \mathbf{b} = 0$
- 88.** Let α, β and γ be distinct real numbers. The points with position vectors $\alpha\hat{i} + \beta\hat{j} + \gamma\hat{k}$, $\beta\hat{i} + \gamma\hat{j} + \alpha\hat{k}$ and $\gamma\hat{i} + \alpha\hat{j} + \beta\hat{k}$ ☑ 2015 I
 (a) are collinear
 (b) form an equilateral triangle
 (c) form a scalene triangle
 (d) form a right-angled triangle
- 89.** The adjacent sides AB and AC of a ΔABC are represented by the vectors $-2\hat{i} + 3\hat{j} + 2\hat{k}$ and $-4\hat{i} + 5\hat{j} + 2\hat{k}$, respectively. The area of the ΔABC is ☑ 2015 I
 (a) 6 sq units (b) 5 sq units (c) 4 sq units (d) 3 sq units
- 90.** Given that the vector α and β are non-collinear. The values of x and y for which $\mathbf{u} - \mathbf{v} = \mathbf{w}$ holds true, if $\mathbf{u} = 2x\alpha + y\beta$, $\mathbf{v} = 2y\alpha + 3x\beta$ and $\mathbf{w} = 2\alpha - 5\beta$, are ☑ 2015 I
 (a) $x = 2, y = 1$ (b) $x = 1, y = 2$
 (c) $x = -2, y = 1$ (d) $x = -2, y = -1$
- 91.** A force $\mathbf{F} = 3\hat{i} + 4\hat{j} - 3\hat{k}$ is applied at the point P , whose position vector is $\mathbf{r} = 2\hat{i} - 2\hat{j} - 3\hat{k}$. What is the magnitude of the moment of the force about the origin? ☑ 2015 I
 (a) 23 units (b) 19 units (c) 18 units (d) 21 units
- 92.** If $|\mathbf{a}| = 7, |\mathbf{b}| = 11$ and $|\mathbf{a} + \mathbf{b}| = 10\sqrt{3}$, then $|\mathbf{a} - \mathbf{b}|$ is equal to ☑ 2015 I
 (a) 40 (b) 10 (c) $4\sqrt{10}$ (d) $2\sqrt{10}$
- 93.** If $\mathbf{a} + \mathbf{b} + \mathbf{c} = 0$, then which of the following is/are correct?
 I. $\mathbf{a}, \mathbf{b}, \mathbf{c}$ are coplanar. II. $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$.
 Select the correct answer using the code given below. ☑ 2015 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 94.** The area of the square, one of whose diagonals is $3\hat{i} + 4\hat{j}$, is ☑ 2015 II
 (a) 12 sq units (b) 12.5 sq units
 (c) 25 sq units (d) 156.25 sq units
- 95.** $ABCD$ is a parallelogram and P is the point of intersection of the diagonals. If O is the origin, then $OA + OB + OC + OD$ is equal to ☑ 2015 II
 (a) $4OP$ (b) $2OP$ (c) OP (d) Null vector
- 96.** If \mathbf{b} and \mathbf{c} are the position vectors of the points B and C respectively, then the position vector of the point D such that $\mathbf{BD} = 4\mathbf{BC}$, is ☑ 2015 II
 (a) $4(\mathbf{c} - \mathbf{b})$ (b) $-4(\mathbf{c} - \mathbf{b})$ (c) $4\mathbf{c} - 3\mathbf{b}$ (d) $4\mathbf{c} + 3\mathbf{b}$

- 97.** If the position vector \mathbf{a} of the point $(5, n)$ is such that $|\mathbf{a}| = 13$, then the value(s) of n can be ☑ 2015 II
 (a) ± 8 (b) ± 12 (c) Only 8 (d) Only 12
- 98.** If $|\mathbf{a}| = 2$ and $|\mathbf{b}| = 3$, then $|\mathbf{a} \times \mathbf{b}|^2 + |\mathbf{a} \cdot \mathbf{b}|^2$ is equal to ☑ 2015 II
 (a) 72 (b) 64 (c) 48 (d) 36
- 99.** If the magnitude of difference of two unit vectors is $\sqrt{3}$, then the magnitude of sum of the two vectors is ☑ 2015 II
 (a) $1/2$ unit (b) 1 unit (c) 2 units (d) 3 units
- 100.** If the vectors $\alpha\hat{i} + \alpha\hat{j} + \gamma\hat{k}, \hat{i} + \hat{k}$ and $\gamma\hat{i} + \gamma\hat{j} + \beta\hat{k}$ lie on a plane, where α, β and γ are distinct non-negative numbers, then γ is ☑ 2015 II
 (a) arithmetic mean of α and β
 (b) geometric mean of α and β
 (c) harmonic mean of α and β
 (d) None of the above
- 101.** Consider the following inequalities in respect of vectors \mathbf{a} and \mathbf{b} .
 I. $|\mathbf{a} + \mathbf{b}| \leq |\mathbf{a}| + |\mathbf{b}|$ II. $|\mathbf{a} - \mathbf{b}| \geq |\mathbf{a}| - |\mathbf{b}|$
 Which of the above is/are correct? ☑ 2015 II
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 102.** The vectors $\mathbf{a}, \mathbf{b}, \mathbf{c}$ and \mathbf{d} are such that $\mathbf{a} \times \mathbf{b} = \mathbf{c} \times \mathbf{d}$ and $\mathbf{a} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$. Which of the following is/are correct?
 I. $(\mathbf{a} - \mathbf{d}) \times (\mathbf{b} - \mathbf{c}) = 0$ II. $(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) = 0$
 Select the correct answer using the code given below. ☑ 2015 II
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 103.** What is a vector of unit length orthogonal to both the vectors $\hat{i} + \hat{j} + \hat{k}$ and $2\hat{i} + 3\hat{j} - \hat{k}$? ☑ 2016 I
 (a) $\frac{-4\hat{i} + 3\hat{j} - \hat{k}}{\sqrt{26}}$ (b) $\frac{-4\hat{i} + 3\hat{j} + \hat{k}}{\sqrt{26}}$
 (c) $\frac{-3\hat{i} + 2\hat{j} - \hat{k}}{\sqrt{14}}$ (d) $\frac{-3\hat{i} + 2\hat{j} + \hat{k}}{\sqrt{14}}$

Directions (Q. Nos. 104-105) Let $\hat{\mathbf{a}}, \hat{\mathbf{b}}$ be two unit vectors and θ be the angle between them. ☑ 2016 I

- 104.** What is $\cos\left(\frac{\theta}{2}\right)$ equal to?
 (a) $\frac{|\hat{\mathbf{a}} - \hat{\mathbf{b}}|}{2}$ (b) $\frac{|\hat{\mathbf{a}} + \hat{\mathbf{b}}|}{2}$ (c) $\frac{|\hat{\mathbf{a}} - \hat{\mathbf{b}}|}{4}$ (d) $\frac{|\hat{\mathbf{a}} + \hat{\mathbf{b}}|}{4}$
- 105.** What is $\sin\left(\frac{\theta}{2}\right)$ equal to?
 (a) $\frac{|\hat{\mathbf{a}} - \hat{\mathbf{b}}|}{2}$ (b) $\frac{|\hat{\mathbf{a}} + \hat{\mathbf{b}}|}{2}$ (c) $\frac{|\hat{\mathbf{a}} - \hat{\mathbf{b}}|}{4}$ (d) $\frac{|\hat{\mathbf{a}} + \hat{\mathbf{b}}|}{4}$

> **HINTS AND SOLUTIONS**

- (b) $\mathbf{AB} = \hat{i} + 2\hat{j} - \hat{k}$
 $\mathbf{CD} = -3(\hat{i} + 2\hat{j} - \hat{k}) = -3\mathbf{AB}$
 Therefore, AB and CD are parallel.
- (a) $(3\mathbf{a} - \mathbf{b}) \times (\mathbf{a} + 3\mathbf{b})$
 $= 3\mathbf{a} \times \mathbf{a} - \mathbf{b} \times \mathbf{a} + 3\mathbf{a} \times 3\mathbf{b} - \mathbf{b} \times 3\mathbf{b}$
 $= 0 - (-\mathbf{a} \times \mathbf{b}) + 9\mathbf{a} \times \mathbf{b} - 0 = 10\mathbf{a} \times \mathbf{b}$
 $\therefore k = 10$ (on comparing with RHS)
- (c) Let x be the position vector of B, then P divides AB in the ratio 2:3.
 $\mathbf{a} = \frac{2x + 3(\mathbf{a} + 2\mathbf{b})}{2 + 3} \Rightarrow x = \mathbf{a} - 3\mathbf{b}$
- (a) On putting the value of \mathbf{d} from the given relations, we have
 $\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d} = \mathbf{a} + \mathbf{b} + \mathbf{c} + (q\mathbf{a} - \mathbf{b} - \mathbf{c})$... (i)
 $= (\mathbf{a} + \mathbf{b} + \mathbf{c}) + \frac{1}{p}(\mathbf{a} + \mathbf{b} + \mathbf{c})$... (ii)
 $\therefore (1 + q)\mathbf{a} + 0\mathbf{b} + 0\mathbf{c} = \left(1 + \frac{1}{p}\right)(\mathbf{a} + \mathbf{b} + \mathbf{c})$
 Since, \mathbf{a} , \mathbf{b} and \mathbf{c} are non-coplanar, we have on comparing the coefficients
 $1 + q = 1 + \frac{1}{p}$ and $1 + \frac{1}{p} = 0$
 $\therefore p = -1$ and $q = -1$
 On putting for p in Eq. (ii) or q in Eq. (i), we get $\mathbf{a} + \mathbf{b} + \mathbf{c} + \mathbf{d} = 0$
- (c) Since, $\lambda \mathbf{a}$ is a unit vector.
 $\therefore |\lambda \mathbf{a}| = 1$
 $\Rightarrow |\lambda| |\mathbf{a}| = 1$
 $\Rightarrow \mathbf{a} = \frac{1}{|\lambda|}$

- (b) $\mathbf{AC} = \mathbf{AB} + \mathbf{BC} = \mathbf{a} + \mathbf{b}$
 $\mathbf{AD} = 2\mathbf{BC} = 2\mathbf{b}$
 $\therefore \mathbf{FA} = \mathbf{DC} = \mathbf{AC} - \mathbf{AD} = \mathbf{a} + \mathbf{b} - 2\mathbf{b} = \mathbf{a} - \mathbf{b}$
- (b) We have, $\mathbf{OP} = \mathbf{OR} + \mathbf{RP}$... (i)
 and $\mathbf{OQ} = \mathbf{OR} + \mathbf{RQ}$... (ii)
 On multiply Eq. (i) by n and Eq. (ii) by m and add, we get the result as given, i.e. $(m + n)\mathbf{OR}$.
 If $n\mathbf{RP} + m\mathbf{RQ} = 0$
 or $-n\mathbf{PR} + m\mathbf{PQ} = 0$
 or $m : n = \mathbf{PR} : \mathbf{RQ}$
- (d) $\mathbf{AD} = 3\mathbf{GD} = 3 \cdot \frac{1}{2}(\mathbf{GB} + \mathbf{GC})$

- (a) Let the position vectors of the vertices be \mathbf{a} , \mathbf{b} and \mathbf{c} respectively, so that the position vector of G the centroid, is $\frac{\mathbf{a} + \mathbf{b} + \mathbf{c}}{3}$

- $\therefore \mathbf{GA} = \text{PV of } A - \text{PV of } G$
 $= \mathbf{a} - \frac{\mathbf{a} + \mathbf{b} + \mathbf{c}}{3} = \frac{2\mathbf{a} - \mathbf{b} - \mathbf{c}}{3}$
 Similarly, $\mathbf{GB} = \frac{2\mathbf{b} - \mathbf{c} - \mathbf{a}}{3}$
 $\mathbf{GC} = \frac{3\mathbf{c} - \mathbf{a} - \mathbf{b}}{3}$
 $\therefore \mathbf{GA} + \mathbf{GB} + \mathbf{GC} = \frac{1}{3}(2\mathbf{a} - 2\mathbf{b} - 2\mathbf{c}) = 0$
- (b) Area = $|\mathbf{a} \times \mathbf{b}| = |8(\hat{i} + \hat{j} - \hat{k})| = 8\sqrt{3}$
- (a) Let $|\mathbf{a}| = |\mathbf{b}| = |\mathbf{c}| = \lambda$
 and $\mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{a} = 0$
 $\therefore (\mathbf{a} + \mathbf{b} + \mathbf{c})^2 = 3\lambda^2$
 $\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}| = \lambda\sqrt{3}$
 Now, $(\mathbf{a} + \mathbf{b} + \mathbf{c}) \cdot \mathbf{a} = \lambda\sqrt{3} \cdot \lambda \cos \theta_1$
 or $\lambda^2 + 0 + 0 = \lambda^2 \sqrt{3} \cos \theta_1$
 $\therefore \cos \theta_1 = \frac{1}{\sqrt{3}} = \cos \theta_2 = \cos \theta_3$
 $\Rightarrow Q_1 = Q_2 = Q_3 = \cos^{-1} \left(\frac{1}{\sqrt{3}} \right)$
- (a) $\mathbf{a} \cdot (\mathbf{b} + \mathbf{c}) = 0$, $\mathbf{b} \cdot (\mathbf{c} + \mathbf{a}) = 0$,
 $\mathbf{c} \cdot (\mathbf{a} + \mathbf{b}) = 0$
 $\therefore 2 \Sigma \mathbf{a} \cdot \mathbf{b} = 0$
 Now, $(\mathbf{a} + \mathbf{b} + \mathbf{c})^2 = \Sigma \mathbf{a}^2 + 2 \Sigma \mathbf{a} \cdot \mathbf{b}$
 $= 9 + 16 + 25 + 0 = 50$
 $\Rightarrow |\mathbf{a} + \mathbf{b} + \mathbf{c}| = 5\sqrt{2}$
- (a)
- (c) $|ab \sin \theta \hat{n}| = |ab \cos \theta|$
 $\therefore ab \sin \theta = ab |\cos \theta|$
 $\Rightarrow \sin \theta = \pm \cos \theta$
 $\Rightarrow \tan \theta = \pm 1 \Rightarrow \theta = 45^\circ, 135^\circ$
- (b) Let $\mathbf{a} = (p\hat{i} + q\hat{j} + r\hat{k})$ then
 $\mathbf{a} \times \hat{\mathbf{j}} = q\hat{k} \times \hat{i} + r\hat{k} \times \hat{i} = r\hat{j} - q\hat{k}$

$$\begin{aligned} \therefore |\mathbf{a} \times \hat{\mathbf{i}}|^2 &= r^2 + q^2 \\ \therefore \text{LHS} &= p^2 + q^2 + q^2 + r^2 + r^2 + p^2 \\ &= 2(p^2 + q^2 + r^2) = 2|\mathbf{a}|^2 = 2a^2 \end{aligned}$$

16. (d) $\sqrt{\{4+4+(p+1)^2\}} = \sqrt{(p^2+2)} + \sqrt{3}$
 On squaring both sides, we get

$$p^2 + 2p + 9 = p^2 + 2 + 3 + 2\sqrt{3} \sqrt{(p^2+2)}$$

$$\therefore 2(p+2) = 2\sqrt{3} \sqrt{(p^2+2)}$$

Again, on squaring both sides, we get

$$p^2 + 4p + 4 = 3p^2 + 6 \Rightarrow p = 1$$

17. (a) $|\mathbf{a}|^2 = 1, |\mathbf{b}|^2 = 1, \mathbf{a} \cdot \mathbf{b} = \cos \theta$

$$\sin^2 \frac{\theta}{2} = \frac{1 - \cos \theta}{2} = \frac{2 - 2 \cos \theta}{4}$$

$$= \frac{|\mathbf{a}|^2 + |\mathbf{b}|^2 - 2(\mathbf{a} \cdot \mathbf{b})}{4} = \left| \frac{\mathbf{a} - \mathbf{b}}{2} \right|^2$$

$$\therefore \sin \frac{\theta}{2} = \frac{|\mathbf{a} - \mathbf{b}|}{2}$$

18. (a) $\mathbf{AB} = \text{PV of } B - \text{PV of } A = -6, -2, 3$
 $\mathbf{BC} = -2, 3, -6, \mathbf{CD} = 6, 2, -3, \mathbf{DA} = 2, -3, 6$
 All the vectors have same modulus

$$= \sqrt{36 + 4 + 9} = 7$$

Hence, the points enclose either a square or a rhombus.
 But $\mathbf{AB} \cdot \mathbf{BC} = 12 - 6 - 18 = -12 \neq 0$
 Hence, AB is not perpendicular to BC .

19. (d) Given $(\mathbf{a} \cdot \mathbf{b})\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\mathbf{c} = \frac{\mathbf{b} + \mathbf{c}}{\sqrt{2}}$
 On comparing the coefficients of \mathbf{b} and \mathbf{c} on both sides, we get

$$\mathbf{a} \cdot \mathbf{c} = \frac{1}{\sqrt{2}} \text{ and } \mathbf{a} \cdot \mathbf{b} = -\frac{1}{\sqrt{2}}$$

 Let θ be the angle between \mathbf{a} and \mathbf{b} .

$$\therefore \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta = -\frac{1}{\sqrt{2}}$$

$$\Rightarrow \cos \theta = -\frac{1}{\sqrt{2}} [\because |\mathbf{a}| = |\mathbf{b}| = 1]$$

$$\Rightarrow \theta = \frac{3\pi}{4}$$

20. (a) $\mathbf{u} \times \mathbf{v} = 2(\mathbf{a} \times \mathbf{b})$

$$\therefore |\mathbf{u} \times \mathbf{v}| = 2 \sqrt{a^2 b^2 \sin^2 \theta}$$

$$= 2 \sqrt{a^2 b^2 (1 - \cos^2 \theta)}$$

$$= 2 \sqrt{a^2 b^2 - (\mathbf{a} \cdot \mathbf{b})^2}$$

$$= 2 \sqrt{16 - (\mathbf{a} \cdot \mathbf{b})^2}$$

21. (a) \mathbf{a} is perpendicular to both \mathbf{b} and \mathbf{c} and hence it is parallel to $\mathbf{b} \times \mathbf{c}$.

$$\therefore \mathbf{a} = t(\mathbf{b} \times \mathbf{c})$$

 On squaring both sides, we get all are unit vectors.

$$1 = t^2 (1 \cdot 1 \sin 30^\circ)^2 \cdot 1 = t^2 \cdot \frac{1}{4}$$

$$\therefore t = \pm 2$$

Now, $\mathbf{a} = \pm 2(\mathbf{b} \times \mathbf{c})$
 22. (c) If \mathbf{c} is perpendicular to both vectors \mathbf{a} and \mathbf{b} .

Then, $\mathbf{c} = \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$ in the vertical upper direction and the other perpendicular unit vector \mathbf{c} on both \mathbf{a} and \mathbf{b} is

$$\mathbf{c} = -\frac{(\mathbf{a} \times \mathbf{b})}{|\mathbf{a} \times \mathbf{b}|}$$

which is vertically below direction.

23. (d) Let the vectors $\mathbf{a} = 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$, $\mathbf{b} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} - \hat{\mathbf{k}}$ and $\mathbf{c} = m\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$ are coplanar, then $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0$

$$\begin{vmatrix} 2 & -3 & 4 \\ 1 & 2 & -1 \\ m & -1 & 2 \end{vmatrix} = 0$$

$$\Rightarrow 2(4-1) + 3(2+m) + 4(-1-2m) = 0$$

$$\Rightarrow -5m + 8 = 0 \Rightarrow m = \frac{8}{5}$$

24. (b) Let $\mathbf{a} = 4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$ and $\mathbf{b} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$
 Now, the projection of \mathbf{b} on $\mathbf{a} = \frac{\mathbf{b} \cdot \mathbf{a}}{|\mathbf{a}|}$

$$= \frac{(\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot (4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}})}{\sqrt{16 + 16 + 49}}$$

$$= \frac{4 + 8 + 7}{\sqrt{81}} = \frac{19}{9}$$

25. (a) Since, the vector \mathbf{a} lies in the plane of vectors \mathbf{b} and \mathbf{c} , i.e. these vectors are coplanar.

$$[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = 0 \Rightarrow \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c}) = 0$$

26. (c) Given p, q, r and s are the magnitude of vectors $3\hat{\mathbf{i}} - 2\hat{\mathbf{j}}$, $2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$, $4\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$, $2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$, respectively.

$$\Rightarrow p = |3\hat{\mathbf{i}} - 2\hat{\mathbf{j}}| = \sqrt{9 + 4} = \sqrt{13} = 3.61$$

$$\Rightarrow q = |2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}| = \sqrt{4 + 4 + 1} = 3 = 3.00$$

$$\Rightarrow r = |4\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{j}}| = \sqrt{16 + 1 + 1} = 3\sqrt{2} = 4.24$$

$$\Rightarrow s = |2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}| = \sqrt{4 + 4 + 9} = \sqrt{17} = 4.12$$

$$\therefore r > s > p > q$$

27. (b) $\because \mathbf{OP} = \hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ and $\mathbf{OQ} = 3\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$

Let $\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ be required position vector of the bisector of the $\angle \text{POQ}$. It will make equal angles with \mathbf{OP} and \mathbf{OQ} .

$$\therefore \text{Angle between } \hat{\mathbf{i}} + 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}} \text{ and } \hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}},$$

$$\theta = \cos^{-1} \left(\frac{1 + 3 + 2}{\sqrt{1 + 9 + 4} \sqrt{1 + 1 + 1}} \right)$$

$$= \cos^{-1} \left(\frac{6}{\sqrt{14} \sqrt{3}} \right)$$

 and angle between $3\hat{\mathbf{i}} + \hat{\mathbf{j}} - 2\hat{\mathbf{k}}$ and $\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$,

$$\phi = \cos^{-1} \left(\frac{1 + 3 + 2}{\sqrt{9 + 1 + 4} \sqrt{1 + 1 + 1}} \right)$$

$$= \cos^{-1} \left(\frac{6}{\sqrt{14} \sqrt{3}} \right)$$

Hence, $\theta = \phi$

28. (b) Since, vectors $a\hat{\mathbf{i}} + a\hat{\mathbf{j}} + c\hat{\mathbf{k}}$, $\hat{\mathbf{i}} + \hat{\mathbf{k}}$ and $c\hat{\mathbf{i}} + c\hat{\mathbf{j}} + b\hat{\mathbf{k}}$ are coplanar.

$$\therefore \begin{vmatrix} a & a & c \\ 1 & 0 & 1 \\ c & c & b \end{vmatrix} = 0$$

$$\Rightarrow 1(ab - c^2) + 1(ac - ac) = 0$$

$$\Rightarrow ab - c^2 = 0$$

So, c is the geometric mean of a and b .

29. (d) In $DACD$,

Now, in $\triangle ABC$,

$$\mathbf{CA} + \mathbf{AB} = \mathbf{CB} \quad \dots \text{(ii)}$$

From Eqs. (i) and (ii),

$$\mathbf{CD} + \mathbf{DA} + \mathbf{AB} = \mathbf{CB}$$

$$\Rightarrow \mathbf{CB} + \mathbf{CD} + \mathbf{DA} + \mathbf{AB} = 2\mathbf{CB}$$

30. (a) Let the vertices of the $\triangle ABC$ be $A(3, -1, 2)$, $B(1, -1, -3)$ and $C(4, -3, 1)$.

$$\therefore \text{Area of } \triangle ABC$$

$$= \frac{1}{2} \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1-3 & -1+1 & -3-2 \\ 4-3 & -3+1 & 1-2 \end{vmatrix}$$

$$= \frac{1}{2} \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ -2 & 0 & -5 \\ 1 & -2 & -1 \end{vmatrix}$$

$$= \frac{1}{2} | \hat{\mathbf{i}}(-10) - \hat{\mathbf{j}}(7) + \hat{\mathbf{k}}(4) |$$

$$= \frac{1}{2} \sqrt{100 + 49 + 16}$$

$$= \frac{1}{2} \sqrt{165} \text{ sq units}$$

31. (b) Given, $(\mathbf{a} + \mathbf{b})$ is perpendicular to \mathbf{b}

$$\begin{aligned} \therefore (\mathbf{a} + \mathbf{b}) \cdot \mathbf{b} &= 0 \\ \Rightarrow \mathbf{a} \cdot \mathbf{b} + b^2 &= 0 \\ \Rightarrow \mathbf{a} \cdot \mathbf{b} &= -b^2 \end{aligned}$$

Also, $\mathbf{a}(\mathbf{a} + 2\mathbf{b}) = 0$
 $\Rightarrow a^2 + 2\mathbf{a} \cdot \mathbf{b} = 0 \Rightarrow \mathbf{a} \cdot \mathbf{b} = -\frac{a^2}{2}$

$$\therefore b^2 = \frac{1}{2}a^2 \Rightarrow a^2 = 2b^2 \Rightarrow a = \sqrt{2}b$$

32. (c) Let the position vectors of B, C and R are \mathbf{b} , \mathbf{c} and \mathbf{r} , respectively.

$$\begin{aligned} \therefore \mathbf{p} &= \frac{\mathbf{a} + \mathbf{b}}{2} \Rightarrow \mathbf{b} = 2\mathbf{p} - \mathbf{a} \quad \dots(i) \\ \mathbf{q} &= \frac{\mathbf{b} + \mathbf{c}}{2} \Rightarrow \mathbf{c} = 2\mathbf{q} - \mathbf{b} \\ \Rightarrow \mathbf{c} &= 2\mathbf{q} - (2\mathbf{p} - \mathbf{a}) \quad [\text{from Eq. (i)}] \\ &= 2\mathbf{q} - 2\mathbf{p} + \mathbf{a} \quad \dots(ii) \end{aligned}$$

and $\mathbf{r} = \frac{\mathbf{a} + \mathbf{c}}{2} = \frac{\mathbf{a} + 2\mathbf{q} - 2\mathbf{p} + \mathbf{a}}{2}$
 $= \mathbf{q} - \mathbf{p} + \mathbf{a} = \mathbf{a} - (\mathbf{p} - \mathbf{q})$

33. (b) $\therefore \mathbf{a} + \mathbf{b} = (2\hat{i} - 3\hat{j} - \hat{k}) + (\hat{i} + 4\hat{j} - 2\hat{k}) = 3\hat{i} + \hat{j} - 3\hat{k}$
 and $\mathbf{a} - \mathbf{b} = (2\hat{i} - 3\hat{j} - \hat{k}) - (\hat{i} + 4\hat{j} - 2\hat{k}) = \hat{i} - 7\hat{j} + \hat{k}$

$$\begin{aligned} \therefore (\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b}) &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & 1 & -3 \\ 1 & -7 & 1 \end{vmatrix} \\ &= \hat{i} \begin{vmatrix} 1 & -3 \\ -7 & 1 \end{vmatrix} - \hat{j} \begin{vmatrix} 3 & -3 \\ 1 & 1 \end{vmatrix} + \hat{k} \begin{vmatrix} 3 & 1 \\ 1 & -7 \end{vmatrix} \\ &= \hat{i}(1 - 21) - \hat{j}(3 + 3) + \hat{k}(-21 - 1) \\ &= -20\hat{i} - 6\hat{j} - 22\hat{k} \\ &= -2(10\hat{i} + 3\hat{j} + 11\hat{k}) \end{aligned}$$

Now, $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -3 & -1 \\ 1 & 4 & -2 \end{vmatrix}$

$$\begin{aligned} &= \hat{i} \begin{vmatrix} -3 & -1 \\ 4 & -2 \end{vmatrix} - \hat{j} \begin{vmatrix} 2 & -1 \\ 1 & -2 \end{vmatrix} + \hat{k} \begin{vmatrix} 2 & -3 \\ 1 & 4 \end{vmatrix} \\ &= \hat{i}(6 + 4) - \hat{j}(-4 + 1) + \hat{k}(8 + 3) \\ &= 10\hat{i} + 3\hat{j} + 11\hat{k} \end{aligned}$$

Hence, $(\mathbf{a} + \mathbf{b}) \times (\mathbf{a} - \mathbf{b}) = -2(\mathbf{a} \times \mathbf{b})$

34. (d) $\because |2\hat{i} + m\hat{j} - 3n\hat{k}| = \sqrt{14} \quad \dots(i)$
 $\Rightarrow 4 + m^2 + 9n^2 = 14$
 $\Rightarrow m^2 + 9n^2 = 10 \quad \dots(iii)$
 $|5\hat{i} + 3m\hat{j} + n\hat{k}| = \sqrt{35}$
 $\Rightarrow 9m^2 + n^2 = 10 \quad \dots(iv)$

From Eqs. (iii) and (iv),
 $m^2 + 9n^2 = 9m^2 + n^2 \Rightarrow n = \pm m$

From given options it is clear that the values given in option (d) satisfy the Eqs. (iii) and (iv).

35. (a) Suppose \mathbf{a} vector makes angles α, β and γ with \hat{i}, \hat{j} and \hat{k} respectively, then
 $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$
 $\Rightarrow \cos^2 \frac{\pi}{3} + \cos^2 \frac{\pi}{4} + \cos^2 \theta = 1$
 $\Rightarrow \cos^2 \theta = 1 - \frac{3}{4} \Rightarrow \cos \theta = \pm \frac{1}{2}$
 $\Rightarrow \theta = \cos^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{3}$

Hence, Statement I is true.

Components of \mathbf{a} are

$$\cos \frac{\pi}{3}, \cos \frac{\pi}{4}, \cos \frac{\pi}{3} \Rightarrow \frac{1}{2}, \frac{1}{\sqrt{2}}, \frac{1}{2}$$

Hence, Statement II is false.

36. (c) It is given that

$$\mathbf{OP} = 2\mathbf{a} + \mathbf{b}, \mathbf{OQ} = \mathbf{a} - 3\mathbf{b}$$

If a point divides the line joining point P and Q externally in the ratio $m : n$, then position vector of the point R is

$$\begin{aligned} \mathbf{R} &= \frac{(\mathbf{a} - 3\mathbf{b}) \times 1 - (2\mathbf{a} + \mathbf{b}) \times 2}{1 - 2} \\ &= \frac{\mathbf{a} - 3\mathbf{b} - 4\mathbf{a} - 2\mathbf{b}}{-1} = 3\mathbf{a} + 5\mathbf{b} \end{aligned}$$

Now, position vector of mid-point of RQ

$$\begin{aligned} &= \frac{\mathbf{OQ} + \mathbf{OR}}{2} = \frac{(3\mathbf{a} + 5\mathbf{b}) + (\mathbf{a} - 3\mathbf{b})}{2} \\ &= \frac{4\mathbf{a} + 2\mathbf{b}}{2} = 2\mathbf{a} + \mathbf{b} \end{aligned}$$

The position vector of point P = $2\mathbf{a} + \mathbf{b}$ which shows that P is mid-point of line segment RQ.

Hence, both statements are true.

37. (b) I. $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$

On squaring both sides, we get

$$\begin{aligned} |\mathbf{a} + \mathbf{b}|^2 &= |\mathbf{a} - \mathbf{b}|^2 \\ \Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}|^2 + |\mathbf{b}|^2 - 2\mathbf{a} \cdot \mathbf{b} \\ \Rightarrow 4\mathbf{a} \cdot \mathbf{b} &= 0 \Rightarrow \mathbf{a} \cdot \mathbf{b} = 0 \end{aligned}$$

Hence, \mathbf{a} and \mathbf{b} are orthogonal to each other.

II. $|\mathbf{a} + \mathbf{b}| = |\mathbf{a}| + |\mathbf{b}|$

On squaring both sides, we get

$$\begin{aligned} |\mathbf{a} + \mathbf{b}|^2 &= (|\mathbf{a}| + |\mathbf{b}|)^2 \\ \Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2|\mathbf{a}||\mathbf{b}| \\ \Rightarrow 2|\mathbf{a}||\mathbf{b}|\cos \theta &= 2|\mathbf{a}||\mathbf{b}| \\ \Rightarrow \cos \theta &= 1 = \cos 0 \Rightarrow \theta = 0 \end{aligned}$$

Hence, \mathbf{a} and \mathbf{b} are parallel to each other.

III. $|\mathbf{a} + \mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2$
 $\Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}|^2 + |\mathbf{b}|^2$
 $\Rightarrow \mathbf{a} \cdot \mathbf{b} = 0$

Hence, \mathbf{a} and \mathbf{b} are orthogonal to each other.

Hence, Statements I and III are correct statements.

38. (c) Consider the regular hexagon ABCDEF with centre at O (origin).

$$\begin{aligned} \mathbf{AD} + \mathbf{EB} + \mathbf{FC} &= 2\mathbf{AO} + 2\mathbf{OB} + 2\mathbf{OC} \\ &= 2(\mathbf{AO} + \mathbf{OB}) + 2\mathbf{OC} \\ &= 2\mathbf{AB} + 2\mathbf{AB} \quad [\because \mathbf{OC} = \mathbf{AB}] \\ &= 4\mathbf{AB} \end{aligned}$$

39. (d) $\mathbf{R} = \mathbf{AB} + \mathbf{AC} + \mathbf{AD} + \mathbf{AE} + \mathbf{AF}$
 $= \mathbf{ED} + \mathbf{AC} + \mathbf{AD} + \mathbf{AE} + \mathbf{CD}$
 $[\because \mathbf{AB} = \mathbf{ED} \text{ and } \mathbf{AF} = \mathbf{CD}]$
 $= (\mathbf{AC} + \mathbf{CD}) + (\mathbf{AE} + \mathbf{ED}) + \mathbf{AD}$
 $= \mathbf{AD} + \mathbf{AD} + \mathbf{AD} = 3\mathbf{AD} = 6\mathbf{AO}$

Sol. (Q. Nos. 40-42)

$$\mathbf{BL} = \frac{1}{3}\mathbf{b}, \quad \mathbf{AL} = \mathbf{a} + \frac{1}{3}\mathbf{b}$$

Let $\mathbf{AP} = \lambda\mathbf{AL}$ and P divides DB in the ratio $\mu : (1 - \mu)$. Then,

$$\mathbf{AP} = \lambda\mathbf{a} + \frac{\lambda}{3}\mathbf{b} \quad \dots(i)$$

Also, $\mathbf{AP} = \mu\mathbf{a} + (1 - \mu)\mathbf{b} \quad \dots(ii)$

From Eqs. (i) and (ii),

$$\lambda\mathbf{a} + \frac{\lambda}{3}\mathbf{b} = \mu\mathbf{a} + (1 - \mu)\mathbf{b}$$

$$\therefore \lambda = \mu \text{ and } \frac{\lambda}{3} = 1 - \mu \Rightarrow \lambda = \frac{3}{4}$$

Hence, P divides AL in the ratio 3:1 and P divides DB in the ratio 3:1 similarly, Q divides DB in the ratio 1:3.

Thus, $DQ = \frac{1}{4}DB$ and $PB = \frac{1}{4}DB$.

$\therefore PQ = \frac{1}{2}DB$, i.e. $PQ : DB = 1 : 2$

40. (c) 41. (b) 42. (c)

Sol. (Q. Nos. 43-45)

We have, $P(-\hat{j} - \hat{k})$, $Q(4\hat{i} + 5\hat{j} + \lambda\hat{k})$, $R(3\hat{i} + 9\hat{j} + 4\hat{k})$ and $S(-4\hat{i} + 4\hat{j} + 4\hat{k})$.

Then, $PQ = 4\hat{i} + 6\hat{j} + (\lambda + 1)\hat{k}$... (i)

$QR = -\hat{i} + 4\hat{j} + (4 - \lambda)\hat{k}$... (ii)

$RS = -7\hat{i} - 5\hat{j} + 0\hat{k}$... (iii)

43. (d) From Eq. (iii), $RS = -7\hat{i} - 5\hat{j}$

44. (d) $|PQ| = |QR|$

$$\begin{aligned} \therefore \sqrt{4^2 + 6^2 + (\lambda + 1)^2} &= \sqrt{(-1)^2 + 4^2 + (4 - \lambda)^2} \\ \Rightarrow 16 + 36 + \lambda^2 + 1 + 2\lambda &= 1 + 16 + 16 + \lambda^2 - 8\lambda \\ \Rightarrow 20 = -10\lambda \Rightarrow \lambda = -2 \end{aligned}$$

45. (b) If P, Q, R and S are coplanar, then PQ, QR and RS are also coplanar.

So, $[PQ \ QR \ RS] = 0$

$$\begin{vmatrix} 4 & 6 & \lambda + 1 \\ -1 & 4 & 4 - \lambda \\ -7 & -5 & 0 \end{vmatrix} = 0 \Rightarrow \lambda = 1$$

46. (b) Given that, $|a| = 10, |b| = 2$ and $a \cdot b = 12$

$$\begin{aligned} \Rightarrow |a| |b| \cos \theta &= 12 \\ \Rightarrow 10 \cdot 2 \cdot \cos \theta &= 12 \\ \Rightarrow \cos \theta &= 3/5 \quad \dots (i) \\ \sin \theta &= \sqrt{1 - \cos^2 \theta} = \sqrt{1 - 9/25} = 4/5 \end{aligned}$$

Now, $|a \times b| = |a| |b| \sin \theta$
 $= |a| |b| |\sin \theta| = 10 \cdot 2 \cdot 1 \cdot |\sin \theta|$
 $= 10 \cdot 2 \cdot 1 \cdot 4/5 = 20 \times \frac{4}{5} = 4 \times 4 = 16$

47. (c) Let the position vectors of the vertices of a rectangle A, B, C and D are

$OA = -\hat{i} + \frac{\hat{j}}{2} + 4\hat{k}$, $OB = \hat{i} + \frac{\hat{j}}{2} + 4\hat{k}$

$OC = \hat{i} - \frac{\hat{j}}{2} + 4\hat{k}$, $OD = -\hat{i} - \frac{\hat{j}}{2} + 4\hat{k}$

Now, $AB = OB - OA = (\hat{i} + \frac{\hat{j}}{2} + 4\hat{k}) - (-\hat{i} + \frac{\hat{j}}{2} + 4\hat{k}) = 2\hat{i}$

$BC = OC - OB = (\hat{i} - \frac{\hat{j}}{2} + 4\hat{k}) - (\hat{i} + \frac{\hat{j}}{2} + 4\hat{k}) = -\hat{j}$

\therefore Area of rectangle $= |AB| \cdot |BC|$

$= (2\hat{i}) \cdot |(-\hat{j})| = 2 \cdot 1 \cdot 1 = 2$ sq units

48. (c) Since, the vectors $\hat{i} - x\hat{j} - y\hat{k}$ and $(\hat{i} + x\hat{j} + y\hat{k})$ are orthogonal to each other, then

$$\begin{aligned} (\hat{i} - x\hat{j} - y\hat{k}) \cdot (\hat{i} + x\hat{j} + y\hat{k}) &= 0 \\ \Rightarrow 1 - x^2 - y^2 &= 0 \\ \Rightarrow x^2 + y^2 &= 1 \end{aligned}$$

which represent a circle with centre at origin and having radius is 1.

49. (c) We know that, if three vectors a, b and c are coplanar, then $[a \ b \ c] = 0$

Let $a = 2\hat{i} - \hat{j} + \hat{k}$, $b = \hat{i} + 2\hat{j} - 3\hat{k}$ and $c = 3\hat{i} + m\hat{j} + 5\hat{k}$

Then, $[a \ b \ c] = \begin{vmatrix} 2 & -1 & 1 \\ 1 & 2 & -3 \\ 3 & m & 5 \end{vmatrix} = 0$

$\Rightarrow 2(10 + 3m) + 1(5 + 9) + 1(m - 6) = 0$
 $\Rightarrow 7m + 28 = 0 \Rightarrow m = -4$

50. (c) Given that, $|a| = |b|$... (i)

Now, $(a + b) \cdot (a - b)$
 $= a \cdot a + b \cdot a - a \cdot b - b \cdot b$
 $= 1 + a \cdot b - a \cdot b - 1 = 0 \neq 1$

i.e. $(a + b)$ is perpendicular to $(a - b)$.

51. (c) Given, $a = (2, 1, -1)$,

$b = (1, -1, 0)$ and $c = (5, -1, 1)$

Now, $a + b - c = (2 + 1 - 5, 1 - 1 + 1, -1 + 0 - 1)$
 $= (-2, 1, -2) = d$ [say]

\therefore Unit vector $(\hat{d}) = \frac{d}{|d|}$
 $= \frac{(-2, 1, -2)}{\sqrt{(-2)^2 + (1)^2 + (-2)^2}}$
 $= \frac{(-2, 1, -2)}{\sqrt{4 + 1 + 4}} = \frac{1}{3}(-2, 1, -2)$

But in opposite direction $d = -d$

$= \frac{1}{3}(2, -1, 2) = \frac{2\hat{i} - \hat{j} + 2\hat{k}}{3}$

52. (d) Since, opposite sides of parallelogram are same

$\therefore AB = a \Rightarrow CD = -a$
 and $BD = b \Rightarrow DA = -b$

Applying addition formula in $\triangle BCD$,

$BD = BC + CD = b - a = -a + b$

53. (b)

54. (c) Given that, $a \times (b \times a)$

which is the vector triple product
 $= (a \cdot a) b - (a \cdot b) a = \lambda b - \mu a$
 where, λ and μ are scalar quantity.
 Hence, $a \times (b \times a)$ is coplanar with both a and b .

55. (c) Given that, $a \cdot b = 0$,
 i.e. a and b are perpendicular to each other and $a \times b = 0$
 i.e. a and b are parallel to each other.
 So, both conditions are possible iff $a = 0$ and $b = 0$

56. (d) $\therefore |p(-3\hat{i} - 2\hat{j} + 13\hat{k})| = 1$ [given]

$$\begin{aligned} \Rightarrow \sqrt{(-3p)^2 + (-2p)^2 + (13p)^2} &= 1 \\ \Rightarrow \sqrt{9p^2 + 4p^2 + 169p^2} &= 1 \\ \therefore p &= \frac{1}{\sqrt{182}} \end{aligned}$$

57. (a) Given,

$(\lambda\hat{i} + \hat{j} - \hat{k}) \times (3\hat{i} - 2\hat{j} + 4\hat{k})$
 $= (2\hat{i} - 11\hat{j} - 7\hat{k})$

$\Rightarrow \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \lambda & 1 & -1 \\ 3 & -2 & 4 \end{vmatrix} = (2\hat{i} - 11\hat{j} - 7\hat{k})$

$\Rightarrow 2\hat{i} - (4\lambda + 3)\hat{j} + (-2\lambda - 3)\hat{k}$
 $= 2\hat{i} - 11\hat{j} - 7\hat{k}$

On comparing the coefficient of, we get
 $(4\lambda + 3) = 11 \Rightarrow \lambda = 2$

58. (c) I. $4\hat{i} \times 3\hat{i} = 12(\hat{i} \times \hat{i}) = 12 \times 0 = 0$
 $[\therefore \hat{i} \times \hat{i} = 0]$

II. $\frac{4\hat{i}}{3\hat{i}} = \frac{4}{3}$

divisibility in vectors are not possible.
 Hence, both I and II are true.

59. (c) Let $a = 4\hat{i} - 4\hat{k}$ and $b = \hat{i} + \hat{j} + \hat{k}$
 Let θ be the angle between a and b .

$\therefore \cos \theta = \frac{a \cdot b}{|a| |b|} = \frac{(4\hat{i} - 4\hat{k}) \cdot (\hat{i} + \hat{j} + \hat{k})}{|a| |b|}$
 $= \frac{4 + 0 - 4}{\sqrt{4^2 + 0 + 4^2} \sqrt{1^2 + 1^2 + 1^2}} = 0 \Rightarrow \theta = \cos 90^\circ$

$\therefore \sin \theta + \cos \theta = \sin 90^\circ + \cos 90^\circ = 1$

60. (d) Let $a = \hat{i} + \hat{j} + \hat{k}$

Let any vector normal to a , then dot product of both vector should be zero.

(a) $(\hat{i} + \hat{j} + \hat{k}) \cdot (\hat{i} + \hat{j} - \hat{k})$
 $= 1 + 1 - 1 = 1 \neq 0$

(b) $(\hat{i} + \hat{j} + \hat{k}) \cdot (\hat{i} - \hat{j} + \hat{k})$
 $= 1 - 1 + 1 = 1 \neq 0$

(c) $(\hat{i} + \hat{j} + \hat{k}) \cdot (\hat{i} - \hat{j} - \hat{k})$
 $= 1 - 1 - 1 = -1 \neq 0$

61. (b) Refer to Question 92.

62. (b) Given that,

Magnitude of $(\mathbf{a} \times \mathbf{b})$
 $=$ Magnitude of $(\mathbf{a} \cdot \mathbf{b})$
 $\Rightarrow |\mathbf{a} \times \mathbf{b}| = |\mathbf{a} \cdot \mathbf{b}|$
 $|\mathbf{a}| |\mathbf{b}| |\sin \theta| |\hat{\mathbf{n}}| = |\mathbf{a}| |\mathbf{b}| |\cos \theta|$
 $\left(\begin{array}{l} \because \mathbf{a} \times \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \sin \theta \hat{\mathbf{n}} \\ \text{and } \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos \theta \end{array} \right)$
 $\Rightarrow |\sin \theta| \cdot 1 = |\cos \theta| \quad [\because |\hat{\mathbf{n}}| = 1]$
 $\Rightarrow |\tan \theta| = 1 \Rightarrow \tan \theta = 1 = \tan \frac{\pi}{4}$
 $\therefore \theta = \frac{\pi}{4}$
 So, the angle between \mathbf{a} and \mathbf{b} is $\frac{\pi}{4}$.

63. (a) Let $\alpha = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}$
 Then, $(\alpha \cdot \hat{\mathbf{i}})\hat{\mathbf{i}} + (\alpha \cdot \hat{\mathbf{j}})\hat{\mathbf{j}} + (\alpha \cdot \hat{\mathbf{k}})\hat{\mathbf{k}}$
 $= \{(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot \hat{\mathbf{i}}\}\hat{\mathbf{i}}$
 $+ \{(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot \hat{\mathbf{j}}\}\hat{\mathbf{j}}$
 $+ \{(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot \hat{\mathbf{k}}\}\hat{\mathbf{k}}$
 $= (x)\hat{\mathbf{i}} + (y)\hat{\mathbf{j}} + (z)\hat{\mathbf{k}} = \alpha$

64. (b) Given that, $\alpha = \hat{\mathbf{k}}$
 and $\gamma = 2\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$
 Since, β is perpendicular to both α and γ .
 i.e. $\beta = \pm(\alpha \times \gamma) = \pm \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 0 & 0 & 1 \\ 2 & 3 & 4 \end{vmatrix}$
 $= \pm \hat{\mathbf{i}}(0-3) - \hat{\mathbf{j}}(0-2) + \hat{\mathbf{k}}(0-0)$
 $= \pm(-3\hat{\mathbf{i}} + 2\hat{\mathbf{j}})$

65. (d) The vector perpendicular to both the vectors $(\hat{\mathbf{i}} - \hat{\mathbf{j}})$ and $\hat{\mathbf{i}} = (\hat{\mathbf{i}} - \hat{\mathbf{j}}) \times \hat{\mathbf{i}} = \hat{\mathbf{i}} \times \hat{\mathbf{i}} - \hat{\mathbf{j}} \times \hat{\mathbf{i}} = 0 + \hat{\mathbf{i}} \times \hat{\mathbf{j}} = \hat{\mathbf{k}}$

66. (a) Let $\mathbf{a} = p(2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 Given that, the length of \mathbf{a} is 3 units.
 i.e. $|\mathbf{a}| = 3$
 $\Rightarrow |p(2\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}})| = 3$
 $\Rightarrow \sqrt{4p^2 + p^2 + 4p^2} = 3 \Rightarrow 9p^2 = 9$
 $\Rightarrow p^2 = 1 \Rightarrow p = \pm 1$

67. (a) Given that, $\mathbf{a} = 2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$,
 $\mathbf{b} = -\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{c} = 3\hat{\mathbf{i}} + \hat{\mathbf{j}}$
 Now,
 $\mathbf{a} + t\mathbf{b} = (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) + t(-\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + \hat{\mathbf{k}})$
 $= (2-t)\hat{\mathbf{i}} + (2+2t)\hat{\mathbf{j}} + (3+t)\hat{\mathbf{k}}$
 Since, vectors $(\mathbf{a} + t\mathbf{b})$ and \mathbf{c} are perpendicular to each other.
 $\therefore (\mathbf{a} + t\mathbf{b}) \cdot \mathbf{c} = 0$
 $\Rightarrow \{(2-t)\hat{\mathbf{i}} + (2+2t)\hat{\mathbf{j}} + (3+t)\hat{\mathbf{k}}\} \cdot (3\hat{\mathbf{i}} + \hat{\mathbf{j}}) = 0$
 $\Rightarrow 3(2-t) + (2+2t) = 0$
 $\Rightarrow 6 - 3t + 2 + 2t = 0 \Rightarrow t = 8$

68. (d) Let $\mathbf{a} = \hat{\mathbf{i}} - 2x\hat{\mathbf{j}} - 3y\hat{\mathbf{k}}$
 and $\mathbf{b} = \hat{\mathbf{i}} + 3x\hat{\mathbf{j}} + 2y\hat{\mathbf{k}}$
 Since, $\mathbf{a} + \mathbf{b}$ are orthogonal to each other.
 $\therefore \mathbf{a} \cdot \mathbf{b} = 0$
 $\Rightarrow (\hat{\mathbf{i}} - 2x\hat{\mathbf{j}} - 3y\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + 3x\hat{\mathbf{j}} + 2y\hat{\mathbf{k}}) = 0$
 $\Rightarrow 1 - 6x^2 - 6y^2 = 0 \Rightarrow x^2 + y^2 = \frac{1}{6}$
 So, the locus of the point (x, y) is a circle.

69. (c) Given that,
 Position vector of A, $\mathbf{OA} = 3\hat{\mathbf{i}} - 5\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$
 and position vector of B, $\mathbf{OB} = \hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$
 $\therefore \mathbf{AB} = \mathbf{OB} - \mathbf{OA}$
 $= (\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) - (3\hat{\mathbf{i}} - 5\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
 $= -2\hat{\mathbf{i}} + 6\hat{\mathbf{j}} - 3\hat{\mathbf{k}}$
 \therefore Length of $\mathbf{AB} = |\mathbf{AB}|$
 $= \sqrt{4 + 36 + 9} = \sqrt{49} = 7$

70. (d) Let $\mathbf{a} = \hat{\mathbf{i}} - m\hat{\mathbf{j}}$ and $\mathbf{b} = \hat{\mathbf{j}} + \hat{\mathbf{k}}$
 Given that, $\frac{\pi}{3}$ is the angle between \mathbf{a} and \mathbf{b} .
 $\therefore \cos \frac{\pi}{3} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}| |\mathbf{b}|} \Rightarrow \frac{1}{2} = \frac{(\hat{\mathbf{i}} - m\hat{\mathbf{j}}) \cdot (\hat{\mathbf{j}} + \hat{\mathbf{k}})}{\sqrt{1+m^2} \sqrt{1+1}}$
 $\Rightarrow \frac{1}{2} = \frac{-m}{\sqrt{2} \sqrt{1+m^2}} \Rightarrow \frac{1}{\sqrt{2}} = \frac{-m}{\sqrt{1+m^2}}$

On squaring both sides, we get
 $1 + m^2 = 2m^2 \Rightarrow m^2 = 1 \Rightarrow m = \pm 1$

Sol. (Q. Nos. 71-72) Given vectors are
 $\mathbf{a} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\mathbf{b} = 4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$

71. (b) Scalar projection of \mathbf{a} on $\mathbf{b} = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{b}|}$
 $= \frac{(\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot (4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}})}{|4\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}|}$
 $= \frac{(4 + 8 + 7)}{\sqrt{(4)^2 + (-4)^2 + (7)^2}} = \frac{19}{9}$
 which is the required scalar projection of \mathbf{a} on \mathbf{b} .

72. (a) The vector perpendicular to both the vectors \mathbf{a} and $\mathbf{b} = \mathbf{a} \times \mathbf{b}$
 $\begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & -2 & 1 \\ 4 & -4 & 7 \end{vmatrix}$
 $= \hat{\mathbf{i}}(-14 + 4) - \hat{\mathbf{j}}(7 - 4) + \hat{\mathbf{k}}(-4 + 8)$
 $= -10\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$

Sol. (Q. Nos. 73-74) Given that,
 A vector \mathbf{r} make an angle 60° with X-axis, i.e. $l = \cos 60^\circ = 1/2$
 and a vector \mathbf{r} make an angle 30° with Y-axis,
 i.e. $m = \cos 30^\circ = \sqrt{3}/2$

73. (c) Let the vector \mathbf{r} make an angle θ with Z-axis, i.e. $n = \cos \theta$

We know that,
 $l^2 + m^2 + n^2 = 1$
 $\Rightarrow \left(\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2 + \cos^2 \theta = 1$
 $\Rightarrow \left(\frac{1}{4} + \frac{3}{4}\right) + \cos^2 \theta = 1$
 $\Rightarrow \cos^2 \theta = 1 - 1 = 0 \Rightarrow \theta = 90^\circ$
 Hence, 90° angle does \mathbf{r} make with Z-axis.

74. (a) The direction cosine of the vector $\mathbf{r} = \langle l, m, n \rangle$
 $\Rightarrow \mathbf{r} = \langle \cos 60^\circ, \cos 30^\circ, \cos 90^\circ \rangle$
 $\Rightarrow \mathbf{r} = \langle \frac{1}{2}, \frac{\sqrt{3}}{2}, 0 \rangle$

Sol. (Q. Nos. 75-76) Given that,
 $|\mathbf{a}| = 7, |\mathbf{b}| = 11$ and $|\mathbf{a} + \mathbf{b}| = 10\sqrt{3}$

75. (b) We have,
 $|\mathbf{a} + \mathbf{b}|^2 = |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} \dots (i)$
 $\because |\mathbf{a} + \mathbf{b}| = 10\sqrt{3}$
 $\Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + 2\mathbf{a} \cdot \mathbf{b} = 300$
 $\Rightarrow (7)^2 + (11)^2 + 2\mathbf{a} \cdot \mathbf{b} = 300$
 $\Rightarrow 2\mathbf{a} \cdot \mathbf{b} = 130$

Now, put the value of $|\mathbf{a}|, |\mathbf{b}|$ and $2\mathbf{a} \cdot \mathbf{b}$ in Eq. (i), we get
 $|\mathbf{a} - \mathbf{b}|^2 = (7)^2 + (11)^2 - 130$
 $\therefore |\mathbf{a} - \mathbf{b}| = \sqrt{40} = 2\sqrt{10}$

76. (d) We have, $(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b}) = |\mathbf{a}|^2 - |\mathbf{b}|^2$
 Let θ be the angle between $(\mathbf{a} + \mathbf{b})$ and $\mathbf{a} - \mathbf{b}$.
 Then, $\cos \theta = \frac{(\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b})}{|\mathbf{a} + \mathbf{b}| |\mathbf{a} - \mathbf{b}|}$
 $= \frac{|\mathbf{a}|^2 - |\mathbf{b}|^2}{|\mathbf{a} + \mathbf{b}| |\mathbf{a} - \mathbf{b}|} = \frac{(7)^2 - (11)^2}{10\sqrt{3} \times 2\sqrt{10}}$
 $= \frac{18 \times (-4)}{20\sqrt{30}} \Rightarrow \theta = \cos^{-1} \left(\frac{-3}{5} \sqrt{\frac{6}{5}} \right)$

which is the required angle.

77. (b) Since, area of $\Delta OAB = \frac{1}{2} |\mathbf{OA} \times \mathbf{OB}|$
 $\therefore \mathbf{OA} \times \mathbf{OB} = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 3 & -1 & 1 \\ 2 & 1 & -3 \end{vmatrix}$
 $= 2\hat{\mathbf{i}} + 11\hat{\mathbf{j}} + 5\hat{\mathbf{k}}$
 $\therefore |\mathbf{OA} \times \mathbf{OB}| = \sqrt{2^2 + 11^2 + 5^2} = 5\sqrt{6}$
 \therefore Required area = $\frac{1}{2} \times 5\sqrt{6} = \frac{5\sqrt{6}}{2}$ sq units

78. (a) Since, unit vector perpendicular to both \mathbf{a} and $\mathbf{b} = \pm \frac{\mathbf{a} \times \mathbf{b}}{|\mathbf{a} \times \mathbf{b}|}$

$$\begin{aligned} \therefore \mathbf{a} \times \mathbf{b} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ -1 & 1 & 1 \\ 1 & -1 & 1 \end{vmatrix} \\ &= \hat{i} [1+1] - \hat{j} [-1-1] + \hat{k} [1-1] \\ &= 2\hat{i} + 2\hat{j} + 0\hat{k} = 2(\hat{i} + \hat{j}) \\ \text{and } |\mathbf{a} \times \mathbf{b}| &= \sqrt{4+4} = 2\sqrt{2} \\ \therefore \text{Required unit vector} \\ &= \pm \frac{2(\hat{i} + \hat{j})}{2\sqrt{2}} = \pm \frac{\hat{i} + \hat{j}}{\sqrt{2}} \end{aligned}$$

79. (a)

80. (a) Let $\mathbf{a} = \lambda\hat{i} + (1 + \lambda)\hat{j} + (1 + 2\lambda)\hat{k}$ and $\mathbf{b} = (1 - \lambda)\hat{i} + \lambda\hat{j} + 2\hat{k}$

For \mathbf{a} and \mathbf{b} to be perpendicular, we should have

$$\begin{aligned} \mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}| |\mathbf{b}| \cos \frac{\pi}{2} = 0 \\ \Rightarrow [\lambda\hat{i} + (1 + \lambda)\hat{j} + (1 + 2\lambda)\hat{k}] \cdot [(1 - \lambda)\hat{i} + \lambda\hat{j} + 2\hat{k}] &= 0 \\ \Rightarrow \lambda - \lambda^2 + \lambda + \lambda^2 + 2 + 4\lambda &= 0 \\ \Rightarrow 6\lambda - \lambda^2 - 2 &= 0 \Rightarrow \lambda = -\frac{2}{6} \Rightarrow \lambda = -\frac{1}{3} \end{aligned}$$

81. (a) $|\mathbf{a}| = 2, |\mathbf{b}| = 5$ and $|\mathbf{a} \times \mathbf{b}| = 8$

$$\begin{aligned} \text{Also, } |\mathbf{a} \times \mathbf{b}| &= |\mathbf{a}| |\mathbf{b}| \sin \theta \\ \Rightarrow |\sin \theta| &= \frac{8}{2 \cdot 5} = \frac{4}{5} \\ \Rightarrow |\cos \theta| &= \frac{3}{5} \Rightarrow \cos \theta = \pm \frac{3}{5} \\ \therefore \mathbf{a} \cdot \mathbf{b} &= |\mathbf{a}| |\mathbf{b}| \cos \theta = 6 \end{aligned}$$

82. (c) Since, $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$

$$\begin{aligned} \Rightarrow [|\mathbf{a} + \mathbf{b}|]^2 &= [|\mathbf{a} - \mathbf{b}|]^2 \\ \Rightarrow \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} + \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{a} &= \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} - \mathbf{a} \cdot \mathbf{b} - \mathbf{b} \cdot \mathbf{a} \\ \Rightarrow \mathbf{a} \cdot \mathbf{b} &= 0 \quad [\because \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}] \end{aligned}$$

Hence, \mathbf{a} is perpendicular to \mathbf{b} .

Sol. (Q. Nos. 83-86) We have,

$$\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0} \quad \dots(i)$$

On squaring both sides, we get

$$\begin{aligned} \mathbf{a} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b} + \mathbf{c} \cdot \mathbf{c} + 2\mathbf{a} \cdot \mathbf{b} &+ 2\mathbf{b} \cdot \mathbf{c} + 2\mathbf{c} \cdot \mathbf{a} = 0 \\ [\because \mathbf{a} \cdot \mathbf{b} = \mathbf{b} \cdot \mathbf{a}, \mathbf{b} \cdot \mathbf{c} = \mathbf{c} \cdot \mathbf{b} &\text{ and } \mathbf{c} \cdot \mathbf{a} = \mathbf{a} \cdot \mathbf{c}] \end{aligned}$$

$$\begin{aligned} \Rightarrow |\mathbf{a}|^2 + |\mathbf{b}|^2 + |\mathbf{c}|^2 &= -2[\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}] \\ \Rightarrow (3)^2 + (5)^2 + (7)^2 &= -2[\mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a}] \end{aligned}$$

$$\begin{aligned} \Rightarrow \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{c} + \mathbf{c} \cdot \mathbf{a} &= \frac{9 + 25 + 49}{-2} = -\frac{83}{2} \end{aligned}$$

Also, $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$ [using Eq. (i)]

$$\begin{aligned} \Rightarrow \mathbf{a} + \mathbf{b} &= -\mathbf{c} \\ \Rightarrow \mathbf{a}^2 + \mathbf{b}^2 + 2\mathbf{a} \cdot \mathbf{b} &= \mathbf{c}^2 \\ \Rightarrow 2\mathbf{a} \cdot \mathbf{b} &= 49 - 9 - 25 = 15 \\ \Rightarrow \mathbf{a} \cdot \mathbf{b} &= \frac{15}{2} \Rightarrow |\mathbf{a}| |\mathbf{b}| \cos \theta = \frac{15}{2} \\ \Rightarrow 3 \cdot 5 \cdot \cos \theta &= \frac{15}{2} \Rightarrow \theta = \frac{\pi}{3} \end{aligned}$$

Now, again using Eq. (i), we have,

$$\begin{aligned} \mathbf{b} + \mathbf{c} &= -\mathbf{a} \\ \Rightarrow \mathbf{b}^2 + \mathbf{c}^2 + 2\mathbf{b} \cdot \mathbf{c} &= \mathbf{a}^2 \\ \Rightarrow 2\mathbf{b} \cdot \mathbf{c} &= \mathbf{a}^2 - \mathbf{b}^2 - \mathbf{c}^2 \\ &= 9 - 25 - 49 = -65 \\ \Rightarrow \mathbf{b} \cdot \mathbf{c} &= -\frac{65}{2} \\ \Rightarrow |\mathbf{b}| |\mathbf{c}| \cos \theta &= -\frac{65}{2} \\ \Rightarrow \cos \theta &= -\frac{65}{2} \times \frac{1}{5} \times \frac{1}{7} = -\frac{13}{14} \end{aligned}$$

Also, $|\mathbf{a} + \mathbf{b}| = |-\mathbf{c}| = |\mathbf{c}| = 7$

83. (c) 84. (b) 85. (d) 86. (a)

87. (c) We have, $|\mathbf{a} + \mathbf{b}| = |\mathbf{a} - \mathbf{b}|$

$$\begin{aligned} \Rightarrow |\mathbf{a} + \mathbf{b}|^2 &= |\mathbf{a} - \mathbf{b}|^2 \\ &= (\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b}) = (\mathbf{a} - \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b}) \\ \Rightarrow |\mathbf{a}|^2 + 2(\mathbf{a} \cdot \mathbf{b}) + |\mathbf{b}|^2 &= |\mathbf{a}|^2 - 2(\mathbf{a} \cdot \mathbf{b}) + |\mathbf{b}|^2 \\ [\because \text{dot product is commutative}] \end{aligned}$$

$$\begin{aligned} \Rightarrow 2(\mathbf{a} \cdot \mathbf{b}) &= -2(\mathbf{a} \cdot \mathbf{b}) \\ \Rightarrow 4(\mathbf{a} \cdot \mathbf{b}) &= 0 \Rightarrow \mathbf{a} \cdot \mathbf{b} = 0 \\ \Rightarrow \mathbf{a} \text{ and } \mathbf{b} &\text{ are perpendicular to each other.} \end{aligned}$$

88. (b) Let A, B and C be the given points whose position vectors are

$$\alpha\hat{i} + \beta\hat{j} + \gamma\hat{k}; \beta\hat{i} + \gamma\hat{j} + \alpha\hat{k} \text{ and } \gamma\hat{i} + \alpha\hat{j} + \beta\hat{k}, \text{ respectively.}$$

Now,

$$\begin{aligned} \mathbf{AB} &= (\beta - \alpha)\hat{i} + (\gamma - \beta)\hat{j} + (\alpha - \gamma)\hat{k} \\ \mathbf{BC} &= (\gamma - \beta)\hat{i} + (\alpha - \gamma)\hat{j} + (\beta - \alpha)\hat{k} \\ \mathbf{AC} &= (\gamma - \alpha)\hat{i} + (\alpha - \beta)\hat{j} + (\beta - \gamma)\hat{k} \\ \Rightarrow |\mathbf{AB}| &= \sqrt{(\beta - \alpha)^2 + (\gamma - \beta)^2 + (\alpha - \gamma)^2} \end{aligned}$$

$$\begin{aligned} &= \sqrt{(\alpha - \beta)^2 + (\beta - \gamma)^2 + (\gamma - \alpha)^2} \quad \dots(i) \\ |\mathbf{BC}| &= \sqrt{(\gamma - \beta)^2 + (\alpha - \gamma)^2 + (\beta - \alpha)^2} \\ &= \sqrt{(\alpha - \beta)^2 + (\alpha - \gamma)^2 + (\gamma - \alpha)^2} \quad \dots(ii) \end{aligned}$$

and $|\mathbf{AC}|$

$$\begin{aligned} &= \sqrt{(\gamma - \alpha)^2 + (\alpha - \beta)^2 + (\beta - \gamma)^2} \\ &= \sqrt{(\alpha - \beta)^2 + (\beta - \gamma)^2 + (\gamma - \alpha)^2} \quad \dots(iii) \end{aligned}$$

From, Eqs. (i), (ii) and (iii), we get

$$|\mathbf{AB}| = |\mathbf{BC}| = |\mathbf{AC}|$$

Hence, ABC form an equilateral triangle.

89. (d) Given, in $\Delta ABC, \mathbf{AB} = 2\hat{i} + 3\hat{j} + 2\hat{k}$ and $\mathbf{AC} = -4\hat{i} + 5\hat{j} + 2\hat{k}$

To find Area of ΔABC .

Clearly, area of

$$\Delta ABC = \frac{1}{2} |\mathbf{AB} \times \mathbf{AC}| \quad \dots(i)$$

Let us first find $\mathbf{AB} \times \mathbf{AC}$, which is given by,

$$\begin{aligned} \mathbf{AB} \times \mathbf{AC} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 2 \\ -4 & 5 & 2 \end{vmatrix} \\ &= \hat{i} (6 - 10) - \hat{j} (-4 + 8) + \hat{k} (-10 + 12) \\ &= -4\hat{i} - 4\hat{j} + 2\hat{k} \\ \Rightarrow |\mathbf{AB} \times \mathbf{AC}| &= \sqrt{(-4)^2 + (-4)^2 + (2)^2} \\ &= \sqrt{32 + 4} = \sqrt{36} = 6 \end{aligned}$$

\therefore From Eq. (i),

$$\text{Area of } \Delta ABC = \frac{1}{2} \times 6 = 3 \text{ sq units}$$

90. (a) Given, α and β are non-collinear, i.e. $\alpha \pm \lambda\beta$ for any λ .

$\Rightarrow \alpha$ and β are linearly independent vectors.

Also, we have

$$\mathbf{u} = 2x\alpha + y\beta; \mathbf{v} = 2y\alpha + 3x\beta \text{ and } \mathbf{w} = 2\alpha - 5\beta \text{ such that } \mathbf{u} - \mathbf{v} = \mathbf{w}.$$

Consider, $\mathbf{u} - \mathbf{v} = \mathbf{w}$

$$\begin{aligned} &= (2x\alpha + y\beta) - (2y\alpha + 3x\beta) \\ &= 2\alpha - 5\beta = (2x - 2y)\alpha + (y - 3x)\beta \\ &= 2\alpha - 5\beta = (2x - 2y - 2)\alpha &+ (y - 3x + 5)\beta = 0 \end{aligned}$$

Since, the vector α and β are linearly independent therefore, we have

$$\begin{aligned} 2x - 2y - 2 &= 0 \Rightarrow x - y = 1 \quad \dots(i) \\ \text{and } y - 3x + 5 &= 0 \\ \Rightarrow y - 3x &= -5 \quad \dots(ii) \end{aligned}$$

On solving Eqs. (i) and (ii), we get $x = 2$ and $y = 1$.

91. (a) We have, $\mathbf{F} = 3\hat{i} + 4\hat{j} - 3\hat{k}$

$$\text{and } \mathbf{OP} = \mathbf{r} = 2\hat{i} - 2\hat{j} - 3\hat{k}$$

Clearly, the magnitude of moment of the force about origin = $|\mathbf{r} \times \mathbf{F}| \quad \dots(i)$

$$\begin{aligned} \text{Let us first find } \mathbf{r} \times \mathbf{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & -2 & -3 \\ 3 & 4 & -3 \end{vmatrix} \\ &= \hat{i} (6 + 12) - \hat{j} (-6 + 9) + \hat{k} (8 + 6) \\ &= 18\hat{i} - 3\hat{j} + 14\hat{k} \\ \therefore \text{From Eq. (i),} \\ |\mathbf{r} \times \mathbf{F}| &= \sqrt{(18)^2 + (-3)^2 + (14)^2} \\ &= 23 \text{ units} \end{aligned}$$

92. (d) We have,
 $|\mathbf{a}| = 7, |\mathbf{b}| = 11$ and $|\mathbf{a} + \mathbf{b}| = 10\sqrt{3}$
 To find $|\mathbf{a} - \mathbf{b}|$
 Consider, $|\mathbf{a} + \mathbf{b}|^2 = (\mathbf{a} + \mathbf{b}) \cdot (\mathbf{a} + \mathbf{b})$
 $\Rightarrow (10\sqrt{3})^2 = \mathbf{a} \cdot \mathbf{a} + \mathbf{a} \cdot \mathbf{b} + \mathbf{b} \cdot \mathbf{a} + \mathbf{b} \cdot \mathbf{b}$
 $\Rightarrow 300 = |\mathbf{a}|^2 + 2(\mathbf{a} \cdot \mathbf{b}) + |\mathbf{b}|^2$
 [∵ dot product is commutative]
 $\Rightarrow 2(\mathbf{a} \cdot \mathbf{b}) = 300 - 170 = 130$
 $\Rightarrow \mathbf{a} \cdot \mathbf{b} = 65$

Now, consider
 $|\mathbf{a} - \mathbf{b}|^2 = (\mathbf{a} - \mathbf{b}) \cdot (\mathbf{a} - \mathbf{b})$
 $= |\mathbf{a}|^2 - 2(\mathbf{a} \cdot \mathbf{b}) + |\mathbf{b}|^2$
 $= 170 - 130 = 40$
 $\therefore |\mathbf{a} - \mathbf{b}|^2 = \sqrt{40} = 2\sqrt{10}$

93. (c) Given, $\mathbf{a} + \mathbf{b} + \mathbf{c} = \mathbf{0}$... (i)
 I. Consider $[\mathbf{a} \ \mathbf{b} \ \mathbf{c}] = \mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})$
 $= -(\mathbf{b} + \mathbf{c}) \cdot (\mathbf{b} \times \mathbf{c})$ [using Eq. (i)]
 $= -(\mathbf{b} \cdot (\mathbf{b} \times \mathbf{c}) + \mathbf{c} \cdot (\mathbf{b} \times \mathbf{c}))$
 $= -([\mathbf{b} \ \mathbf{b} \ \mathbf{c}] + [\mathbf{c} \ \mathbf{b} \ \mathbf{c}])$
 $= -(0 + 0) = 0$

Thus, the vectors are coplanar.
 II. Consider,
 $\mathbf{a} \times \mathbf{b} = \mathbf{a} \times (-\mathbf{a} - \mathbf{c})$
 $= -(\mathbf{a} \times \mathbf{a} + \mathbf{c})$ [using Eq. (i)]
 $= -(\mathbf{a} \times \mathbf{a} + \mathbf{a} \times \mathbf{c})$
 $= -(\mathbf{0} + \mathbf{a} \times \mathbf{c}) = -(\mathbf{a} \times \mathbf{c})$
 $= \mathbf{c} \times \mathbf{a}$... (ii)
 [using Eq. (i)]

Similarly,
 $\mathbf{b} \times \mathbf{c} = \mathbf{a} \times \mathbf{b}$... (iii)
 From Eqs. (ii) and (iii), we get
 $\mathbf{a} \times \mathbf{b} = \mathbf{b} \times \mathbf{c} = \mathbf{c} \times \mathbf{a}$

94. (b) The length of diagonal is $3\hat{i} + 4\hat{j}$.
 $\therefore \sqrt{9 + 16} = \sqrt{25} = 5$
 Let the length of square be e .
 $\therefore e\sqrt{2} = 5 \Rightarrow e = \frac{5}{\sqrt{2}}$
 Now, area = $e^2 = \left(\frac{5}{\sqrt{2}}\right)^2 = \frac{25}{2}$
 $= 12.5$ sq units

95. (a) We know that, P will be the mid-point of AC and BD .

$\therefore OA + OC = 2OP$... (i)

and $OB + OD = 2OP$... (ii)
 On adding Eqs. (i) and (ii), we get
 $OA + OB + OC + OD = 4OP$

96. (c) Given, $BD = 4BC$
 It means D divides the join of BC externally in the ratio $4:3$.
 \therefore Position vector of D
 $= \frac{4\mathbf{c} - 3\mathbf{b}}{4 - 3}$
 $= 4\mathbf{c} - 3\mathbf{b}$

97. (b) We have,
 $\mathbf{a} = 5\hat{i} + n\hat{j}$
 $\therefore |\mathbf{a}| = \sqrt{25 + n^2} = 13$
 $\Rightarrow 25 + n^2 = 169$
 $\Rightarrow n^2 = 169 - 25 = 144$
 $\Rightarrow n = \pm 12$

98. (d) We have,
 $|\mathbf{a}| = 2, |\mathbf{b}| = 3$
 $\therefore |\mathbf{a} \times \mathbf{b}|^2 + |\mathbf{a} \cdot \mathbf{b}|^2$
 $= |\mathbf{a}|^2 |\mathbf{b}|^2 \sin^2 \theta + |\mathbf{a}|^2 |\mathbf{b}|^2 \cos^2 \theta$
 $= |\mathbf{a}|^2 |\mathbf{b}|^2 (\sin^2 \theta + \cos^2 \theta) = 36$

99. (b) Given, $|\hat{\mathbf{a}} - \hat{\mathbf{b}}| = \sqrt{3}$
 On squaring both sides, we get
 $|\mathbf{a}|^2 + |\mathbf{b}|^2 - 2\mathbf{a} \cdot \mathbf{b} = 3$
 [∵ $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are unit vectors, so
 $|\hat{\mathbf{a}}| = |\hat{\mathbf{b}}| = 1$]
 $\Rightarrow 2\hat{\mathbf{a}} \cdot \hat{\mathbf{b}} = -1$
 Now, $|\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 = |\hat{\mathbf{a}}|^2 + |\hat{\mathbf{b}}|^2 + 2\hat{\mathbf{a}} \cdot \hat{\mathbf{b}}$
 $= 1 + 1 - 1 = 1$
 $\Rightarrow \hat{\mathbf{a}} + \hat{\mathbf{b}} = 1$ unit

100. (b) Since, the vectors are coplanar.
 $\therefore \begin{vmatrix} \alpha & \alpha & \gamma \\ 1 & 0 & 1 \\ \gamma & \gamma & \beta \end{vmatrix} = 0$
 $\Rightarrow \alpha(0 - \gamma) - \alpha(\beta - \gamma) + \gamma(\gamma) = 0$
 $\Rightarrow \gamma^2 = \alpha\beta \Rightarrow \gamma = \sqrt{\alpha\beta}$
 Hence, γ is GM of α and β .

101. (c) I. Correct, because in a triangle, sum of two sides is greater than third side.
 II. Correct, because in a triangle, difference of two sides always smaller than third side. These two inequality is known as triangle inequality.

102. (c) We have, $\mathbf{a} \times \mathbf{b} = \mathbf{c} \times \mathbf{d}$
 and $\mathbf{a} \times \mathbf{c} = \mathbf{b} \times \mathbf{d}$
 I. $(\mathbf{a} - \mathbf{d}) \times (\mathbf{b} - \mathbf{c})$

$= \mathbf{a} \times \mathbf{b} - \mathbf{a} \times \mathbf{c} - \mathbf{d} \times \mathbf{b} + \mathbf{d} \times \mathbf{c}$
 $= \mathbf{c} \times \mathbf{d} - \mathbf{b} \times \mathbf{d} + \mathbf{b} \times \mathbf{d} - \mathbf{c} \times \mathbf{d} = 0$
 [∵ $\mathbf{a} \times \mathbf{b} = \mathbf{c} \times \mathbf{d}$]
 \therefore Hence, I is correct.

II. $(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d})$
 Take $\mathbf{a} \times \mathbf{b} = \mathbf{X}$
 $\therefore \mathbf{X} \times (\mathbf{c} \times \mathbf{d}) = (\mathbf{X} \cdot \mathbf{d})\mathbf{c} - (\mathbf{X} \cdot \mathbf{c})\mathbf{d}$
 $= [(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{d}]\mathbf{c} - [(\mathbf{a} \times \mathbf{b}) \cdot \mathbf{c}]\mathbf{d}$
 $= [(\mathbf{c} \times \mathbf{d}) \cdot \mathbf{d}]\mathbf{c} - [(\mathbf{c} \times \mathbf{d}) \cdot \mathbf{c}]\mathbf{d}$
 $= 0 \cdot \mathbf{c} - 0 \cdot \mathbf{d} = 0$
 \therefore Hence, II is also correct.

103. (b) Let $\mathbf{a} = \hat{i} + \hat{j} + \hat{k}$,
 and $\mathbf{b} = 2\hat{i} + 3\hat{j} - \hat{k}$
 Clearly, the vector which is orthogonal to both the vectors, is

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 1 & 1 \\ 2 & 3 & -1 \end{vmatrix}$$

$$= -4\hat{i} + 3\hat{j} + \hat{k}$$

Now, required vector
 $=$ Unit vector along $\mathbf{a} \times \mathbf{b}$
 $= \frac{-4\hat{i} + 3\hat{j} + \hat{k}}{\sqrt{(-4)^2 + (3)^2 + 1^2}}$
 $= \frac{-4\hat{i} + 3\hat{j} + \hat{k}}{\sqrt{26}}$

Sol. (Q. Nos. 104-105)
 Given $\hat{\mathbf{a}}$ and $\hat{\mathbf{b}}$ are unit vectors.
 Now,
 $|\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 = (\hat{\mathbf{a}} + \hat{\mathbf{b}}) \cdot (\hat{\mathbf{a}} + \hat{\mathbf{b}})$
 $= |\hat{\mathbf{a}}|^2 + |\hat{\mathbf{b}}|^2 + 2|\hat{\mathbf{a}}||\hat{\mathbf{b}}|\cos\theta$
 $\Rightarrow |\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 = 2 + 2\cos\theta$... (i)
 $= 2(1 + \cos\theta)$
 Similarly,
 $|\hat{\mathbf{a}} - \hat{\mathbf{b}}|^2 = 2(1 - \cos\theta)$... (ii)

104. (b) From Eq. (i)
 $|\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 = 2 \times 2 \cos^2\left(\frac{\theta}{2}\right)$
 $|\hat{\mathbf{a}} + \hat{\mathbf{b}}|^2 = 2 \cos\left(\frac{\theta}{2}\right)$
 $\therefore \cos\left(\frac{\theta}{2}\right) = \frac{|\hat{\mathbf{a}} + \hat{\mathbf{b}}|}{2}$

105. (a) From Eq. (ii),
 $|\hat{\mathbf{a}} - \hat{\mathbf{b}}|^2 = 2 \times 2 \sin^2\left(\frac{\theta}{2}\right)$
 $\sin\left(\frac{\theta}{2}\right) = \frac{|\hat{\mathbf{a}} - \hat{\mathbf{b}}|}{2}$

28

STATISTICS

In NDA exam, generally 6-8 questions are asked from this chapter which are based on central tendency, variance and standard deviation, correlation and lines of regression.

Statistics is the science of collection, organisation, presentation, analysis and interpretation of the numerical data.

- (i) **Data** The word data means, a set of useful information from the given facts.
- (ii) **Primary and secondary data** The data collected by the investigator himself is known as the primary data, while the data, which is already collected by other persons is known as secondary data. e.g. As investigator collects data related to industries through the government organisations.
- (iii) **Variable or Variate** A characteristics that varies in magnitude from observation to observation. e.g. Weight, height, income, age, etc. are variables.
- (iv) **Frequency** The number of times an observation occurs in the given data, is called the frequency of the observation.

Classification of Data

- (i) **Grouped data** A data which can be organised into classes is called grouped data.
e.g. 0-10 3
 10-20 4
 20-30 5
- (a) **Continuous data** If the upper limit of first interval is equal to the lower limit of second interval, then it is called continuous data. Above example is for continuous data.
- (b) **Discontinuous data** If the upper limit of first interval is not equal to lower limit of second interval, then it is called discontinuous data.
e.g. 0-9 3
 10-19 2
 20-29 1

- (ii) **Ungrouped data** A data which cannot be organised into classes or it just a list of number is called ungrouped data.
e.g. 3, 5, 11, 15, ...

Frequency Distribution

There are two types of frequency distribution which are as follow

- (i) **Discrete frequency distribution** A frequency distribution is called a discrete frequency distribution, if data is presented in such a way that exact measurements of the units are clearly shown.

Marks	Number of students (Frequency)
40	7
60	3
80	3
100	2
Total	15

- (ii) **Continuous frequency distribution** A frequency distribution in which data are arranged in classes groups which are not exactly measurable.

Marks	Number of students (Frequency)
10-20	1
20-30	2
30-40	3
40-50	4
50-60	6
60-70	7
Total	23

Cumulative Frequency Distribution

The frequency of the first class is added to that of the second and this sum is added to that of the third and so on, then the frequencies so obtained are known as cumulative frequency (*cf*).

There are two types of cumulative frequency *viz.* less than and greater than. For less than cumulative frequency, we add up the frequency from above and for greater than cumulative frequency, we add up frequencies from below.

The cumulative frequency distributions are as follow

Less than cumulative frequency distribution

Wages (in ₹)	Number of workers (Cumulative frequency)
Less than 1099.5	125
Less than 1199.5	275
Less than 1299.5	475
Less than 1399.5	725
Less than 1499.5	900
Less than 1599.5	1000

Greater than cumulative frequency distribution

Wages (in ₹)	Number of workers (Cumulative frequency)
Greater than 999.5	1000
Greater than 1099.5	875
Greater than 1199.5	725
Greater than 1299.5	525
Greater than 1399.5	275
Greater than 1499.5	100

Relative Frequency Distribution

Relative frequencies are very useful for the comparison of two or more frequency distributions. To find the percentage of relative frequency to the total frequency, given formula is used i.e.

$$\text{Relative frequency \%} = \left[\frac{\text{Class frequency}}{\text{Total frequency}} \right] \times 100$$

Graphical Representation of Frequency Distribution

- Bar diagrams** In bar diagrams, only the length of the bars are taken into consideration. The width at each bar can be any but widths at all the bars is same. On each of these lengths on the horizontal axis, we erect (vertical) a rectangle, whose height is

proportional the frequency of the class. Such representation gives a bar diagram.

- Pie diagrams** A pie diagram consists of a circle divided into as many sectors as there are classes in a frequency distribution. Each part of a data, marks a certain central angle and sum of all the angles of sector is 360°. We divide 360° in the proportion of the various relative frequencies. i.e.

$$\text{Central angle} = \left[\frac{\text{Frequency} \times 360^\circ}{\text{Total frequency}} \right]$$

- Histogram** A histogram is a set of adjacent rectangles, whose area is proportional to the frequencies at a given continuous frequency distribution. There is no gap between any two successive rectangles

- Frequency polygon** To draw the frequency polygon of an ungrouped frequency distribution, we plot the points with abscissae as the variate values and the ordinate as the corresponding frequencies. These plotted points are joined by straight lines to obtain the frequency polygon.

$$\bar{X} = \frac{f_1x_1 + f_2x_2 + \dots + f_nx_n}{f_1 + f_2 + \dots + f_n} \text{ or } \bar{X} = \frac{\sum_{i=1}^n f_i x_i}{N}$$

where, $N = f_1 + f_2 + \dots + f_n = \sum_{i=1}^n f_i$

(ii) **Shortcut method** If the values of x or (and) f is large, the calculation of arithmetic mean by the formula used above is quite tedious and time consuming. In such a case, we use the formula

$$\bar{X} = A + \frac{1}{N} \sum_{i=1}^n f_i d_i$$

where, $d_i = x_i - A$ and A is assumed mean.

EXAMPLE 3. Find the mean wage from the data given below.

Wages (in ₹)	800	820	860	900	920	980	1000
Number of workers	7	14	19	25	20	10	5

- a. 890 b. 890.5 c. 891.2 d. 891.8

Sol. c. Let the assumed mean be $A = 900$.

The given data can be written as under

Wages (in ₹) (x_i)	Number of workers (f_i)	$d_i = x_i - A$	$f_i d_i$
800	7	-100	-700
820	14	-80	-1120
860	19	-40	-760
900	25	0	0
920	20	20	400
980	10	80	800
1000	5	100	500
Total	$N = \sum f_i = 100$		$\sum f_i d_i = -880$

Here, $A = 900$

$$\therefore \text{Mean} = \bar{X} = A + 1/N (\sum f_i d_i) = 900 + \left(-\frac{880}{100}\right) = 891.2$$

Hence, mean wage = ₹ 891.2

(iii) **Step deviation method** Sometimes during the application of shortcut method of finding the mean, the deviations d_i are divisible by a common number h (say). In such a case, the arithmetic is reduced to a great extent by taking

$$u_i = \frac{x_i - A}{h}, i = 1, 2, \dots, n$$

$$\bar{X} = A + h \left(\frac{1}{N} \sum_{i=1}^n f_i u_i \right)$$

EXAMPLE 4. Apply the step deviation method to find the arithmetic mean of the distribution.

Variate	5	10	15	20	25	30	35	40	45	50
Frequency	20	43	75	67	72	45	39	9	8	6

- a. 22.214 b. 28.346
c. 30.125 d. None of these

Sol. a. Let the assumed mean be $A = 25$ and $h = 5$.

The calculations are

Variate (x_i)	Frequency (f_i)	Deviation, $d_i = x_i - A$	$u_i = \frac{x_i - A}{h}$	$f_i u_i$
5	20	-20	-4	-80
10	43	-15	-3	-129
15	75	-10	-2	-150
20	67	-5	-1	-67
25	72	0	0	0
30	45	5	1	45
35	39	10	2	78
40	9	15	3	27
45	8	20	4	32
50	6	25	5	30
Total	$N = \sum f_i = 384$			$\sum f_i u_i = -214$

$$\therefore \text{Mean} (\bar{X}) = A + h \left(\frac{1}{N} \sum f_i u_i \right)$$

$$\Rightarrow \bar{X} = 25 + 5 \left(-\frac{214}{384} \right) = 25 - 2.786 = 22.214$$

Arithmetic Mean of a Grouped or Continuous Frequency Distribution

For computing arithmetic in a continuous frequency distribution, we need to compute the mid-point of class intervals (x). The mid-points are multiplied by the corresponding frequencies (f_x).

The sum of this product is obtained and is divided by the sum of frequencies. The arithmetic mean may be computed by applying any of the methods used in a discrete frequency distribution.

EXAMPLE 5. Calculate the arithmetic mean for the following frequency distribution.

Class	0-8	8-16	16-24	24-32	32-40	40-48
Frequency	8	7	16	24	15	7

- a. 22.404 b. 24.202
c. 25.404 d. 27.202

Sol. c. Let the assumed mean be $A = 28$ and $h = 8$.

The calculations are

Class	Mid-value (x_i)	Frequency (f_i)	$u_i = \frac{x_i - A}{h}$	$f_i u_i$
0-8	4	8	-3	-24
8-16	12	7	-2	-14
16-24	20	16	-1	-16
24-32	28	24	0	0
32-40	36	15	1	15
40-48	44	7	2	14
Total		$N = \sum f_i = 77$		$\sum f_i u_i = -25$

Here, $A = 28$ and $h = 8$

$$\begin{aligned} \therefore \bar{x} &= A + h \cdot \frac{1}{N} (\sum f_i u_i) \\ &= 28 + 8 \left(-\frac{25}{77} \right) = 28 - \frac{200}{77} = 25.404 \end{aligned}$$

Combined Mean

If we are given the AM of the two data sets and their sizes, then the combined AM of two data sets can be obtained by the formula

$$\bar{x}_{12} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

where, \bar{x}_{12} = Combined mean of two data sets 1 and 2

\bar{x}_1 = Mean of the first data

\bar{x}_2 = Mean of the second data

x_1 = Size of the first data

x_2 = Size of the second data

Properties of Arithmetic Mean

- (i) Mean is dependent of change of origin but it is independent of change of scale.
- (ii) Algebraic sum of the deviations of a set of values from their arithmetic mean is zero.
- (iii) The sum of the squares of the deviations of a set of values is minimum, when taken about mean.

Geometric Mean (GM)

The n th root of the product of the values is called geometric mean.

- (i) **Geometric mean for ungrouped data** If x_1, x_2, \dots, x_n are n non-zero values of a variate X , then geometric mean is

$$GM = (x_1 \cdot x_2 \dots x_n)^{1/n}$$

$$\log GM = \frac{1}{n} (\log x_1 + \log x_2 + \dots + \log x_n)$$

$$\log GM = \frac{1}{n} \sum_{i=1}^n \log x_i, G = \text{antilog} \left(\frac{1}{n} \sum_{i=1}^n \log x_i \right)$$

- (ii) **Geometric mean for grouped data** If x_1, x_2, \dots, x_n are n observations whose corresponding frequencies are f_1, f_2, \dots, f_n , then geometric mean is given by

$$GM = (x_1^{f_1} \cdot x_2^{f_2} \dots x_n^{f_n})^{1/N}$$

$$\log GM = \frac{1}{N} (f_1 \log x_1 + f_2 \log x_2 + \dots + f_n \log x_n)$$

$$\log GM = \frac{1}{n} \sum_{i=1}^n f_i \log x_i, G = \text{antilog} \left(\frac{1}{N} \sum_{i=1}^n f_i \log x_i \right)$$

- (iii) **Combined geometric mean** If G_1 and G_2 are the geometric means of two series of sizes n_1 and n_2 respectively, then the geometric mean GM of the combined series is given by

$$\log GM = \frac{n_1 \log G_1 + n_2 \log G_2}{n_1 + n_2}$$

as median divides as distribution into two equal parts, when $N = f_1 + f_2 + \dots + f_n$

EXAMPLE 6. Find the geometric mean for the following distribution of student's marks.

Marks	0-30	30-50	50-80	80-100
Number of students	20	30	40	10

- a. 43.92
- b. 43.43
- c. 43.13
- d. 43.29

Sol. d.

Marks	Number of students	Mid-points	$f \log x$
0-30	20	15	23.5218
30-50	30	40	48.0168
50-80	40	65	72.5165
80-100	10	90	19.5424
Total	$\sum f = 100$		$\sum f \log x = 163.6425$

$$GM \text{ of } x = \bar{x} = \text{antilog} \left(\frac{\sum f \log x}{\sum f} \right) = \text{antilog} \left(\frac{163.6425}{100} \right)$$

$$= \text{antilog}(1.6364), \bar{x} = 43.29$$

Harmonic Mean (HM)

The harmonic mean of any series is the reciprocal of the arithmetic mean of the reciprocals of the observations.

- (i) **Harmonic mean for ungrouped data**

If x_1, x_2, \dots, x_n are n non-zero values of a variate X , then harmonic mean is

$$HM = \frac{n}{\frac{1}{x_1} + \frac{1}{x_2} + \dots + \frac{1}{x_n}} = \frac{n}{\sum_{i=1}^n \left(\frac{1}{x_i} \right)}$$

- (ii) **Harmonic mean for grouped data** If x_1, x_2, \dots, x_n are n observations, whose corresponding frequencies of each variate is f_1, f_2, \dots, f_n , then

$$\text{HM} = \frac{f_1 + f_2 + \dots + f_n}{\frac{f_1}{x_1} + \frac{f_2}{x_2} + \dots + \frac{f_n}{x_n}} = \frac{N}{\sum_{i=1}^n \left(\frac{f_i}{x_i} \right)} = \frac{\sum_{i=1}^n f_i}{\sum_{i=1}^n \frac{f_i}{x_i}}$$

where, $N = f_1 + f_2 + \dots + f_n$

Note If Geometric Mean (GM) and Harmonic Mean (HM) of a statistical sequence is known, then Arithmetic Mean (AM) can be obtained as $\text{AM} = \frac{(\text{GM})^2}{(\text{HM})}$ or $(\text{GM})^2 = (\text{AM}) \times (\text{HM})$

EXAMPLE 7. The harmonic mean for the given data, will be

Marks	30-39	40-49	50-59	60-69	70-79	80-89	90-99
f	2	3	11	20	32	25	7

- a. 66.90 b. 69.60 c. 60.96 d. 60.69

Sol. b. The necessary calculations are as follows

Marks	x	f	f/x
30-39	34.5	2	0.0580
40-49	44.5	3	0.0674
50-59	54.5	11	0.2018
60-69	64.5	20	0.3101
70-79	74.5	32	0.4295
80-89	84.5	25	0.2959
90-99	94.5	7	0.0741
		$\Sigma f = 100$	$\Sigma \left(\frac{f}{x} \right) = 1.4368$

$$\text{Harmonic mean, } \bar{x} = \frac{\Sigma f}{\Sigma \left(\frac{f}{x} \right)} = \frac{100}{1.4368} = 69.60$$

Median

Median of a distribution is the value of the variable such that the number of observations above it is equal to the number of observations below it.

Median of Ungrouped Individual Observations

In case of individual observations, x_1, x_2, \dots, x_n to find the median, we use the following method

- (i) Arrange the observations x_1, x_2, \dots, x_n in ascending or descending order.

- (ii) If n is odd, then median is the value of $\left(\frac{n+1}{2} \right)$ th observation. If n is even, then median is the values of $\left(\frac{n}{2} \right)$ th and $\left(\frac{n}{2} + 1 \right)$ th observations.

EXAMPLE 8. Find the median of the daily wages (in ₹) of ten workers 29, 25, 17, 18, 8, 15, 22, 11, 9 and 14.

- a. 8 b. 15 c. 16 d. 17

Sol. c. Arranging the wages in ascending order of magnitude, we have 8, 9, 11, 14, 15, 17, 18, 22, 25, 29

Since, there are 10 observations, therefore median is the arithmetic mean of $\left(\frac{10}{2} \right)$ th and $\left(\frac{10}{2} + 1 \right)$ th observations.

$$\therefore \text{Median} = \frac{15 + 17}{2} = 16$$

Median of Discrete Frequency Distribution

In case of a discrete frequency distribution $x_i, f_i, i = 1, 2, \dots, n$, we calculate the median by using the following method

- (i) First arrange the data in ascending or descending order and then find the cumulative frequencies (cf).
- (ii) Find $\frac{N}{2}$, where $N = \sum_{i=1}^n f_i$.
- (iii) See the cumulative frequency (cf) just greater than $\frac{N}{2}$. The corresponding value of x is median.

EXAMPLE 9. Obtain the median for the following frequency distribution.

x	1	2	3	4	5	6	7	8	9
f	8	10	11	16	20	25	15	9	6

- a. 5 b. 6 c. 4 d. None of these

Sol. a.

x	f	cf
1	8	8
2	10	18
3	11	29
4	16	45
5	20	65
6	25	90
7	15	105
8	9	114
9	6	120
Total	$N = 120$	

Here, $N = 120 \Rightarrow \frac{N}{2} = 60$

We find that the cumulative frequency just greater than $N/2$ is 65 and the value of x corresponding to 65 is 5. Therefore, median is 5.

Median of a Grouped or Continuous Frequency Distribution

To calculate the median of a grouped or continuous frequency distribution, we use the following method

- (i) Prepare the cumulative frequency column and obtain $N = \sum f_i$ and find $\frac{N}{2}$.
- (ii) See the cumulative frequency just greater than $\frac{N}{2}$ and determine the corresponding class. This class is known as the median class.
- (iii) Use the following formula, Median $= l + \left(\frac{N/2 - C}{f} \right) \times b$

where,

l = Lower limit of the median class

f = Frequency of the median class

b = Width (size) of the median class

C = Cumulative frequency of the class preceding the median class

EXAMPLE 10. Calculate the median from the following distribution.

Class	5-10	10-15	15-20	20-25	25-30	30-35	35-40	40-45
Frequency	5	6	15	10	5	4	2	2

- a. 18.5 b. 18 c. 19 d. 19.5

Sol. d.

Class	Frequency	Cumulative frequency
5-10	5	5
10-15	6	11
15-20	15	26
20-25	10	36
25-30	5	41
30-35	4	45
35-40	2	47
40-45	2	49
Total	$N = 49$	

We have, $N = 49$

$\therefore \frac{N}{2} = \frac{49}{2} = 24.5$

The cumulative frequency just greater than $N/2$ is 26 and the corresponding class is 15-20.

Thus, 15-20 is the median class such that

$l = 15, f = 15, C = 11$ and $h = 5$

$\therefore \text{Median} = l + \left(\frac{N/2 - C}{f} \times h \right)$
 $= 15 + \left(\frac{24.5 - 11}{15} \right) \times 5 = 15 + \frac{13.5}{3} = 19.5$

Mode

Mode is the observation with maximum frequency, whenever the other observations have for less frequencies.

Mode of Individual Observation

The value which is repeated maximum number of times is called mode of the series.

EXAMPLE 11. Find the mode for the following series. 2.5, 2.3, 2.2, 2.2, 2.4, 2.7, 2.7, 2.5, 2.3, 2.2, 2.6, 2.2

- a. 2.2 b. 2.3 c. 2.7 d. 2.6

Sol. a. Arranging the data in the form of a frequency table, we have

Value	Frequency
2.2	4
2.3	2
2.4	1
2.5	2
2.6	1
2.7	2

We see that the value 2.2 has the maximum frequency 4. So, the mode for the given series is 2.2.

Mode of a Discrete Series

Mode of a discrete series is the value of variable consisting highest frequency.

EXAMPLE 12. Compute the modal value for the following frequency distribution.

x	95	105	115	125	135	145	155	165	175
f	4	2	18	22	21	19	10	3	2

- a. 115 b. 125 c. 22 d. 120

Sol. b. From the given table, it is clear that 125 has the highest frequency 22. Hence, modal value of the given frequency distribution is 125.

Mode of a Continuous Series

To calculate the mode of a grouped or continuous frequency distribution, we use the following method.

- (i) First find the modal group which has maximum frequency.

(ii) Use the following formula,

$$\text{Mode} = l + \left(\frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h$$

where,

l = Lower limit of modal group

h = Size of modal group

f_1 = Frequency of modal group

f_0 = Frequency of group before to modal group

f_2 = Frequency of group next to modal group

EXAMPLE 13. Find the mode of following distribution.

Class interval	Frequency
0-20	17
20-40	28
40-60	32
60-80	24
80-100	19

- a. 40 b. 45.32 c. 46.67 d. 49.82

Sol. c. From the given table, it is clear that modal group is 40-60.

Here, $l = 40$, $f_0 = 28$, $f_1 = 32$, $f_2 = 24$, $h = 20$

$$\begin{aligned} \therefore \text{Mode} &= l + \left(\frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h \\ &= 40 + \left(\frac{32 - 28}{64 - 28 - 24} \right) \times 20 = 40 + 6.67 = 46.67 \end{aligned}$$

Symmetric Distribution

A distribution is a symmetric distribution, if the values of mean, mode and median coincide. In a symmetric distribution, frequencies are symmetrically distributed on both sides of the centre point of the frequency curve.

Relationship between Mean, Median and Mode

$$\text{Mean} - \text{Mode} = 3 (\text{Mean} - \text{Median})$$

$$\Rightarrow \text{Mode} = 3 \text{ Median} - 2 \text{ Mean}$$

EXAMPLE 14. If the arithmetic mean and mode of data are 24 and 12 respectively, then the median of the data is

- a. 20 b. 18 c. 21 d. 22

Sol. a. We have, mean = 24 and mode = 12

$$\therefore \text{Mode} = 3 \text{ Median} - 2 \text{ Mean}$$

$$\Rightarrow 12 = 3 \text{ Median} - 2 \times 24$$

$$\Rightarrow \text{Median} = 20$$

VARIANCE AND STANDARD DEVIATION

The variance of a variable is the arithmetic mean of the squares of all deviations of x from the arithmetic mean of the observations and is denoted by $\text{var}(x)$ or σ^2 .

The positive square root of the variance of a variable x is known as the standard deviation and is denoted by σ .

Thus, standard deviation = $\sqrt{\text{var}(x)}$.

The calculation of variance and standard deviation can be done by using the following formulas.

(i) For individual series,

$$\text{SD} = \sigma = \sqrt{\left[\frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})^2 \right]} \quad \text{or} \quad \sigma = \sqrt{\left[\frac{\sum_{i=1}^n x_i^2}{n} - \bar{x}^2 \right]}$$

Let A be any assumed mean and $d_i = x_i - A$.

$$\text{Then, } \sigma = \sqrt{\left[\frac{\sum_{i=1}^n d_i^2}{n} - \left(\frac{\sum_{i=1}^n d_i}{n} \right)^2 \right]}$$

(ii) For frequency distribution,

$$\sigma = \sqrt{\left[\frac{1}{N} \sum_{i=1}^n f_i (x_i - \bar{x})^2 \right]}$$

$$\text{Variance} = \sigma^2$$

For grouped data, it becomes

$$\text{SD} = \sigma = \sqrt{\left[\frac{\sum_{i=1}^n f_i d_i^2}{N} - \left(\frac{\sum_{i=1}^n f_i d_i}{N} \right)^2 \right]}, \quad N = \sum_{i=1}^n f_i$$

where, $N = \sum f_i$

$$\therefore \text{Coefficient of dispersion} = \frac{\sigma}{\bar{x}}$$

$$\text{and coefficient of variation} = \frac{\sigma}{\bar{x}} \times 100$$

Properties of Standard Deviation

- SD is independent of change of origin.
- If the values of the variate x are multiplied by a constant, then the SD of the new observation can be obtained by multiplying the initial SD by the same constant, i.e. if $y = kx$, then $\sigma_y = k\sigma_x$. Thus, SD is not dependent of change in scale.

Thus, if $y = ax + b$, $\sigma_y = |a| \sigma_x$

Combined Standard Deviation for Two Series

Let \bar{x}_1, \bar{x}_2 be the respective means and σ_1, σ_2 be the respective SD of the two given series. Let \bar{x}_{12} be the combined mean. Also, let $D_1 = (\bar{x}_1 - \bar{x}_{12})$ and $D_2 = (\bar{x}_2 - \bar{x}_{12})$. Then,

$$\text{Combined SD} = \sigma_{12} = \sqrt{\left[\frac{n_1(\sigma_1^2 + D_1^2) + n_2(\sigma_2^2 + D_2^2)}{n_1 + n_2} \right]}$$

$$\text{Variance } (\sigma^2) = \frac{1}{n_1 + n_2} [n_1(\sigma_1^2 + D_1^2) + n_2(\sigma_2^2 + D_2^2)]$$

EXAMPLE 15. Compute the variance and standard deviation of the following observations of marks of 5 students out of 25 of a tutorial group. 8, 12, 13, 15, 22

- a. 21.2 and 4.604
- b. 20.6 and 5.534
- c. 19.8 and 4.322
- d. None of these

Sol. a. We have, $\bar{x} = \frac{8 + 12 + 13 + 15 + 22}{5} = 14$

x_i	$(x_i - \bar{x})$	$(x_i - \bar{x})^2$
8	-6	36
12	-2	4
13	-1	1
15	1	1
22	8	64
Total		$\Sigma(x_i - \bar{x})^2 = 106$

Here, $n = 5, \Sigma(x_i - \bar{x})^2 = 106$
 $\therefore \text{var}(\bar{x}) = \frac{1}{n} \Sigma(x_i - \bar{x})^2 = \frac{106}{5} = 21.2$
 and $\text{SD} = \sqrt{\text{var}(\bar{x})} = \sqrt{21.2} = 4.604$

EXAMPLE 16. The standard deviation of n observations x_1, x_2, \dots, x_n is 6. The standard deviation of another set of n observations y_1, y_2, \dots, y_n is 8. What is the standard deviation of n observations

- a. 10
- b. 7
- c. 14
- d. 2

Sol. d. The standard deviation of n observations x_1, x_2, \dots, x_n is 6 and of y_1, y_2, \dots, y_n is 8, then the standard deviation of n observations $x_1 - y_1, x_2 - y_2, \dots, x_n - y_n$ is $8 - 6 = 2$.

CORRELATION

The tendency of simultaneous variation between two variables is called correlation or covariation. It denotes the degree of inter-dependence between variables.

Correlation Coefficient

The number showing the degree or extent to which x are related to each other is called correlation coefficient. It is denoted by $P(x, y)$ or r_{xy} or simply r .

Methods of Calculating Correlation Coefficients

1. Karl Pearson's Coefficient of Correlation

Covariance $(x, y) = \text{cov}(x, y)$

$$= \frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y}) = \frac{1}{n} \sum_{i=1}^n x_i y_i - \bar{x} \bar{y}$$

Let σ_x and σ_y be the SD of variables x and y , respectively. Then, coefficient of correlation

$$r(x, y) = \frac{\text{cov}(x, y)}{\sigma_x \sigma_y} = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2} \sqrt{\sum_{i=1}^n (y_i - \bar{y})^2}}$$

$$= \frac{n \Sigma x_i y_i - (\Sigma x_i)(\Sigma y_i)}{\sqrt{\{n \Sigma x_i^2 - (\Sigma x_i)^2\} \{n \Sigma y_i^2 - (\Sigma y_i)^2\}}}$$

2. Rank Correlation (Spearman's)

Let d be the difference between paired ranks and n be the number of items ranked. Then, ρ the coefficient of

$$\text{rank correlation is given by } \rho = 1 - \frac{6 \sum_{i=1}^n d^2}{n(n^2 - 1)}$$

Note The rank correlation coefficient lies between -1 and 1 .

EXAMPLE 17. Find Karl Pearson's coefficient of correlation between x and y for the following data.

x	2	10	8	6	8
y	4	6	7	10	6

- a. 0.186
- b. 0.286
- c. 0.382
- d. 0.492

Sol. b. Here, $n = 5$, We shall use the change of variables

$$u_i = x_i - 8 \quad \text{and} \quad v_i = y_i - 7$$

We obtain,

x_i	y_i	u_i	v_i	u_i^2	v_i^2	$u_i v_i$
2	4	-6	-3	36	9	18
10	6	2	-1	4	1	-2
8	7	0	0	0	0	0
6	10	-2	3	4	9	-6
8	6	0	-1	0	1	0

We have, $\Sigma x_i = 34, \Sigma y_i = 33, \Sigma u_i = -6, \Sigma v_i = -2$
 $\Sigma u_i^2 = 44, \Sigma v_i^2 = 20$ and $\Sigma u_i v_i = 10$

Hence, we obtain

$$\rho(x, y) = \frac{n \Sigma u_i v_i - [\Sigma u_i][\Sigma v_i]}{\sqrt{[n \Sigma u_i^2 - (\Sigma u_i)^2][n \Sigma v_i^2 - (\Sigma v_i)^2]}}$$

$$= \frac{5(10) - (-6)(-2)}{\sqrt{[5(44) - (-6)^2][5(20) - (-2)^2]}}$$

$$= \frac{50 - 12}{\sqrt{(220 - 36)(100 - 4)}} = \frac{38}{\sqrt{184 \times 96}} = \frac{38}{16\sqrt{69}} = 0.286$$

Properties of Correlation

- (i) $-1 \leq r(x, y) \leq 1$
- (ii) If $r = 1$, then the coefficient of correlation is perfectly positive.
- (iii) If $r = -1$, the correlation is perfectly negative.
- (iv) The correlation coefficient is a pure number independent of the unit of measurement.
- (v) The coefficient of correlation is independent of the change in origin and scale.
- (vi) If $-1 < r < 1$, it indicates the degree of linear relationship between x and y , where as its sign tells about the direction of relationship.
- (vii) If x and y are two independent variables, $r = 0$.
- (viii) If $r = 0$, x and y are said to be uncorrelated. It does not imply that the two variates are independent.
 $r(x, y) = 0$
- (ix) If x and y are random variables and a, b, c and d are any numbers such that $a \neq 0, c \neq 0$, then

$$r(ax + b, cy + d) = \frac{|ac|}{ac} r(x, y)$$

LINES OF REGRESSION

The line of regression is the line which gives the best estimate to the value of one variable for any specific value of the other variable. Therefore, the line of regression is the line of best fit and is obtained by the principle of least squares.

Regression Analysis

- (i) The line of regression of y on x or regression line of y on x is given by

$$y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x})$$

- (ii) The line of regression of x on y or regression line of x on y is given by $x - \bar{x} = r \frac{\sigma_x}{\sigma_y} (y - \bar{y})$

- (iii) Regression coefficient of y on x , is denoted by y_x ,

$$b_{yx} = r \frac{\sigma_y}{\sigma_x} = \frac{\text{cov}(x, y)}{\sigma_x^2}$$

- (iv) Regression coefficient of x on y , is denoted by x_y ,

$$b_{xy} = r \frac{\sigma_x}{\sigma_y} = \frac{\text{cov}(x, y)}{\sigma_y^2}$$

- (v) If θ is the angle between the two regression lines, then

$$\tan \theta = \frac{(1 - r^2)}{|r|} \cdot \frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2}$$

where, $\tan \theta = \frac{M_2 - M_1}{1 + M_1 M_2}$

- (a) If $r = 0, \theta = \frac{\pi}{2}$, then the two regression lines are perpendicular to each other.
- (b) If $r = 1$ or $-1, \theta = 0, \pi$, then the regression lines coincide.

Properties of the Regression Coefficients

- (i) Both regression coefficients and correlation coefficient r have the same sign.
- (ii) Coefficient of correlation is the geometric mean between the regression coefficients.
- (iii) If one of the regression coefficient is greater than unity, the other must be less than unity
 $0 < |b_{xy} b_{yx}| \leq 1, \text{ if } r \neq 0$
i.e. if $|b_{xy}| > 1, |b_{yx}| < 1$
- (iv) Regression coefficients are independent of the change of origin but not of scale.
- (v) Arithmetic mean of the regression coefficient is greater than the correlation coefficient.
- (vi) The two lines of regression cut each other at the point (\bar{x}, \bar{y}) . Thus, on solving the two lines of regression, we get the values of means of the variables in the bivariate distribution.

EXAMPLE 18. Find the equations of the lines of regression on the basis of the following data.

x	4	2	3	4	2
y	2	3	2	4	4

- a. $x + 4y = 15$
- b. $x + 4y = 45$
- $4x + y = 45$
- $4x + y = 15$
- c. $x + 4y = 45$
- d. None of these
- $4x + y = 45$

Sol. d. Here, $\Sigma x = 15, \Sigma y = 15, \Sigma x^2 = 49, \Sigma y^2 = 49,$

$$\Sigma xy = 44 \text{ and } n = 5$$

$$\therefore b_{xy} = \frac{n \Sigma xy - (\Sigma x)(\Sigma y)}{n \Sigma y^2 - (\Sigma y)^2} = \frac{5(44) - (15)(15)}{5(49) - (15)^2} = -\frac{5}{20} = -\frac{1}{4}$$

$$\text{and } b_{yx} = \frac{n \Sigma xy - (\Sigma x)(\Sigma y)}{n \Sigma x^2 - (\Sigma x)^2} = \frac{5(44) - (15)(15)}{5(49) - (15)^2} = -\frac{1}{4}$$

$$\text{Also, } \bar{x} = \frac{15}{5} = 3 \text{ and } \bar{y} = \frac{15}{5} = 3$$

$$\text{The lines of regression are } y - 3 = -\frac{1}{4}(x - 3) \Rightarrow x + 4y = 15$$

$$\text{and } x - 3 = -\frac{1}{4}(y - 3) \Rightarrow 4x + y = 15$$

PRACTICE EXERCISE

1. The curve given below represent a/an

- (a) pie diagram (b) bar diagram
(c) ogive (d) histogram

2. Cumulative frequency curve of given table is

Class interval	0-10	10-20	20-30	30-40	40-50
Frequency	4	10	25	8	2

3. If the values of a set are measured in cm, what will be the unit of variance?

- (a) cm (b) cm^2
(c) cm^3 (d) No unit

4. Consider the following frequency distribution

Class interval	0-10	10-20	20-30	30-40	40-50
Frequency	14	f_2	28	f_4	15

If the sum of the frequencies is 100 and median is 25, then f_2 and f_4 will be

- (a) 15 and 28 (b) 20 and 23
(c) 22 and 21 (d) 21 and 22
5. If the standard deviation of 15 items is 6 and each item is decreased by 1, then standard deviation will be
- (a) 5 (b) 7 (c) 9 (d) 6

6. The standard deviation in a variable x is σ . The standard deviation of the variable $\frac{ax+b}{c}$; where

a, b and c are constants, is

- (a) $\left(\frac{a}{c}\right)\sigma$ (b) $\left|\frac{a}{c}\right|\sigma$
(c) $\left(\frac{a^2}{c^2}\right)\sigma$ (d) None of these

7. If $\bar{x} = \bar{y} = 0$, $\Sigma x_i y_i = 12$, $\sigma_x = 2$, $\sigma_y = 3$ and $n = 10$, then the coefficient of correlation is

- (a) 0.4 (b) 0.3 (c) 0.2 (d) 0.1

8. If b_{yx} and b_{xy} are regression coefficients of y on x and x on y respectively, then which of the following statements is true?

- (a) $b_{xy} = 1.5$ and $b_{yx} = 1.4$ (b) $b_{xy} = 1.5$ and $b_{yx} = 0.9$
(c) $b_{xy} = 1.5$ and $b_{yx} = 0.8$ (d) $b_{xy} = 1.5$ and $b_{yx} = 0.6$

9. If $n = 10$, $\Sigma x = 4$, $\Sigma y = 3$, $\Sigma x^2 = 8$, $\Sigma y^2 = 9$ and $\Sigma xy = 3$, then coefficient of correlation is

- (a) $\frac{1}{4}$ (b) $\frac{7}{12}$ (c) $\frac{15}{4}$ (d) $\frac{14}{3}$

10. The standard deviation of some consecutive integers is found to be 2. Which of the following statements best describes the nature of the consecutive integers?

- (a) The integers are any set of eight consecutive integers
(b) The integers are any set of eight consecutive positive integers
(c) The integers are any set of seven consecutive integers
(d) None of the above

11. The two lines of regression are $8x - 10y = 66$ and $40x - 18y = 214$ and variance of x series is 9. What is the standard deviation of y series?

- (a) 3 (b) 4 (c) 6 (d) 9

12. What is the standard deviation of numbers 7, 9, 11, 13 and 15?

- (a) 2.2 (b) 2.4 (c) 2.6 (d) 2.8

13. If the monthly expenditure pattern of a person who earns a monthly salary of ₹ 15000 is represented in a pie diagram, then the sector angle of an item on transport expenses measures 15° . What is his monthly expenditure on transport?

- (a) ₹ 450 (b) ₹ 625
(c) ₹ 675 (d) Insufficient data

14. In a study on the relationship between investment (x) and profit (y), the two regression equations $3x + y - 12 = 0$ and $x + 2y - 14 = 0$ were obtained based on the data on x and y . What is the mean \bar{x} ?

- (a) 6 (b) 5 (c) 4 (d) 2

15. If $\sum_{i=1}^n (x_i - 2) = 110$, $\sum_{i=1}^n (x_i - 5) = 20$, then what is the mean?

- (a) $\frac{11}{2}$ (b) $\frac{2}{11}$ (c) $\frac{17}{3}$ (d) $\frac{17}{9}$

16. The marks scored by two students A and B in six subjects are given below

A	71	56	55	75	54	49
B	55	74	83	54	38	52

Which one of the following statements is most appropriate?

- (a) The average scores of A and B are same but A is consistent
 (b) The average scores of A and B are not same but A is consistent
 (c) The average scores of A and B are same but B is consistent
 (d) The average scores of A and B are not same but B is consistent

17. The average age of 20 students in a class is 15 yr. If the teacher's age is included, the average increase by one. What is the teacher's age?

- (a) 30 yr (b) 21 yr (c) 42 yr (d) 36 yr

18. A class consists of 3 sections A, B and C with 35, 35 and 30 students, respectively. The arithmetic means of the marks secured by students of sections A and B , who appeared for a test of 100 marks are 74 and 70, respectively. The arithmetic mean of the marks secured by students of section C , who appeared for a test in the same subject which carried 75 marks is 51. What is the average percentage of marks secured by all the 100 students of the three sections?

- (a) 70 (b) 70.80 (c) 65 (d) 67.50

19. The frequency distribution of a discrete variable X with one missing frequency f is given below.

X	1	2	3	4
Frequency	2	3	f	5

If the arithmetic mean of X is $\frac{23}{8}$, then what is the value of the missing frequency?

- (a) 5 (b) 6 (c) 8 (d) 10

20. What is the value of n for which the numbers 1, 2, 3, ..., n have variance 2?

- (a) 4 (b) 5 (c) 6 (d) 8

21. The frequency curve for the distribution of income in a region is positively skewed as shown in the figure below.

Then, for this distribution

- (a) Mean < Mode < Median (b) Mode < Median < Mean
 (c) Mode < Mean < Median (d) Median < Mean < Mode

22. If n_1 and n_2 are the sizes, G_1 and G_2 the geometric means of two series respectively, then which one of the following expresses the geometric mean (G) of the combined series?

- (a) $\log G = \frac{n_1 G_1 + n_2 G_2}{n_1 + n_2}$ (b) $\log G = \frac{n_2 \log G_1 + n_1 \log G_2}{n_1 + n_2}$
 (c) $G = \frac{n_1 \log G_1 + n_2 \log G_2}{n_1 + n_2}$ (d) None of these

23. The distributions X and Y with total number of observations 36 and 64 and means 4 and 3, respectively are combined. What is the mean of the resulting distribution $X + Y$?

- (a) 3.26 (b) 3.32 (c) 3.36 (d) 3.42

24. Consider the two series of observations A and B as follows

Series A	1019	1008	1015	1006	1002
Series B	1.9	0.8	1.5	0.6	0.2

If the standard deviation of the series A is $\sqrt{38}$, then what is the standard deviation of the series B ?

- (a) 3.8 (b) $\sqrt{0.38}$ (c) 0.38 (d) $\sqrt{38}$

25. Consider the following data

	Factory A	Factory B
Mean wage of workers	₹ 540	₹ 620
Standard deviation of wages	₹ 40.50	₹ 31

What is the variability in the wages of the workers in Factory A?

- (a) 100% more than the variability in the wages of the workers in factory B
 (b) 50% more than the variability in the wages of the workers in factory B
 (c) 50% less than the variability in the wages of the workers in factory B
 (d) 150% more than the variability in the wages of the workers in factory B

26. The mean of 7 observations is 10 and that of 3 observations is 5. What is the mean of all the 10 observations?

- (a) 15 (b) 10 (c) 8.5 (d) 7.5

27. The coefficient of regressions b_{yx} and b_{xy} from the set of observations

$\{(x, y)\} = \{(4, 2), (2, 3), (3, 2), (4, 4), (2, 4)\}$ will be

- (a) $\frac{1}{4}, \frac{1}{4}$ (b) $\frac{-1}{4}, \frac{1}{4}$ (c) $\frac{-1}{4}, \frac{-1}{4}$ (d) $\frac{1}{4}, \frac{-1}{4}$

- 28.** Consider the following statements with regard to correlation coefficient r between random variables x and y .
- I. $r = +1$ or -1 means there is a linear relation between x and y .
 - II. $-1 \leq r \leq 1$ and r^2 is a measure of the linear relationship between the variables.

Which of the above statement(s) is/are correct?

- (a) Only I
- (b) Only II
- (c) Both I and II
- (d) Neither I nor II

- 29.** Consider the following statements
The appropriate number of classes while constructing a frequency distribution should be chosen such that
- I. The class frequency first increases to a peak and then declines.
 - II. The class frequency should cluster around the class mid-point.

Which of the above statement(s) is/are correct?

- (a) Only I
- (b) Only II
- (c) Both I and II
- (d) Neither I nor II

Directions (Q. Nos. 30-31) *The following table gives the continuous frequency distribution of a continuous variable X.*

Class interval	0-10	10-20	20-30	30-40	40-50
Frequency	5	10	20	5	10

- 30.** What is the median of the above frequency distribution?
(a) 23 (b) 24 (c) 25 (d) 26
- 31.** What is the mean of the above frequency distribution?
(a) 25 (b) 26 (c) 27 (d) 28

Directions (Q. Nos 32-33) *A scientist is weighing each of 30 fishes. Their mean weight worked out is 30 g and standard deviation of 2g. Later it was found that the measuring scale was misaligned and always under reported every fish weight by 2g.*

- 32.** The correct mean of the fishes is
(a) 32 (b) 28 (c) 30 (d) 31
- 33.** The standard deviation of the fishes is
(a) 3 (b) 4 (c) 1 (d) 2

Directions (Q. Nos. 34-36) *An incomplete frequency distribution is given below.*

Variate	Frequency
10-20	12
20-30	30
30-40	x
40-50	65
50-60	45
60-70	25
70-80	18

Total of the frequency is 229.

- 34.** The value of missing frequency x is
(a) 35 (b) 24 (c) 34 (d) 44
- 35.** The median of the given distribution is
(a) 46 (b) 48 (c) 36 (d) 50
- 36.** The mean of the given distribution is
(a) 47.3 (b) 45.8 (c) 42 (d) 40

Directions (Q. Nos. 37-39) *The table below gives an incomplete frequency distribution with two missing frequencies f_1 and f_2 .*

Value of x	Frequency
0	f_1
1	f_2
2	4
3	4
4	3

The total frequency is 18 and the arithmetic mean of x is 2.

- 37.** What is the value of f_2 ?
(a) 4 (b) 3 (c) 2 (d) 1
- 38.** What is the standard deviation?
(a) $\frac{\sqrt{5}}{2}$ (b) $\frac{\sqrt{5}}{3}$ (c) $\frac{4}{3}$ (d) $\frac{16}{9}$
- 39.** What is the coefficient of variance?
(a) $\frac{200}{3}$ (b) $\frac{50\sqrt{5}}{9}$ (c) $\frac{600}{\sqrt{5}}$ (d) 150

Directions (Q. Nos. 40-43)

Study the pie chart given below and answer the questions that follow.

The following pie chart gives the distribution of funds in a five year plan under the major heads of development

expenditures Agriculture (A), Industry (B), Education (C), Employment (D) and Miscellaneous (E).

The total allocation is 36000 (in crore of rupees).

- 40.** Which head is allocated maximum funds?
(a) Agriculture (b) Industry
(c) Employment (d) Miscellaneous
- 41.** How much money (in crore) is allocated to Education?
(a) 3000 (b) 6000 (c) 9000 (d) 10800
- 42.** How much money (in crore) is allocated to both Agriculture and Employment?
(a) 20000 (b) 21000 (c) 24000 (d) 27000
- 43.** How much excess money (in crore) is allocated to Miscellaneous over Education?
(a) 3600 (b) 42000 (c) 4500 (d) 4800

PREVIOUS YEARS' QUESTIONS

- 44.** What is the mode for the data 20, 20, 20, 21, 21, 21, 21, 21, 22, 22, 22, 22, 22, 22, 22, 23, 23, 23, 23, 23, 24, 24 and 25? **☑ 2012 I**
(a) 7 (b) 21 (c) 22 (d) 25
- 45.** The geometric mean and harmonic mean of two non-negative observations are 10 and 8, respectively. Then, what is the arithmetic mean of the observations? **☑ 2012 I**
(a) 4 (b) 9 (c) 12.5 (d) 25
- 46.** What is the arithmetic mean of first 16 natural numbers with weights being the number itself? **☑ 2012 I**
(a) $17/2$ (b) $33/2$ (c) 11 (d) $187/2$
- 47.** Consider the following statements
I. A continuous random variable can take all values in an interval.
II. A random variable which takes a finite number of values is necessarily discrete.
III. Construction of a frequency distribution is based on data which are discrete.
Which of the above statement(s) is/are correct?
(a) Both I and II (b) Both II and III **☑ 2012 I**
(c) Both I and III (d) All of these
- 48.** If values of variable X are 2, 9, 3, 7, 5, 4, 3, 2 and 10, then what is its median? **☑ 2012 I**
(a) 2 (b) 4 (c) 7 (d) 9
- 49.** What is the standard deviation of 7, 9, 11, 13 and 15? **☑ 2012 II**
(a) 2.4 (b) 2.5 (c) 2.7 (d) 2.8
- 50.** Frequency curve may be **☑ 2012 II**
(a) symmetrical (b) positive skew
(c) negative skew (d) All of these
- 51.** The median of 27 observations of a variable is 18. Three more observations are made and the values of these observations are 16, 18 and 50. What is the median of these 30 observations?
(a) 18 (b) 19 **☑ 2012 II**
(c) 25.5 (d) Cannot be determined
- 52.** The algebraic sum of the deviations of 20 observations measured from 30 is 2. What would be the mean of the observations? **☑ 2012 II**
(a) 30 (b) 32 (c) 30.2 (d) 30.1
- 53.** The arithmetic mean of numbers a, b, c, d and e is M . What is the value of $(a - M) + (b - M) + (c - M) + (d - M) + (e - M)$? **☑ 2012 II**
(a) M (b) $a + b + c + d + e$
(c) 0 (d) $5M$
- 54.** What is the mean of first n odd natural numbers? **☑ 2012 II**
(a) n (b) $(n + 1)/2$ (c) $n(n + 1)/2$ (d) $n + 1$
- 55.** The mean of 10 observations is 5. If 2 is added to each observation and then multiplied by 3, then what will be the new mean? **☑ 2012 II**
(a) 5 (b) 7 (c) 15 (d) 21
- 56.** The standard deviation of the observations 5, 5, 5, 5, 5 is **☑ 2013 I**
(a) 0 (b) 5 (c) 20 (d) 25
- 57.** If two lines of regression are perpendicular, then the correlation coefficient r is **☑ 2013 I**
(a) 2 (b) $\frac{1}{2}$ (c) 0 (d) None of these
- 58.** The average marks obtained by the students in a class are 43. If the average marks obtained by 25 boys are 40 and the average marks obtained by the girl students are 48, then what is the number of girl students in the class? **☑ 2013 I**
(a) 15 (b) 17 (c) 18 (d) 20
- 59.** Variance is always independent of the change of
(a) origin but not scale (b) only scale **☑ 2013 I**
(c) both origin and scale (d) None of these
- 60.** The harmonic mean H of two numbers is 4 and the arithmetic mean A and geometric mean G satisfy the equation $2A + G^2 = 27$. The two numbers are **☑ 2013 I**
(a) 6, 3 (b) 9, 5 (c) 12, 7 (d) 3, 1
- 61.** Consider the following frequency distribution
- | Class interval | 0-10 | 10-20 | 20-30 | 30-40 | 40-50 |
|----------------|------|-------|-------|-------|-------|
| Frequency | 14 | x | 27 | y | 15 |
- If the total of the frequencies is 100 and mode is 25, then which one of the following is correct? **☑ 2013 I**
(a) $x = 2y$ (b) $2x = y$ (c) $x = y$ (d) $x = 3y$
- 62.** The marks obtained by 13 students in a test are 10, 3, 10, 12, 9, 7, 9, 6, 7, 10, 8, 6 and 7. The median of this data is **☑ 2013 I**
(a) 7 (b) 8 (c) 9 (d) 10
- 63.** Consider the following statements
I. Both variance and standard deviation are measures of variability in the population.
II. Standard deviation is the square of the variance.
Which of the above statement(s) is/are correct?
(a) Only I (b) Only II **☑ 2013 I**
(c) Both I and II (d) Neither I nor II
- 64.** Coefficient of correlation is the measure of
(a) central tendency **☑ 2013 II**
(b) dispersion
(c) Both central tendency and dispersion
(d) Neither central tendency nor dispersion

- 65.** Which one of the following measures is determined only after the construction of cumulative frequency distribution? **☑ 2013 II**
 (a) Arithmetic mean (b) Mode
 (c) Median (d) Geometric mean

- 66.** The arithmetic mean of the squares of the first n natural numbers is **☑ 2013 II**
 (a) $\frac{n(n+1)(2n+1)}{6}$ (b) $\frac{n(n+1)(2n+1)}{2}$
 (c) $\frac{(n+1)(2n+1)}{6}$ (d) $\frac{(n+1)(2n+1)}{3}$

- 67.** The mean of 20 observations is 15. On checking, it was found that two observations were wrongly copied as 3 and 6. If wrong observations are replaced by correct values 8 and 4, then the correct mean is **☑ 2013 II**
 (a) 15 (b) 15.15 (c) 15.35 (d) 16

- 68.** Consider the following statements
 I. Both the regression coefficients have same sign.
 II. If one of the regression coefficients is greater than unity, the other must be less than unity.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II **☑ 2013 II**
 (c) Both I and II (d) Neither I nor II

- 69.** p, q, r, s and t are five numbers such that the average of p, q and r is 5 and that of s and t is 10. What is the average of all the five numbers? **☑ 2014 I**
 (a) 7.75 (b) 7.5 (c) 7 (d) 5

Directions (Q. Nos. 70-72) *The number of telephone calls received in 245 successive, one minute intervals at an exchange is given below in the following frequency distribution.* **☑ 2014 I**

Number	0	1	2	3	4	5	6	7
Frequency	14	21	25	43	51	40	39	12

- 70.** What is the mean of the distribution?
 (a) 3.76 (b) 3.84 (c) 3.96 (d) 4.05
- 71.** What is the median of the distribution?
 (a) 3.5 (b) 4 (c) 4.5 (d) 5
- 72.** What is the mode of the distribution?
 (a) 3 (b) 4 (c) 5 (d) 6
- 73.** For two variables x and y , the two regression coefficients are $b_{yx} = -3/2$ and $b_{xy} = -1/6$. The correlation coefficient between x and y is **☑ 2014 I**
 (a) $-1/4$ (b) $1/4$ (c) $-1/2$ (d) $1/2$

- 74.** The variance of numbers $x_1, x_2, x_3, \dots, x_n$ is V . Consider the following statements.
 I. If every x_i is increased by 2, the variance of the new set of numbers is V .

II. If the numbers x_i is squared, the variance of the new set is V^2 .

Which of the following statement(s) is/are correct?
 (a) Only I (b) Only II **☑ 2014 I**
 (c) Both I and II (d) Neither I nor II

- 75.** What is the mean of the squares of the first 20 natural numbers? **☑ 2014 I**
 (a) 151.5 (b) 143.5 (c) 65 (d) 72

Directions (Q. Nos. 76-78) *The mean and standard deviation of 100 items are 50, 5 and that of 150 items are 40, 6 respectively.* **☑ 2014 I**

- 76.** What is the combined mean of all 250 items?
 (a) 43 (b) 44 (c) 45 (d) 46
- 77.** What is the combined standard deviation of all 250 items?
 (a) 7.1 (b) 7.3 (c) 7.5 (d) 7.7
- 78.** What is the variance of all the 250 items?
 (a) 50.6 (b) 53.3 (c) 55.6 (d) 59.3
- 79.** The cumulative frequency of the largest observed value must always be **☑ 2014 I**
 (a) less than the total number of observations
 (b) greater than the total number of observations
 (c) equal to total number of observations
 (d) equal to mid-point of the last class interval
- 80.** Consider the following statements in respect of histogram
 I. The histogram is a suitable representation of a frequency distribution of a continuous variable.
 II. The area included under the whole histogram is the total frequency.
 Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II **☑ 2014 II**
 (c) Both I and II (d) Neither I nor II

- 81.** The regression lines will be perpendicular to each other, if the coefficient of correlation r is equal to **☑ 2014 II**
 (a) 1 (b) 1 or -1 (c) -1 (d) 0

- 82.** If \bar{x} and \bar{y} are the means of two distributions such that $\bar{x} < \bar{y}$ and \bar{z} is the mean of the combined distribution, then which one of the following statements is correct? **☑ 2014 II**
 (a) $\bar{x} < \bar{y} < \bar{z}$ (b) $\bar{x} > \bar{y} > \bar{z}$ (c) $\bar{z} = \frac{\bar{x} + \bar{y}}{2}$ (d) $\bar{x} < \bar{z} < \bar{y}$

- 83.** What is the mean deviation about the mean for the data 4, 7, 8, 9, 10, 12, 13 and 17? **☑ 2014 II**
 (a) 2.5 (b) 3 (c) 3.5 (d) 4

- 84.** The variance of 20 observations is 5. If each observation is multiplied by 2, then what is the new variance of the resulting observations? **☑ 2014 II**
 (a) 5 (b) 10 (c) 20 (d) 40

- 85.** The 'less than' ogive curve and the 'more than' ogive curve intersect at ☑ 2015 I
 (a) Median (b) Mode
 (c) Arithmetic mean (d) None of these
- 86.** Which of the following statements is/are correct in respect of regression coefficients?
 I. It measures the degree of linear relationship between two variables.
 II. It gives the value by which one variable changes for a unit change in the other variable.
Select the correct answer using the code given below. ☑ 2015 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 87.** Which one of the following measures of central tendency is used in construction of index numbers? ☑ 2015 I
 (a) Harmonic mean (b) Geometric mean
 (c) Median (d) Mode
- 88.** A set of annual numerical data, comparable over the years, is given for the last 12 yr.
 Consider the following statements
 I. The data is best represented by a broken line graph, each corner (turning point) representing the data of one year.
 II. Such a graph depicts the chronological change and also enables one to make a short term forecast.
Which of the above statement(s) is/are correct?
 (a) Only I (b) Only II ☑ 2015 I
 (c) Both I and II (d) Neither I nor II
- 89.** The mean and the variance of 10 observations are given to be 4 and 2 respectively. If every observation is multiplied by 2, the mean and the variance of the new series will be respectively ☑ 2015 I
 (a) 8 and 20 (b) 8 and 4 (c) 8 and 8 (d) 80 and 40
- 90.** The mean of five numbers is 30. If one number is excluded, their mean becomes 28. The excluded number is ☑ 2015 I
 (a) 28 (b) 30 (c) 35 (d) 38
- 91.** The correlation coefficient between two variables X and Y is found to be 0.6. All the observations on X and Y are transformed using the transformations $U = 2 - 3X$ and $V = 4Y + 1$. The correlation coefficient between the transformed variables U and V will be ☑ 2015 I
 (a) - 0.5 (b) + 0.5 (c) - 0.6 (d) + 0.6
- 92.** The arithmetic mean of 1, 8, 27, 64, ... upto n terms is given by ☑ 2015 II
 (a) $\frac{n(n+1)}{2}$ (b) $\frac{n(n+1)^2}{2}$ (c) $\frac{n(n+1)^2}{4}$ (d) $\frac{n^2(n+1)^2}{4}$
- 93.** The geometric mean of the observations $x_1, x_2, x_3, \dots, x_n$ is G_1 . The geometric mean of the observations $y_1, y_2, y_3, \dots, y_n$ is G_2 . The geometric mean of observations $\frac{x_1}{y_1}, \frac{x_2}{y_2}, \frac{x_3}{y_3}, \dots, \frac{x_n}{y_n}$ is ☑ 2015 II
 (a) $G_1 G_2$ (b) $\ln(G_1 G_2)$ (c) $\frac{G_1}{G_2}$ (d) $\ln\left(\frac{G_1}{G_2}\right)$
- 94.** The regression coefficients of a bivariate distribution are -0.64 and -0.36. Then, the correlation coefficient of the distribution is ☑ 2015 II
 (a) 0.48 (b) - 0.48 (c) 0.50 (d) - 0.50
- 95.** If m is the geometric mean of $\left(\frac{y}{z}\right)^{\log(yz)}$, $\left(\frac{z}{x}\right)^{\log(zx)}$ and $\left(\frac{x}{y}\right)^{\log(xy)}$ then what is the value of m ? ☑ 2016 I
 (a) 1 (b) 3 (c) 6 (d) 9
- 96.** What is the mean deviation from the mean of the numbers 10, 9, 21, 16, 24? ☑ 2016 I
 (a) 5.2 (b) 5.0
 (c) 4.5 (d) 4.0
- 97.** If the total number of observations is 20, $\Sigma x_i = 1000$ and $\Sigma x_i^2 = 84000$, then what is the variance of the distribution? ☑ 2016 I
 (a) 1500 (b) 1600
 (c) 1700 (d) 1800
- 98.** The mean of the series x_1, x_2, \dots, x_n is \bar{X} . If x_2 is replaced by λ , then what is the new mean? ☑ 2016 I
 (a) $\bar{X} - x_2 + \lambda$ (b) $\frac{\bar{X} - x_2 - \lambda}{n}$
 (c) $\frac{\bar{X} - x_2 + \lambda}{n}$ (d) $\frac{n\bar{X} - x_2 + \lambda}{n}$
- 99.** For the data 3, 5, 1, 6, 5, 9, 5, 2, 8, 6, the mean, median and mode are x , y and z , respectively. Which one of the following is correct? ☑ 2016 I
 (a) $x = y \neq z$ (b) $x \neq y = z$ (c) $x \neq y \neq z$ (d) $x = y = z$
- 100.** Consider the following statements in respect of a histogram.
 I. The total area of the rectangles in a histogram is equal to the total area bounded by the corresponding frequency polygon and the X -axis.
 II. When class intervals are unequal in a frequency distribution, the area of the rectangle is proportional to the frequency.
Which of the above statement(s) is/are correct? ☑ 2016 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II

> HINTS AND SOLUTIONS

1. (c)
2. (a)

Class interval	Frequency	Cumulative frequency
0-10	4	4
10-20	10	14
20-30	25	39
30-40	8	47
40-50	2	49

3. (b)
4. (c) Median = 25, median class = 20-30,
 $l_1 = 20, l_2 = 30, f = 28$.
Let $f_2 = x$,
then $f_4 = 43 - x, C = (14 + x)$

Class interval	Frequency	Cumulative frequency
0-10	14	14
10-20	x	$14 + x$
20-30	28	$42 + x$
30-40	$43 - x$	85
40-50	15	100

$$\therefore \text{Median} = l_1 + \frac{(l_2 - l_1)}{f} \times \left(\frac{n}{2} - C\right)$$

$$\Rightarrow 20 + \frac{10}{28} \times [50 - (14 + x)] = 25$$

[given]

$$\Rightarrow x = 22$$

$$\therefore f_2 = 22$$

$$\text{and } f_4 = (43 - 22) = 21$$

5. (d) If each item of a data is increased or decreased by the same constant, then standard deviation of the data remains unchanged, i.e. SD is 6.

6. (b) Let $y = \frac{ax + b}{c}$

$$\Rightarrow y = \frac{a}{c}x + \frac{b}{c}$$

$$\Rightarrow y = Ax + B,$$

where $A = \frac{a}{c}, B = \frac{b}{c}$

So, $y = A\bar{x} + B$

$$\therefore y - \bar{y} = (Ax + B) - (A\bar{x} + B)$$

$$= A(x - \bar{x})$$

$$\Rightarrow (y - \bar{y})^2 = A^2(x - \bar{x})^2$$

$$\Rightarrow \Sigma(y - \bar{y})^2 = A^2 \Sigma(x - \bar{x})^2$$

$$\Rightarrow n\sigma_y^2 = A^2(n\sigma_x^2)$$

$$\Rightarrow \sigma_y = |A| \sigma_x$$

$$\therefore \sigma_y = \left| \frac{a}{c} \right| \sigma$$

7. (c) $\therefore r = \frac{\Sigma(x_i - \bar{x})(y_i - \bar{y})}{n\sigma_x\sigma_y}$

$$= \frac{\Sigma(x_i - 0)(y_i - 0)}{(10)(2)(3)} = \frac{\Sigma(x_i)(y_i)}{(10)(2)(3)}$$

$$= \frac{\Sigma x_i y_i}{(10)(2)(3)} = \frac{12}{(10)(2)(3)} = 0.2$$

8. (d) In option (d),
 $r = \sqrt{1.5 \times 0.6} = \sqrt{0.9} < 1$

9. (a) $r = \frac{n\Sigma xy - \Sigma x \Sigma y}{\sqrt{\{n\Sigma x^2 - (\Sigma x)^2\}\{n\Sigma y^2 - (\Sigma y)^2\}}}$

$$= \frac{10 \times 3 - 4 \times 3}{\sqrt{\{10 \times 8 - (4)^2\}\{10 \times 9 - (3)^2\}}}$$

$$= \frac{18}{\sqrt{64 \times 81}} = \frac{18}{8 \times 9} = \frac{1}{4}$$

10. (c)
11. (b) The regression coefficient y on x on the line $8x - 10y = 66$,

$$b_{yx} = 4/5$$

The regression coefficient x on y on the line $40x - 18y = 214, b_{yx} = \frac{9}{20}$

$$\Rightarrow r^2 = \frac{36}{100} \Rightarrow r = 0.6$$

$$\Rightarrow b_{yx} = \frac{r\sigma_y}{\sigma_x}$$

$$\therefore \sigma_y = \frac{\frac{4}{5} \times 3}{0.6} = \frac{12}{3} = 4$$

12. (d) $\therefore \bar{x} = \frac{7 + 9 + 11 + 13 + 15}{5} = \frac{55}{5} = 11$

Now,

$$SD = \sqrt{\frac{(7-11)^2 + (9-11)^2 + (11-11)^2 + (13-11)^2 + (15-11)^2}{5}}$$

$$= \sqrt{\frac{16 + 4 + 0 + 4 + 16}{5}} = \sqrt{8} = 2.8 \text{ (approx)}$$

13. (b) Since, monthly salary = ₹ 15000
 and sector angle of expenses = 15°

\therefore Amount = $\frac{15^\circ}{360^\circ} \times 15000 = ₹ 625$

14. (d) Since, lines of regression passes through (\bar{x}, \bar{y}) .

$\therefore 3\bar{x} + \bar{y} - 12 = 0$... (i)

and $\bar{x} + 2\bar{y} - 14 = 0$... (ii)

On solving Eqs. (i) and (ii), we get $\bar{x} = 2$ and $\bar{y} = 6$

15. (c) $\therefore \sum_{i=1}^n (x_i - 2) = 110$

$\therefore x_1 + x_2 + \dots + x_n - 2n = 110$
 $\Rightarrow x_1 + x_2 + \dots + x_n = 2n + 110$... (i)

and $\sum_{i=1}^n (x_i - 5) = 20 \Rightarrow x_1 + x_2 + \dots + x_n - 5n = 20$

$\Rightarrow x_1 + x_2 + \dots + x_n = 5n + 20$... (ii)

From Eqs. (i) and (ii), we get $5n + 20 = 2n + 110$

$\Rightarrow 3n = 90 \Rightarrow n = 30$

Now, mean = $\frac{x_1 + x_2 + \dots + x_n}{n} = \frac{5 \times 30 + 20}{30} = \frac{170}{30} = \frac{17}{3}$

16. (b) Average marks of A
 $= \frac{71 + 56 + 55 + 75 + 54 + 49}{6} = \frac{360}{6} = 60$

and SD = $\sqrt{\frac{121 + 16 + 25 + 225 + 36 + 121}{6}} = \sqrt{\frac{544}{6}} = 9.52$

Also, average marks of B
 $= \frac{55 + 74 + 83 + 54 + 38 + 52}{6} = \frac{356}{6} = 59.33 \approx 59$

and SD = $\sqrt{\frac{16 + 225 + 576 + 25 + 441 + 49}{6}} = \sqrt{\frac{1332}{6}} = \sqrt{222} \approx 14.9$

Now, $CV_A = \frac{9.52}{60} \times 100 = 15.87$

and $CV_B = \frac{14.9}{59} \times 100 = 25.25$

Thus, the average scores of A and B are not same but A is consistent as coefficient of variable is less than that of B.

17. (d) Let the teacher's age be x yr.

$\therefore 15 + 1 = \frac{20 \times 15 + x}{21} \Rightarrow 16 \times 21 = 300 + x \Rightarrow$

$x = 336 - 300 = 36$ yr

18. (b) Since, section C carried 51 average marks out of 75.

\therefore C carried $\frac{51}{75} \times 100$ i.e. 68 average marks out of 100.

So, average percentage marks = $\frac{35 \times 74 + 35 \times 70 + 30 \times 68}{100}$
 $= \frac{2590 + 2450 + 2040}{100} = 70.80$

19. (b) Arithmetic mean = $\frac{2 \times 1 + 3 \times 2 + 3f + 4 \times 5}{2 + 3 + f + 5}$

$\Rightarrow \frac{23}{8} = \frac{28 + 3f}{10 + f}$

$\Rightarrow 230 + 23f = 224 + 24f \Rightarrow f = 6$

20. (b) Mean of the numbers = $\frac{2}{n} = \frac{n+1}{2}$

\therefore Variance = $\frac{\left(1 - \frac{n+1}{2}\right)^2 + \left(2 - \frac{n+1}{2}\right)^2 + \dots + \left(n - \frac{n+1}{2}\right)^2}{n}$

$(1^2 + 2^2 + 3^2 + \dots + n^2) + n\left(\frac{n+1}{2}\right)^2 - 2\left(\frac{n+1}{2}\right)$

$\Rightarrow 2 = \frac{(1 + 2 + 3 + \dots)}{n}$

$\Rightarrow 2n = \frac{1}{6} n(n+1)(2n+1) + \frac{n(n+1)^2}{4} - 2\left(\frac{n+1}{2}\right)\left\{\frac{n(n+1)}{2}\right\}$

$\Rightarrow 2n = n(n+1)\left[\frac{2n+1}{6} + \frac{n+1}{4} - \frac{n+1}{2}\right]$

$\Rightarrow 2 = (n+1)\left[\frac{4n+2-3n-3}{12}\right]$

$\Rightarrow 24 = (n+1)(n-1)$

$\Rightarrow n^2 - 1 = 24 \Rightarrow n^2 = 25 \Rightarrow n = \pm 5$

$\therefore n = 5$ [since, n cannot be negative]

21. (d)

22. (b) Required expression is $\log G = \frac{n_2 \log G_1 + n_1 \log G_2}{n_1 + n_2}$

23. (c) Required mean = $\frac{36 \times 4 + 64 \times 3}{36 + 64} = \frac{144 + 192}{100} = \frac{336}{100} = 3.36$

24. (b) Standard deviation of the series B

$= \sqrt{\frac{1}{5}(19^2 + 0.8^2 + 15^2 + 0.6^2 + 0.2^2) - \left(\frac{19 + 0.8 + 15 + 0.6 + 0.2}{5}\right)^2}$

$= \sqrt{\frac{6.9}{5} - 1} = \sqrt{1.38 - 1} = \sqrt{0.38}$

25. (c) The availability in the wages of the workers in factory A is 50% less than the variability in the wages of the workers in factory B.

26. (c) Given, mean of 7 observations = 10

$\Rightarrow \frac{\sum_{i=1}^7 X_i}{7} = 10 \Rightarrow \sum_{i=1}^7 X_i = 70$... (i)

and mean of 3 observations = 5 $\Rightarrow \frac{\sum_{i=1}^3 X_i}{3} = 5$

$\Rightarrow \sum_{i=1}^3 X_i = 15$... (ii)

On adding Eqs. (i) and (ii), we get

$\sum_{i=1}^7 X_i + \sum_{i=1}^3 X_i = 70 + 15 \Rightarrow \sum_{i=1}^{10} X_i = 85$

\therefore Mean of 10 observations = $\frac{\sum_{i=1}^{10} X_i}{10} = \frac{85}{10} = 8.5$

27. (c) For calculation of b and b_{yx} we have to calculate Σx , Σy , Σxy , Σx^2 and Σy^2 . We have

x	4	2	3	4	2	$\Sigma x = 15$
y	2	3	2	4	4	$\Sigma y = 15$
xy	8	6	6	16	8	$\Sigma xy = 44$
x^2	16	4	9	16	4	$\Sigma x^2 = 49$
y^2	4	9	4	16	16	$\Sigma y^2 = 49$

$$\therefore b_{yx} = \frac{\Sigma xy - \frac{1}{n} \Sigma x \Sigma y}{\Sigma x^2 - \frac{1}{n} (\Sigma x)^2} = \frac{44 - \frac{1}{5}(15)(15)}{49 - \frac{1}{5}(15)^2} = \frac{44 - 45}{49 - 45} = \frac{-1}{4}$$

$$b_{xy} = \frac{\Sigma xy - \frac{1}{n} \Sigma x \Sigma y}{\Sigma y^2 - \frac{1}{n} (\Sigma y)^2} = \frac{44 - 45}{49 - 45} = \frac{-1}{4}$$

28. (c) We know that, when two lines are coincident linearly, then $r = \pm 1$. Also, if $r \in [-1, 1]$, then there is a relation measure of the linear relationship between the variables.

29. (b)

30. (c)

Class interval	Frequency (f)	Cumulative frequency (cf)
0-10	5	5
10-20	10	15
20-30	20	35
30-40	5	40
40-50	10	50
Total	$N = 50$	

$$\therefore \frac{N}{2} = \frac{50}{2} = 25$$

Here, $f_k = 20$, $l = 20$, $b = 10$, $cf = 15$

$$\text{Now, median} = l + \frac{\frac{N}{2} - cf}{f} = 20 + \frac{10}{20}(25 - 15)$$

$$= 20 + \frac{10}{20}(25 - 15)$$

$$= 20 + \frac{10}{20} \cdot 10 = 20 + 5 = 25$$

31. (b)

Class interval	Frequency (f)	Mid-value (x)	fx
0-10	5	5	25
10-20	10	15	150
20-30	20	25	500
30-40	5	35	175
40-50	10	45	450
Total	$N = 50$		$\Sigma fx = 1300$

$$\text{Now, mean} = \frac{\Sigma fx}{N} = \frac{1300}{50} = 26$$

Sol. (Q Nos. 32-33) Let x_1, x_2, \dots, x_{30} be actual weights of 30 fishes and y_1, y_2, \dots, y_{30} be the weights of fishes taken from misaligned increasing scale. Then, $y_i = x_i + 2$; $i = 1, 2, \dots, 30$

$$\Rightarrow \bar{Y} = \bar{X} + 2 \text{ and } \sigma_y = \sigma_x$$

$$\Rightarrow 30 = \bar{x} + 2 \text{ and } \sigma_y = \sigma_x$$

[Standard deviation is independent of change of origin]

$$\Rightarrow \bar{x} = 28 \text{ and } \sigma_y = 2$$

Hence, correct mean is 28 and standard deviation is 2.

32. (b) 33. (d)

$$34. (c) \sum_{i=1}^n f_i = 229$$

$$\Rightarrow 12 + 30 + x + 65 + 45 + 25 + 18 = 229$$

$$\Rightarrow x + 195 = 229 \Rightarrow x = 34$$

35. (a)

Class interval	x_i	Frequency (f_i)	cf	$f_i x_i$
10-20	15	12	12	180
20-30	25	30	42	750
30-40	35	34	76	1190
40-50	45	65	141	2925
50-60	55	45	186	2475
60-70	65	25	211	1625
70-80	75	8	229	1350
Total		$\Sigma f_i = 229$	10495	$\Sigma f_i x_i$

$$\text{Here, } \frac{N}{2} = \frac{229}{2} = 114.5$$

Hence, the cumulative frequency just greater than 114.5 is 141. Median group is 40-50 class.

$$\therefore \text{Median} = l + b \left\{ \frac{\frac{N}{2} - cf}{f} \right\}$$

$$= 40 + 10 \left[\frac{229}{2} - 76 \right]$$

$$= 40 + 10 \frac{65}{65} = 40 + 10 = 50$$

$$= 40 + 10 \frac{(114.5 - 76)}{65} = 45.9 \approx 46$$

$$36. (b) \text{ Mean} = \frac{\Sigma f_i x_i}{\Sigma f_i} = \frac{10495}{229} = 45.8$$

Sol. (Q Nos. 37-39)

x	f	fx
0	f_1	0
1	f_2	f_2
2	4	8
3	4	12
4	3	12
Total	$f_1 + f_2 + 11$	$32 + f_2$

$$\text{Now, } f_1 + f_2 + 11 = 18$$

$$\Rightarrow f_1 + f_2 = 7 \quad \dots(i)$$

$$\text{and } \frac{32 + f_2}{18} = 2$$

$$\Rightarrow f_2 = 36 - 32 = 4$$

On putting the value of f_2 in Eq. (i),

$$\text{we get } f_1 = 7 - 4 = 3$$

37. (a) $f_2 = 4$

38. (c) $\therefore \bar{x} = 2$ [given]

x	$x - \bar{x}$	$(x - \bar{x})^2$	f	$f(x - \bar{x})^2$
0	-2	4	3	12
1	-1	1	4	4
2	0	0	4	0

4	2	4	3	12
Total			18	32

$$\text{Now, SD} = \sqrt{\frac{\Sigma f(x - \bar{x})^2}{N}}$$

$$= \sqrt{\frac{32}{18}} = \sqrt{\frac{16}{9}} = \frac{4}{3}$$

39. (a) Coefficient of variance = $\frac{\sigma}{\bar{x}} \times 100$

$$= \frac{4}{3} \times \frac{1}{2} \times 100 = \frac{200}{3}$$

40. (c) Employment is allocated maximum funds.

41. (a) Money allocated to Education = $\frac{30^\circ}{360^\circ} \times 36000 = 3000$

42. (b) Money allocated to both Agriculture and Employment

$$= \left(\frac{90^\circ + 120^\circ}{360^\circ} \right) \times 36000 = \frac{210}{360} \times 36000 = 21000$$

43. (c) Required value of money

$$= \left(\frac{75^\circ - 30^\circ}{360^\circ} \right) \times 36000 = \frac{45}{360} \times 36000 = 4500$$

44. (c)

45. (c) Given, geometric mean (G) = 10 and harmonic mean (H) = 8

Let A be the arithmetic mean, then $G^2 = AH$

$$\Rightarrow A = \frac{G^2}{H}$$

$$\Rightarrow A = \frac{(10)^2}{8} = \frac{100}{8} = 12.5$$

60. (a) Given that, Harmonic mean H of two numbers = 4

Let the two numbers be a and b .

Also, given that, $2A + G^2 = 27$... (i)

We know that, relation between arithmetic mean (A), geometric mean (G) and harmonic mean (H) is $G^2 = AH$

which satisfy the Eq. (i).

$\therefore 2A + AH = 27$

$\Rightarrow 2A + A \cdot 4 = 27 \Rightarrow 6A = 27$... (ii)

Arithmetic mean ' A ' of two numbers a and b is

$\frac{a+b}{2} = A = \frac{9}{2}$ [from Eq. (ii)]

$\Rightarrow a + b = 9$... (iii)

$\therefore H = \frac{2ab}{a+b} = \frac{2ab}{9} = 4 \Rightarrow ab = 18$... (iv)

We have, $(a-b)^2 = (a+b)^2 - 4ab$
 $= (9)^2 - 4 \cdot 18 = 81 - 72 = 9$

$\Rightarrow a - b = \pm 3$... (v)

From Eqs. (iii) and (v),

Case I $a + b = 9$ and $a - b = 3 \Rightarrow 2a = 12 \Rightarrow a = 6$ and $b = 3$

Case II $a + b = 9$ and $a - b = -3 \Rightarrow 2a = 6 \Rightarrow a = 3$ and $b = 6$

Hence, the required numbers are 6 and 3 or 3 and 6.

61. (c) Class interval	0-10	10-20	20-30	30-40	40-50
Frequency	14	x	27	y	15

Given that, Sum of frequencies = 100

$\Rightarrow 14 + x + 27 + y + 15 = 100$

$\Rightarrow x + y + 57 = 100 \Rightarrow x + y = 43$... (i)

For mode, $f_m = 27, f_1 = x$ and $f_2 = y, l_1 = 20, b = 10$

Clearly, 20-30 is the modal class.

Since, mode lies between 20-30.

$\therefore \text{Mode} = l_1 + \left(\frac{f_m - f_1}{2f_m - f_1 - f_2} \right) \times b$

Given, $25 = 20 + \left(\frac{27 - x}{54 - x - y} \right) \times 10 \Rightarrow 5 = \frac{270 - 10x}{54 - x - y}$

$\Rightarrow 270 - 10x = -5x - 5y + 270$

$\Rightarrow 5x - 5y = 0 \Rightarrow x = y$... (ii)

From Eqs. (i) and (ii), we get $2x = 43 \Rightarrow x = \frac{43}{2} = 21.5$

$\therefore x = y = 21.5$

62. (b) Arrange the given data in ascending order, we get

3, 6, 6, 7, 7, 7, 8, 9, 9, 10, 10, 10, 12

Total terms, $n = 13$ (odd)

$\therefore \text{Median} = \left(\frac{n+1}{2} \right)$ th term

$= \left(\frac{13+1}{2} \right)$ th term = 7th term = 8

63. (d) 64. (d) 65. (c) 66. (c)

67. (b) Given that,

Mean of 20 observations = 15

\therefore Sum of 20 observations = $20 \times 15 = 300$

\therefore Sum of actual (correct) observations

$= 300 - (3 + 6) + (8 + 4) = 300 - 9 + 12 = 303$

\therefore Correct mean = $\frac{303}{20} = 15.15$

68. (c) Let $b_{yx} > 1 \Rightarrow \frac{1}{b_{xy}} < 1$... (i)

We have, $b_{yx} \cdot b_{xy} = r^2 \leq 1 \Rightarrow b_{xy} \leq \frac{1}{b_{yx}} < 1$ [from Eq. (i)]

Hence, if one of the regression coefficients is greater than one, the other must be less than one. So, both statements are true.

69. (c) Given that, p, q, r, s and t are five numbers,

\therefore Average of p, q and $r = 5 \Rightarrow \frac{p+q+r}{3} = 5$

$\Rightarrow p + q + r = 15$... (i)

and average of s and $t = 10 \Rightarrow \frac{s+t}{2} = 10 \Rightarrow s + t = 20$... (ii)

Now, average of all five numbers

$= \frac{p+q+r+s+t}{5} = \frac{(p+q+r) + (s+t)}{5}$

$= \frac{15 + 20}{5} = \frac{35}{5} = 7$

Sol. (Q. Nos. 70-72) Given frequency distribution is

Number of calls (x_i)	0	1	2	3	4	5	6	7
Frequency (f_i)	14	21	25	43	51	40	39	12

70. (a) Mean = $\frac{\sum f_i x_i}{\sum f_i}$

$= \frac{[(0 \times 14 + 1 \times 21 + 2 \times 25 + 3 \times 43 + 4 \times 51 + 5 \times 40 + 6 \times 39 + 7 \times 12)]}{(14 + 21 + 25 + 43 + 51 + 40 + 39 + 12)}$
 $= \frac{(0 + 21 + 50 + 129 + 204 + 200 + 234 + 84)}{245} = \frac{922}{245} = 3.76$

Number of calls (x_i)	Frequency (f_i)	Cummulative Frequency (cf)
0	14	14
1	21	35
2	25	60
3	43	103
4	51	154
5	40	194
6	39	233
7	12	245
Total	$N = \sum f_i = 245$	

Here, $\frac{N}{2} = \frac{245}{2} = 122.5$

The cumulative frequency 154 which is equal or just greater than $\frac{N}{2}$.

\therefore Required median = Value of the variable corresponding to the cumulative frequency 154

72. (b) We see that in the frequency distribution the higher frequency is 51.

∴ Required mode = Value of variable corresponding to the higher frequency = 4

73. (c) Given that, two regression coefficients are,

$$b_{yx} = -3/2 \text{ and } b_{xy} = -1/6$$

Now, correlation coefficient between x and y i.e.

$$r = \sqrt{b_{xy} \cdot b_{yx}} = \sqrt{(-1/6) \times (-3/2)} = \sqrt{\frac{1}{2} \times \frac{1}{2}} = \pm \frac{1}{2}$$

Here, we have to take negative sign because b_{xy} and b_{yx} both have negative sign.

Hence, correlation coefficient (r) = $-1/2$.

74. (c)

I. We know that, variance is not dependent on change of origin, i.e. independent on change of origin.

So, if every x_i is increased by 2, the variance of the new set of numbers is not change, i.e. V .

II. We know that, variance is dependent on change of scale. So, if the number x_i is squared, the variance of the new set V^2 .

i.e. if $V(x_i) = V$

$$\text{Then, } V_{(x_i \times x_i)} = V_{(x_i)} \cdot V_{(x_i)} = V \cdot V = V^2$$

75. (b) Mean of first 20 natural numbers

$$\begin{aligned} &= \frac{\text{Sum of the squares first of 20 natural numbers}}{\text{Number of observations}} \\ &= \frac{(1^2 + 2^2 + 3^2 + \dots + 20^2)}{20} \\ &= \frac{1}{20} \times \frac{20(20+1)(20 \times 2 + 1)}{6} \left[\because \sum n^2 = \frac{n(n+1)(2n+1)}{6} \right] \\ &= \frac{21 \times (40+1)}{6} = \frac{21 \times 41}{6} = \frac{7 \times 41}{2} = \frac{287}{2} = 143.5 \end{aligned}$$

∴ Required mean = 143.5

Sol. (Q. Nos. 76-78) Given that, mean of 100 items, $\bar{x}_{100} = 50$

Mean of 150 items, $\bar{x}_{150} = 40$

and standard deviation of 100 items, $\sigma_{100} = 5$

Standard deviation of 150 items, $\sigma_{150} = 6$

76. (b) Here, $n_1 = 100, \bar{x}_{100} = 50$ and $n_2 = 150, \bar{x}_{150} = 40$

$$\begin{aligned} \therefore \text{Combined mean of all 250 items, } \bar{x}_{250} &= \frac{n_1 \cdot \bar{x}_{100} + n_2 \cdot \bar{x}_{150}}{n_1 + n_2} \\ &= \frac{100 \times 50 + 150 \times 40}{100 + 150} = \frac{5000 + 6000}{250} = \frac{11000}{250} = 44 \end{aligned}$$

77. (c) We know that, if n_1 and n_2 are the sizes, $\bar{X}_{100}, \bar{X}_{150}$ are the means and $\sigma_{100}, \sigma_{150}$ are the standard deviation of the series, then the standard deviation of the combined series is

$$\sigma = \sqrt{\frac{n_1(\sigma_{100}^2 + d_1^2) + n_2(\sigma_{150}^2 + d_2^2)}{n_1 + n_2}} \quad \dots (i)$$

where, $d_1 = \bar{X}_{100} - \bar{X}_{250}$ and $d_2 = \bar{X}_{150} - \bar{X}_{250}$

Here, $d_1 = 50 - 44 = 6 \Rightarrow d_1^2 = 36$

and $d_2 = 40 - 44 = -4 \Rightarrow d_2^2 = 16$

From Eq. (i),

Combined standard deviation of all 250 items i.e.

$$\begin{aligned} \sigma_{250} &= \sqrt{\frac{100\{(5)^2 + 36\} + 150\{(6)^2 + 16\}}{100 + 150}} \\ &= \sqrt{\frac{100(25 + 36) + 150(36 + 16)}{250}} = \sqrt{\frac{100 \times 61 + 150 \times 52}{250}} \\ &= \frac{\sqrt{10 \times 61 + 15 \times 52}}{5} = \frac{\sqrt{610 + 780}}{5} = \frac{\sqrt{1390}}{5} \\ &= \frac{37.28}{5} = 7.456 \approx 7.5 \end{aligned}$$

78. (c) Variance of all the 250 items

$$= (\sigma_{250})^2 = (7.456)^2 = 55.59 \approx 55.6$$

79. (a) The cumulative frequency of the largest observed value must always be less than the total number of observations. e.g.

Marks obtained	Number of students	Cummulative frequency
0-10	2	2
10-20	18	20
20-30	30	50
30-40	45	95
40-50	35	130
50-60	20	150
60-70	6	156
70-80	3	159
Total	$N = 159$	

(i) $95 < N = 159$

(ii) $95 \neq N = 159$

(iii) $95 \neq 159$

(iv) Mid-point of (70-80) = $75 \neq 95$

80. (a)

81. (d) Angle between the regression lines will be

$$\begin{aligned} \tan \theta &= \left\{ \left(\frac{1-r^2}{r} \right) \left(\frac{\sigma_x \sigma_y}{\sigma_x^2 + \sigma_y^2} \right) \right\} \Rightarrow \tan \frac{\pi}{2} = \left(\frac{1-r^2}{r} \right) \left(\frac{\sigma_x \cdot \sigma_y}{\sigma_x^2 + \sigma_y^2} \right) \\ \Rightarrow r \cdot (\sigma_x^2 + \sigma_y^2) &= 0 \Rightarrow r = 0 \end{aligned}$$

82. (d) It is obvious that $\bar{x} < \bar{z} < \bar{y}$

83. (b) Mean deviation about the mean = $\frac{\sum |x_i - \bar{x}|}{N}$

$$\text{Here, } \bar{x} = \frac{4 + 7 + 8 + 9 + 10 + 12 + 13 + 17}{8} = 10$$

∴ Mean deviation about mean

$$\begin{aligned} &= \frac{|4 - 10| + |7 - 10| + |8 - 10| + |9 - 10| + |10 - 10|}{8} \\ &\quad + \frac{|12 - 10| + |13 - 10| + |17 - 10|}{8} \\ &= \frac{6 + 3 + 2 + 1 + 0 + 2 + 3 + 7}{8} = \frac{24}{8} = 3 \end{aligned}$$

84. (c) Let x_1, x_2, \dots, x_{20} be the given observations.

$$\text{We have, } \frac{1}{20} \sum_{i=1}^{20} (x_i - \bar{x})^2 = 5$$

To find variance of $2x_1, 2x_2, 2x_3, \dots, 2x_{20}$, let \bar{x} denotes the mean of new observation.

$$\text{Clearly, } \bar{X} = \frac{\sum_{i=1}^{20} 2x_i}{20} = \frac{2 \sum_{i=1}^{20} x_i}{20} = 2\bar{x}$$

Now, variance of new observation = $\frac{1}{20} \sum_{i=1}^{20} (2x_i - 2\bar{x})^2$
 $= \frac{1}{20} \sum_{i=1}^{20} 4(x_i - \bar{x})^2 = 4 \left(\frac{1}{20} \sum_{i=1}^{20} (x_i - \bar{x})^2 \right) = 4 \times 5 = 20$

- 85.** (a) The median of grouped data is the x -coordinate of the point of intersection of 'less than' and 'more than' ogive curves.
86. (c) Both Statements are true.
87. (b) Geometric mean is used in construction of index numbers.
88. (b) Only Statement II is correct.
89. (c) Let the observations be x'_i 's, $i = 1, 2, \dots, 10$ and the mean and variance of y'_i 's are $\bar{x} = 4$ and $\sigma^2 = 2$.

Now, let $y_i = 2x'_i$'s and the mean and variance of y_i 's and \bar{y} and σ_1^2 then

$$\bar{y} = \frac{\sum 2x_i}{10} = 2 \frac{\sum 2x_i}{10} = 2\bar{x} = 8 \text{ and } \sigma_1^2 = \text{var}(y_i \text{'s}) = \text{var}(2x_i \text{'s}) = 4 \text{var}(x_i \text{'s}) = 4 \times 2 = 8$$

Thus, the mean and variance of new series are 8 and 8.

- 90.** (d) Let the numbers are x_1, x_2, x_3, x_4 and x_5 . Then,

we have, $\frac{x_1 + x_2 + x_3 + x_4 + x_5}{5} = 30$

$$\Rightarrow x_1 + x_2 + x_3 + x_4 + x_5 = 150 \quad \dots(i)$$

Now, suppose x_1 is excluded, then $\frac{x_2 + x_3 + x_4 + x_5}{4} = 28$ [given]

$$\Rightarrow x_2 + x_3 + x_4 + x_5 = 112 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get $x_1 = 150 - 112 = 38$

- 91.** (c) We have, $r(x, y) = 0.6$

To find $r(U, V)$, where $U = 2 - 3x$ and $V = 4y + 1$

$$\text{Clearly } r(U, V) = \frac{\text{cov}(U, V)}{\sqrt{\text{var}(U) \cdot \text{var}(V)}} \quad \dots(i)$$

Now, $\text{var}(U) = \text{var}(2 - 3x) = (-3)^2 \text{var}(x) = 9 \text{var}(x)$

$\text{var}(V) = \text{var}(4y + 1) = \text{var}(4y) = 16 \text{var}(y)$

$$\begin{aligned} \text{cov}(U, V) &= E[(U - \bar{U})(V - \bar{V})] \\ &= E[((2 - 3x) - (2 - 3\bar{x}))((4y + 1) - (4\bar{y} + 1))] \\ &= E[(-3 \times + 3\bar{x})(4y - 4\bar{y})] \\ &= (-3)(4) E[(x - \bar{x})(y - \bar{y})] = -12 \text{cov}(X, Y) \end{aligned}$$

Thus, from Eq. (i), we have

$$\begin{aligned} r(U, V) &= \frac{-12 \text{cov}(X, Y)}{\sqrt{9 \text{var}(x) \cdot 16 \text{var}(y)}} = \frac{-12 \text{cov}(X, Y)}{3 \cdot 4 \sqrt{\text{var}(x) \cdot \text{var}(y)}} \\ &= -r(X, Y) = -0.6 \end{aligned}$$

- 92.** (c) Given, 1, 8, 27, 64, ... upto n terms = $1^3, 2^3, 3^3, 4^3, \dots$ upto n terms

$$\begin{aligned} \therefore \text{AM} &= \frac{1^3 + 2^3 + 3^3 + \dots + n^3}{n} = \frac{\left[\frac{n(n+1)}{2} \right]^2}{n} = \frac{n^2(n+1)^2}{4n} \\ &= \frac{n(n+1)^2}{4} \left[\because \sum n^3 = 1^3 + 2^3 + \dots + n^3 = \left\{ \frac{n(n+1)}{2} \right\}^2 \right] \end{aligned}$$

- 93.** (c) Geometric mean of $x_1, x_2, x_3, \dots, x_n$ is G_1 .

$$\Rightarrow G_1 = (x_1, x_2, \dots, x_n)^{\frac{1}{n}}$$

Geometric mean of $y_1, y_2, y_3, \dots, y_n$ is G_2 .

$$\Rightarrow G_2 = (y_1, y_2, y_3, \dots, y_n)^{\frac{1}{n}}$$

$$\therefore \text{GM of } \frac{x_1}{y_1}, \frac{x_2}{y_2}, \frac{x_3}{y_3}, \dots, \frac{x_n}{y_n} = \left(\frac{x_1}{y_1}, \frac{x_2}{y_2}, \frac{x_3}{y_3}, \dots, \frac{x_n}{y_n} \right)^{\frac{1}{n}}$$

$$= \frac{(x_1, x_2, x_3, \dots, x_n)^{\frac{1}{n}}}{(y_1, y_2, y_3, \dots, y_n)^{\frac{1}{n}}} = \frac{G_1}{G_2}$$

- 94.** (b) We have, $b_{xy} = -0.64, b_{yx} = -0.36$

$$\therefore \text{Correlation coefficient } (\sigma) = \sqrt{b_{xy} \times b_{yx}} = \pm \sqrt{(-0.64)(-0.36)} = \pm 0.48 \Rightarrow \sigma = -0.48$$

Because b_{xy} and b_{yx} both are negative.

- 95.** (a) Here, $m = \left[\left(\frac{y}{z} \right)^{\log(yz)} \times \left(\frac{z}{x} \right)^{\log(zx)} \times \left(\frac{x}{y} \right)^{\log(xy)} \right]^{\frac{1}{3}}$

$$\therefore m^3 = x^{\log(yz) - \log(zx)} \times y^{\log(zx) - \log(xy)} \times z^{\log(xy) - \log(yz)}$$

$$\Rightarrow m^3 = x^{\log\left(\frac{y}{z}\right)} \times y^{\log\left(\frac{z}{x}\right)} \times z^{\log\left(\frac{x}{y}\right)}$$

Taking log on both sides, we get

$$3 \log m = \log\left(\frac{y}{z}\right) \log x + \log\left(\frac{z}{x}\right) \log y + \log\left(\frac{x}{y}\right) \log z$$

$$\Rightarrow 3 \log m = \log y \log x - \log z \log x + \log z \log y$$

$$- \log x \log y + \log x \log z - \log y \log z$$

$$\Rightarrow 3 \log m = 0 \Rightarrow \log m = 0 \Rightarrow m = e^0 = m = 1$$

- 96.** (a) Given, $x_i = 10, 9, 21, 16, 24$

$$\therefore \sum x_i = 10 + 9 + 21 + 16 + 24 = 80$$

Now, $\bar{X} = \frac{\sum x_i}{n} = \frac{80}{5} = 16 \Rightarrow \text{MD} = \frac{\sum |x_i - \bar{X}|}{n}$

$$= \frac{|10 - 16| + |9 - 16| + |21 - 16| + |16 - 16| + |24 - 16|}{5}$$

$$= \frac{6 + 7 + 5 + 0 + 8}{5} = \frac{26}{5} = 5.2$$

- 97.** (c)

- 98.** (d) We know, $\bar{X} = \frac{x_1 + x_2 + \dots + x_n}{n} \Rightarrow x_1 + x_2 + \dots + x_n = n\bar{X}$

$$\Rightarrow x_1 + x_3 + \dots + x_n = n\bar{X} - x_2$$

$$\Rightarrow x_1 + x_3 + \dots + x_n + \lambda = n\bar{X} - x_2 + \lambda$$

$$\Rightarrow \text{Mean} = \frac{\text{Sum of all values}}{\text{Total number of values}} = \frac{x_1 + x_3 + \dots + x_n + \lambda}{n} = \frac{n\bar{X} - x_2 + \lambda}{n}$$

- 99.** (d) Mean = $\frac{\sum x_i}{n} = \frac{3 + 5 + 1 + 6 + 5 + 9 + 5 + 2 + 8 + 6}{10} = \frac{50}{10} = 5$

Now, the data in 'Ascending' order is 1, 2, 3, 5, 5, 5, 6, 6, 8, 9

Clearly, median (mid value) is 5 and mode (most appeared value) is also 5.

$$\therefore x = y = z$$

- 100.** (c)

29

PROBABILITY

In NDA exam, generally 8-10 questions are asked from this chapter, which are based on addition theorem, conditional probability and mean and variance of binomial distribution.

Principle of probability is the most interesting branch of Modern Mathematics and it is used in various fields of knowledge. It is not only used in insurance principle and statistics but also used in Biology and Physics.

Some Useful Terms

Experiment

An operation which can produce some well defined outcomes is called an experiment.

There are two types of experiments

1. **Deterministic experiment** Those experiments which when repeated under identical conditions produce the same result or outcome are known as deterministic experiment. e.g. When a stone is thrown upwards, it is sure that the stone will fall downward.
2. **Random experiment** An experiment whose outcome cannot be predicted with certainty is called a random experiment.

Sample Space

The set of all possible outcomes is called sample space. It is usually denoted by S .

e.g. In tossing a fair coin, sample space is $S = \{H, T\}$, if we throw a die, then sample space is $S = \{1, 2, 3, 4, 5, 6\}$.

Event

The possible subsets of the sample space associated with a random experiment is called the event of that experiment. It is usually denoted by E .

e.g. If we throw a die, then event of getting an even number is $E = \{2, 4, 6\}$.

Various types of events are given below

1. **Elementary event** An event containing only a single sample point is called an elementary event or simple event.
2. **Compound events** Events obtained by combining together two or more elementary are known as the compound events.

3. **Equally likely events** A set of events is said to be equally likely, if they all have equal possibility to occur. e.g. If we throw a die, then we cannot say which one of 1, 2, 3, 4, 5, 6 occur. Here, all the events have equal possibility to occur.
4. **Exhaustive events** A set of events is said to be exhaustive, if atleast one of them necessarily occurs whenever the experiment is performed, i.e. union of all the events gives sample space.
5. **Mutually exclusive events** A set of events is said to be mutually exclusive, if the occurrence of one of the events excludes the possibility of the occurrence of any other, i.e. they cannot occur simultaneously. Thus, E_1 and E_2 are mutually exclusive, if and only if $E_1 \cap E_2 = \phi$.
6. **Complementary event** The complement of an event E is the set of all sample points of space other than the sample points in E . It is denoted by \bar{E} , E' or E^c .
7. **Independent event** A set of events is said to be independent, if the occurrence of an event is not influenced by the occurrence of the rest of the sets.
If two event A and B are independent, then the joint probability is

$$P(A \text{ and } B) = P(A \cap B) = P(A) P(B)$$

Probability of Occurrence an event

The probability of an event to occur is the ratio of the number of cases in its favour to the total number of cases. Let S be a sample space and E be an event of which probability is to be known, such that $n(S) = n$, $n(E) = m$ and each outcome is equally likely, then

$$P(E) = \frac{m}{n}$$

$$= \frac{\text{Number of favourable outcomes of } E}{\text{Total number of possible outcomes}}$$

Here, $P(E)$ is the probability of happening of an event E and

$P(\bar{E})$ = Probability of not happening of an event E

$$= 1 - \frac{m}{n} = \frac{n - m}{n}$$

From the definition, it follows that $0 \leq P(E) \leq 1$, and $P(E) + P(\bar{E}) = 1$

i.e. probability of an event lies between 0 and 1, where 0 and 1 are the probabilities of impossible event and sure event, respectively.

EXAMPLE 1. Two dice are thrown. What is the probability that sum of the numbers appearing on the dice is 8?

- a. $\frac{1}{6}$ b. $\frac{4}{9}$ c. $\frac{5}{36}$ d. $\frac{7}{36}$

Sol. c. Let S be the sample space, then the following are the

$$\text{possible outcomes } S = \left\{ \begin{array}{l} (1, 1), (2, 2), \dots, (1, 6) \\ (2, 1), (2, 2), \dots, (2, 6) \\ \vdots \\ (6, 1), (6, 2), \dots, (6, 6) \end{array} \right\}$$

$$\therefore n(s) = 6 \times 6 = 36$$

Let A be the event that the sum of the numbers appearing on the dice is 8.

$$\therefore A = \{(3, 5), (5, 3), (2, 6), (6, 2), (4, 4)\} \Rightarrow n(A) = 5$$

$$\therefore \text{Required probability} = \frac{n(A)}{n(S)} = \frac{5}{36}$$

EXAMPLE 2. A bag contains 5 red, 4 white and 6 green balls. Three balls are drawn at random. What is the probability that a red, a white and a green balls are drawn?

- a. $\frac{24}{91}$ b. $\frac{25}{91}$ c. $\frac{29}{91}$ d. $\frac{31}{91}$

Sol. a. Total number of balls in the bag = 5 + 4 + 6 = 15

Let S be the sample space, then the number of ways in which 3 balls can be drawn out of 15 ball = $n(S) = {}^{15}C_3$

Let A be the event of drawing one red, one white and one green ball, then the required number of ways

$$= n(A) = {}^5C_1 \times {}^4C_1 \times {}^6C_1$$

$$\therefore \text{Required probability} = \frac{n(A)}{n(S)} = \frac{{}^5C_1 \times {}^4C_1 \times {}^6C_1}{{}^{15}C_3} = \frac{24}{91}$$

Odds in Favour and Odds in Against

If in a random experiment, total number of outcomes is n out of which m are favourable to an event A , then

$$\text{odds in favour of } A = \frac{m}{n - m}$$

$$\text{and odds against of } A = \frac{n - m}{m}$$

$$\therefore P(A) = \frac{\text{Number of favourable cases to } A}{\text{Total number of cases}} = \frac{m}{n}$$

$$\text{and } P(\bar{A}) = 1 - P(A) = 1 - \frac{m}{n} = \frac{n - m}{n}$$

EXAMPLE 3. The odds in favour of an event are 2 : 7. Find the probability of occurrence of this event.

- a. $\frac{2}{9}$ b. $\frac{5}{12}$ c. $\frac{7}{12}$ d. $\frac{2}{5}$

Sol. a. \therefore Total number of outcomes = 2 + 7 = 9

and favourable number of cases = 2, then $P(E) = \frac{2}{9}$

Addition Theorem

- (i) If A and B are two events associated with a random experiment, then

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

If A and B are mutually exclusive events i.e.

$$A \cap B = \phi, \text{ then}$$

$$P(A \cap B) = 0$$

$$\therefore P(A \cup B) = P(A) + P(B)$$

- (ii) For any three events, A , B and C

$$\begin{aligned} P(A \cup B \cup C) &= P(A) + P(B) + P(C) \\ &\quad - P(A \cap B) - P(B \cap C) \\ &\quad - P(A \cap C) + P(A \cap B \cap C) \end{aligned}$$

If A , B and C are mutually exclusive events, then

$$P(A \cup B \cup C) = P(A) + P(B) + P(C)$$

EXAMPLE 4. Two cards are drawn from a pack of 52 cards. What is the probability that either both are red or both are kings?

- a. $\frac{7}{13}$ b. $\frac{63}{221}$ c. $\frac{55}{221}$ d. $\frac{3}{26}$

Sol. c. Let E_1 = Event of getting both red cards

E_2 = Event of getting both kings

and $E_1 \cap E_2$ = Event of getting 2 kings of red cards

$$\therefore P(E_1) = \frac{{}^{26}C_2}{{}^{52}C_2} = \frac{325}{1326} \Rightarrow P(E_2) = \frac{{}^4C_2}{{}^{52}C_2} = \frac{6}{1326}$$

$$\text{and } P(E_1 \cap E_2) = \frac{{}^2C_2}{{}^{52}C_2} = \frac{1}{1326}$$

$$\begin{aligned} \therefore P(\text{both red or both kings}) &= P(E_1 \cup E_2) \\ &= P(E_1) + P(E_2) - P(E_1 \cap E_2) \\ &= \frac{325}{1326} + \frac{6}{1326} - \frac{1}{1326} = \frac{330}{1326} = \frac{55}{221} \end{aligned}$$

Conditional Probability

Let A and B are two events associated with a random experiment. Then, the probability of occurrence of an event A under the condition that B has already been occurred such that $P(B) \neq 0$, is called the conditional probability and denoted by $P(A/B)$

$$P(A/B) = \frac{P(A \cap B)}{P(B)}$$

Similarly, $P(B/A) = \frac{P(A \cap B)}{P(A)}$, where $P(A) \neq 0$

If A and B are independent events, then

$$P(B/A) = P(B) [\because P(A \cap B) = P(A) \cdot P(B)]$$

EXAMPLE 5. If A and B are two independent events such that $P(A) = \frac{1}{2}$ and $P(B) = \frac{1}{5}$, then which of the following is correct?

- a. $P\left(\frac{A}{B}\right) = \frac{1}{2}$ b. $P\left(\frac{A}{A \cup B}\right) = \frac{5}{6}$
c. $P\left(\frac{A \cap B}{A' \cup B'}\right) = 0$ d. All of these

Sol. d. Since, A and B are independent events

$$\begin{aligned} \therefore P(A/B) &= P(A) = \frac{1}{2} \\ P\left(\frac{A}{A \cup B}\right) &= \frac{P[A \cap (A \cup B)]}{P(A \cup B)} \\ \Rightarrow P\left[\frac{A}{A \cup B}\right] &= \frac{P(A)}{P(A \cup B)} = \frac{\frac{1}{2}}{\frac{1}{2} + \frac{1}{5} - \frac{1}{10}} \\ &= \frac{\frac{1}{2}}{\frac{1}{2} + \frac{1}{5} - \frac{1}{10}} = \frac{\frac{1}{2}}{\frac{6}{10}} = \frac{5}{6} \end{aligned}$$

$$\text{Similarly, } P\left(\frac{A \cap B}{A' \cup B'}\right) = P\left(\frac{A \cap B}{(A \cap B)'}\right) = 0$$

Multiplication Theorem

If A and B are two events associated with a random experiment then

$$\begin{aligned} P(A \cap B) &= P(A/B)P(B), \text{ if } P(B) \neq 0 \\ &= P(B/A)P(A), \text{ if } P(A) \neq 0 \end{aligned}$$

EXAMPLE 6. Two cards are drawn from deck of 52 cards. Find the probability that both the cards are aces

- (i) when first card is put back before drawing the second card.
(ii) when first card is not returned into the pack. Compare the two results.

Sol. There are 4 aces in a deck of 52 cards.

Let event A : First drawn card is an ace.

event B : Second drawn card is an ace.

- (i) It is the case of 'with replacement'

$$P(A) = \frac{4}{52} = \frac{1}{13}, \quad P(B) = \frac{4}{52} = \frac{1}{13}$$

Since, both the events are independent,

$$P(A \cap B) = P(A) \cdot P(B) = \frac{1}{13} \times \frac{1}{13} = \frac{1}{169}$$

- (ii) It is the case of 'without replacement'.

$$P(A) = \frac{4}{52} = \frac{1}{13}$$

Since, the second trial is made without replacement, only 3 aces and 51 cards are left after the first trial.

EXAMPLE 9. In a Binomial Distribution (BD) the mean is 15 and variance is 10, then parameter is

- a. 28 b. 16 c. 45 d. 25

Sol. c. Given, mean of BD $= np = 15$

and variance of BD $= npq = 10$

$$\Rightarrow np(1-p) = 10 \quad [\because p+q=1]$$

$$\therefore 1-p = \frac{10}{15} = \frac{2}{3} \Rightarrow p = 1 - \frac{2}{3} \Rightarrow p = \frac{1}{3}$$

$$\therefore x = \frac{15}{1/3} = 15 \times 3 = 45$$

EXAMPLE 10. Let x denotes the number of times heads occur in n tosses of a fair coin. If $P(x=4)$, $P(x=5)$ and $P(x=6)$ are in AP, then the value of n is

- a. 7 b. 10
c. 12 d. 15

Sol. a. Clearly, x is a binomial variate with parameters n and $p = 1/2$ such that

$$P(x=r) = {}^n C_r p^r q^{n-r} = {}^n C_r \left(\frac{1}{2}\right)^r \left(\frac{1}{2}\right)^{n-r} = {}^n C_r \left(\frac{1}{2}\right)^n$$

Now, $P(x=4)$, $P(x=5)$ and $P(x=6)$ are in AP.

$$\therefore 2P(x=5) = P(x=4) + P(x=6)$$

$$\Rightarrow 2 \cdot {}^n C_5 \left(\frac{1}{2}\right)^n = {}^n C_4 \left(\frac{1}{2}\right)^n + {}^n C_6 \left(\frac{1}{2}\right)^n$$

$$\Rightarrow 2 \cdot {}^n C_5 = {}^n C_4 + {}^n C_6$$

$$\Rightarrow 2 \frac{n!}{(n-5)!5!} = \frac{n!}{(n-4)!4!} + \frac{n!}{(n-6)!6!}$$

$$\Rightarrow \frac{2}{5(n-5)} = \frac{1}{(n-4)(n-5)} + \frac{1}{6 \times 5}$$

$$\Rightarrow n^2 - 21n + 98 = 0 \Rightarrow (n-7)(n-14) = 0$$

$$\therefore n = 7$$

> PRACTICE EXERCISE

- Two cards are drawn at random from a deck of 52 cards. The probability of these two being aces is
(a) $1/26$ (b) $1/221$ (c) $1/2$ (d) $1/18$
- A card is drawn from a well-shuffled deck of cards. The probability of getting a queen of club or king of heart is
(a) $1/52$ (b) $1/26$ (c) $1/13$ (d) $1/56$
- In shuffling a pack of cards 3 are accidentally dropped, then the chance that missing card should be of different suits is
(a) $169/425$ (b) $261/425$ (c) $104/425$ (d) $425/169$
- If there are 4 addressed envelopes and 4 letters. Then, the chance that all the letters are not mailed through proper envelope is
(a) $1/24$ (b) 1 (c) $23/24$ (d) $9/2$
- A and B are two events such that $P(A) = 0.3$ and $P(A \cup B) = 0.8$. If A and B are independent, then $P(B)$ is
(a) $2/3$ (b) $3/8$ (c) $2/7$ (d) $5/7$
- A speaks truth in 60% cases and B speaks truth in 70% cases. The probability that they will say the same thing while describing single event, is
(a) 0.56 (b) 0.54 (c) 0.38 (d) 0.94
- The probability that in the toss of two dice, we obtain an even sum or a sum less than 5 is
(a) $1/2$ (b) $1/6$ (c) $1/3$ (d) $5/9$
- The probabilities of solving a problem by three students A, B and C are $1/2$, $1/3$ and $1/4$, respectively. The probability that the problem will be solved is
(a) $1/4$ (b) $1/2$ (c) $3/4$ (d) $1/3$
- The probability that a man can hit a target is $\frac{3}{4}$. He tries 5 times. The probability that he will hit the target atleast three times is
(a) $291/364$ (b) $371/464$ (c) $471/502$ (d) $459/512$
- A draws two cards with replacement from a deck of 52 cards and B throws a pair of dice. The chance that A gets both cards of same suit and B gets total of 6 is
(a) $1/144$ (b) $1/4$ (c) $5/144$ (d) $7/144$
- If A and B are such events that $P(A) > 0$ and $P(B) \neq 1$, then $P(\bar{A}/\bar{B})$ is equal to
(a) $1 - P(A/B)$ (b) $1 - P(\bar{A}/B)$
(c) $\frac{1 - P(A \cup B)}{P(\bar{B})}$ (d) $\frac{P(\bar{A})}{P(\bar{B})}$
- In solving any problem, odds against A are 4 to 3 and odds in favour of B in solving the same is 7 to 5. Then, probability that problem will be solved is
(a) $5/21$ (b) $16/21$
(c) $15/84$ (d) $69/84$

- 13.** Two events A and B have probability 0.25 and 0.50. The probability that both occur simultaneously is 0.14. Then, probability that neither A nor B occur is
 (a) 0.75 (b) 0.61 (c) 0.39 (d) None of these
- 14.** A contest consists of predicting the results (win, draw or defeat) of 8 matches played by the Indian cricket team. A person sent his entry by predicting at random. The probability that his entry contains 4 correct predictions is
 (a) $\frac{12}{3^8}$ (b) $\frac{70}{3^8}$ (c) $\frac{1120}{3^8}$ (d) $\frac{70}{3^{12}}$
- 15.** Of cigarette smoking population 70% are men and 30% are women, 10% of these men and 20% of these women smoke Wills. The probability that a person seen smoking a Wills to be men is
 (a) 1/5 (b) 7/13 (c) 5/13 (d) 7/10
- 16.** Two friends P and Q have equal number of daughters. The two friends have three cinema tickets which are to be distributed among their daughters. If the probability that all the tickets go to daughters of P be $1/20$, then the number of daughters each has is
 (a) 5 (b) 3 (c) 4 (d) 6
- 17.** A cricket team has 15 members, of whom only 5 can bowl. If the names of the 15 members are put into a hat and 11 drawn at random, then the chance of obtaining an eleven containing atleast 3 bowlers is
 (a) 7/13 (b) 11/15 (c) 12/13 (d) 15/14
- 18.** The probability of India winning a test match against England is $1/2$. Assuming independence of the result of various matches, the chance that in a 5 match series, India's second win occur at 3rd test is
 (a) $\frac{2}{3}$ (b) $\frac{1}{4}$ (c) $\frac{1}{8}$ (d) $\frac{1}{2}$
- 19.** There is a point inside a circle. What is the probability that this point is close to the circumference than to the centre?
 (a) $\frac{3}{4}$ (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{3}$
- 20.** A husband and wife appear in an interview for two vacancies in the same post. The probability of husband's selection is $1/5$ and that of wife selection is $1/3$. What is the probability that only one of them will be selected?
 (a) $\frac{1}{5}$ (b) $\frac{2}{5}$
 (c) $\frac{3}{5}$ (d) $\frac{4}{5}$
- 21.** If the letters of the word 'REGULATION' be arranged at random, the probability that there will be exactly 4 letters between R and E is
 (a) $\frac{1}{10}$ (b) $\frac{1}{9}$ (c) $\frac{1}{5}$ (d) $\frac{1}{2}$
- 22.** A box contains 6 distinct dolls. From this box, three dolls are randomly selected one by one with replacement. What is the probability of selecting 3 distinct dolls?
 (a) 5/54 (b) 12/25 (c) 1/20 (d) 5/9
- 23.** An experiment consists of flipping a coin and then flipping it a second time if head occurs. If a tail occurs on the first flip, then a six-faced die is tossed once. Assuming that the outcomes are equally likely, what is the probability of getting one head and one tail?
 (a) 1/4 (b) 1/36 (c) 1/6 (d) 1/8
- 24.** In an examination, there are 3 multiple-choice questions and each question has 4 choices. If a student randomly selects an answer for all the three questions, what is the probability that the students will not answer all the three questions correctly?
 (a) 1/64 (b) 63/64 (c) 1/12 (d) 11/12
- 25.** If A and B are events such that $P(A \cup B) = 0.5$, $P(\bar{B}) = 0.8$ and $P(A/B) = 0.4$, then what is $P(A \cap B)$ equal to?
 (a) 0.08 (b) 0.02 (c) 0.8 (d) 0.2
- 26.** Three digital numbers are formed using the digits 0, 2, 4, 6, 8. A number is chosen at random out of these numbers. What is the probability that the number has the same digits?
 (a) 1/16 (b) 1/25 (c) 16/25 (d) 1/645
- 27.** What is the probability of having 53 Sundays or 53 Mondays in a leap year?
 (a) 2/7 (b) 3/7 (c) 4/7 (d) 5/7
- 28.** An observed event B can occur after one of the three events A_1, A_2, A_3 . If $P(A_1) = P(A_2) = 0.4$, $P(A_3) = 0.2$ and $P(B/A_1) = 0.25$, $P(B/A_2) = 0.4$ $P(B/A_3) = 0.125$, what is the probability of A_1 after observing B ?
 (a) $\frac{1}{3}$ (b) $\frac{6}{19}$ (c) $\frac{20}{57}$ (d) $\frac{2}{5}$
- 29.** Two balls are selected from a box containing 2 blue and 7 red balls. What is the probability that atleast one ball is blue?
 (a) $\frac{2}{9}$ (b) $\frac{7}{9}$ (c) $\frac{5}{12}$ (d) $\frac{7}{12}$

- 30.** The probability of guessing a correct answer is $\frac{x}{12}$. If the probability of not guessing the correct answer is $2/3$, then what is x equal to?
 (a) 2 (b) 3 (c) 4 (d) 6
- 31.** Three letters are randomly selected from the 26 capital letters of the English alphabet. What is the probability that the letter A will not be included in the choice?
 (a) $1/2$ (b) $23/26$ (c) $12/13$ (d) $25/26$
- 32.** The probability distribution of random variable X with two missing probabilities p_1 and p_2 is given below

X	$P(X)$
1	k
2	p_1
3	$4k$
4	p_2
5	$2k$

It is further given that $P(X \leq 2) = 0.25$ and $P(X \geq 4) = 0.35$.

Consider the following statements

- I. $p_1 = p_2$ II. $p_1 + p_2 = P(X = 3)$

Which of the above statement(s) is/are correct?

- (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 33.** A and B are two events with positive probability, $P(A/B)$ is the conditional probability of A given B , and \bar{A} is the complement of A .

Consider the following statements

- I. $P(A/B) = P(A) \Rightarrow P(B/A) = P(B)$
 II. $P(\bar{B}/A) = P(\bar{B}) \Rightarrow P(B/A) = P(B)$
 III. $P(A \cap B) = P(A) \cdot P(B) \Rightarrow P(\bar{A} \cap \bar{B}) = P(\bar{A}) \cdot P(\bar{B})$

Which of the above statement(s) is/are correct?

- (a) I and II (b) I and III
 (c) II and III (d) I, II and III
- 34.** Let $U = \{1, 2, 3, \dots, 20\}$. Let A, B and C be the subsets of U . Let A be the set of all numbers, which are perfect squares, B be the set of all numbers, which are multiples of 5 and C be the set of all numbers, which are divisible by 2 and 3? Consider the following statements
- I. A, B and C are mutually exclusive.
 II. A, B and C are mutually exhaustive.
 III. The number of elements in the complement set of $A \cup B$ is 12.
- Which of the above statement(s) is/are correct?
 (a) Both I and II (b) Both I and III
 (c) Both II and III (d) I, II and III

Directions (Q. Nos. 35-36) There are four boxes A_1, A_2, A_3 and A_4 . Box A_i has i cards and on each card a number is printed, the numbers are from 1 to i . A box is selected randomly, the probability of selection of box A_i is $i/10$ and then a card is drawn. Let E_i represents the event that a card with number i' is drawn.

- 35.** $P(E_1)$ is equal to
 (a) $\frac{1}{5}$ (b) $\frac{1}{10}$ (c) $\frac{2}{5}$ (d) $\frac{1}{4}$
- 36.** $P(A_3 / E_2)$ is equal to
 (a) $\frac{1}{4}$ (b) $\frac{1}{3}$ (c) $\frac{1}{2}$ (d) $\frac{2}{3}$

Directions (Q. Nos. 37-39) There are 4 red, 5 blue and 3 green marbles in a basket.

- 37.** If two marbles are picked randomly, then the probability that both marbles are red is
 (a) $\frac{3}{7}$ (b) $\frac{1}{2}$ (c) $\frac{1}{11}$ (d) $\frac{1}{6}$
- 38.** If three marbles are picked randomly, then the probability that atleast one of them is blue, is
 (a) $\frac{7}{12}$ (b) $\frac{37}{44}$ (c) $\frac{5}{12}$ (d) $\frac{7}{44}$
- 39.** If three marbles are picked randomly, then the probability that either all are red or all are green, is
 (a) $\frac{7}{44}$ (b) $\frac{7}{12}$ (c) $\frac{5}{12}$ (d) $\frac{1}{44}$

Directions (Q. Nos. 40-43) If A and B are two independent events such that $P(A) = 1/2$ and $P(B) = \frac{1}{5}$, then

- 40.** $P(A \cup B)$ is equal to
 (a) $\frac{1}{5}$ (b) $\frac{2}{5}$ (c) $\frac{3}{5}$ (d) $\frac{4}{5}$
- 41.** $P\left(\frac{A}{B}\right)$ is equal to
 (a) $\frac{1}{2}$ (b) $\frac{2}{3}$ (c) $\frac{2}{5}$ (d) $\frac{5}{3}$
- 42.** $P\left(\frac{A}{A \cup B}\right)$ is equal to
 (a) $\frac{1}{6}$ (b) $\frac{5}{6}$ (c) $\frac{3}{5}$ (d) $\frac{2}{5}$
- 43.** $P\left(\frac{A \cap B}{A \cup B}\right)$ is equal to
 (a) 0 (b) 1 (c) $\frac{1}{2}$ (d) $\frac{2}{3}$

> PREVIOUS YEARS' QUESTIONS

Directions (Q. Nos. 44-45) Two dice each numbered from 1 to 6 are thrown together. Let A and B be two events given by
 A : even number on the first die
 B : number on the second die is greater than 4

☑ 2012 I

- 44.** What is the value of $P(A \cup B)$?
 (a) $1/2$ (b) $1/4$ (c) $2/3$ (d) $1/6$
- 45.** What is the value of $P(A \cap B)$?
 (a) $1/2$ (b) $1/4$ (c) $2/3$ (d) $1/6$

Directions (Q. Nos. 46-47) An urn contains one black ball and one green ball. A second urn contains one white and one green ball. One ball is drawn at random from each urn.

☑ 2012 I

- 46.** What is the probability that both balls are of same colour?
 (a) $1/2$ (b) $1/3$ (c) $1/4$ (d) $2/3$
- 47.** What is the probability of getting atleast one green ball?
 (a) $1/2$ (b) $1/3$ (c) $2/3$ (d) $3/4$
- 48.** What is the most probable number of successes in 10 trials with probability of success $2/3$?
 ☑ 2012 II
 (a) 10 (b) 7 (c) 5 (d) 4
- 49.** Which one of the following is correct? ☑ 2012 II
 (a) An event having no sample point is called an elementary event
 (b) An event having one sample point is called an elementary event
 (c) An event having two sample points is called an elementary event
 (d) An event having many sample points is called an elementary event
- 50.** Three coins are tossed simultaneously. What is the probability that they will fall two heads and one tail?
 ☑ 2012 II
 (a) $1/3$ (b) $1/2$ (c) $1/4$ (d) $3/8$
- 51.** If $P(E)$ denotes the probability of an event E , then \bar{E} is called certain event, if ☑ 2012 II
 (a) $P(E) = 0$ (b) $P(E) = 1$
 (c) $P(E)$ is either 0 or 1 (d) $P(E) = 1/2$
- 52.** In throwing a six faced die, let A be the event that an even number occurs, B be the event that an odd number occurs and C be the event that a number greater than 3 occurs. Which one of the following is correct? ☑ 2013 I
 (a) A and C are mutually exclusive
 (b) A and B are mutually exclusive
 (c) B and C are mutually exclusive
 (d) A , B and C are mutually exclusive

- 53.** A fair coin is tossed repeatedly. The probability of getting a result in the fifth toss different from those obtained in the first four tosses is ☑ 2013 I
 (a) $1/2$ (b) $1/32$ (c) $31/32$ (d) $1/16$
- 54.** If \bar{A} and \bar{B} are any two events such that $P(\bar{A}) = 0.4$, $P(\bar{B}) = 0.3$, $P(A \cup B) = 0.9$, then what is the value of $P(\bar{A} \cup \bar{B})$? ☑ 2013 I
 (a) 0.2 (b) 0.5 (c) 0.6 (d) 0.7
- 55.** A bag contains 5 black and 3 white balls. Two balls are drawn at random one after the other without replacement. What is the probability that both are white? ☑ 2013 I
 (a) $1/28$ (b) $1/14$ (c) $3/28$ (d) $1/21$
- 56.** What is the probability of getting a sum of 7 with two dice? ☑ 2013 I
 (a) $1/6$ (b) $1/3$ (c) $1/12$ (d) $5/36$
- 57.** Four coins are tossed simultaneously. What is the probability of getting exactly 2 heads? ☑ 2013 I
 (a) $1/2$ (b) $1/4$ (c) $1/8$ (d) $3/8$
- 58.** Consider a random experiment of throwing together a dice and two coins. The associated sample space has ☑ 2013 I
 (a) 8 points (b) 12 points (c) 24 points (d) 36 points
- 59.** Two numbers are successively drawn from the set $U = \{1, 2, 3, 4, 5, 6, 7, 8\}$, the second being drawn without replacing the first. The number of elementary events in the sample is ☑ 2013 I
 (a) 64 (b) 56
 (c) 32 (d) 14
- 60.** If X follows a binomial distribution with parameters $n = 100$ and $p = 1/3$, then $P(X = r)$ is maximum when ☑ 2013 I
 (a) $r = 16$ (b) $r = 32$ (c) $r = 33$ (d) $r = 34$
- 61.** The binomial distribution has ☑ 2013 I
 (a) only one parameter (b) two parameters
 (c) three parameters (d) four parameters
- 62.** What is the number of outcomes when a coin is tossed and then a dice is rolled only in case a head is shown on the coin? ☑ 2013 II
 (a) 6 (b) 7 (c) 8 (d) 5
- 63.** If $P(A) = \frac{3}{2}$, $P(B) = \frac{2}{5}$ and $P(A \cup B) - P(A \cap B) = \frac{2}{5}$, then what is $P(A \cap B)$ equal to? ☑ 2013 II
 (a) $\frac{3}{5}$ (b) $\frac{5}{11}$
 (c) $\frac{1}{3}$ (d) $\frac{3}{11}$
- 64.** A die is tossed twice. What is the probability of getting a sum of 10? ☑ 2013 II
 (a) $\frac{1}{18}$ (b) $\frac{1}{6}$ (c) $\frac{1}{12}$ (d) $\frac{5}{12}$

- 65.** If three events A , B and C are mutually exclusive, then which one of the following is correct? ☑ 2013 II
 (a) $P(A \cup B \cup C) = 0$ (b) $P(A \cup B \cup C) = 1$
 (c) $P(A \cap B \cap C) = 0$ (d) $P(A \cap B \cap C) = 1$
- 66.** Three dice are thrown. What is the probability of getting as triplet? ☑ 2013 II
 (a) $\frac{1}{6}$ (b) $\frac{1}{18}$ (c) $\frac{1}{36}$ (d) $\frac{1}{72}$
- 67.** If A and B are independent events such that $P(A) = \frac{1}{5}$, $P(A \cup B) = \frac{7}{10}$, then what is $P(\bar{B})$ equal to? ☑ 2013 II
 (a) $\frac{2}{7}$ (b) $\frac{3}{7}$ (c) $\frac{3}{8}$ (d) $\frac{7}{9}$
- 68.** Consider the following statements
 I. If A and B are exhaustive events, then their union is the sample space.
 II. If A and B are exhaustive events, then their intersection must be an empty event.
 Which of the above statement(s) is/are correct? ☑ 2013 II
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 69.** Which one of the following may be the parameter of a Binomial distribution? ☑ 2013 II
 (a) $np = 2$, $npq = 4$ (b) $n = 4$, $p = \frac{3}{2}$
 (c) $n = 8$, $p = 1$ (d) $np = 10$, $npq = 8$
- 70.** In a binomial distribution, the occurrence and the non-occurrence of an event are equally likely and the mean is 6. The number of trials required is ☑ 2013 II
 (a) 15 (b) 12 (c) 10 (d) 6
- 71.** A box contains 3 white and 2 black balls. Two balls are drawn at random one after the other. If the balls are not replaced, what is the probability that both the balls are black? ☑ 2014 I
 (a) $\frac{2}{5}$ (b) $\frac{1}{5}$ (c) $\frac{1}{10}$ (d) None of these
- 72.** It has been found that, if A and B play a game 12 times, A wins 6 times, B wins 4 times and they draw twice. A and B take part in a series of 3 games. The probability that they win alternately, is ☑ 2014 I
 (a) $\frac{5}{12}$ (b) $\frac{5}{36}$ (c) $\frac{19}{27}$ (d) $\frac{5}{27}$
- 73.** Let X denotes the number of scores which exceed 4 in 18 tosses of a symmetrical die. Consider the following statements
 I. The arithmetic mean of X is 6.
 II. The standard deviation of X is 2.
 Which of the above statement(s) is/are correct? ☑ 2014 I
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- Directions** (Q. Nos. 74-77) Number X is randomly selected from the set of odd numbers and Y is randomly selected from the set of even numbers of the set $\{1, 2, 3, 4, 5, 6, 7\}$. Let $Z = (X + Y)$. ☑ 2014 I
- 74.** What is $P(Z = 5)$ equal to?
 (a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{1}{4}$ (d) $\frac{1}{6}$
- 75.** What is $P(Z = 10)$ equal to?
 (a) 0 (b) $\frac{1}{2}$ (c) $\frac{1}{3}$ (d) $\frac{1}{5}$
- 76.** What is $P(Z > 11)$ equal to?
 (a) 0 (b) $\frac{1}{4}$ (c) $\frac{1}{6}$ (d) $\frac{1}{12}$
- 77.** What is $P(Z$ is the product of two prime numbers) equal to?
 (a) 0 (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) None of these
- 78.** Suppose A and B are two events. Event B has occurred and it is known that $P(B) < 1$. What is $P(A/B')$ equal to? ☑ 2014 II
 (a) $\frac{P(A) - P(B)}{1 - P(B)}$ (b) $\frac{P(A) - P(AB)}{1 - P(B)}$
 (c) $\frac{P(A) + P(B')}{1 - P(B)}$ (d) None of these
- 79.** For any two events A and B , which one of the following holds? ☑ 2014 II
 (a) $P(A \cap B) \leq P(A) \leq P(A \cup B) \leq P(A) + P(B)$
 (b) $P(A \cup B) \leq P(A) \leq P(A \cap B) \leq P(A) + P(B)$
 (c) $P(A \cup B) \leq P(B) \leq P(A \cap B) \leq P(A) + P(B)$
 (d) $P(A \cap B) \leq P(B) \leq P(A) + P(B) \leq P(A \cup B)$
- 80.** The probability that in a random arrangement of the letters of the word 'UNIVERSITY', the two I's do not come together is ☑ 2014 II
 (a) $\frac{4}{5}$ (b) $\frac{1}{5}$ (c) $\frac{1}{10}$ (d) $\frac{9}{10}$
- 81.** There are 4 white and 3 black balls in a box. In another box, there are 3 white and 4 black balls. An unbiased die is rolled. If it shows a number less than or equal to 3, then a ball is drawn from the second box, otherwise from the first box. If the ball drawn is black, then the probability that the ball was drawn from the first box, is ☑ 2014 II
 (a) $\frac{1}{2}$ (b) $\frac{6}{7}$ (c) $\frac{4}{7}$ (d) $\frac{3}{7}$
- 82.** Two students X and Y appeared in an examination. The probability that X will qualify the examination is 0.05 and Y will qualify the examination is 0.10. The probability that both will qualify the examination is 0.02. What is the probability that only one of them will qualify the examination? ☑ 2014 II
 (a) 0.15 (b) 0.14 (c) 0.12 (d) 0.11
- 83.** A fair coin is tossed four times. What is the probability that atmost three tails occur? ☑ 2014 II
 (a) $\frac{7}{8}$ (b) $\frac{15}{16}$ (c) $\frac{13}{16}$ (d) $\frac{3}{4}$

- 84.** Two cards are drawn successively without replacement from a well-shuffled pack of 52 cards. The probability of drawing two aces is ☑ 2015 I
 (a) $\frac{1}{26}$ (b) $\frac{1}{221}$ (c) $\frac{4}{223}$ (d) $\frac{1}{13}$
- 85.** Two similar boxes $B_i (i = 1, 2)$ contain $(i + 1)$ red and $(5 - i - 1)$ black balls. One box is chosen at random and two balls are drawn randomly. What is the probability that both the balls are of different colours? ☑ 2015 I
 (a) $\frac{1}{2}$ (b) $\frac{3}{10}$ (c) $\frac{2}{5}$ (d) $\frac{3}{5}$
- 86.** The mean and the variance in a binomial distribution are found to be 2 and 1, respectively. The probability $P(X = 0)$ is ☑ 2015 I
 (a) $\frac{1}{2}$ (b) $\frac{1}{4}$ (c) $\frac{1}{8}$ (d) $\frac{1}{16}$
- 87.** If A and B are two events such that $P(A \cup B) = \frac{3}{4}$, $P(A \cap B) = \frac{1}{4}$ and $P(\bar{A}) = \frac{2}{3}$, then what is $P(B)$ equal to? ☑ 2015 I
 (a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{1}{8}$ (d) $\frac{2}{9}$
- 88.** In throwing of two dice, the number of exhaustive events that '5' will never appear on any one of the dice is ☑ 2015 I
 (a) 5 (b) 18 (c) 25 (d) 36
- 89.** Two men hit at a target with probabilities $\frac{1}{2}$ and $\frac{1}{3}$, respectively. What is the probability that exactly one of them hits the target? ☑ 2015 I
 (a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{1}{6}$ (d) $\frac{2}{3}$
- 90.** If $A \subseteq B$, then which one of the following is not correct? ☑ 2015 I
 (a) $P(A \cap \bar{B}) = 0$ (b) $P(A/B) = \frac{P(A)}{P(B)}$
 (c) $P(B/A) = \frac{P(B)}{P(A)}$ (d) $P(A/(A \cup B)) = \frac{P(A)}{P(B)}$
- 91.** In an examination, the probability of a candidate solving a question is $\frac{1}{2}$. Out of given 5 questions in the examination, what is the probability that the candidate was able to solve atleast 2 questions? ☑ 2015 I
 (a) $\frac{1}{64}$ (b) $\frac{3}{16}$ (c) $\frac{1}{2}$ (d) $\frac{13}{16}$
- 92.** If $x \in [0, 5]$, then what is the probability that $x^2 - 3x + 2 \geq 0$? ☑ 2015 II
 (a) $\frac{4}{5}$ (b) $\frac{1}{5}$ (c) $\frac{2}{5}$ (d) $\frac{3}{5}$
- 93.** Three digits are chosen at random from 1, 2, 3, 4, 5, 6, 7, 8 and 9 without repeating any digit. What is the probability that the product is odd? ☑ 2015 II
 (a) $\frac{2}{3}$ (b) $\frac{7}{48}$ (c) $\frac{5}{42}$ (d) $\frac{5}{108}$
- 94.** What is the probability that the sum of any two different single digit natural numbers is a prime number? ☑ 2015 II
 (a) $\frac{5}{27}$ (b) $\frac{7}{18}$ (c) $\frac{1}{3}$ (d) None of these
- 95.** A problem in Statistics is given to three students A , B and C whose chances of solving it independently are $\frac{1}{2}$, $\frac{1}{3}$ and $\frac{1}{4}$, respectively. The probability that the problem will be solved, is ☑ 2015 II
 (a) $\frac{1}{12}$ (b) $\frac{11}{12}$ (c) $\frac{1}{2}$ (d) $\frac{3}{4}$
- 96.** A bag contains 4 white and 2 black balls and another bag contains 3 white and 5 black balls. If one ball is drawn from each bag, then the probability that one ball is white and one ball is black, is ☑ 2015 II
 (a) $\frac{5}{24}$ (b) $\frac{13}{24}$ (c) $\frac{1}{4}$ (d) $\frac{2}{3}$
- 97.** Seven unbiased coins are tossed 128 times. In how many throws would you find atleast three heads? ☑ 2015 II
 (a) 99 (b) 102 (c) 103 (d) 104
- 98.** Two events A and B are such that $P(\text{not } B) = 0.8$, $P(A \cup B) = 0.5$ and $P(A/B) = 0.4$. Then, $P(A)$ is equal to ☑ 2015 II
 (a) 0.28 (b) 0.32
 (c) 0.38 (d) None of these
- 99.** An insurance company insured 2000 scooter drivers, 4000 car drivers and 6000 truck drivers. The probabilities of an accident involving a scooter driver, car driver and a truck driver are 0.01, 0.03 and 0.15, respectively. One of the insured persons meets with an accident. The probability that the person is a scooter driver, is ☑ 2015 II
 (a) $\frac{1}{52}$ (b) $\frac{3}{52}$ (c) $\frac{15}{52}$ (d) $\frac{19}{52}$

- 100.** If mean and variance of a binomial variate X are 2 and 1 respectively, then the probability that X takes a value greater than 1, is **☑ 2015 II**
 (a) $\frac{2}{3}$ (b) $\frac{4}{5}$ (c) $\frac{7}{8}$ (d) $\frac{11}{16}$
- 101.** An unbiased coin is tossed until the first head appears or until four tosses are completed, whichever happens earlier. Which of the following statement(s) is/are correct?
 I. The probability that no head is observed is $1/16$.
 II. The probability that the experiment ends with three tosses is $1/8$.
Select the correct answer using the code given below. **☑ 2015 II**
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 102.** A coin is tossed 5 times. The probability that tail appears an odd number of times, is **☑ 2015 II**
 (a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{2}{5}$ (d) $\frac{1}{5}$
- 103.** A fair coin is tossed 100 times. What is the probability of getting tails an odd number of times? **☑ 2016 I**
 (a) $1/2$ (b) $3/8$ (c) $1/4$ (d) $1/8$
- 104.** A certain type of missile hits the target with probability $p = 0.3$. What is the least number of missiles should be fired so that there is atleast an 80% probability that the target is hit? **☑ 2016 I**
 (a) 5 (b) 6
 (c) 7 (d) None of these
- 105.** A point is chosen at random inside a rectangle measuring 6 inches by 5 inches. What is the probability that the randomly selected point is atleast one inch from the edge of the rectangle? **☑ 2016 I**
 (a) $\frac{2}{3}$ (b) $\frac{1}{3}$ (c) $\frac{1}{4}$ (d) $\frac{2}{5}$
- 106.** For two mutually exclusive events A and B , $P(A) = 0.2$ and $P(\bar{A} \cap B) = 0.3$. What is $P(A | (A \cup B))$ equal to? **☑ 2016 I**
 (a) $\frac{1}{2}$ (b) $\frac{2}{5}$ (c) $\frac{2}{7}$ (d) $\frac{2}{3}$
- 107.** What is the probability of 5 Sunday in the month of December? **☑ 2016 I**
 (a) $1/7$ (b) $2/7$
 (c) $3/7$ (d) None of these
- 108.** Three dice are thrown simultaneously. What is the probability that the sum on the three faces is atleast 5? **☑ 2016 I**
 (a) $\frac{17}{18}$ (b) $\frac{53}{54}$
 (c) $\frac{103}{108}$ (d) $\frac{215}{216}$
- 109.** Two independent events A and B have $P(A) = 1/3$ and $P(B) = 3/4$. What is the probability that exactly one of the two events A or B occurs? **☑ 2016 I**
 (a) $1/4$ (b) $5/6$ (c) $5/12$ (d) $7/12$
- 110.** A coin is tossed three times. What is the probability of getting head and tail alternately? **☑ 2016 I**
 (a) $1/8$ (b) $1/4$ (c) $1/2$ (d) $3/4$

HINTS AND SOLUTIONS

1. (b) Required probability = $\frac{{}^4C_2}{{}^{52}C_2}$

$$= \frac{4 \times 3}{52 \times 51} = \frac{1}{221}$$

2. (b) Here, $n(S) = 52$,
 $n(E_1) = 1, n(E_2) = 1, n(E_1 \cap E_2) = \phi$
 $\therefore P(E_1 \cup E_2) = P(E_1)$
 $+ P(E_2) - P(E_1 \cap E_2)$

$$= \frac{1}{52} + \frac{1}{52} - 0 = \frac{1}{26}$$

3. (a) Total ways = ${}^{52}C_3 = 22100$
 There are 4 suits in a pack of cards, so three suits can be selected in 4C_3 ways and one card each from different suits can be selected in ${}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1$ ways.
 So, favourable ways

$$= {}^4C_3 \times {}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1$$

$$= 8788$$

 \therefore Required probability = $\frac{8788}{22100} = \frac{169}{425}$

4. (c) Sample space = $4! = 4 \times 3 \times 2 \times 1 = 24$
 If all letter mailed right addressed envelopes, favourable outcomes

$$= 1 \times 1 \times 1 \times 1 = 1$$

$$P(E) = \frac{\text{Favourable outcomes}}{\text{Total outcomes}} = \frac{1}{24}$$

 The chance that all the letters not mailed through proper envelope

$$P(E') = 1 - P(E) = 1 - \frac{1}{24} = \frac{23}{24}$$

5. (a) $P(A \cup B) = 0.8$
 $\Rightarrow P(A) + P(B) - P(A \cap B) = 0.8$
 $\Rightarrow P(A) + P(B) - P(A) \cdot P(B) = 0.8$
 [$\because A$ and B are independent events]
 $\Rightarrow 0.3 + P(B) \{1 - P(A)\} = 0.8$
 $\Rightarrow P(B) (1 - 0.3) = 0.5$
 $\Rightarrow 0.7 P(B) = 0.5$
 $\therefore P(B) = \frac{0.5}{0.7} = \frac{5}{7}$

6. (b) Given, $P(A) = 0.6, P(B) = 0.7$
 Here, A and B are independent events.
 $\therefore P(A \cap B) = P(A) \times P(B)$

$$= 0.6 \times 0.7 = 0.42$$

$$P(\bar{A} \cap \bar{B}) = P(\bar{A}) \times P(\bar{B})$$

$$= 0.4 \times 0.3 = 0.12$$

 Probability that A and B will say same thing = Probability that both speak truth or false

$$= P(A \cap B) + P(\bar{A} \cap \bar{B})$$

$$= 0.42 + 0.12 = 0.54$$

7. (a) Let $A =$ Event of getting an even Sum

$$= \{(1, 1), (1, 3), (3, 1), (2, 2), (1, 5), (5, 1), (2, 4), (4, 2), (3, 3), (2, 6), (6, 2), (3, 5), (5, 3), (4, 4), (4, 6), (6, 4), (5, 5), (6, 6)\}$$

 and $B =$ Event of getting sum less than 5

$$= \{(1, 1), (2, 1), (1, 2), (1, 3), (3, 1), (2, 2)\}$$

 $\Rightarrow A \cap B = \{(1, 1), (1, 3), (3, 1), (2, 2)\}$
 $\therefore P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$$= \frac{18}{36} + \frac{6}{36} - \frac{4}{36} = \frac{5}{9}$$

8. (c) $P(A) = \frac{1}{2}, P(\bar{A}) = \frac{1}{2}$
 $P(B) = \frac{1}{3}, P(\bar{B}) = \frac{2}{3}$
 $P(C) = \frac{1}{4}, P(\bar{C}) = \frac{3}{4}$
 Problem will be solved, if even one of them solve it; so first we calculate probability that it is not solved.

$$P(\bar{A}) \cdot P(\bar{B}) \cdot P(\bar{C}) = \frac{1}{2} \times \frac{2}{3} \times \frac{3}{4} = \frac{1}{4}$$

 \therefore Required probability = $1 - \frac{1}{4} = \frac{3}{4}$

9. (a) Here, $p = \frac{3}{4}, q = \frac{1}{4}$ and $n = 5$
 \therefore Required probability

$$= {}^5C_3 \left(\frac{3}{4}\right)^3 \left(\frac{1}{4}\right)^2 + {}^5C_4 \left(\frac{3}{4}\right)^4 \left(\frac{1}{4}\right)$$

$$+ {}^5C_5 \left(\frac{3}{4}\right)^5$$

$$= \frac{10 \cdot 27}{4^5} + \frac{5 \cdot 81}{4^5} + \frac{243}{4^5}$$

$$= \frac{270 + 405 + 243}{1024}$$

$$= \frac{459}{512}$$

10. (c) The probability of drawing two cards of same suit = $\frac{13}{52} \times \frac{13}{52}$ and it can be of any suit out of 4.
 So, $P(A) = \frac{4 \times 13 \times 13}{52 \times 52} = \frac{1}{4}$

$$P(B) = \frac{5}{36}$$

 Since, A and B independent events.
 Thus, required probability

$$= P(A) \cdot P(B)$$

$$= \frac{1}{4} \times \frac{5}{36} = \frac{5}{144}$$

11. (c) $P(\bar{A}/\bar{B}) = \frac{P(\bar{A} \cap \bar{B})}{P(\bar{B})}$

$$= \frac{P(\overline{A \cup B})}{P(\bar{B})} = \frac{1 - P(A \cup B)}{P(\bar{B})}$$

12. (b) Here, $P(A) = \frac{3}{7}, P(B) = \frac{7}{12}$,
 $P(\bar{A}) = \frac{4}{7}, P(\bar{B}) = \frac{5}{12}$

Problem will be solved if atleast one person solves it.
 \therefore Required probability

$$= 1 - [P(\bar{A}) \cdot P(\bar{B})]$$

$$= 1 - \frac{4}{7} \cdot \frac{5}{12} = 1 - \frac{5}{21} = \frac{16}{21}$$

13. (c) $P(A) = 0.25, P(B) = 0.50$
 $P(A \cap B) = 0.14$
 Probability (Neither A nor B occur)
 $= 1 - \text{Probability (either } A \text{ or } B \text{ occur)}$
 $= 1 - P(A \cup B)$

$$= 1 - [P(A) + P(B) - P(A \cap B)]$$

$$= 1 - 0.25 - 0.50 + 0.14 = 0.39$$

14. (c) Here, $n = 8, p = \frac{1}{3}, q = 1 - p$

$$= 1 - \frac{1}{3} = \frac{2}{3}$$

 [out of 3 possibilities, only one is correct]
 \therefore Required probability = ${}^8C_4 p^4 q^4$

$$= 70 \left(\frac{1}{3}\right)^4 \left(\frac{2}{3}\right)^4 = \frac{1120}{3^8}$$

15. (b) Let E_1 and E_2 denote the cigarette smoking population of men and women, respectively.

Given, $P(E_1) = 0.7, P(E_2) = 0.3$

$$P\left(\frac{A}{E_1}\right) = 0.1, P\left(\frac{A}{E_2}\right) = 0.2$$

Using Baye's theorem, $P(E_1 / A)$

$$= \frac{P(E_1)P(A / E_1)}{P(E_1) \times P(A / E_1) + P(E_2)P(A / E_2)}$$

$$= \frac{0.7 \times 0.1}{0.7 \times 0.1 + 0.3 \times 0.2}$$

$$= \frac{0.07}{0.07 + 0.06} = \frac{0.07}{0.13} = \frac{7}{13}$$

16. (b) Let each of the friends have n daughters. Then, the probability that all the tickets go to daughters of P is $\frac{{}^nC_3}{{}^{2n}C_3}$.

$$\therefore \frac{{}^nC_3}{{}^{2n}C_3} = \frac{1}{20}$$

$$\Rightarrow \frac{n(n-1)(n-2)}{2n(2n-1)(2n-2)} = \frac{1}{20} \Rightarrow \frac{n-2}{4(2n-1)} = \frac{1}{20}$$

$$\Rightarrow 5n-10 = 2n-1 \Rightarrow 3n = 9$$

$$\therefore n = 3$$

17. (c) Required probability

$$= \frac{{}^5C_3 \times {}^{10}C_8 + {}^5C_4 \times {}^{10}C_7 + {}^5C_5 \times {}^{10}C_6}{{}^{15}C_{11}}$$

$$= \frac{1}{{}^{15}C_{11}} (10 \times 45 + 5 \times 120 + 1 \times 210)$$

$$= \frac{1260 \times 1 \times 2 \times 3 \times 4}{15 \times 14 \times 13 \times 12} = \frac{12}{13}$$

18. (b) Required probability = P (India wins first and third test) + P (India wins second and third test)

$$= \frac{1}{2} \left(1 - \frac{1}{2}\right) \left(\frac{1}{2}\right) + \left(1 - \frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) = \frac{1}{8} + \frac{1}{8} = \frac{1}{4}$$

19. (a) Let the radius of given circle be r . Now make a concentric circle with radius $r/2$.

The given point is close to the circumference than to the centre, if it lies in the shaded region.

$$\therefore \text{Required probability} = \frac{\pi\{r^2 - (r/2)^2\}}{\pi r^2} = \frac{3/4 r^2}{r^2} = \frac{3}{4}$$

20. (b) Probability of selection of husband $P(H) = \frac{1}{5}$

$$\therefore P(\bar{H}) = 1 - \frac{1}{5} = \frac{4}{5}$$

and probability of selection of wife $P(W) = \frac{1}{3}$

$$\therefore P(\bar{W}) = 1 - \frac{1}{3} = \frac{2}{3}$$

\therefore Probability that only one of them is selected = $P(H)P(\bar{W}) + P(\bar{H})P(W)$

$$= \left(\frac{1}{5}\right)\left(\frac{2}{3}\right) + \left(\frac{4}{5}\right)\left(\frac{1}{3}\right) = \frac{2}{15} + \frac{4}{15} = \frac{6}{15} = \frac{2}{5}$$

21. (b) There are 10 letters in the word "REGULATION". These 10 letters can be arranged in $10!$ ways.

Exactly 4 letters can be placed between R and E in ${}^8C_4 \times 4! \times 2! \times 5!$ ways.

$$\text{Hence, required probability} = \frac{{}^8C_4 \times 4! \times 2! \times 5!}{10!} = \frac{1}{9}$$

22. (a) \therefore Favourable event for first doll = 1

\therefore Probability for first doll = $1/6$

Favourable event for second doll = 5

\therefore Probability for second doll = $5/6$

Favourable event for third doll = 4

\therefore Probability for third doll = $4/6$

$$\therefore \text{Required probability} = \frac{1}{6} \cdot \frac{5}{6} \cdot \frac{4}{6} = \frac{5}{54}$$

23. (d) The favourable events to come head at flipping a first coin = $\{HT, HH\}$

The favourable events to come tail at flipping a first coin = $\{T1, T2, T3, T4, T5, T6\}$

The total favourable events = $\{HT, HH, T1, T2, T3, T4, T5, T6\}$

$$\therefore \text{Required probability} = \frac{1}{8}$$

24. (b) P (All three questions are correct) = $\frac{1}{4} \cdot \frac{1}{4} \cdot \frac{1}{4} = \frac{1}{64}$

$$P$$
 (All three questions will not correct) = $1 - \frac{1}{64} = \frac{63}{64}$

25. (a) Given, $P(A/B) = 0.4$, $P(\bar{B}) = 0.8$, $P(A \cup B) = 0.5$

$$\therefore P(B) + P(\bar{B}) = 1$$

$$\Rightarrow P(B) = 1 - P(\bar{B}) = 1 - 0.8 = 0.2$$

We know that, multiplication theorem of probability,

$$P(A \cap B) = P(B) \cdot P(A/B) = 0.2 \times 0.4 = 0.08$$

26. (b) Favourable numbers = $\{222, 444, 666, 888\}$

Total digit numbers = $4 \times 5 \times 5$

$$\therefore \text{Required probability} = \frac{4}{4 \times 25} = \frac{1}{25}$$

27. (b) A leap year has 366 days, in which 2 days may be any of the following pairs.

(Sunday, Monday), (Monday, Tuesday), (Tuesday, Wednesday), (Wednesday, Thursday), (Thursday, Friday), (Friday, Saturday), (Saturday, Sunday).

$$\therefore \text{Required probability} = \frac{2}{7} + \frac{2}{7} - \frac{1}{7} = \frac{3}{7}$$

28. (c) Required probability = $P(A_1/B)$

$$= \frac{P(A_1)P(B/A_1)}{P(A_1)P(B/A_1) + P(A_2)P(B/A_2) + P(A_3)P(B/A_3)}$$

$$= \frac{0.4 \times 0.25}{0.4 \times 0.25 + 0.4 \times 0.4 + 0.2 \times 0.125}$$

$$= \frac{0.1}{0.1 + 0.16 + 0.025} = \frac{0.1}{0.285} = \frac{20}{57}$$

29. (a) Required probability = P (one ball is blue) +

$$P$$
 (both balls are blue)
$$= \frac{2}{9} \times \frac{7}{8} + \frac{2}{9} \times \frac{1}{8} = \frac{14}{72} + \frac{2}{72} = \frac{16}{72} = \frac{2}{9}$$

30. (c) Let E denotes the event of guessing a correct answer. Then, $P(E) + P(\bar{E}) = 1$

$$\Rightarrow \frac{x}{12} + \frac{2}{3} = 1 \Rightarrow x = 4$$

31. (b) Required probability = $\frac{{}^{25}C_3}{{}^{26}C_3} = \frac{23}{26}$

32. (d) $\therefore P(X \leq 2) = 0.25$

$$\begin{aligned} \Rightarrow P(X=1) + P(X=2) &= 0.25 \\ \Rightarrow k + p_1 &= 0.25 \Rightarrow p_1 = 0.25 - k \\ \text{and } P(X \geq 4) &= 0.35 \\ \Rightarrow P(X=4) + P(X=5) &= 0.35 \\ \Rightarrow p_2 + 2k &= 0.35 \\ \Rightarrow p_2 &= 0.35 - 2k \Rightarrow p_1 \neq p_2 \\ \text{and } p_1 + p_2 &= 0.25 - k + 0.35 - 2k \\ &= 0.6 - 3k \neq P(X=3) \end{aligned}$$

Hence, neither I nor II is correct.

33. (d) I. $P(A/B) = \frac{P(A \cap B)}{P(B)}$

$$\Rightarrow P(A) = \frac{P(A \cap B)}{P(B)}$$

[$\because P(A/B) = P(A)$, given]

$$\Rightarrow P(A \cap B) = P(A) \cdot P(B)$$

$$\therefore P(B/A) = \frac{P(A \cap B)}{P(A)}$$

$$= \frac{P(A) \cdot P(B)}{P(A)} = P(B)$$

Hence, Statement I is correct.

II. $P(\bar{B}/A) = \frac{P(\bar{B} \cap A)}{P(A)}$

$$\Rightarrow P(\bar{B}) = \frac{P(A) - P(A \cap B)}{P(A)}$$

[$\because P(\bar{B}/A) = P(\bar{B})$, given]

$$\Rightarrow P(A)[1 - P(B)] = P(A) - P(A \cap B)$$

$$\Rightarrow P(A \cap B) = P(A) \cdot P(B)$$

$$\therefore P(B/A) = \frac{P(A \cap B)}{P(A)}$$

$$= \frac{P(A) \cdot P(B)}{P(A)} = P(B)$$

Hence, Statement II is correct.

III. Given, $P(A \cap B) = P(A) \cdot P(B)$

$\Rightarrow A$ and B are independent events.

$\Rightarrow \bar{A}$ and \bar{B} are independent events.

$$\therefore P(\bar{A} \cap \bar{B}) = P(\bar{A}) \cdot P(\bar{B})$$

Hence, Statement III is also correct.

34. (b) $U = \{1, 2, 3, \dots, 20\}$

A = Set of all natural numbers which are perfect square = $\{1, 4, 9, 16\}$

B = Set of all natural numbers which are multiples of 5 = $\{5, 10, 15, 20\}$

C = Set of all natural numbers which are divisible by 2 and 3 = $\{6, 12, 18\}$

Here,

$$A \cup B = \{1, 4, 9, 16, 5, 10, 15, 20\}$$

$$\Rightarrow n(A \cup B) = 8$$

$$\Rightarrow n(A \cup B)' = 20 - 8 = 12$$

Hence, Statements I and III are correct.

35. (c) $P(E_1) = \frac{1}{10} \times 1 + \frac{2}{10} \times \frac{1}{2}$

$$+ \frac{3}{10} \times \frac{1}{3} + \frac{4}{10} \times \frac{1}{4} = \frac{2}{5}$$

36. (b) $P(A_3/E_2)$

$$= \frac{\frac{3}{10} \times \frac{1}{3}}{\frac{2}{10} \times \frac{1}{2} + \frac{3}{10} \times \frac{1}{3} + \frac{4}{10} \times \frac{1}{4}} = \frac{1}{3}$$

37. (c) Required probability = $\frac{{}^4C_2}{{}^{12}C_2} = \frac{1}{11}$

38. (b) Required probability

$$= 1 - P(\text{none is blue}) = 1 - \frac{7}{44} = \frac{37}{44}$$

39. (d) Required probability

$$= \frac{{}^3C_3 + {}^4C_3}{{}^{12}C_3} = \frac{1 + 4}{220} = \frac{5}{220} = \frac{1}{44}$$

40. (c) Since, A and B are independent events, therefore

$$P(A \cap B) = P(A) \cdot P(B) = \frac{1}{2} \times \frac{1}{5} = \frac{1}{10}$$

Now, $P(A \cup B) = P(A) + P(B)$

$$\therefore P(A \cap B) = \frac{1}{2} + \frac{1}{5} - \frac{1}{10} = \frac{3}{5}$$

41. (a) $P\left(\frac{A}{B}\right) = P(A) = \frac{1}{2}$

[since, A and B are independent]

42. (b) $P\left(\frac{A}{A \cup B}\right) = \frac{P[A \cap (A \cup B)]}{P(A \cup B)}$

$$= \frac{P(A)}{P(A \cup B)} = \frac{1/2}{3/5} = \frac{5}{6}$$

43. (a) $P\left(\frac{A \cap B}{A \cup \bar{B}}\right) = P\left(\frac{A \cap B}{A \cap B}\right) = 0$

44. (c) Let S be the sample space.

$$\therefore n(S) = 36$$

A : even number on the first die

B : number on the second die is greater than 4

$$\therefore n(A) = 18, n(B) = 12,$$

$$P(A) = \frac{18}{36} = \frac{1}{2}$$

and $P(B) = \frac{12}{36} = \frac{1}{3}$

Also, $A \cap B = \{(2, 5), (2, 6), (4, 5), (4, 6), (6, 5), (6, 6)\}$

$$P(A \cap B) = \frac{6}{36} = \frac{1}{6}$$

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$= \frac{1}{2} + \frac{1}{3} - \frac{1}{6}$$

$$= \frac{3 + 2 - 1}{6} = \frac{4}{6} = \frac{2}{3}$$

45. (d)

46. (c) Probability that both balls are of same colour = $P(\text{one green ball from urn I}) \times P(\text{One green ball from urn II})$

$$= \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$$

47. (d) Probability of getting atleast one green ball = $P(\text{one green ball from urn I and one white ball from urn II}) + P(\text{one green ball from urn I and one green ball from urn II}) + P(\text{one black ball from urn I and one green ball from urn II})$

$$= \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} = \frac{3}{4}$$

48. (b) We have,

$$(n+1)p = (10+1) \times \frac{2}{3} = \frac{22}{3}$$

which is not an integer.

\therefore Required number of successes

$$= \left\lceil \frac{22}{3} \right\rceil = 7$$

49. (b) **50.** (d) **51.** (b)

52. (b) We have, $A = \{2, 4, 6\}$, $B = \{1, 3, 5\}$ and $C = \{4, 5, 6\}$ since $A \cap B = \phi$, therefore A and B are mutually exclusive.

53. (d) Probability of getting head in a single toss, $P(H) = 1/2$

Probability of getting tail in a single toss, $P(T) = 1/2$

\therefore Required probability

$$= P(HHHHT \text{ or } TTTTH)$$

$$= P(HHHHT) + P(TTTTH)$$

$$= P(H) \cdot P(H) \cdot P(H) \cdot P(H) \cdot P(T)$$

$$+ P(T) \cdot P(T) \cdot P(T) \cdot P(T) \cdot P(H)$$

$$= \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)$$

$$+ \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right) \left(\frac{1}{2}\right)$$

$$= 2 \times \frac{1}{32} = \frac{1}{16}$$

54. (c) Given that, $P(\bar{A}) = 0.4, P(\bar{B}) = 0.3$ and $P(A \cup B) = 0.9$

By addition theorem of probability,

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$\Rightarrow P(A \cup B) = 1 - P(\bar{A}) + 1 - P(\bar{B}) - \{1 - P(\bar{A} \cap \bar{B})\}$$

$$\Rightarrow P(A \cup B) = 2 - P(\bar{A}) - P(\bar{B}) - 1 + P(\bar{A} \cap \bar{B})$$

$$\Rightarrow P(\bar{A} \cap \bar{B}) = P(A \cup B)$$

$$+ P(\bar{A}) + P(\bar{B}) - 1$$

[by De-Morgan's law,

$$P(\bar{A} \cap \bar{B}) = P(\overline{A \cup B})]$$

$$\Rightarrow P(\bar{A} \cap \bar{B}) = 0.9 + 0.4 + 0.3 - 1 = 0.6$$

55. (c) Required probability = $\frac{3}{8} \times \frac{2}{7} = \frac{3}{28}$

56. (a)

57. (a) Probability of getting a head in a single coin, $p = 1/2$
 Probability of getting a tail in a single coin, $q = \frac{1}{2}$
 \therefore Probability of getting exactly two heads
 $= {}^4C_2 \times \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{2}\right)^{4-2}$
 $= \frac{4 \times 3}{2} \times \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{2}\right)^2 = 6 \times \frac{1}{4} \times \frac{1}{4} = \frac{3}{8}$

58. (c) For a dice, sample space
 $= \{1, 2, 3, 4, 5, 6\}$
 Total number = 6
 For a coin, sample space = $\{H, T\}$
 Total number = 2
 Therefore, associated sample space of throwing together a dice and two coin
 $= 6 \times 2 \times 2 = 24$ points.

59. (b) First number is drawn from given set in 8C_1 ways.
 And, second number is drawn from the set in 7C_1 ways.
 Hence, number of elementary events
 $= {}^8C_1 \times {}^7C_1 = 8 \times 7 = 56$

60. (c) We have, $(n+1)p = \frac{101}{3}$ which is not an integer.
 $\therefore P(X=r)$ is maximum when
 $r = \left\lceil \frac{101}{3} \right\rceil = 33$

61. (b) **62.** (b)

63. (c) Given that, $P(A) = \frac{2}{3}$, $P(B) = \frac{2}{5}$
 and $P(A \cup B) - P(A \cap B) = \frac{2}{5}$
 $\Rightarrow P(A) + P(B) - 2P(A \cap B) = \frac{2}{5}$
 $\Rightarrow \frac{2}{3} + \frac{2}{5} - 2P(A \cap B) = \frac{2}{5}$
 $\therefore P(A \cap B) = \frac{1}{3}$

64. (c) Required probability = $\frac{3}{36} = \frac{1}{12}$

65. (c)

66. (c) Total sample space,
 $n(S) = 6 \times 6 \times 6 = 216$
 Favourable cases,
 $E = \{(1, 1, 1), (2, 2, 2), (3, 3, 3), (4, 4, 4), (5, 5, 5), (6, 6, 6)\}$
 $\therefore n(E) = 6$
 \therefore Required probability
 $= \frac{n(E)}{n(S)} = \frac{6}{216} = \frac{1}{36}$

67. (c) Given that,
 $P(A) = \frac{1}{5}$, $P(A \cup B) = \frac{7}{10}$
 Also, A and B are independent events,
 $\therefore P(A \cap B) = P(A) \cdot P(B)$
 $\Rightarrow P(A) + P(B) - P(A \cap B) = P(A) \cdot P(B)$
 $\Rightarrow \frac{1}{5} + P(B) - \frac{7}{10} = \frac{1}{5} \times P(B)$
 $\Rightarrow P(B) - \frac{P(B)}{5} = \frac{7}{10} - \frac{1}{5} = \frac{5}{10}$
 $\Rightarrow \frac{4P(B)}{5} = \frac{1}{2} \Rightarrow P(B) = \frac{5}{8}$
 $\therefore P(\bar{B}) = 1 - P(B) = 1 - \frac{5}{8} = \frac{3}{8}$

68. (a) Two or more events associated to a random experiments are exhaustive, if at least one of them necessarily occurs i.e. their union is the sample space.
 i.e. $A_1 \cup A_2 \cup \dots \cup A_n = S$
 Hence, only Statement I is correct.

69. (d) (a) $np = 2$ and $npq = 4$
 $\Rightarrow 2q = 4 \Rightarrow q = 2$
 Which is not possible.
 (b) $n = 4$ and $p = 3/2$
 Here, $p > 1$, which is not possible.
 (c) $n = 8$ and $p = 1$
 Here, $p = 1$, this is also not possible.
 (d) $np = 10$ and $npq = 8$
 $\Rightarrow 10q = 8 \Rightarrow q = \frac{4}{5}$
 and $p = 1 - q = 1 - 4/5 = 1/5$
 $\therefore n = 50$
 which is possible.
 Hence, correct option is (d).

70. (b) Given, $p = q = \frac{1}{2}$
 and mean of Binomial distribution
 $= np = 6$
 $\Rightarrow n \times \frac{1}{2} = 6 \Rightarrow n = 12$

71. (c) Total sample space, $n(S) = {}^5C_2$,
 Now, favourable events,
 $n(E) =$ Two selected balls are black.
 $= {}^3C_0 \times {}^2C_2$
 \therefore Required probability = $\frac{n(E)}{n(S)}$
 $= \frac{{}^3C_0 \times {}^2C_2}{{}^5C_2} = \frac{1 \times 1}{\frac{5 \times 4}{2}} = \frac{1}{10}$

72. (b) $\therefore P(A \text{ wining}) = \frac{6}{12} = \frac{1}{2}$
 and $P(B \text{ wining}) = \frac{4}{12} = \frac{1}{3}$
 \therefore Required probability

$$= P(A) \cdot P(B) \cdot P(A) + P(B) \cdot P(A) \cdot P(B)$$

$$= \frac{1}{2} \cdot \frac{1}{3} \cdot \frac{1}{2} + \frac{1}{3} \cdot \frac{1}{2} \cdot \frac{1}{3}$$

$$= \frac{1}{12} + \frac{1}{18} = \frac{3+2}{36} = \frac{5}{36}$$

73. (c) Given that, $n =$ Total number of tosses = 18 and $X =$ Number of scores which exceed 4 in 18 tosses of a symmetrical die = $\{5, 6\}$.
 $\Rightarrow n(X) = 2$
 $\therefore p = \frac{n(X)}{n(S)} = \frac{2}{6} = \frac{1}{3}$
 and $q = 1 - p = 1 - \frac{1}{3} = \frac{2}{3}$ [$\because p + q = 1$]

Now, arithmetic mean of X
 $= np = 18 \times \frac{1}{3} = 6$
 and standard deviation of X
 $= \sqrt{\text{Variance of } X} = \sqrt{npq}$
 $= \sqrt{18 \times \frac{1}{3} \times \frac{2}{3}}$
 $= \sqrt{4} = 2$

Hence, both Statements I and II are correct.

Sol. (Q. Nos. 74-77) Given that, $X =$ Set of odd numbers from the set A .

$Y =$ Set of even numbers from the set A .

Let set $A = \{1, 2, 3, 4, 5, 6, 7\}$ and $Z = X + Y$

74. (d) Now, $Z = 5$ is only possible when $X = 1, 3$ and $Y = 4, 2$
 Sample space = $\{(1, 2), (1, 4), (1, 6), (3, 2), (3, 4), (3, 6), (5, 2), (5, 4), (5, 6), (7, 2), (7, 4), (7, 6)\}$

$\therefore n(S) = 12$
 and favourable space = $\{(1, 4), (3, 2)\}$
 $\therefore n(E) = 2$
 So, $P(Z = 5) = \frac{n(E)}{n(S)} = \frac{2}{12} = \frac{1}{6}$

75. (a) We know that, sum of even and odd numbers can never be an even number.
 $\therefore P(Z = 10) = 0$

76. (d) Now, $Z > 11$ is only possible when $X = 7$ and $Y = 6$
 \therefore Favourable case = $\{7, 6\}$
 $\Rightarrow n(E_3) = 1$
 $\therefore P(Z > 11) = \frac{n(E_3)}{n(S)} = \frac{1}{12}$

77. (c) $\therefore Z =$ Product of two prime numbers
 $= \{2 \times 2, 3 \times 3, 5 \times 5, 7 \times 7, 2 \times 3, 2 \times 5, 2 \times 7, 3 \times 5, 3 \times 7, 5 \times 7\}$
 $= \{4, 9, 25, 49, 6, 10, 14, 15, 21, 35\}$
 $\therefore Z = X + Y \leq 13$

[∵ maximum of X is 7 and maximum of Y is 6]
 ∴ $Z \neq 25, 49, 14, 15, 21, 35$
 Also, we know that, sum of the odd and even number is always an odd number.
 [∵ $Z = X + Y$]

So, $Z \neq 4, 6, 10$
 ∴ $Z = 9$ is only remaining case.
 Favourable case = $\{(3, 6), (5, 4), (7, 2)\}$
 ∴ $n(E_4) = 3$

So, required probability

$$= \frac{n(E_4)}{n(S)} = \frac{3}{12} = \frac{1}{4}$$

78. (b) $P(A/B') = \frac{P(A \cap B')}{P(B')}$

$$= \frac{P(A) - P(A \cap B)}{1 - P(B)} = \frac{P(A) - P(AB)}{1 - P(B)}$$

79. (a) Clearly, $A \cap B \subseteq A$
 $\Rightarrow P(A \cap B) \leq P(A)$... (i)
 $A \subseteq A \cup B$
 $\Rightarrow P(A) \leq P(A \cup B)$... (ii)

We know that,
 $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
 $\Rightarrow P(A \cup B) \leq P(A) + P(B)$... (iii)

From Eqs. (i), (ii) and (iii),
 $P(A \cap B) \leq P(A) \leq P(A \cup B)$
 $\leq P(A) + P(B)$

80. (a) ∵ 1U, 1N, 2I, 1V, 1E, 1R, 1S, 1T, 1Y
 ∴ Total number of possible arrangements = $\frac{10!}{2!}$

and favourable arrangements = $\frac{10!}{2!} - 9!$
 ∴ Required probability = $\frac{\frac{10!}{2!} - 9!}{\frac{10!}{2!}}$

$$= \frac{9!(5-1)}{9! \times 10} \times 2 = \frac{4}{5}$$

81. (a) Box I \rightarrow 4 W, 3 B, Box II \rightarrow 3 W, 4 B
 Probability for choosing first box = $\frac{3}{6} = \frac{1}{2}$

Probability for choosing second box = $\frac{1}{2}$
 ∴ Required probability

$$= \frac{\frac{1}{2} \times \frac{3}{7}}{\frac{1}{2} \times \frac{3}{7} + \frac{1}{2} \times \frac{4}{7}} = \frac{\frac{3}{14}}{\frac{3}{14} + \frac{4}{14}} = \frac{3/14}{7/14} = \frac{3}{7}$$

82. (a) Let A and B be the events that X and Y qualify the examination, respectively. We have, $P(A) = 0.05$, $P(B) = 0.10$ and $P(A \cap B) = 0.02$
 Required probability

$$= P(A \cap \bar{B}) + P(B \cap \bar{A})$$

$$= P(A) - P(A \cap B) + P(B) - P(A \cap B)$$

$$= P(A) + P(B) - 2P(A \cap B)$$

$$= 0.05 + 0.1 - 2(0.02)$$

$$= 0.15 - 0.04 = 0.11$$

83. (b) Let S be the sample space of the experiment and E be the event that at most three tails occur.

Clearly, $n(S) = 2^4$ and
 $n(E) = {}^4C_0 + {}^4C_1 + {}^4C_2 + {}^4C_3$

$$= 1 + 4 + \frac{4 \times 3}{2 \times 1} + 4$$

$$= 1 + 4 + 6 + 4 = 15$$

∴ $P(E) = \frac{n(E)}{n(S)} = \frac{15}{16}$

84. (b) Total number of ways drawing 2 cards successively without replacement

$$= {}^{52}C_1 \times {}^{51}C_1$$

and number of ways 2 aces without replacement = ${}^4C_1 \times {}^3C_1$

∴ Required probability

$$= \frac{{}^4C_1 \times {}^3C_1}{{}^{52}C_1 \times {}^{51}C_1} = \frac{4 \times 3}{52 \times 51}$$

$$= \frac{1}{13 \times 17} = \frac{1}{221}$$

85. (d) Let E_1 be the event that box B_1 is chosen, E_2 be the event that box B_2 is chosen and A be the event that balls are of different colours.

Clearly, $P(E_1) = P(E_2) = \frac{1}{2}$,
 $P\left(\frac{A}{E_1}\right) = \frac{{}^2C_1 \times {}^3C_1}{{}^5C_2} = \frac{6}{10} = \frac{3}{5}$
 and $P\left(\frac{A}{E_2}\right) = \frac{{}^3C_1 \times {}^2C_1}{{}^5C_2} = \frac{6}{10} = \frac{3}{5}$

Now, by the theorem of total probability, we have

$$P(A) = P(E_1) \cdot P\left(\frac{A}{E_1}\right) + P(E_2) \cdot P\left(\frac{A}{E_2}\right)$$

$$= \frac{1}{2} \cdot \frac{3}{5} + \frac{1}{2} \cdot \frac{3}{5} = \frac{1}{2} \left(\frac{2 \times 3}{5}\right) = \frac{3}{5}$$

86. (d) Let X be a random variable that follows binomial distribution with parameter n and p .

Then, Mean = $E(x) = np = 2$... (i)
 and variance = $\text{var}(x) = npq = 1$... (ii)

On dividing Eq. (ii) by Eq. (i), we get
 $q = \frac{1}{2} \Rightarrow p = \frac{1}{2}$

[∵ $p + q = 1$]

Now, on substituting the value of p in Eq. (i), we get $n = 4$

Thus, $P(X = 0) = {}^4C_0 \left(\frac{1}{2}\right)^0 \left(\frac{1}{2}\right)^{4-0}$

$$= 1 \times 1 \times \left(\frac{1}{2}\right)^4 = \frac{1}{16}$$

87. (b)

88. (c) Since, 5 will never appear on any one of the dice, so number of exhaustive events are
 $= 36 - 6 - 6 + 1 = 36 - 11 = 25$

89. (a) Let A be the event that Mr. A hit the target and B be the event that Mr. B hit the target

∴ $P(A) = \frac{1}{2}$ and $P(B) = \frac{1}{3}$

Now, P

(exactly one of them hits the target)

$$= P(A \cap \bar{B}) + P(\bar{A} \cap B)$$

$$= P(A) \cdot P(\bar{B}) + P(\bar{A}) \cdot P(B)$$

$$= \frac{1}{2} \cdot \frac{2}{3} + \frac{1}{2} \cdot \frac{1}{3} = \frac{3}{6} = \frac{1}{2}$$

90. (c) As, $A \subseteq B$, then $A \cup B = B$ and $A \cap B = A$.

Clearly, $P(A \cap \bar{B}) = P(\phi) = 0$

Now, $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{P(A)}{P(B)}$

$\Rightarrow P\left(\frac{A}{A \cup B}\right) = P\left(\frac{A}{B}\right) = \frac{P(A)}{P(B)}$

but $P\left(\frac{B}{A}\right) = \frac{P(B \cap A)}{P(A)} = \frac{P(A)}{P(A)} = 1$

Hence, option (c) is not correct.

91. (d) Let solving a question is success and not solving a question is failure.

Let probability of success = $p = \frac{1}{2}$ and

probability of failure = $q = \frac{1}{2}$

Let X be random variable that denotes the number of success in 5 trials.

Required probability = $P(X \geq 2)$

$$= 1 - [P(X = 0) + P(X = 1)]$$

$$= 1 - \left[{}^5C_0 \left(\frac{1}{2}\right)^5 + {}^5C_1 \left(\frac{1}{2}\right)^5 \right]$$

$$= 1 - \frac{6}{32} = \frac{26}{32} = \frac{13}{16}$$

92. (a) Total length of interval in which x lies = $5 - 0 = 5$

Given, $x^2 - 3x + 2 \geq 0$... (i)

$\Rightarrow (x - 2)(x - 1) \geq 0 \Rightarrow x \leq 1$ or $x \geq 2$

But $x \in [0, 5]$, therefore solution of Eq. (i) is $x \in [0, 1] \cup [2, 5]$

\therefore Total length of interval $= (1-0) + (5-2) = 1+3 = 4$

\therefore Required probability $= \frac{4}{5}$

93. (c) Here, $n(S) = {}^9C_3$, Let favourable event $= E$
 $\therefore n(E) = {}^5C_3$,

$$\text{Now, } P(E) = \frac{n(E)}{n(S)} = \frac{{}^5C_3}{{}^9C_3} = \frac{5}{42}$$

94. (b) We have, single digit natural numbers $= \{1, 2, 3, \dots, 9\}$

$$\therefore n(S) = {}^9C_2 = 36$$

The sum of two different numbers which are prime 2, 3, 5, 7, 11, 13, 17, 19.

Favourable outcomes $= (1, 2), (1, 4), (1, 6), (2, 3), (2, 5), (2, 9), (3, 2), (4, 1), (6, 1), (9, 2), (7, 4), (4, 7), (7, 6), (6, 7)$

$$\therefore n(E) = 14$$

$$\text{Hence, } P(E) = \frac{n(E)}{n(S)} = \frac{14}{36} = \frac{7}{18}$$

95. (a) P (problem will be solved)
 $= 1 - P$ (problem will not be solved by A, B and C)
 $= 1 - \left\{ \left(1 - \frac{1}{2}\right) \left(1 - \frac{1}{3}\right) \left(1 - \frac{1}{4}\right) \right\}$
 $= 1 - \frac{1}{2} \times \frac{2}{3} \times \frac{3}{4} = 1 - \frac{1}{4} = \frac{3}{4}$

96. (b)

97. (a) Given, $p = q = \frac{1}{2}$, $n = 7$, $N = 128$ and $r = 3, 4, 5, 6, 7$

$$\begin{aligned} \text{Required number of throws} &= 128 \cdot P(X \geq 3) \\ &= [{}^7C_3 p^3 q^4 + {}^7C_4 p^4 q^3 + {}^7C_5 p^5 q^2 \\ &\quad + {}^7C_6 p^6 q^1 + {}^7C_7 p^7 q^0] \\ &= 128 \left[35 \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^4 + 35 \left(\frac{1}{2}\right)^4 \left(\frac{1}{2}\right)^3 \right. \\ &\quad \left. + 21 \left(\frac{1}{2}\right)^5 \left(\frac{1}{2}\right)^2 + 7 \left(\frac{1}{2}\right)^6 \left(\frac{1}{2}\right)^1 + \left(\frac{1}{2}\right)^7 \right] \\ &= 128 \left\{ \left(\frac{1}{2}\right)^7 [35 + 35 + 21 + 7 + 1] \right\} \\ &= \left[\frac{1}{128} \times 99 \right] \times 128 = 99 \end{aligned}$$

98. (c) Given, $P(\bar{B}) = 0.8$

$$\Rightarrow P(B) = 1 - P(\bar{B}) = 1 - 0.8 = 0.2$$

$$P(A \cup B) = 0.5, P(A/B) = 0.4$$

$$\therefore P(A/B) = \frac{P(A \cap B)}{P(B)}$$

$$\Rightarrow 0.4 = \frac{P(A \cap B)}{0.2}$$

$$\Rightarrow 0.08 = P(A \cap B)$$

$$\text{Hence, } P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$\Rightarrow 0.5 = P(A) + 0.2 - 0.08$$

$$\Rightarrow 0.5 = P(A) + 0.12 \Rightarrow P(A) = 0.38$$

99. (a) Let $P(A) = P(\text{scooter}) = \frac{2000}{12000} = \frac{1}{6}$

$$P(B) = P(\text{car}) = \frac{4000}{12000} = \frac{1}{3}$$

$$\text{and } P(C) = P(\text{truck}) = \frac{6000}{12000} = \frac{1}{2}$$

Let $E =$ Event that person meets with accident.

$$\text{Then, } P\left(\frac{E}{A}\right) = \frac{1}{100}, P\left(\frac{E}{B}\right) = \frac{3}{100}, P\left(\frac{E}{C}\right) = \frac{15}{100}$$

\therefore Required probability

$$\begin{aligned} &= \frac{P(A) \cdot P\left(\frac{E}{A}\right)}{P(A) \cdot P\left(\frac{E}{A}\right) + P(B) \cdot P\left(\frac{E}{B}\right) + P(C) \cdot P\left(\frac{E}{C}\right)} \\ &= \frac{\frac{1}{6} \times \frac{1}{100}}{\frac{1}{6} \times \frac{1}{100} + \frac{1}{3} \times \frac{3}{100} + \frac{1}{2} \times \frac{15}{100}} = \frac{\frac{1}{6}}{\frac{1}{6} + 1 + \frac{15}{2}} \\ &= \frac{\frac{1}{6}}{\frac{1}{6} + 6 + 45} = \frac{1}{52} \end{aligned}$$

100. (d) Given, $np = 2$ and $npq = 1 \Rightarrow 2 \times q = 1 \Rightarrow q = \frac{1}{2}$

$$\Rightarrow p + q = 1 \Rightarrow p = \frac{1}{2} \Rightarrow n \times \frac{1}{2} \times \frac{1}{2} = 1 \Rightarrow n = 4$$

$$\begin{aligned} \therefore P(X > 1) &= {}^4C_2 p^2 q^2 + {}^4C_3 p^3 q^1 + {}^4C_4 p^4 q^0 \\ &= 6 \left(\frac{1}{2}\right)^2 \left(\frac{1}{2}\right)^2 + 4 \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^1 + 1 \times \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^4 (6 + 4 + 1) = \frac{11}{16} \end{aligned}$$

101. (c) \therefore Probability of no head $= \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} = \frac{1}{16}$

Probability of the experiments end with three tosses, if TTH comes.

$$\therefore \text{Required probability} = \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} = \frac{1}{8}$$

Hence, both statements are correct.

102. (a) We have,

$$p = \text{Probability of tail appear} = \frac{1}{2}$$

$$q = \text{Probability of tail not appear} = 1 - p = \frac{1}{2}$$

Now, P (tail appear odd number of times)

$$\begin{aligned} &= P(X = 1) + P(X = 3) + P(X = 5) \\ &= {}^5C_1 \left(\frac{1}{2}\right)^1 \left(\frac{1}{2}\right)^4 + {}^5C_3 \left(\frac{1}{2}\right)^3 \left(\frac{1}{2}\right)^2 + {}^5C_5 \left(\frac{1}{2}\right)^5 \\ &= \frac{5}{32} + \frac{10}{32} + \frac{1}{32} = \frac{16}{32} = \frac{1}{2} \end{aligned}$$

103. (a) Clearly, total number of outcomes $= 2^{100}$ and number of favourable outcomes

$$\begin{aligned} &= {}^{100}C_1 + {}^{100}C_3 + \dots + {}^{100}C_{99} = 2^{100-1} \\ &= 2^{99} \quad [\because {}^nC_1 + {}^nC_3 + {}^nC_5 + \dots = 2^{n-1}] \end{aligned}$$

$$\text{Hence, required probability} = \frac{2^{99}}{2^{100}} = \frac{1}{2}$$

104. (a) Let n missiles be fired and r of them hits the target.

$$\therefore P(X = r) = {}^n C_r p^r q^{n-r} = {}^n C_r (0.3)^r (0.7)^{n-r}$$

Target is hit when atleast 1 missile strikes the target.

$$\therefore P(X \geq 1) = 1 - P(X = 0)$$

This must be greater than 80%.

$$\text{So, } 1 - {}^n C_0 (0.3)^0 (0.7)^{n-0} \geq \frac{80}{100}$$

$$\Rightarrow 1 - \left(\frac{7}{10}\right)^n \geq \frac{80}{100} \Rightarrow \left(\frac{7}{10}\right)^n \leq \frac{20}{100} \Rightarrow n \geq 5$$

105. (d) Let A_2 = Area in which a randomly selected point lies

$$= (6-2) \times (5-2) = 4 \times 3 = 12 \text{ sq inch}$$

$$A_1 = \text{Total area} = 6 \times 5 = 30 \text{ sq inch}$$

$$\therefore \text{Required probability} = \frac{A_2}{A_1} = \frac{12}{30} = \frac{2}{5}$$

106. (b) As, $\bar{A} \cap B = B - A \cap B$

So, in given case, $P(\bar{A} \cap B) = P(B) = 0.3$

[$\because A$ and B are mutually exclusive, so $A \cap B = \phi \Rightarrow P(A \cap B) = 0$]

$$\begin{aligned} \text{and } P(A | A \cup B) &= \frac{P[A \cap (A \cup B)]}{P(A \cup B)} \\ &= \frac{P(A)}{P(A) + P(B)} = \frac{0.2}{0.2 + 0.3} = \frac{2}{5} \end{aligned}$$

107. (c) Number of days in December = 31

\therefore Number of complete weeks = 4 (i.e. $7 \times 4 = 28$ days)

Remaining 3 days can be (M, T, W), (T, W, Th), (W, Th, F), (Th, F, Sa), (F, Sa, S), (Sa, S, M), (S, M, T)

Out of these 7, 3 are favourable outcomes.

So, probability of having 5 Sunday in the month of December is $\frac{3}{7}$.

108. (b) Total outcomes = $6 \times 6 \times 6 = 216$

$$\text{Now, required probability} = 1 - P(\text{sum} = 3 \text{ or } 4) = 1 - \left[\frac{1}{216} + \frac{3}{216} \right]$$

[\because sum 3 = {1, 1, 1} and sum 4 = {(1, 1, 2), (1, 2, 1), (2, 1, 1)}]

$$= 1 - \frac{4}{216} = \frac{53}{54}$$

109. (d) Given, $P(A) = \frac{1}{3}$ and $P(B) = \frac{3}{4}$

Now, P (exactly one)

$$= P(A) + P(B) - 2P(A \cap B)$$

$$= P(A) + P(B) - 2P(A) \cdot P(B)$$

[\because event A and B are independent]

$$= \frac{1}{3} + \frac{3}{4} - 2 \times \frac{1}{3} \times \frac{3}{4}$$

$$= \frac{1}{3} + \frac{3}{4} - \frac{1}{2} = \frac{4 + 9 - 6}{12} = \frac{7}{12}$$

110. (b) Given, a coin is tossed three times.

Now, required probability

$$= P(HTH) + P(THT)$$

$$= \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}$$

$$= \frac{1}{8} + \frac{1}{8} = \frac{2}{8} = \frac{1}{4}$$

30

MISCELLANEOUS

In NDA exam, sometimes 1 question is asked from simple topics of General Maths which is based on finding the value of expression, solving the equations or finding angle between minute and hour hand of watch etc.

Sometimes in the examination, we face the questions which are not specified in the given chapters. Thus, we are introducing this chapter to discuss general problems related to rational or irrational numbers, percentage, area, volume etc. To solve them, we do not require any specific method or formula. Even, if we use any formula, it will be very usual. Also, we are providing statement based and comprehension based questions, which we generally face in the examination. In both of these type of questions some conditions is given based on that we have to select options in statement type or have to solve given questions in comprehension type.

EXAMPLE 1. If $x = a^{1/3} - a^{-1/3}$, then what is $(x^3 + 3x)$ equal to?

- a. zero b. $a + \frac{1}{a}$ c. $a - \frac{1}{a}$ d. $a^3 + \frac{1}{a^3}$

Sol. c. Given, $x = a^{1/3} - a^{-1/3}$

On cubing both sides, we get $x^3 = (a^{1/3} - a^{-1/3})^3 = a - a^{-1} - 3a^{1/3} \cdot a^{-1/3}(a^{1/3} - a^{-1/3})$

$$\Rightarrow x^3 = a - \frac{1}{a} - 3x \Rightarrow x^3 + 3x = a - \frac{1}{a}$$

EXAMPLE 2. The value of given expression $\sqrt[3]{2 + \sqrt{5}} + \sqrt[3]{2 - \sqrt{5}}$, will be

- a. a whole number b. rational number but not a whole number
c. irrational number d. None of these

Sol. b. $\sqrt[3]{2 + \sqrt{5}} + \sqrt[3]{2 - \sqrt{5}} = (2 + \sqrt{5})^{1/3} + (2 - \sqrt{5})^{1/3}$

$$= 2^{1/3} \left(1 + \frac{\sqrt{5}}{2}\right)^{1/3} + 2^{1/3} \left(1 - \frac{\sqrt{5}}{2}\right)^{1/3} = 2^{1/3} \left\{1 + \frac{6}{5}\sqrt{5} + \dots + 1 - \frac{\sqrt{5}}{6} + \dots\right\}$$

From the above expression, we conclude that the value of given expression is a rational number but not a whole number.

EXAMPLE 3. If $a^2 + b^2 + c^2 = 0$, then find the value of $\frac{(a^4 - b^4)^3 + (b^4 - c^4)^3 + (c^4 - a^4)^3}{(a^2 - b^2)^3 + (b^2 - c^2)^3 + (c^2 - a^2)^3}$.

- a. $a^2b^2c^2$ b. $-a^2b^2c^2$ c. abc d. $3a^2b^2c^2$

Sol. b.
$$\frac{(a^4 - b^4)^3 + (b^4 - c^4)^3 + (c^4 - a^4)^3}{(a^2 - b^2)^3 + (b^2 - c^2)^3 + (c^2 - a^2)^3}$$

$$= \frac{3(a^4 - b^4)(b^4 - c^4)(c^4 - a^4)}{3(a^2 - b^2)(b^2 - c^2)(c^2 - a^2)}$$

$$= (a^2 + b^2)(b^2 + c^2)(c^2 + a^2) \quad [\because a^3 + b^3 + c^3 - 3abc = 0]$$

$$= (-c^2)(-a^2)(-b^2) \quad [\because a^2 + b^2 + c^2 = 0]$$

$$= -a^2b^2c^2$$

EXAMPLE 4. From following given equations, which of the following is/are linear?

- I. $2x + y - z = 5$ II. $\pi x + y - ez = \log 3$
 III. $3x + 2y = 7/z$ IV. $\sin x - y - 5z = 4$

Select the best option(s) from the given options.

- a. Only I b. I and II
 c. III and IV d. I, II and IV

Sol. b. From the following given equations only

$$2x + y - z = 5$$

and $\pi x + y - ez = \log 3$ are linear.

EXAMPLE 5. If 34 cm long wire is converted into a quadrilateral whose each angle is 90° , then the maximum curved surface area of that quadrilateral will be

- a. 68 cm^2
 b. 70 cm^2
 c. 71.25 cm^2
 d. 72.25 cm^2

Sol. d. Let the side of the quadrilateral be a cm.

$$\therefore 4a = 34 \Rightarrow a = \frac{34}{4} = \frac{17}{2}$$

$$\therefore \text{Maximum area} = \left(\frac{17}{2}\right)^2 = \frac{289}{4} = 72.25 \text{ cm}^2$$

> PRACTICE EXERCISE

1. If $x = \left(a + \sqrt{a^2 + b^3}\right)^{1/3} + \left(a - \sqrt{a^2 + b^3}\right)^{1/3}$, then what is the value of $x^3 + 3bx - 2a$?
 (a) $2a^3$ (b) $-2a^3$ (c) 1 (d) 0

2. What is the square root of $9 + 2\sqrt{14}$?
 (a) $1 + 2\sqrt{2}$ (b) $\sqrt{3} + \sqrt{6}$ (c) $\sqrt{2} + \sqrt{7}$ (d) $\sqrt{2} + \sqrt{5}$

3. If $x(x + y + z) = 9$, $y(x + y + z) = 16$ and $z(x + y + z) = 144$, then what is x equal to?
 (a) $\frac{9}{5}$ (b) $\frac{9}{7}$ (c) $\frac{9}{13}$ (d) $\frac{16}{13}$

4. If $2^x + 3^y = 17$ and $2^{x+2} - 3^{y+1} = 5$, what is the value of x ?
 (a) 3 (b) 2 (c) 1 (d) 0

5. If $a^x = b$, $b^y = c$ and $c^z = a$, then the value of $\frac{1}{(xy + yz + zx)} \left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z}\right)$.
 (a) 0 (b) abc (c) -1 (d) +1

6. If $\frac{x-a}{b+c} + \frac{x-b}{c+a} + \frac{x-c}{a+b} = 3$, then the value of x will be
 (a) 0 (b) $a + b + c$
 (c) 1 (d) abc

7. The average daily income of workers of a factory including that of the owner is ₹ 110. However, if the income of the owner is excluded, the average

daily income of the remaining 9 workers is ₹ 76. What is the daily income of the owner?

- (a) ₹ 300 (b) ₹ 316 (c) ₹ 322 (d) ₹ 416

8. During a certain plan period, a state out of a total budget of ₹ 1400 crores had spent 28% of the total amount on Agriculture, 35% on Industry, 12% on Energy and 8% on Social Welfare, 105 crores on Education and the balance amount on Transport. What is the amount spent on Transport in crores of rupees?

- (a) 123 (b) 145 (c) 165 (d) 133

9. In a town, 35.4% of the people are not literates, 27% have education up to primary school, 18.6% have education up to middle school. The people with education up to high school are twice the number of people with education up to pre-university. Of the remaining, 660 are graduates. If the population of the town is 15000, then what is the number of people with education up to high school?

- (a) 3120 (b) 1560
 (c) 1460 (d) None of these

10. If the vectors A and B are perpendicular and the dot product of AB vanishes, then the workdone, when the force and displacement are perpendicular to each other is

- (a) 0 (b) 1 (c) AB (d) FD

PREVIOUS YEARS' QUESTIONS

11. If d is the number of degrees contained in an angle, m is the number of minutes and s is the number of seconds, then the value of $(s - m)/(m - d)$ is ☑ 2013 I
- (a) 1 (b) 60
 (c) $\frac{1}{60}$ (d) None of these

12. What is the angle (in circular measure) between the hour hand and the minute hand of a clock when the time is half past 4? ☑ 2013 II
- (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{4}$ (c) $\frac{\pi}{6}$ (d) None of these
13. If $8x - 9y = 20$ and $7x - 10y = 9$, then what is $2x - y$ equal to? ☑ 2013 II
- (a) 10 (b) 11 (c) 12 (d) 13

ANSWERS

1	d	2	c	3	c	4	a	5	d	6	b	7	d	8	d	9	c	10	a
11	b	12	b	13	a														

HINTS AND SOLUTIONS

1. (d) Given, $x = (a + \sqrt{a^2 + b^3})^{1/3} + (a - \sqrt{a^2 + b^3})^{1/3}$
- On cubing both sides, we get
 $x^3 = (a + \sqrt{a^2 + b^3}) + (a - \sqrt{a^2 + b^3})$
 $+ 3(a + \sqrt{a^2 + b^3})^{1/3}(a - \sqrt{a^2 + b^3})^{1/3}$
 $\{(a + \sqrt{a^2 + b^3})^{1/3} + (a - \sqrt{a^2 + b^3})^{1/3}\}$
 $\Rightarrow x^3 = 2a - 3b(x)$
 $\Rightarrow x^3 + 3bx - 2a = 0$
2. (c) $9 + 2\sqrt{14} = (\sqrt{7})^2 + (\sqrt{2})^2 + 2\sqrt{7} \times \sqrt{2}$
 $= (\sqrt{7} + \sqrt{2})^2$
 $\therefore \sqrt{9 + 2\sqrt{14}} = (\sqrt{7} + \sqrt{2})$
3. (c) Given, $x(x + y + z) = 9$,
 $y(x + y + z) = 16$ and $z(x + y + z) = 144$
 On adding all equations, we get
 $(x + y + z)(x + y + z) = 9 + 16 + 144$
 $\Rightarrow x + y + z = 13$
 $[\because x(x + y + z) = 9]$
 $\Rightarrow x(13) = 9$
 $\Rightarrow x = \frac{9}{13}$
4. (a)
5. (d) We have,
 $= \frac{1}{(xy + yz + zx)} \left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z} \right)$
 $\frac{1}{(xy + yz + zx)} \cdot \frac{(xy + yz + zx)}{xyz} = \frac{1}{xyz}$
 $\left[\text{as, } x = \frac{\log b}{\log a}, y = \frac{\log c}{\log b}, z = \frac{\log a}{\log c} \right]$
 $= \frac{\log a}{\log b} \times \frac{\log b}{\log c} \times \frac{\log c}{\log a} = 1$

6. (b) We have,
 $\frac{x-a}{b+c} + \frac{x-b}{c+a} + \frac{x-c}{a+b} = 3$
- Its possible only if,
 $\frac{x-a}{b+c} = \frac{x-b}{c+a} = \frac{x-c}{a+b} = 1$
- Thus, $x = a + b + c$
7. (d) Total number of members in a factory = worker + owner = $9 + 1 = 10$
- Now, the total daily income of workers of a factory including that of the owner = $110 \times 10 = 1100$ and the total daily income of workers of a factory excluding that of the owner = $(10 - 1) \times 76 = 9 \times 76 = 684$
- Hence, the daily income of the owner = ₹ $(1100 - 684) = ₹ 416$
8. (d) According to the question,
 $1400 = \frac{28 \times 1400}{100} + \frac{35 \times 1400}{100}$
 $+ \frac{12 \times 1400}{100} + \frac{8 \times 1400}{100} + 105$
 $+ \text{Transport}$
 $\Rightarrow 1400 = 392 + 490 + 168 + 112 + 105 + \text{Transport}$
 $\therefore \text{Transport} = ₹ 133 \text{ crores}$
9. (c) Total literate people in a town = $(100 - 35.4)\% = 64.6\%$
 Education upto primary = 27%
 Education upto middle = 18.6%
 Education upto graduate = $\frac{660}{15000} \times 100\% = 4.4\%$
 $\therefore \text{Total} = 50\%$

- Let pre-university students = x
 Then, high school students = $2x$
 \therefore According to the question,
 $2x + x = (64.6 - 50)\%$ of 15000
 $\Rightarrow 3x = \frac{14.6}{100} \times 15000 \Rightarrow x = 730$
 \therefore Total people upto high school = $2x = 2 \times 730 = 1460$
10. (a) We have, $AB = 0$, if A and B are perpendicular, then
 Work done = $F \cdot d = |F| \cdot |d| \cos \theta$
 Since, $\theta = 90^\circ$
 Work done = $|F| \cdot |d| \cos 90^\circ = 0$
11. (b) Given that, d is the number of degrees contained in angle, m is the number of minutes and s is the number of seconds.
 i.e. $m = 60d$ and $s = 60m$
 Now,
 $\frac{s - m}{m - d} = \frac{60m - 60d}{m - d} = \frac{60(m - d)}{(m - d)} = 60$
12. (b) At 30 min past 4, the minute hand is at 6 and hour hand slightly advanced from 4.
 Since, 10 min small parts between 4 and 6.
 \therefore Angles = $10 \times 6^\circ = 60^\circ$
 Since, hour hand slightly moves from 4 O' clock.
 So, the angle is lesser than 60° .
 \therefore In 30 min, minute hand moves = $30 \times \frac{1^\circ}{2} = 15^\circ$
 \therefore Required angle = $60^\circ - 15^\circ = 45^\circ$
13. (a)

GENERAL ENGLISH

TREND ANALYSIS

(2016-2014)

S.No.	Chapter Name	2016 (I)	2015 (II)	2015 (I)	2014 (II)

01

SPOTTING THE ERRORS

Generally, 10 to 15 questions based on spotting the errors are asked in NDA/NA exam. In this type of questions, the given sentences are divided into three parts with each part marked as (a), (b) and (c). We have to choose that part as our answer which has an error. If there is no error in any part, then choose option (d) as your answer.

‘Spotting the errors’ is that area of English language, where the grammatical skills of the candidates are comprehensively tested. Therefore, it can be said to be the most important part of the language proficiency test.

This is an integrated grammar exercise, so it covers all the grammatical parts. *This includes*

- Parts of speech
- Number, gender, cases and degrees
- Confusing words
- Usages of tenses
- Non-finites
- Determiners and articles

All these areas are to be studied thoroughly to score high in the NDA examination.

FORMAT OF THE QUESTION

Each question consists of a complex sentence, which is divided into **three** or **four parts**. One of the parts contains an **error**. The candidate has to spot the error and mark the incorrect option/part. Incorrect part of the sentence is the **right option**. In case, the sentence does not contain any error, option (d) needs to be selected.

Direction Which part of the following sentence is erroneous? In case there is no error, choose option (d).

Question The train should arrive at 7:30 in the morning but it was almost an hour late No error
(a) (b) (c) (d)

Ans. (a) In the given sentence, option (a) is given as ‘The train should arrive’. It should be ‘The train should have arrived’. Use of Present Perfect Tense is required here for an obligation. So, **option (a)** has an error and it is the right option.

NOUN

Noun is the name of a person, place or a thing apart from intangible things.

Examples of Noun are Akshay, Neha, Delhi, New York, Cup, Chair, Truth, Charity, etc.

Kinds of Noun

- 1. Common Noun** It is a name given to every person or thing of the same class or kind.
e.g. - Boy, girl, fan, chair, etc.
- 2. Proper Noun** Details of a common noun are signified by proper noun.
e.g. - Amit, Amita, Polar fan, Supreme chair, etc.
- 3. Material Noun** It is a substance, a material or an ingredient we can see and touch which is used for making things.
e.g. - Gold, coal, wheat, rubber, etc.
- 4. Collective Noun** It is the name of a group of persons or things.
e.g. - Army, police, mob, crowd, parliament, fleet, flock, team, etc.
- 5. Abstract Noun** It is the name of a feeling, quality or a state.
e.g. - **Feeling** Love, fear, hate, anger, respect, pleasure, etc.
- **Quality** Strength, pitch, innocence, gluttony, judgement, obedience, beauty, etc.
- **State** Weariness, tiredness, mercy, birth, death, etc.
- 5. Collective nouns** take a plural verb and are substituted by a plural pronoun when the group members do not behave as a whole but take different directions.
e.g. - The jury ~~is~~ / *are* divided in ~~its~~ / *their* decision.
- The Ministry *are* much divided in *their* opinion regarding the foreign policy.
- 6. Collective nouns**, even when they denote living beings, are considered to be of neuter gender.
e.g. - India has a big army and *it* is divided into three major divisions.
- 7. Young children** and lower animals are also referred to as neuter gender.
e.g. - The baby started crying when *it* was hungry.
- The lizard lost *its* tail when *it* was frightened.
- 8. When objects** without life are personified, they are considered either of masculine or of feminine gender. Masculine Gender is used for strength, violence, anger and vengeance. It is used with sun, death, summer, winter.
e.g. - Nature has taken *his* vengeance by claiming lives of 100 persons.
- The sun, with *his* brilliance, came out of the clouds.

These sentences emphasise the strong masculine traits of nature and the sun, 'vengeance' and 'brilliance', so the masculine gender 'his' is used.

Feminine Gender is used for beauty, gentleness and gracefulness. It is used with earth, moon, spring, nature and even for sun.

- e.g. - Nature offers ~~its~~ / *her* lap to those who seek it.
- The sun, with *her* warmth, provided relief from the bitter cold.

The tender feminine traits of nature and the sun are revealed. So, the feminine gender (her) is used.

Rules of Noun

- Articles are not used before material nouns.
e.g. - *The* leather is used in making shoes. (X)
- Leather is used in making shoes. (✓)
- Material nouns and abstract nouns are not used in plural.
e.g. - Gold, Copper, Wood, Steel, etc.
- *Cares* of the old is necessary. (X)
- *Care* of the old is necessary. (✓)
- Proper nouns are sometimes used as common nouns.
e.g. - Samudragupta is *the* Napoleon of India.
- Kalidas is *the* Shakespeare of India.
In these two sentences, the proper nouns Napoleon and Shakespeare are used as common nouns.
- Collective nouns usually take a singular verb and are substituted by a singular pronoun.
e.g. - The jury *has* given *its* verdict.
- The team *has* performed to *its* potential.
- 9. Units of counting**, i.e., pair, dozen, score, hundred, thousand, etc, when used after numbers retain their singular form.
e.g. - Ten pair, Five dozen, Ten score, Five hundred, Ten thousand, Five lakh, Ten crore, Five million, Ten billion, etc.
- My friend bought two *dozen* / ~~dozens~~ eggs from the market.
Here, the quantity is mentioned before the dozen, so we have its singular form.
e.g. - My friend bought *dozens* of eggs from the market.
The quantity is not mentioned in the above sentence, so we use the plural form 'dozens'.
e.g. - Sunil Gavaskar scored *thousands* of runs in his career.
The exact number of runs is not given in the above sentence.

10. In a compound noun, a compound word is not used in plural if a noun does the work of an adjective.

- e.g. - He is pursuing a two year/~~years~~ diploma course.
 - He is a fifteen year/~~years~~ old boy.
 - I have got a hundred rupee note.
 - He ran a five mile race.
 - They went on a fifteen day tour.
 - The diploma course he is pursuing, is of two years.
 - The boy is of fifteen years.
 - I have a note of hundred rupees.
 - The race he ran was of five miles.
 - Their tour was of fifteen days.

11. The following nouns are used only in plural.

- Names of instruments, which have two parts forming a kind of pair. Like scissors, spectacles, glasses, tongs, etc.
 e.g. - Scissors *are* / ~~is~~ used to cut.
 - My pair of spectacles *is* very expensive.
 Here, we use singular form 'is' as the word 'pair' is added before the word 'spectacles'.
- Certain articles of dress like trousers, shorts, jeans, etc.
 e.g. - Jeans *are* in vogue these days.
- Certain collective nouns (although they are singular in form). Police, cattle, gentry, peasantry, clergy, people, company, poultry, majority, artillery, infantry, etc.
 e.g. - Police *have* reached the crime scene.
 - Cattle *are* grazing in the field.
- Certain other nouns are thanks, assets, premises, alms, proceeds, contents, refreshments, orders, repairs, requirements, rations, statistics (*collection of data*), credentials, etc.
 e.g. - Court should make it mandatory for the ministers to declare their *assets*.
 - Alms *were* distributed in the beggars.

12. Some plural forms are commonly used in singular like Mathematics, Statistics, Physics, Economics (*All subjects*), Gymnastics, News, Innings, Series, Measles, Rabies, Mumps, Rickets, Summons, Names of Books, etc.

13. Uncountable nouns are used in the singular forms only. Indefinite article (a, an) is not used before them, nor are they (a, an) used with plural verbs. 'Much' is used in place of 'Many' for denoting plurality.

Some of the important nouns of this category are as follow

Advice, information, hair, luggage, business, work, word (promise), mischief, bread, scenery, abuse, vacation, evidence, employment, alphabet, poetry, furniture, baggage, trouble, fuel, wheat, rice, stationary are material nouns.

- e.g. - (a) He gave me *an* information. (X)
 He gave me information. (✓)
 - (b) You should be true to your *words*. (X)
 You should be true to your word. (✓)
 - (c) He was punished for committing (X)
many mischiefs.
 He was punished for committing (✓)
 much mischief.

Numbers of Noun

There are two kinds of numbers of nouns, which are as follow

Singular Noun It refers to one (single) person, thing, etc. e.g. boy, girl, table, man, etc.

Plural Noun It refers to more than one persons, things, etc. e.g. cities, boys, girls, men, etc.

- Sometimes plurals are made by changing the inside vowel.

Singular	Plural
Man	Men
Woman	Women
Foot	Feet
Tooth	Teeth
Mouse	Mice

- Sometimes plurals are made by adding 's' to the principal word of a compound noun. e.g.

Singular	Plural
Brother-in-law	Brothers-in-law
Vice-Admiral	Vice-Admirals
Court Martial	Courts Martial
Commander-in-chief	Commanders-in-chief
Runner-up	Runners-up
Looker-on	Lookers-on

- Some miscellaneous ones are as follow*

Singular	Plural
Ox	Oxen
Datum	Data
Medium	Media
Stratum	Strata
Index	Indices
Formula	Formulae
Lacuna	Lacunae
Alumnus	Alumni
Corrigendum	Corrigenda
Erratum	Errata
Syllabus	Syllabi

- Nouns like sheep, deer, offspring, cod, fish, salmon, etc have the same form in both the numbers.

Cases

There are three types of cases

1. Nominative Case

A noun or pronoun is in the nominative case if it is used as the subject of a verb.

e.g. - *Sachin Tendulkar* scored a century.

Clue Put *Who* in active sentence and *What* in passive sentence before the verb.

2. Objective Case

A noun or pronoun is in the objective case if it is used as the object of a verb.

e.g. - Sachin Tendulkar scored *a century* (Active).
- A century was scored by *Sachin Tendulkar* (Passive).

Clue Put *What* in active sentence and *Whom* in the passive sentence after the subject and the verb.

3. Possessive Case

A noun is said to be in the possessive case if it denotes possession, authorship, origin, kind.

e.g. - *Amit's* house is at the back-side.

How is Possessive Case Formed

- i. By adding 's to a singular noun.
- ii. By adding 's to plural nouns not ending in s.
e.g. - *Children's* school, *Men's* club.
- iii. By adding only an apostrophe to a plural noun ending in s.
e.g. - *Boys'*, *victims'*, *pilgrims'*.
- iv. By adding only an apostrophe to a singular noun when there are hissing sounds.
e.g. - *Jesus'* blessings, for *peace'* sake, for *conscience'* sake.

Rules of Possessive Case

- i. In case of a compound noun, the possessive sign is attached only to the last word.
e.g. - *My brother-in-law's* marriage.
- *The Queen-of-England's* residence.
- ii. When two or more nouns show joint possession, the apostrophe sign is put with the latter only.
e.g. - Dharmendra is *Sunny* and *Bobby's* father.
- iii. The words his, hers, its, theirs, yours, ours are possessive and they are not written with the possessive sign.
e.g. - Neither did his efforts succeed nor *your's/your's*.
- iv. The adverb 'else' combined with indefinite pronouns (somebody, anybody, etc) is expressed in possessive case as 'somebody else's' in place of 'somebody's else'.
e.g. - Is it your house? I thought it is *somebody's else-/somebody else's*?

- v. The words **church, house, school, shop** are often omitted after a possessive case.
e.g. - Yesterday, I met my friend at *St John's*.
- vi. The possessive case is chiefly used with the names of living things.
- vii. The possessive case is also used with nouns denoting time, space or weight.
e.g. - *Stone's* throw away distance
- *A minute's* time
- *A day's* journey

Confusing Nouns

Words	Meaning	Example

➤ EXPLANATIONS

- 1.** (a) When a person is assigned to a new station, he receives his 'orders'. This is a set of instructions, including where to be, when to be there etc. So, the correct sentence would be 'Orders have been issued
- 2.** (c) 'Alphabet' is the set of letters in a language. e.g. English alphabet has 26 letters from A-Z. In the given sentence, we will use 'alphabet' instead of 'alphabets'.
- 3.** (a) When a quantity is given before 'score' like '2' or '5' etc, 'score' is not used in the plural form e.g., two score of books.
- 4.** (b) The word 'mischief' does not have a plural form. Hence, 'mischief' would be used.
- 5.** (a) The plural of 'sheep' is 'sheep'. In the given sentence, the word 'sheeps' is incorrect.
- 6.** (c) The word 'content' is used in its plural form 'contents' when it is used to mean 'something contained'. So, the given sentence will have 'contents' instead of 'content'.
- 7.** (b) As 'work' is an uncountable noun we need to use 'much work' instead of 'many works'.
- 8.** (b) As we know that in a compound noun, a compound word is not used in plural if a noun does the work of an adjective.
In the given sentence, 'five years old' is an adjective of noun 'boys'. So, 'five year old' would be used instead of 'five years old'.
- 9.** (b) 'True to your word' means 'promise'. In the given sentence, the phrase 'true to your words' is incorrect.
- 10.** (b) In the given sentence, 'two hundred rupees' is used as an adjective of the noun 'notes'. It should be 'two hundred rupee'.
- 11.** (b) As 'advice' is an uncountable noun, the article 'an' would not be used before it.
- 12.** (c) The possessive pronoun in the given sentence 'somebody's else' is incorrectly used. Its correct usage will be 'somebody else's'.
- 13.** (a) The correct usage of 'spectacle' is 'spectacles'.
- 14.** (a) The book 'Arabian Nights' is a singular noun. So, 'are' would be replaced by 'is'.
- 15.** (c) The correct use of 'vacations' is 'vacation'.
- 16.** (a) 'Rations have run out' should be used.
- 17.** (a) 'The table's wood' does not seem appropriate. It should be replaced by 'The wood of the table' which makes sense.
- 18.** (c) 'News' is used as a singular noun. So, 'coming from the front is very encouraging' would be used.
- 19.** (b) As 'work' is an uncountable noun, 'because a lot of work' would be used.
- 20.** (a) The plural of 'ox' is 'oxen'. In the sentence, 'oxes' is used instead of 'oxen' which is incorrect.

PRONOUN

Words used in place of nouns are called pronoun. Generally, pronoun are words used in place of nouns. They are used to avoid the repetition of noun word in a sentence. e.g. I saw a boy on the roof. *He* seemed to recognise me.

In this example, the pronoun 'he' is italicised, used instead of repeating the noun 'boy' which is underlined.

Kinds of Pronoun

Personal Pronouns

This pronoun refers or is related to the words which are used in place of nouns referring to person. *Personal pronouns have the following categorisations*

1st Person : The one(s) speaking (I, me, my, mine, we, us, our, ours).

2nd Person : The one(s) spoken to (you, your, yours).

3rd Person : The one(s) spoken about (he, him, his, she, her, hers, it, its, they, their, theirs).

Persons	Nominative Case		Objective Case		Possessive Case	
	Singular	Plural	Singular	Plural	Singular	Plural
I Person	I	We	Me	Us	My/Mine	Our/Ours
II Person	You	You	You	You	Your/Yours	Your/Yours
III Person						
Male	He	} They	Him	} Them	His	} Their/Theirs
Female	She		Her		Her/Hers	
Neuter	It		It		Its	

Rules of Personal Pronouns

- A personal pronoun must be of the same number, gender and person as the noun for which it stands, i.e. antecedent should agree with the noun.
 - e.g. - I am not one of those who believe everything ~~it~~ / *they* see.
 - Every man must love *his* / ~~her~~ / ~~their~~ country.
 - He is one of the best boys that *have* played here.
- The component of the verb *to be* (*is, am, are, was, were, will, shall*), when it is expressed by a pronoun, should be in the nominative case.

To be means

<i>Is</i>	:	He, She, It
<i>Am</i>	:	I
<i>Are</i>	:	We, You, They
<i>Was</i>	:	I, He, She, It
<i>Were</i>	:	We, You, They
<i>Will</i>	:	You, He, She, It, They
<i>Shall</i>	:	I, We

 - e.g. - It is ~~me~~ / *I*.
 - It will be *he* / ~~him~~ who is going to win.
 - Was it ~~her~~ / *she* who did it for you.
- If a pronoun is used as the object of the verb or of a preposition, it should be in the objective case.
 - e.g. - He was shouting at ~~I~~ / *me*.
 - He was teaching ~~he~~ / *him*.
 - The sweets are to be distributed among *you, him* and *me*.

- Objective case is used after the following words *let, like, but, etc.*
 - e.g. - It is no one else but ~~he~~ / *him* who has done the crime.
 - He likes *me*.
 - Let *him* come inside.
- Words such as *as good as, as well as, as soon as, as beautiful as, as intelligent as, etc* are followed by nominative case.
 - e.g. - When it comes to providing news, no one is as good as *he*.
 - In studies he is as good as *he*.
- 2, 3, 1 Rule** The second person should come before the third and the third person before the first. This case applies to singular pronouns only.
 - e.g. - *I, You and He* are good friends. (X)
 - *You, He and I* are good friends. (✓)
- 1, 2, 3 Rule** 2, 3, 1 becomes 1, 2, 3 when we are talking about plural pronouns.
 - e.g. - *We, You, and They* will go to the party.
 - *We, You and They* will take dinner at *our/ their / your* house.

Exception When it comes to confessing something or committing a crime, 2, 3, 1 gets changed to 1, 2, 3 for all types of pronouns.

 - e.g. - *I, you and he* will be punished for the crime.

8. When a pronoun stands for a collective noun, it must be in the neuter gender. But if the collective noun denotes separation or division, the pronoun used is plural.
e.g. - The jury gave *its* decision unanimously.
- The jury *were* divided in *their* opinion.
9. When two or more nouns are joined by 'and', the pronoun used would be plural.
e.g. - Ram *and* Mohan went to their school.
- Suresh *and* members of his family have completed their work.

Case I *Separate persons, the pronoun used for them must be plural.*

Case II *Same person, the pronoun used for them must be singular.*

[**Hint** If a single Article is used before the nouns, the verb and the pronoun are both singular, because the reference is to a singular person only].

- e.g. - The Comptroller and Auditor General *has* / ~~have~~ submitted *his* / ~~their~~ report.
- The Chairman and the Managing Director ~~has~~ / *have* submitted ~~his~~ / *their* report.

10. When two or more singular nouns are joined by or, either-or or neither-nor, the pronoun and the verb should be singular.
e.g. - Either Raj or Amar *is* doing *his* duty.
11. Whenever one singular and one plural noun are used with either-or or neither-nor, the plural noun always comes second. In this case, the verb and the pronoun both become plural.
e.g. - Neither Amit nor his friends ~~was~~ / *were* present in *their* house.
12. While writing question tag, the subject and verb must be according to the main sentence.
e.g. - Our minister is intelligent, *isn't he*?
- The boys are not enjoying themselves, *are they*?
- They went to Delhi yesterday, *didn't they*?

Reflexive Pronouns

Reflexive Pronouns are pronouns that refer back to the subject of the sentence. They end in-self, as in singular form, or-selves in plural form.

- e.g. - Myself, themselves, yourself, ourselves etc.

Rules of Reflexive Pronouns

- The reflexive pronoun is used with the following words absent, avail, apply, enjoy, pride, resign, acquit, revenge, exert, adapt, adjust, etc.
e.g. - He absented *himself* from the class.
- He acquitted *himself* admirably in the meeting.

- With the following words, reflexive pronouns are not used Bathe, break, feed, hide, turn, move, rest, qualify, stop, etc.
e.g. - We *bathed* in the river.
- We *fed* at the motel.
- A reflexive pronoun cannot be used as a substitute for the subject.
e.g. - Amit and I / ~~myself~~ were present on the site.
- I / ~~Myself~~ will see to it that you do not get the job.

Demonstrative Pronouns

The pronouns that are used to point out the objects to which they refer are called demonstrative pronouns like these, that, those, such, it, this, etc.

- e.g. - *That* is the book I was looking for.

Rules of Demonstrative Pronouns

- Do not commit the error of omission by forgetting to use 'that' (for plural use 'those').
e.g. - The Mumbai Film Studio is *bigger than* Noida. (X)
- The Mumbai Film Studio is *bigger than that* of (✓)
Noida.
- Pronoun 'it' comes before the phrase or clause to which it refers, whereas 'this' follows the phrase or clause it refers to.
e.g. - *This* is true that India has won the match. (X)
- *It* is true that India has won the match. (✓)

Indefinite Pronouns

When a pronoun refers to a person or a thing in a general way, but not to any person or thing in particular, it is called indefinite pronoun like any, anyone, none, someone, everyone, everybody, one, etc.

Rules of Indefinite Pronouns

- One, if used in a sentence, always repeats itself.
e.g. - *One* must respect ~~his~~ / *one's* country for ~~his~~ / *one's* sake.
- *One* must obey ~~their~~ / *one's* elders.
- When we are not talking specifically about females, only masculine gender is used.
e.g. - Everyone was getting ready for *his* / ~~her~~ *show*.
- Everyone of the Miss India contestants was getting ready for *her* show.
- 'Either' is replaced by 'anyone' when we are talking about more than two persons or things. Same is the case with 'none' or 'neither'.
e.g. - I couldn't contact ~~either~~ / *anyone* of the three.
- *Anyone* of the three can come in.
- *None* / ~~Neither~~ of his body parts is defective.
- 'Each other' should be used in speaking of two persons or things, 'one another' in speaking of more than two.
e.g. - We should love *one another*.

Relative Pronouns

This pronoun refers or relates to some noun which comes after this pronoun. Besides, it acts as a conjunction also because it connects two sentences.

- e.g. - Who, whom, which, where, etc.
- He is the boy *who* has topped the class.

Rules of Relative Pronouns

1. 'Who' is used for subject and 'Whom' for object.
e.g. - *Who* are you?
- *Whom* were you talking to?
- She is the girl ~~*who*~~ / *whom* I met in the train.
2. The relative pronoun *that* is preferred to 'who' or 'which' in the following cases

Case I After adjectives in the superlative degree.

- e.g. - It is the best movie ~~*which*~~ / *that* I have ever seen.
- It is the best food ~~*which*~~ / *that* I have had for years.

Case II After the following words all, same, any, only, nothing, the only, etc.

- e.g. - It is the same book ~~*which*~~ / *that* I saw in the market yesterday.
- All *that* glitters is not gold.
- It is not for nothing *that* he studied Psychology.

Case III After the interrogative pronouns, 'who' and 'what'.

- e.g. - Who is the girl ~~*which*~~ / *that* comes in your dreams?
- What is it *that* you want?

Case IV After two antecedents, one denoting a person and the other denoting an animal or a thing.

- e.g. - The man and his dog *that* had entered the school were turned out.

3. The relative pronoun should be placed as near as possible to its antecedent.

- e.g. - The office was located in the heart of the town ~~*which*~~ had beautiful interior decoration. (X)
- The office, *which* had beautiful interior decoration, was located in the center of the town. (✓)

4. The relative pronoun 'What' is used without any antecedent.

- e.g. - I mean ~~*that*~~ / *what* I say.
- ~~*That*~~ / *What* cannot be cured must be endured.

5. 'Whose' is used to refer to persons only; 'of which' is used while referring to lifeless objects.

- e.g. - I have a friend *whose* father is a doctor.
- I saw a watch, the dial *of which* was made of gold.

Interrogative Pronouns

The interrogative pronouns are used for making queries or asking questions. The pronoun 'who', 'what' and 'which' are used as interrogative pronouns.

Rules of Interrogative Pronouns

1. 'What' is used in broad sense, while 'Which' is used in the specific sense.
e.g. - *What* are you doing these days?
- *Which* institute have you joined for that?
2. 'Which' is used in place of 'who' and 'what' when we are referring to a choice between two or among more than two things or persons.
e.g. - Of the two brothers ~~*who*~~ / *which* is more intelligent?
- ~~*Who*~~ / *Which* is your mother in the crowd?

SPOTTING THE ERRORS SET 2

ERRORS OF PRONOUN

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

1. The master did not know (a)/ who of the servants (b)/ broke the glass. (c)/ No error (d)

7. He, You and I (a)/ shall manage (b)/ this problem together. (c)/ No error (d)
8. Was it him (a)/ who got injured (b)/ in an accident this morning? (c)/ No error (d)

- 9.** As soon as he (a)/ saw his mother (b)/ he ran to her and embraced. (c)/ No error (d)
- 10.** Due to me being a newcomer (a)/ I was unable to get a house (b)/ suitable for my wife and me. (c)/ No error (d)
- 11.** The audience (a)/ are requested (b)/ to be in its seats. (c)/ No error (d)
- 12.** A scientist must follow (a)/ his hunches and his data (b)/ wherever it may lead. (c)/ No error (d)
- 13.** I am used to (a)/ many guests everyday (b)/ but there was none today. (c)/ No error (d)
- 14.** The number of vehicles (a)/ plying on this road (a)/ is more than on the main road. (c)/ No error (d)
- 15.** Being a destitute (a)/ I admitted him (b)/ to an old people's home. (c)/ No error (d)
- 16.** One should make (a)/ his best efforts if one wishes to achieve (b)/ success in this organisation. (c)/ No error (d)
- 17.** May I (a)/ know who you want (b)/ to see please? (c)/ No error (d)
- 18.** Our is the only country (a)/ in the world that can boast of (b)/ unity in diversity. (c)/ No error (d)
- 19.** Last summer he went (a)/ to his uncle's village (b)/ and enjoyed very much. (c)/ No error (d)
- 20.** If I were him (a)/ I would have taught (b)/ those cheats a lesson. (c)/ No error (d)

► EXPLANATIONS

- 1.** (b) As the sentence refers to a choice among more than two persons (servants) 'which' will be used in place of 'who'.
- 2.** (c) When a pronoun stands for a collective noun ('ruling party' in the sentence) it must be in the neuter gender. Hence, 'its' will be used in place of 'their'.
- 3.** (b) As the sentence refers to a particular set of people (Indians), it will contain a reflexive pronoun 'themselves' after 'adapt'.
- 4.** (c) The given sentence compares the subject 'he' with a number of people 'those'. Hence, at the end of the sentence, 'he meets' would be replaced by 'they meet'.
- 5.** (b) In this sentence, the pronoun 'one's' is missing before the word 'critics'. Hence, we will add 'one's' before 'critics'.
- 6.** (c) The given sentence has an indefinite pronoun 'one'. As per the rule, 'his' should be replaced with 'one's' to make the sentence grammatically correct.
- 7.** (a) As per the rule, the second person should come before the third and the third person comes before the first. So, the correct order will be : 'You, he and I.....'
- 8.** (a) As per the rule, the component of the verb 'to be' (was) when expressed by a pronoun should be in the nominative case. Hence, 'him' in the sentence will be replaced by 'he'.
- 9.** (c) The sentence is incomplete as it does not answer the question 'whom did he embrace?' So, we will add 'her' at the end of the sentence.
- 10.** (a) The pronoun 'me' used in part (a) of the sentence is incorrect. It should be replaced by 'I'.
- 11.** (c) As the sentence refers to living beings ('audience') the pronoun 'its' will be replaced by 'their'.
- 12.** (c) The pronoun 'it' is incorrectly used in the sentence. It should be replaced by 'they' as the sentence refers to 'his hunches' and 'his data'.
- 13.** (c) The sentence refers to 'many guests' (plural) so the verb used with it should be plural. Hence, 'was' should be changed to 'were'.
- 14.** (c) The sentence does not have 'that' after 'than'. So, to make the sentence meaningful 'that' should be added after 'than'.
- 15.** (a) The sentence does not convey the intended meaning as it has 'He' missing in the beginning. So, the correct sentence would start as 'He being a destitute '
- 16.** (b) As the sentence begins with an Indefinite pronoun 'one', it should not have 'his' in the sentence. Hence, we replace 'his' by 'one's' to make the sentence correct.
- 17.** (b) The pronoun 'who' would be replaced by 'whom' to make it meaningful.
- 18.** (a) The reflexive pronoun 'ours' will be used in the sentence instead of 'our' to make the sentence correct.
- 19.** (c) The reflexive pronoun 'himself' would be used after the word 'enjoyed' to make the sentence meaningful.
- 20.** (a) The verb 'were' when expressed by a pronoun should be in the nominative case. Hence, 'he' would be used instead of 'him'.

VERB

A verb is a word (such as jump, think, happen or exist) that is usually one of the main parts of a sentence and that expresses an action, an occurrence, or a state of being.

Classification of Verbs

Verb can be classified as follows

1. Main Verbs

Main verbs have meanings related to actions, events and states. Most verbs in English are main verb. e.g. go, show, exist, etc.

Main verb can be divided into two categories transitive and intransitive, which are as follow

(i) Transitive Verbs

A transitive verb is a verb that can take a direct object.

e.g. She played the piano.

(ii) Intransitive Verbs

An Intransitive verb has two characteristics. **First**, it is an action verb expressing a double activity like arrive, go, lie, sneeze, sit, die, etc. **Second**, unlike a transitive verb, it will not have a direct object receiving the action.

Intransitive verbs have the pattern N + V (Noun + Verb). The clause is complete without anything else.

e.g. - John *smiled*.
- Nothing *happened*.

Here, 'smiled' and 'happened' are intransitive verbs.

Linking Verbs

Some main verbs are called Linking verbs. These verbs are not followed by objects. Instead they are followed by phrases which give extra information about the subject. Linking verbs include appear, feel, look, seem sound, smell, taste, become, etc.

e.g. - A face *appeared* at the window.

In this sentence, 'appeared' is the linking verb and 'at the window' is the phrase.

2. Auxiliary Verbs

Auxiliary verb can be divided into two categories primary and modal auxiliary verbs, which are as follow

(i) Primary Auxiliary Verbs

Primary auxiliary verbs can further be divided as follow

- i. Verbs 'to be' : is, am, are, was, were
- ii. Verbs 'to have' : have, has, had
- iii. Verbs 'to do' : do, does, did
- iv. Verbs 'shall' and 'will'

(ii) Modal Auxiliary Verbs

Modal Auxiliary verbs denote the mood/mode of the subject. They are can, could, may, might, should, used to, need, dare, etc.

Tenses

There are three basic tenses : Present, Past and Future.

These can further be divided into the following segments

1. **Simple** The action is mentioned simply. Nothing is said about whether the action is complete or not.
2. **Continuous** The action is incomplete or going on at the time of speaking.
3. **Perfect** The action is finished or complete with respect to a certain point of time.
4. **Perfect Continuous** The action is going on continuously over a long period of time and is yet to be finished.

Simple Present

(He, She, It, Single name — $V_1 + s, es$)

(They, you, I, Plurals— V_1)

- To express a habitual action.
e.g. - He *goes* for a walk in the morning.
- It *rains* in winter in Tamil Nadu.
- He often *gets* late for dinner.
- To express universal truths.
e.g. - The sun *rises* in the east.
- Two and two *make* four.
- In exclamatory sentences beginning with 'here' and 'there', to express what is actually taking place in the present.
e.g. - Here he *comes*!
- There *goes* the train!
- To indicate a future event that is part of a plan or an arrangement.
e.g. - PM *comes* to the town next month.
- The Indian team *goes* to England this month.
- To introduce quotations.
e.g. - Gita *says*, "Give your best and do not worry for the results".
- Pope *says*, "A little knowledge is a dangerous thing".

Present Continuous

(Is / Am / Are + $V_1 + ing$)

- To express an action going on at the time of speaking.
e.g. - I am *studying* in the class.

- To express a temporary action which may not be actually happening at the time of speaking.
e.g. - I am *preparing* for the competition.
- I am *working* on a project.
- It also represents future action or a definite arrangement in the near future.
e.g. - I am *going* to Mumbai tomorrow.
- He is *coming* tonight.
- When the reference is to a particular obstinate habit, the present continuous is used instead of present simple. An adverb, like always, constantly, etc, is also used.
e.g. - It is no use scolding him, he ~~always does~~ / is *always doing* what is forbidden.
- The following verbs are normally used in the present simple instead of present continuous
 - (a) Verbs of **Appearance** Look, appear, seem.
 - (b) Verbs of **Emotion** Want, wish, desire, feel, like, love, hate, hope, prefer, etc.
 - (c) Verbs of **Perception** See, hear, smell, taste, notice, recognize, etc.
 - (d) Verbs of **Possession** Belong to, consist of, contain, own, etc.
 - (e) Verbs of **Thinking** Agree, believe, consider, forget, imagine, know, mind, remember, etc.

Present Perfect (*Has / Have + V₃*)

- It is used to indicate completed activities in the immediate past. It is a mixture of present and past. It always implies a strong connection of past with the present.
e.g. - He *has* just *gone* out.
- The most important point is that it is used with the past actions whose time is not given and not definite.
e.g. - He *came* here. (X)
- He *has come* here. (✓)
- He *came* here yesterday. (✓)
- It is used with the adverbs like ever, just, recently, already, yet, so far, of late, lately, by the time, for, etc.
e.g. - He *has already* finished the work.
- *Recently*, he *has* started working on a new project.
- I *have just seen* that film.
- It is the best book that I *have ever read*.
- I *have known* him *for* twenty years.
- He *has started* coming late *lately*.
- He *hasn't paid* the bill *so far*.
- It can never be used with the words like last, ago, yesterday, before, back, formerly, fixed time, etc.
e.g. - He *has come* here yesterday. (X)
- He *came* here yesterday. (✓)
- India *has won* last year. (X)
- India *won* last year. (✓)

Present Perfect Continuous

(*Have been/Has been + V₁ + ing*)

- To express an action which began at sometime in the past and is still continuing.
e.g. - He is *playing* since 8 o'clock. (X)
- He *has been playing* since 8 o'clock. (✓)
- He *has been playing* for the last four hours. (✓)

Simple Past (*V₂*)

- To indicate an action completed in the past at a definite time.
e.g. - I *did* this. (X)
- I *have* done this. (✓)
- I *did* this yesterday. (✓)
- Denoted by last, ago, yesterday, back, before, formerly, any fixed time, etc.
e.g. - We *heard* a terrifying news *last* night.
- They *celebrated* the occasion two days *ago*.
- He *inherited* his father's business *after* his father's demise.
- The train *didn't* arrive on time *yesterday*.
- She *didn't* go there *in the morning*.
- To indicate past habits, indicated generally by the words like often, seldom, never, normally, generally, always, frequently, rarely, daily, used to, etc.
e.g. - As a kid, I *often went* to school on foot.
- My friend *frequently visited* his home town in the past.
- I *seldom wrote* a cheque even when there was balance in my account.
- *Whenever* I *called* on him he *pretended* to be ill.
- He *always carried* a stick when he *went* for a walk.
- After 'it is time'.
e.g. - It is time Indian cricket team ~~*starts*~~ / *started* winning test matches.

- The conjunction **since** denotes present time dating back to some event. It is therefore, followed by a Simple Past Tense and preceded by some form of Present Perfect Tense.
e.g., Many things have happened since I have left the school. (X)
- Many things have happened since I left the school. (✓)

Past Continuous (*Was/Were + V₁ + ing*)

- To denote an action going on at some time in the past.
e.g. - When I went to his house, he *was playing*.
- I *was studying* yesterday.
- For persistent habits in the past.
e.g. - He *was* always *mooching* around.

Past Perfect (*Had + V₃*)

- To describe an action completed before a certain moment in the past.
 - e.g. - I met him in New Delhi in 2000. I *had seen* him last five years before. (✓)
 - It *had rained* yesterday. (X)
 - It *rained* yesterday. (✓)
 - My friend *had come* to visit me. (X)
 - My friend *came* to visit me yesterday. (✓)
- Past perfect should be used only when we wish to say that one action completed before the other started. It should never be used at all in any other sense.
 - e.g. - I *went* to Mumbai. (X)
 - I *had gone* to Mumbai (X)
 - Ravi *had* walked two miles by lunch time. (✓)
 - I *had gone* to Mumbai when he *came* to meet me. (✓)

Past Perfect Continuous (*Had been + V₁ + ing*)

- To express an action that began before a certain point of time in the past and continued upto that time.
 - e.g. - He *had been studying* for two hours when his girlfriend came.
 - Tendulkar *had been* playing for eleven years when his toe got injured.
- If there is Past tense in the Principal clause, it must be followed by a past tense in the Dependent clause. In an Indirect narration, the Simple Past in the Dependent clause is changed to Past Perfect, if the Principal clause is in the Past tense.
 - e.g. - He told me that he *intended* to start a business. (X)
 - He told me that he *had intended* to start a business. (✓)
 - He hinted that he *tried* to save him. (X)
 - He hinted that he *had tried* to save him. (✓)
- The exception to the above rule is if some universal, habitual or generally recognised fact is mentioned in the Dependent clause, the Present tense must be retained in all conditions.
 - e.g. - He told me that the earth *moves* round the sun.
 - His illness convinced me that all men *are* mortal.

Simple Future (*Shall / Will + V₁*)

- To express an action that is still to take place.
 - e.g. - I *shall go* for the preparation when I shall receive the call letter. (X)
 - I *shall go* for the preparation when I receive the call letter. (✓)

Future Continuous (*Shall be / Will be + V₁ + ing*)

- To express an action going on at some time in the future.
 - e.g. - I *shall be earning* when I *shall* be 21. (X)
 - I *shall be earning* when I am 21. (✓)

Future Perfect (*Shall have / Will have + V₃*)

- To indicate the completion of an action by a certain future time.
 - e.g. - We *shall have completed* our syllabus by next month.
 - I *shall have done* this work by tomorrow.

Future Perfect Continuous(*Will have been / Shall have been + V₁ + ing*)

- To indicate an action which is in progress over a period of time and will be in progress at a certain time in future.
 - e.g. - Tendulkar *will have been playing* for India for 20 years when he completes the age of 35.
 - Time *will have been clocking* for ages in the coming moments.

Subject-Verb Agreement

1. If two subjects together express one idea, one being added to the other for the sake of emphasis or clarification, the verb is singular. No plurality is left to exist in such a case.
 - e.g. - Slow and steady *wins* the race.
 - Bread and butter *is* essential for one's existence.
2. When the plural noun denotes some specific quantity, distance, time or amount considered as a whole, the verb *is* generally singular.
 - e.g. - Six miles *is* not a long distance for me.
 - Ten lakh *is* equivalent to a million.
3. Two or more singular subjects connected by 'either-or', 'neither-nor', take a verb in singular (third person singular verb).
 - e.g. - *Either* Vivek *or* Vimal *is* absent today.
 - He asked me if *either* of the applicants *was* suitable.
 - *Either* you *or* I *shall / will* go to the party.
4. When the subjects joined by 'or' or 'nor' are of different numbers, the verb must be plural and the plural subject must be placed next to the verb.
 - e.g. - *Either* Amit *or* his parents *are* coming to the party.

5. Any noun qualified by 'each' or 'every' is followed by a singular verb. Even if two nouns so qualified are connected by 'and', the verb must still be singular.
e.g. - *Each* one of these boys *has* the potential to get selected.
- *Every* man and woman *was filled* with joy.
- *Every* day and each hour *teaches* us something.
6. Verb is according to the first subject when they are connected with and not, with, as well as, in addition to, along with, besides, like, together, etc.
e.g. - Rahul *and not* his friend *was* absent.
- Amit, *like* his friends, *is* always late.
- He *as well as* you *is* a good boy.
7. When two nouns or pronouns are joined by 'not only...but also', the verb agrees with the second noun or pronoun.
e.g. - *Not only* the officer *but also* the soldiers *were* awarded.
8. If the subject is 'the number of', the singular verb is used and the noun is plural.
e.g. - The number of one-dayers *played* these days *has / have* led to the deterioration of the game.
9. A 'great many' is always followed by plural verb and a plural noun.
e.g. - A great many *students have* passed this year.
- A great many *fish are* there in the pond.
10. 'Many a' is always followed by a singular verb and a singular noun.
e.g. - Many a *soldier has* got medal this year.
- Many a *student has* passed this year with flying colours.
11. A singular or a plural verb is used with words as pains, a lot of, means, variety, plenty, rest, wages, according to the sense in which they are used.
e.g. - A large number of girls *were* absent on account of bad weather.
- The number of admissions *has* gradually fallen off.
- A variety of books on the subject *are* available.
12. A verb should agree with its subject and not with the complement. But in the case of sentence beginning with 'The', the verb is according to the predicate/complement.
e.g. - Our only guide *was* the stars.
- The stars *were* our only guide.
13. In a compound sentence, both auxiliary verbs and principal verbs should be mentioned separately if they differ in number, form or voice. In such cases, one verb cannot act for both the clauses.

- e.g. - He has not and will not *marry* in near future. (X)
- He has not *married* and will not *marry* in near future. (✓)
- She is *intelligent* but her sisters *dull*. (X)
- She is *intelligent* but her sisters *are dull*. (✓)
- She is *intelligent* but her sister *is dull*. (✓)

14. Use of 'shall' and 'will'.

- To express simple future action 'shall' is used in the first person, and 'will' in the second and third person.
e.g. - I *shall* come.
- You *will* come.
- He *will* come.
- Shall is used in the second and third persons to express Command, Promise, Threat, Determination.
- Will is used in the first person to express Willingness, Promise, Threat, Determination.
e.g. - You *shall* not steal. (Command)
- You *shall* have a holiday tomorrow. (Promise)
- You *shall* be punished for this. (Threat)
- You *shall* do it for your country. (Determination)
- I *will* send you my book. (Willingness).
- I *will* try to do better next time. (Promise).
- I *will* punish you if you do that again. (Threat).
- I *will* succeed or die in this attempt. (Determination).
- In asking questions 'shall' is used in the first person and 'will' in the third person. In the second person, 'shall' and 'will' are used according to the answer expected.
e.g. - *Shall* we go?
- We shall go.
- *Will* he come tomorrow?
- He will come tomorrow.
- *Will* you do this for me?
- I *will* do it for you.

UNREAL PAST/ SUBJUNCTIVE MOOD

A wish, desire, purpose, supposition contrary to fact or condition is expressed in subjunctive mood.

In subjunctive mood, 'were' and 'had' are used as the case may be. The sentence basically goes in the past tense.

- e.g. - I wish I *had* a car.
- I wish I *had* not met him.

There are three types of conditional clauses. Each kind contains a different pair of tenses.

i. Present likely condition

- e.g. - I *shall* go for the preparation when I *get* the call letter.
- You *will* pass if you *work hard*.

- ii. Present unlikely condition
 - e.g. - If I *had* a house, I *would not have* rented yours.
 - If he *tried*, he *would succeed*.
 - If I *were* you, I *would* marry this girl.
- iii. Past condition
 - e.g. - If he *had* studied, he *would have* got the call letter last year itself.
 - If she *had* brought money, she *could have* bought the jewellery.
- After, 'as if/as though'.
 - e.g. - He behaves *as if* he were the owner of this place.
 - He came in looking *as though* he had seen a ghost.

THE INFINITIVE (T₀ + V₁)

Rules of Infinitive

1. In negative sentences, 'dare not' and 'need not' are used without *to*.
 - e.g. - You dare not *to* leave India. (X)
 - How dare you *to* fail in the exam? (X)
 - You dare not fail in the exam. (✓)
2. Prepositions 'but' and 'except' take the infinitive without *to*.
 - e.g. - He did nothing *but* cry.
 - There is no alternative *except* this offer.
3. Expressions like would rather, had rather, rather than, had better, as soon as, etc are followed by infinitive without *to*.
 - e.g. - I would rather *to* go for picnic. (X)
 - I would better *to* sleep. (X)
 - I had better go / ~~gone~~ there. (✓)
 - I would as soon walk as *to* ride. (X)
4. The infinitive without *to* is used after Auxiliary verbs such as shall, will, can, may, did, should; but ought is an exception.
 - e.g. - I *should* go.
 - I *ought to* go.
5. The *to* of one infinitive can be made to do duty for *to* of another infinitive in the sentence, provided that the verbs in the two infinitives are synonymous. If two separate ideas are better expressed by two infinitives, *to* of the latter infinitive should be omitted.
 - e.g. - He helped me *to* progress and prosper.
 - It lies in my power *to* succeed or *to* fail.
 - It is a nice feeling *to* rejoice and *to* weep with others.

6. Do not forget to use the preposition whenever the infinitive 'to' is made to qualify a noun.
 - e.g. - I have no pen to *write*. (X)
 - I have no pen to *write with*. (✓)

THE GERUND (V₁ + ing)

A verb which does the action of a noun.

- e.g. - *Drinking* four litres of water a day keeps you in good shape.
- *Running* tap makes a lot of noise.
- *Smoking* isn't a good habit.

Rules of Gerund

1. *The following words are followed by gerund*

Avoid, dislike, enjoy, help (in the sense of avoid), mind, prevent, risk, stop, etc.

 - e.g. - I cannot *help* looking at you.
 - I do not *mind* going there.
 - I *enjoy* myself studying for long hours.
 - *Stop* doing that silly thing.
2. *The following phrases are followed by a gerund*

Accustomed to, fed-up with, habitual to, addicted to, is no good, is used to, looking forward to, tired of, is worth, with a view to, owing to, object to, given to, taken to, etc.

 - e.g. - I am *accustomed to* talking for hours.
 - I am *fed up with* his useless accusing.
 - It is *no good* scolding him.
3. A gerund, and not an infinitive is used after such verbs and participles as are followed by their appropriate prepositions.

e.g. - desirous of	disqualify from
- refrain from	prevent from
- debar from	desist from
- restrain from	prohibit from
- dissuade from	abstain from
- intent on	bent on
- keen on	aim at
- confident of	insist on
- persist in	succeed in
- fond of	successful in
- justified in	hesitate in
- a hope of	fortunate in
- harm in	assist in
- confidence in	chance of
- feel pleasure in	interested in
4. The noun or pronoun governing a gerund must be in the possessive case.
 - e.g. - I am tired of *his* accusing. (✓)
 - Please excuse *me* being late. (X)
 - Please excuse *my* being late. (✓)
 - I remember him winning the race. (X)
 - I remember his winning the race. (✓)
 - I like my friend coming on time. (X)
 - I like my friend's coming on time. (✓)

SPOTTING THE ERRORS **SET 3****ERRORS OF VERB**

Directions (Q.Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

1. Each of these players (a)/ have been warned (b)/ not to repeat the silly mistake. (c)/ No error (d)
2. Lime and soda (a)/ is (b)/ a digestive drink. (c)/ No error (d)
3. The mother as well as her children (a)/ were brought (b)/ to the police station for interrogation. (c)/ No error (d)

17. Everyone of the new Nursing Homes (a)/ coming up in the urban areas (b)/ need a lot of improvement. (c)/ No error (d)
18. Never I have come across (a)/ a man (b)/ who is foolish to such an extent. (c)/ No error (d)
19. He will be likely (a)/ to take part in the ceremony (b)/ provided he is granted leave. (c)/ No error (d)
20. Two thirds of the majority (a)/ are needed to pass (b)/ the resolution for the impeachment of the President. (c)/ No error (d)

> EXPLANATIONS

1. (b) The phrase 'Each of' takes a singular verb. So, 'have' would be replaced by 'has'.
2. (d) There is no error in the sentence.
3. (b) The phrase 'as well as' takes the verb as per the noun before it. As 'mother' is singular, 'were' would be changed to 'was'.
4. (b) As per the rule, if two subjects together express one idea, one being added to the other for the sake of emphasis or classification, the verb is singular. Hence, 'are' in the sentence would be replaced by 'is'.
5. (a) The verb 'allowed' will be added after 'has' to make the sentence grammatically correct. This is because as per the rule that in a compound sentence both auxiliary verbs and principal verbs should be mentioned separately if they differ in number, form or voice.
6. (b) The phrase 'as well as' takes a singular verb. Hence, we would replace 'are' in the given sentence by 'is' to make it grammatically correct.
7. (b) The sentence would be grammatically incorrect unless we add 'have' after 'thirty'. (Explanation same as answer 5).
8. (d) The sentence is correct.
9. (a) The sentence should start with 'So honestly did he work' to make it grammatically correct.
10. (b) In the sentence 'four miles' is some specific distance considered as a whole. Hence, a singular verb 'is' would be used instead of 'are'.
11. (a) The correct usage of 'No sooner' in the sentence will be 'No sooner was he brought.....'
12. (b) When using 'like', the verb in the sentence should agree with the subject 'He'. Hence, 'were' in the given sentence would be replaced by 'was'.
13. (b) As per the rule, 'None of' takes a singular verb. Hence, we would replace 'are' by 'is' in the given sentence.
14. (b) In the sentence 'five thousand rupees' is some specific amount considered as a whole. Hence, we would use 'is' instead of 'are' in the given sentence.

- 15. (a) As the students demanded the same thing i.e., declaring a holiday. So the students would be taken as a singular entity. Therefore, 'were' in the sentence would be replaced by 'was'.
- 16. (d) The sentence is correct.
- 17. (c) 'Everyone of' uses a singular verb. Hence, the verb 'need' in the given sentence should be replaced by 'needs'.

- 18. (a) 'Never I have' in the given sentence should be replaced by 'Never have I' to make it grammatically correct.
- 19. (a) As the given sentence is in the present tense, 'will be' in the sentence would be replaced by 'is'.
- 20. (b) In the given sentence, 'majority' means a collection of people who have the same point of view (vote). Therefore, this will be considered as a single entity. It will take a singular verb and hence 'are' in the given sentence will be replaced by 'is'.

ADJECTIVE

An adjective is a word used with a noun or a pronoun to add something to its meaning.

Kinds of Adjective

1. Proper Adjectives

They are derived from proper noun.

Proper Nouns	Proper Adjectives
India	Indian
China	Chinese
Turkey	Turkish
America	American
Shakespeare	Shakespearean

2. Possessive Adjectives

My, our, your, his, their, her, its are called possessive adjectives.

3. Adjectives of Quality

It shows the traits of a person or a thing.

- e.g. - Flowers were plucked *fresh*. (X)
- *Fresh* flowers were plucked. (✓)

Confusing Words

Words	Meaning	Example
Verbal	It pertains to words.	His <i>verbal</i> words spoken <i>orally</i> are more dangerous than his figures on paper.
Oral	It means mouth.	
Common	Shared by all concerned.	It is <i>common</i> to everyone that India and Pakistan do not share a very good <i>mutual</i> understanding.
Mutual	In relation to each other.	

4. Adjectives of Number

It shows how many persons or things are meant or in what order a person or thing stands.

It is of three types which are as follows

- (a) **Definite Numeral Adjective** These adjectives denote exact number or order of persons/things.
e.g. - The first *three* benches of this class.

- (b) **Indefinite Numeral Adjective** Few, many, less, more, some, any, etc.

- Use of *Less*, *Little* and *Fewer*

'Less' denotes quantity and 'fewer' denotes number.

e.g.

- ~~Not less than~~ / *No fewer than* 10000 persons died in the Gujarat earthquake.

- (c) **Distributive Numeral Adjective** Each and Every

- 'Each' is used in speaking of two or more things. The important point is that the things should be limited in number.

- 'Every' is used in speaking of more than two persons or things, where the things are not limited.
e.g. - ~~Each~~ / *Every* day is important for someone or the other.

Confusing Words

Words	Meaning	Example
Other	'Other' means second of the two.	Call the <i>other</i> boy who is with you.
Another	'Another' means additional one.	There is <i>another</i> boy also who wants to meet you.

5. Adjectives of Quantity

It shows how much of a thing is meant.

- e.g. - Any, some, little, etc.

Confusing Words

Words	Meaning	Example
Little	'Little' has a negative meaning and it means hardly any.	He has <i>little</i> hope of recovery. (i.e., he is not likely to recover).
A Little	'A little' has a positive meaning. It means some, though not much.	He has <i>a little</i> hope of recovery. (i.e. he may possibly recover).
The Little	'The little' means not much but all there is.	<i>The little</i> money that Bihar had has gone to Jharkhand.
Any	'Any' is used in negative or/and interrogative sentences.	I shall not buy <i>any</i> material from this shop.
Some	'Some' is used in affirmative sentences.	I shall buy <i>something</i> from this shop.

However, if the question is a request or a command, 'some' replaces *any*.

- e.g. - Can I buy *something* from your shop?
 - Can I have *some* money?
 - Why don't you take *something*?

6. Exclamatory Adjectives

It is used to express surprise like

- e.g. - *What* an idea!
 - *What* a piece of work!

7. Interrogative Adjectives

These adjectives are used to ask questions.

- e.g. - *Which* picture do you like the most?

8. Demonstrative Adjectives

It points out which person or thing is meant.

- e.g. - *This* boy is intelligent.

• The plural forms 'these' and 'those' are often wrongly used with the singular nouns 'kind of' and 'sort of'.

- e.g. - *These sort/sorts* of questions are frequently asked in the exam.

Comparison of Adjectives

- 1. Positive Degree** When only one case is there.
e.g. - Meerut is a *big* city.
- 2. Comparative Degree** When two cases are there.
e.g. - Meerut is *bigger* than Ghaziabad.
- She is *better* than anybody else in the school.
- 3. Superlative Degree** When more than two cases are there.
e.g. - Meerut is the *biggest* city of West Uttar Pradesh.
- He is the *most corrupt* politician of all in the country.

Confusing Words

Words	Meaning	Example
Later / Latter / Latest / Last	'Later' and 'latest' refer to time. 'Latter' and 'last' refer to position.	Tempest was the <i>last/latest</i> play of Shakespeare. What is the <i>last/latest</i> news?
	Latter : Former (opposite) Last : First (opposite) Later : Earlier (opposite) Latest : Earliest (opposite)	He came <i>latter/later</i> than me. The first half of the movie was very entertaining but the <i>latter</i> wasn't.
Elder / Eldest	For blood relations only.	I am his <i>elder</i> brother.
Old / Older / Oldest	For both persons and things.	My friend is <i>older</i> than I am.

Farther	Geographical distance (comparative degree). Its superlative is 'farthest'.	Mumbai is <i>farther</i> than Gwalior. (✗) Mumbai is <i>farther</i> than Gwalior from Meerut. (✓) Kanyakumari is the <i>farthest</i> place in the South. (✓) I would like to add <i>further</i> meaning to the studies. (✓)
Further	Besides (in addition to)	
Nearest	It shows distance	The <i>nearest</i> post-office is <i>next</i> to the college.

Rules of Degrees

- Double comparatives and double superlatives are not used together.
e.g. - She is the *most prettiest* girl. (✗)
- She is the *prettiest* girl. (✓)
- This boy is *more sweeter* than that boy. (✗)
- This boy is *sweeter* than that boy. (✓)
- The Adjective ending in *-er* (e.g. wiser) should be used as 'more wise' while comparing two qualities of the same person or thing.
e.g. - He is ~~wiser~~/*more wise* than strong.
- He is ~~more-wise~~/*wiser* than his brother.
- In comparative cases, 'other' is used with than.
e.g. - He is *more* intelligent than his classmates. (✗)
- He is *more* intelligent than his *other* classmates. (✓)
- He is *stronger* than any person in the class. (✗)
- He is *stronger* than any *other* person in the class. (✓)
- This boy (*who has come from outside*) is *more* intelligent than any other boy in the class. (✓)
- The Nile is *longer* than any river in the world. (✗)
- The Nile is *longer* than any *other* river in the world. (✓)
- In superlative cases, *other* is not used.
e.g. - Samudragupta was the most powerful of all kings of his time.
- Adjectives expressing qualities, that do not have different degrees, cannot be compared.
e.g. - Perfect, complete, circular, finish, square, empty, impossible, enough, full, unique, wonderful, marvelous, excellent, ultimate.
- This glass is *more* full than that glass. (✗)
- I have had *more* than enough. (✗)

6. Similar things should be compared when we compare two things.
 e.g. - The climate of Dehradun is better *than* Meerut. (X)
 - The climate of Dehradun is better *than* that of Meerut. (✓)
 - The pollution in Delhi is greater *than* any other city in India. (X)
 - The pollution of Delhi is greater *than* that of any other city in India. (✓)
7. The comparative degree is generally followed by 'than', but the following comparative adjectives are followed by the preposition 'to'.
 e.g. - Superior, inferior, junior, senior, prefer, preferable, elder, younger, prior, etc.
 - He is senior *to* me.
 - I prefer tea *to* coffee.
 - The Jallianwala massacre happened prior *to* the Non-Cooperation Movement.
8. If there is a gradual increase, it is expressed with two comparatives and not with positives.
 e.g. - Indian fielding is getting *better and better* day-by-day.
 - He became *more and more* intelligent while studying.
9. When two adjectives qualify the same noun, both the adjectives should be represented in the same degree.
 e.g. - Taj Mahal is the *most beautiful* and the *most sought-after* place in India.
 - He is the *best* and *honest* minister of our time. (X)
 - He is the *best* and the *most honest* minister of our time. (✓)
10. The adjectives 'little' and 'few' are not made to qualify the nouns, 'quantity' and 'number'. Instead 'small' should be used to qualify these nouns.
 e.g. - Would you please lend me ~~a few~~/*small* number of books for a month?
 - I asked him not to waste even ~~a little~~/*small* quantity of food.
11. Do not say 'two first' for 'first two'.
 e.g. - I saw only the *two first* episodes of the serial. (X)
 - I saw only the *first two* episodes of the serial. (✓)
12. When two adjectives in different degrees of comparison are used in the same sentence, each should be complete in itself.
 e.g. - He is *as good* if not better than his brother. (X)
 - He is *as good as* if not better than his brother. (✓)
13. *Worth* + V_1 + *ing* is placed after the same noun it qualifies.
 e.g. - Taj Mahal is a monument *worth visiting*.
 - Computer is a commodity *worth buying*.

Confusing Words

Words	Meaning	Example
Hard	Difficult, tough	He studies <i>hard</i> . (i.e. works very hard in studies)
Hardly	Rarely, a little	He <i>hardly</i> studies. (i.e. he rarely studies)
Late	Delay	<i>Lately</i> he is coming <i>late</i> from the office.
Lately	Now-a-days	
Near	Close	Although he was <i>near</i> the truck, he <i>nearly</i> escaped.
Nearly	Almost	

SPOTTING THE ERRORS SET 4

✓ ERRORS OF ADJECTIVE

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

- There were (a)/ no less than fifty persons (b)/ present in the room. (c)/ No error (d)
- Few remarks (a)/ that he made were (b)/ offensive to my friend. (c)/ No error (d)
- It is a (a)/ worth watching documentary (b)/ & you must not miss it. (c)/ No error (d)
- Of all the students (a)/ Rita was less worried (b)/ when the date for the annual examination was announced. (c)/ No error (d)
- Even the most perfect person (a)/ in the world is said to have erred (b)/ when there was time to perform. (c)/ No error (d)
- The meeting was postponed (a)/ because only a few number of persons (b)/ were present there. (c)/ No error (d)
- The tiger is (a)/ as swift as (b)/ any animal. (c)/ No error (d)
- In the opinion of everyone (a)/ she is wiser (b)/ than beautiful. (c)/ No error (d)

9. He had to cut a sorry figure (a)/ when he realised that he had (b)/ no any money in his purse. (c)/ No error (d)

11. Neither she is intelligent (a)/ nor hard working (b)/ and still she expects to secure first class. (c)/ No error (d)
12. I requested him (a)/ to lend me few books (b)/ that might help me in my studies. (c)/ No error (d)
13. He is the tallest (a)/ than anybody (b)/ in the school. (c)/ No error (d)
14. I was surprised (a)/ to see her speak (b)/ with somewhat anger. (c)/ No error (d)
15. Your essay (a)/ should not exceed more than (b)/ hundred words. (c)/ No error (d)
16. My brother is elder (a)/ than me although (b)/ he looks younger. (c)/ No error (d)
17. Could you (a)/ give me any money (b)/ to buy food? (c)/ No error (d)
18. Privatisation offers the most ideal situation (a)/ for consumers because private sector (b)/ is very conscious of quality. (c)/ No error
19. Little care on your part (a)/ would have made you (b)/ more successful than your friend. (c)/ No error (d)
20. He is as intelligent if not more intelligent (a)/ than his brother who has qualified (b)/ for this post. (c)/ No error (d)

> EXPLANATIONS

1. (b) 'No less than' is used for quantity while 'no fewer than' is used for number. Hence, in the given sentence 'no fewer than' should be used.
2. (a) The word 'few' means 'none' and 'a few' means 'some'. So, 'A few' would be used in the sentence instead of 'few'.
3. (b) The usage of 'worth watching documentary' is incorrect. The correct usage will be 'documentary worth watching.'
4. (b) The superlative degree of the adjective 'worried' i.e., 'least worried' should be used in the sentence to make it grammatically correct.
5. (a) 'Perfect' is an adjective expressing qualities and does not have any degree. So, 'most perfect' used in the sentence is incorrect.
6. (b) As per the rule, the adjectives 'little' and 'few' are not made to qualify the nouns, 'quantity' and 'number'. Hence, 'small' should replace 'a few' in the given sentence.
7. (c) The sentence is erroneous. To make it grammatically correct, we need to add 'other' after the word 'any' in the sentence.
8. (b) According to the rule, adjectives ending in -er (wiser) should be used as 'more wise' while comparing two qualities of the same person or thing. So, 'wiser' in the given sentence should be replaced by 'more wise'.
9. (c) The 'any' in the given sentence is not needed. So, we will delete 'any' from the sentence.
10. (c) 'More successful' is going to be replaced by 'most successful' to make the sentence meaningful.
11. (a) The sentence is starting with 'Neither she is intelligent' which is not the correct way. Hence, we change the sentence to the following 'Neither is she intelligent nor hard working'
12. (b) 'Few' means 'nothing'. So, we will use 'a few' in the given sentence to make it meaningful.
13. (b) 'Than anybody' in the sentence does not make sense with 'tallest'. So, 'of all' is used instead of 'than anybody'.
14. (c) 'Somewhat' does not make sense with 'anger'. So, we would use 'some' instead of 'somewhat'.
15. (b) 'Exceed hundred words' itself means that the essay should not be more than hundred words. Hence, we remove 'more than' from the sentence.
16. (b) 'Elder to me' would be the correct usage.
17. (b) 'Any money' does not make sense as 'any' is used in negative sense. So, we will replace 'any' by 'some'.
18. (a) Adjectives like 'ideal' do not have degrees. So, we would remove 'most' from the sentence.
19. (a) 'Little' means 'no' or 'negligible'. Hence, it should be replaced by 'A little'.
20. (a) The correct usage 'is as intelligent as'. So, part (a) of the sentence is erroneous.

ARTICLES

Articles are the members of determiners family. The word 'a, an and the' are articles. Articles are used before nouns.
e.g. My brother is *a* businessman.

Indefinite Articles

- Indefinite article 'A' is used before the words starting with the consonants.
- Indefinite article 'An' is used with the words starting with the vowel sound. (a, e, i, o, u)
 - e.g. - *An* umbrella is kept there.
 - *A* European lives in our colony.
 - Meerut has *a* university.
 - *An* honest and hardworking person always succeeds in life.
 - *An* hour is left.
 - *An* MA, *An* SP, *An* LLB

Use of Indefinite Articles

- (a) Before a common noun in singular to suggest the sense of one.
 - e.g. - Twelve inches make *a* foot.
 - There is *a* fan in the room.
 - *A* man is standing on the road.
- (b) Before a common noun in singular to suggest the vague sense of a certain or any.
 - e.g. - *A* book is kept there.
- (c) To make a common noun of a proper noun.

In this case, both definite and/or indefinite article can be used according to the case.

 - e.g. - Ajay is *a* Sherlock Holmes of our class.
 - Samudragupta was *the* Napoleon of India.
- (d) In the sense of each, every or per.
 - e.g. - The doctor advised the patient to take the medicine twice *a* day.
 - He studies for two hours *a* day.
- (e) In exclamations before singular countable nouns.
 - e.g. - What *a* shot!
 - What *a* beautiful girl!

Definite Article

Use of Definite Article 'The'

- (a) When we speak of a particular person or thing or one already referred to.
 - e.g. - *The* book is kept there.
 - *The* cassette of that movie is available in *the* market.
 - *The* book you mentioned is available in *the* store.
 - *The* pleasant weather is inviting us outside.

- (b) Before the names of physical features in Geography.
 - e.g. - *The* Himalayas, *The* Ganges, *The* Indian Ocean, etc.
 - However, if the reference is to a Single Island or a Single Mountain, 'the' is not used.
 - e.g. - *The* Kanchenjunga is the highest peak of the Himalayas in India. (X)
 - *The* North Andaman is a part of the Andaman group of islands. (X)
- (c) Before common nouns which are names of things unique of their kind.
 - e.g. - *The* Sun, *The* Moon, *The* Earth, *The* Sky.
- (d) Before the names of countries which show federation.
 - e.g. - *The* United States of America, *The* United Kingdom, *The* Republic of Korea, *The* Republic of South Africa, etc.

Exception The Netherlands, The Hague
- (e) Before the names of religious and mythological books, newspapers, magazines, journals, etc.
 - e.g. - *The* Bible, *The* Dainik Jagran, *The* India Today, *The* Times of India, etc
- (f) Before Superlatives.
 - e.g. - I am *the* best.
 - He is *the* cleverest.
- (g) As an adverb with a comparative.
 - e.g. - *The* more, *the* merrier.
 - *The* sooner, *the* better.
 - *The* higher you go, *the* colder it is.
- (h) Before terms denoting Nationality, Community and Castes.
 - e.g. - *The* Australians, *The* Indians, *The* Hindus, etc
- (i) Before historic events.
 - e.g. - *The* Ist Battle of Panipat, *The* Revolt of 1857, *The* Quit India Movement, *The* Gulf War, etc.
- (j) Before musical instruments.
 - e.g. - I can play *the* flute very well.
 - Ustad Amjad Ali Khan plays *the* sarod.
- (k) Before an adjective when it represents a class of a person.
 - e.g. - *The* rich should help *the* poor to come up.
 - *The* old should be respected by *the* young.
- (l) Before a unit of measurement.
 - e.g. - Cloth is sold by *the* metre.
 - Bananas are sold by *the* dozen.
- (m) Before a common noun to give the force of superlative.
 - e.g. - He is *the* man.
 - This is *the* thing to do.

- (n) Before the adjectives 'same' and 'whole' and after the adjectives 'all' and 'both'.
 e.g. - He is *the same* person that I saw yesterday.
 - *The whole* class performed splendidly.
 - *All the* boys passed with flying colours.
 - *Both the* friends were present there.
- (o) Before a common noun to give it the meaning of an abstract noun.
 e.g. - *The* moralist in Gandhi revolted against injustice.
 - *The* judge in him prevailed upon the father and he sentenced his son to death.
- (p) Before various Cups and Trophies.
 e.g. - Sri Lanka has won *the* Asia Cup.
 - Almost all countries participate in *the* Olympics.
- (q) Before comparative degree in case of a choice.
 e.g. - He is *the* stronger of the two friends.

Omission of Articles

- (a) Before proper noun.
 e.g. - *The* New Delhi is the capital of India. (X)
- (b) Before material noun and abstract noun used in general sense.
 e.g. - The building is made up of *the* brick and *the* stone. (X)
 - I have *the* love for you. (X)
 - *The* care of the old is necessary. (X)
- However, if the material noun and abstract noun show some specific cases, article should be used.
 e.g. - *The* stone of Kota is of good quality.
 - *The* love I have for you is unconditional and infinite.
- (c) Before a noun used in its widest sense.
 e.g. - *The* science is a subject based on facts. (X)
 - *The* man is immortal. (X)
 - *The* tiger is the national animal of India. (X)
- (d) Before the noun following 'kind of'.
 e.g. - What *kind of* a person you are? (X)
 - What *kind of* a book is it? (X)
- (e) Before uncountable nouns.
 e.g. - He gave me *advice*.
 - He passed on *information* to me.
- (f) Before school, college, home, church, temple, sea, work, bed, table, hospital, market, prison, court.
 However, when their purpose is thought of rather than the actual building, 'the' is used.
 e.g. - I go to *church* every Sunday.
 - I go to *bed* early these days.
- (g) Before names of diseases.
 e.g. - *AIDS* can be prevented using safety measures.
 - *Cancer* can be treated if detected early.
- (h) Before regular meals except when preceded by an Adjective.
 e.g. - I usually take *breakfast* at 9 o'clock.
 - We should take *dinner* atleast two hours before the sleeping time to avoid indigestion.
 - They gave us a sumptuous *lunch*.
- (i) Before modes of travel.
 e.g. - He will go by *air*.
 - Journey by *road* takes time.
- (j) Before names of relations like uncle, mother, father, etc.
 e.g. - *Uncle* will come tomorrow.
 - *Father* is working on a project.
- (k) Before adjectives used as nouns signifying a language or colours.
 e.g. - He doesn't know Hindi, but he knows *English*.
 - I like *red and blue*.
- (l) When two or more descriptive adjectives qualifying the same noun are connected by 'and', the Article is used before the first adjective only.
 e.g. - It is *a* Hindi and English Dictionary.
 (Here, the dictionary is one).
- (m) When two or more adjectives qualify different nouns, expressed or understood, the Article is used before each adjective.
 e.g. - *The* inner and *the* outer wall were both strongly defended.
 - He possesses *a* black dog and *a* white bitch.

SPOTTING THE ERRORS **SET 5****ERRORS OF ARTICLES**

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

1. The road (a)/ to famous monument (b)/ passes through a forest. (c)/ No error (d)
2. Our Housing Society comprises of (a)/ six blocks and (b)/ thirty three flats in an area of about thousand sq. metres. (c)/ No error (d)
3. Now that she is living in her own flat, (a)/ she cleans the windows (b)/ twice a week in the summer and once a week in the winter. (c)/ No error (d)
4. With little imagination and enterprise, (a)/ the tournament could have been transformed (b)/ into a major attraction. (c)/ No error (d)
5. These display (a)/ the (b)/ remarkable variety. (c)/ No error (d)
6. If you have faith in Almighty (a)/ everything will turn out (b)/ to be all right. (c)/ No error (d)
7. According to the Bible (a)/ it is meek and humble (b)/ who shall inherit the earth. (c)/ No error (d)
8. I am not wealthy (a)/ so I cannot afford (b)/ to buy a expensive car. (c)/ No error (d)
9. My father is (a)/ in bad mood (b)/ today. (c)/ No error (d)
10. On my request (a)/ Lalit introduced me to his friend (b)/ who is singer and a scientist. (c)/ No error (d)
11. This town isn't very well known (a)/ and there isn't much to see (b)/ so a few tourists come here. (c)/ No error (d)
12. He took to (a)/ reading Times (b)/ for better knowledge of the facts. (c)/ No error (d)
13. The accelerating pace of life in our metropolitan city (a)/ has had the tremendous effect (b)/ on the culture and life-style of the people. (c)/ No error (d)
14. Both the civilians (a)/ and armymen (b)/ joined the First World War. (c)/ No error (d)
15. The school is (a)/ within hundred yards (b)/ from my house. (c)/ No error (d)
16. The majority of the computer professionals recommends (a)/ that effective measures (b)/ should be taken against software piracy. (c)/ No error (d)
17. The famous Dr. Chandra (a)/ is only dentist (b)/ in our village. (c)/ No error (d)
18. This candidate lacks (a)/ an experience (b)/ otherwise he is well qualified. (c)/ No error (d)
19. The person I met (a)/ in the theatre (b)/ was the playwright himself. (c)/ No error (d)
20. The war of Mahabharata (a)/ is the full length illustration (b)/ of a righteous war. (c)/ No error (d)

> EXPLANATIONS

1. (b) The Article 'the' should be used before 'famous' as the sentence refers to a particular thing i.e., 'monument'.
2. (c) Article 'a' is used before a common noun to suggest the sense of 'one'. Therefore, 'a' would be used before 'thousand sq. metres' to suggest that it refers to one thousand square metres.
3. (c) The season e.g., summer, winter, etc are abstract nouns. So, articles are not used with them. So, we would remove 'the' before 'summer' and 'winter' and change them to 'summers' and 'winters'.
4. (a) 'Little' means 'none or negligible'. Thus, we should use article 'a' before 'little' as 'a little' means 'some'.
5. (b) In the given sentence, 'the' used with 'remarkable' is incorrect. Instead of 'the' we should use the article 'a'.
6. (a) In the given sentence, the article 'the' would come before 'almighty'. This is done because 'almighty' in the given sentence refers to 'God'.
7. (b) The given sentence implies to represent a class of persons i.e., 'the meek' and 'the humble'. Therefore, 'the' should be used before the adjectives 'meek' and 'humble'.
8. (c) The article 'a' in the given sentence should be replaced by 'an'.
9. (b) The article 'a' should precede the word 'bad' as it starts with a consonant.
10. (c) The article 'a' should precede the word 'singer'.
11. (c) 'A few' means some and 'few' means 'hardly any'. As per the sentence structure, 'few' should be used instead of 'a few'.
12. (b) In the given sentence, 'Times' is the name of a newspaper. Therefore, it should be written as 'The Times'.
13. (b) The sentence is incorrect as 'the' is used before the adjective 'tremendous'. So, to correct the sentence we would use 'a' instead of 'the' before 'tremendous'.
14. (b) As per the rule, 'the' should come before an adjective which represents a class of people. Therefore, we should add 'the' before 'armymen'.
15. (b) In the given sentence, the article 'a' should come before 'hundred yards' to convey the meaning that the school is within one hundred yards from the house.

16. (a) The verb 'recommends' is used incorrectly. It should be replaced by 'recommend' to make the sentence grammatically correct.
17. (b) The sentence wants to emphasise the fact that Dr. Chandra is the only dentist in the village. So, we would use 'the' before the word 'only' to convey the desired meaning.
18. (b) As per the rule, articles are omitted before abstract nouns used in general sense. In the given sentence, 'experience' is an abstract noun. So, it should not be preceded by an article.
19. (d) No error.
20. (a) 'The' should be added before 'Mahabharata' as it is a mythological book.

ADVERB

An adverb tells more about a verb, an adjective or another adverb.

e.g. - He is running *fast*.

Here 'fast' is the adverb which tells how he is running.

Kinds of Adverb

- 1. Adverb of Time** Answers the question 'when'.
e.g. - I shall meet you *tomorrow*.
- We were late by *two hours*.
- The clock struck *twelve*.
- 2. Adverb of Place** Answers the question 'where'.
e.g. - I shall meet you *in the market*.
- I shall meet you *there*.
- We were studying *in the institute*.
- 3. Adverb of Manner** Answers the question 'how'.
e.g. - He is sitting *quietly*.
- He is dancing *like Hritik Roshan*.
- 4. Adverb of Frequency** These tell us 'How often' an action takes place.
e.g. - Delhi Police is with you, *always*.
- 5. Adverb of Degree or Quantity** These tell us 'how much' or 'in what degree' or 'to what extent'.
e.g. - We have studied *enough*.
- There is *something* fishy out here.
- There is *little* doubt of his success.

Rules of Adverbs

- 1. So and Too** They should not be used without their co-relatives 'that' and 'to'.
e.g. - He is *so* rich (X)
- He is *so* rich that he can buy anything. (✓)
- He is *too* intelligent (X)
- He is *too* stupid to pass any exam. (✓)
- 2. Difference between very and much**
(a) 'Very' is used in positive degree and 'much' is in comparative degree.
e.g. - He is *much* intelligent. (X)
- He is *very* intelligent.
- He is *much* intelligent than his brother. (✓)
- (b) 'Very' is used with $V_1 + \text{ing}$.
'Much' is used with V_3 .
e.g. - The match became ~~much~~ / *very* interesting.
- The crowd became *much* / ~~very~~ interested in the match.
- 3.** Some words retain their form when they become adverbs : Fast, first, next, back, ill, better, best, etc.
- 4.** Adverbs ending in -ly form the comparative by adding 'more' and superlative by adding 'most'.
e.g. - This work is *more beautifully* done than that work.
- The scenery of Kashmir is *most lovely* of all.
- 5.** Adverbs of manner, place and time are generally placed after the verb or after the object of the verb.
e.g. - We visited Kashmir *last year*.
- He is talking *on and on*.
- He is sitting *quietly*.
- 6. MPT RULE** If adverbs of manner, place and time are used in a single sentence, then the sequence followed is that of *MPT*.
e.g. - I read the book *yesterday* meticulously (X) at home.
- I read the book meticulously at home *yesterday*. (✓)
- 7.** When an adverb modifies an adjective or another adverb, the adverb comes before it.
e.g. - Her dress was ready *nearly*. (X)
- Her dress was *nearly ready*. (✓)
- He is sitting *quietly*. (✓)
- 8.** Adverbs of frequency such as always, ever, never, seldom, frequently, etc, are always placed before the verb they modify.
e.g. - He *sometimes* comes late.
- She *always* looks beautiful.
- 9.** 'Enough' is both an Adjective and an Adverb. As an adverb, it is always placed after the adjective it modifies. As an adjective it is placed before the noun.
e.g. - He is *enough* intelligent. (X)
- He is intelligent *enough* to win the competition. (✓)
- He has *enough* money to spend.

10. 'Only' and 'even' should be placed immediately before the word intended to modify.
 e.g. - I worked *only* two sums. (X)
 - I *only* worked two sums. (✓)
11. An adverb can be placed at the beginning of a sentence, when it is intended to qualify, not any word in particular, but sentence as a whole.
 e.g. - *Fortunately*, he was not present at that time.
 - *Interestingly*, the PM went in the metro.
12. 'Ever' is sometimes misused for 'never'. 'Seldom or never' and 'seldom if ever' are both correct, but 'seldom or ever' is incorrect. In the same manner, little if anything is correct, but little or anything is wrong.
 e.g. - He *seldom or never* passes in the examination with fair means.
 - He *seldom if ever* parties.
13. 'Else' should be followed by 'but', and not by 'than'.
 e.g. - It is nothing *else than* / *but* his carelessness which has led to his failure.
 - Aishwarya Rai is nothing *else but* a statue of beauty.
14. 'Rather' and 'Fairly' can mean moderately. But 'fairly' is used with favourable adjectives and adverbs while 'rather' is used with unfavourable adjectives and adverbs.
 e.g. - She is *fairly* intelligent but my sister is *rather* stupid.
 - He did *fairly* well in her exams but his sister did *rather* badly.
 - He grew up in *rather* unusual circumstances.
15. 'Rather' can also be used when we are correcting something that we have just said.
 e.g. - The process is not a circle but *rather* a spiral.
16. 'Rather' is also used in case of preference—would rather, had rather, rather than are used to express preference.
 e.g. - I *would rather* study than sleep.
 - I prefer getting up early *rather than* sleeping late.
17. We use 'rather' before verbs that introduce our thoughts and feelings, in order to express our opinion politely, especially when a different opinion has been expressed.
 e.g. - I *rather* think that he was telling the truth.
 - I *rather* like the decorative effect.
18. Adverb 'as' should be used to introduce predicative of the verbs such as regard, describe, define, treat, view, know.
 e.g. - I regard him *as* my elder brother.
 - The newspapers described the situation *as* horrible.
 - Biology is defined *as* the study of nature.
19. Adverb 'as' should not be used to introduce predicative of the verbs such as name, elect, think, consider, call, appoint, make, choose.
 e.g. - He was *considered* the best dancer of his time.
 - He was *appointed* Governor by the President.
 - Saurav Ganguly was *chosen* the captain.
 - He was called *dynamic* by his mates.
20. Negative Adverbs should not be used with the words that are already negative in sense. So two negatives should be avoided. Seldom, nowhere, never, nothing, hardly, scarcely, neither, barely, rarely, are some of the Adverbs. The verbs in such category are 'deny', 'forbid', while the conjunctions are 'unless', 'until', 'lest' and 'both'.
 e.g. - *No one scarcely* practises all the exercises. (X)
 - *Scarcely anyone* practises all the exercises. (✓)
 - I *rarely* went to meet ~~nobody~~/*anybody* in my childhood.
 - She *hardly* knows *anything*/~~nothing~~ about me.
 - He does *nothing* without ~~ever~~/~~never~~ consulting me.
 - He has denied that he was ~~not~~ going there.
 - Walk steadily, lest you should ~~not~~ fall.
 - Both of them are not coming. (X)
 - Neither of them is coming. (✓)
21. Consider the following cases
- (a) 'Coward', 'miser', 'niggard', 'rogue' are Nouns. 'Cowardly', 'miserly', 'niggardly', 'roguish' are Adjectives.
 e.g. - An officer is trained never to fight ~~cowardly~~ / *in a cowardly manner*.
 - Although he seems brave, he is actually a *coward*.
 - It was a sheer *cowardly* act of violence.
- (b) 'Fast' retains its form in both Adjective and Adverb.
 e.g. - He is *fast* (Adjective).
 - He is running *fast* (Adverb).
- (c) 'Direct' and 'Directly' are adverbs. Direct means *straight* and Directly means *at once*.
 e.g. - Don't stop anywhere, return home *direct*.
 - Don't stop now, return home *directly*.
- (d) 'Manly', 'masterly', 'slovenly', 'monthly', 'weekly', 'sickly', 'friendly' are Adjectives and should not be confused with Adverbs.
 e.g. - He is earning fifty thousand rupees ~~monthly~~ / *a month*.
 - He is a *friendly* old man.

22. The use of 'never' for 'not' is incorrect, because 'never' means *not ever*.
- e.g. - I *never* remember having met him. (X)
 - I do *not* remember ever having met him. (✓)
 - We met the other day, but he *never* referred to the matter. (X)
 - We met the other day, but he did *not* refer to the matter. (✓)

23. No sentence should begin with 'Due to'. It must be used after some form of the verb 'to be'.
- e.g. - *Due to* bad weather, the match was abandoned. (X)
 - It was *due to* bad weather, the match was abandoned. (✓)
24. **Cent-per cent** It should be hundred per cent.
 25. **Do the needful** It should be do what is necessary.

SPOTTING THE ERRORS SET 6

ERRORS OF ADVERB

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

1. Firstly, you should think (a)/ over the meaning of the words (b)/ and then use them. (c)/ No error (d)
2. The driver tried his best (a)/ to avert the accident by bringing the car (b)/ to a suddenly stop. (c)/No error (d)
3. The Sunshine hotel was fully equipped (a)/ to offer leisure stay (b)/ to its clients. (c)/ No error (d)
4. The technician reminded them (a)/ to have a thoroughly cleaning (b)/ of the machine after each use. (c)/ No error (d)
5. I am (a)/ much glad (b)/ that you have won the trophy. (c)/ No error (d)
6. He is too coward (a)/ to make it (b)/ happen. (c)/ No error (d)
7. People invent new machines (a)/ when they think (b)/ different. (c)/ No error (d)
8. A man entered the tavern (a)/ and asked for some bread and cheese (b)/ with a decided foreign accent. (c)/ No error (d)
9. Watch how careful (a)/ the sparrow knits the straws (b)/ into one another to form a nest. (c)/ No error (d)
10. He is very (a)/ blind to read (b)/ the smallest of prints. (c)/ No error (d)
11. On hearing the news (a)/ he went directly (b)/ to the Manager's room. (c)/ No error (d)
12. They reached home (a)/ safely (b)/ although they started late. (c)/ No error (d)
13. It is the duty of every citizen (a)/ to do his utmost to defend (b)/ the hardly won freedom of the country. (c)/ No error (d)
14. The principal was (a)/ enough kind to (b)/ grant me scholarship. (c)/ No error (d)
15. It is nothing else (a)/ than foolishness (b)/ that led to his downfall. (c)/ No error (d)
16. I shall give you a reward (a)/ if you do your work (b)/ satisfactory. (c)/ No error (d)
17. The tried travellers were bundled off (a)/ to the nearby cop house till anyone (b)/ could come and vouch for their credentials. (c)/ No error (d)
18. I advised my brother to engage two coolies instead of one (a)/ because the luggage was too much heavy (b)/ for a single coolie to handle. (c)/ No error (d)
19. There is no one else (a)/ whom I esteem (b)/ than your father. (c)/ No error (d)
20. Although I was (a)/ in Delhi last month (b)/ I never meet him. (c)/ No error (d)

> EXPLANATIONS

1. (a) 'Firstly' is used to introduce a first point or reason. It does not make sense in the given sentence. So, we would use 'first' instead of 'firstly'.
2. (c) 'Suddenly stop' in the sentence does not make sense. Hence, we would change it to 'sudden stop' to make the sentence meaningful.
3. (b) 'Leisure' is an adjective and does not make sense in the sentence. It should be changed to its adverb form i.e. 'leisurely'.
4. (b) 'Thoroughly cleaning' is incorrect. It should be 'thorough cleaning'.
5. (b) 'Much' is used in comparative degree and 'very' is used in positive degree. So, we should use 'very' in place of 'much' in the given sentence.
6. (d) The sentence is correct.
7. (c) 'Different' in the sentence does not convey the right meaning of the sentence. It must be changed to 'differently'.

8. (c) 'Decided' is incorrect and does not make sense with the sentence. It should be changed to its adverb form 'decidedly'.
9. (a) 'Careful' in the given sentence should be changed to 'carefully' to convey the right meaning of the sentence.
10. (a) 'Very' is used in positive degree. Instead of 'very' we should use 'too' to convey the correct meaning of the sentence.
11. (b) 'Direct' means straight and 'directly' means 'at once'. Hence, we would use 'direct' in the sentence instead of 'directly'.
12. (d) The sentence is correct.
13. (c) 'Hardly won freedom' means 'negligibly won freedom' and does not make sense in the sentence. It should be changed to 'hard won freedom'.
14. (b) 'Enough kind' does not make sense. It should be changed to 'kind enough'.
15. (b) 'Than' used in the sentence is incorrect. It should be changed to 'but'.
16. (c) 'Satisfactory' does not make sense with the sentence. It should be changed to 'satisfactorily' (adverb form).
17. (b) 'Anyone' should be replaced by 'someone' to make the sentence meaningful.
18. (b) 'Too' and 'much' are not used together. It should be 'too heavy'.
19. (b) 'More' should be used after 'esteem' to make the sentence meaningful.
20. (c) 'Never' in the given sentence should be replaced by 'did not' to make the sentence meaningful.

CONJUNCTIONS

These are the words that merely join together sentences or words.

Rules of Conjunctions

- 'Scarcely' and 'Hardly' should be followed by when and not by then.
e.g. - *Scarcely* had I started for the institute, *when* / ~~then~~ the rain started.
- *Hardly* had he arrived, *when* he had to leave again.
- 'No sooner' is followed by than and not by when.
e.g. - *No sooner* had I started, *than* / ~~when~~ the rain started.
- *No sooner* did he arrive, ~~then~~ / *than* he had to leave.
- 'Seldom or never' and 'seldom if ever' are both correct, but 'seldom or ever' is incorrect.
e.g. - He *seldom or never* goes to see movies in theatre.
- 'Either-or', 'Neither-nor', 'not only-but also', 'both-and', 'whether-or' etc., should be followed by the same parts of speech or of the same function.
e.g. - He *neither* agreed to my proposal *nor* (X) to his.
- He agreed *neither* to my proposal *nor* (✓) to his.
- *Neither* he helps his mother by money (X) *nor* by other means.
- He helps his mother *neither* by money (✓) *nor* by other means.
- He helps his mother *not only* by money (✓) *but also* by other means.
- The conjunctions 'though' (or although) and 'but' do the work of setting one statement against another by way of oppositions or contrast and therefore the correlative of 'though' is 'yet' or a comma (,).
e.g. - *Though* he worked hard, *yet* he could not top the class.
- After the adjective 'other' (which is regarded as a kind of comparative), the only word that can be correctly used for contrasting one thing with another is 'than'. The prepositions *from*, *but*, *except* in such a connection are wrong.
e.g. - He had no *other* option ~~but~~ / *than* to fight.
- He had *another* reason ~~from~~ / *than* what he professed.
- She had no other claim to the post-~~except~~ / *than* her good looks.
- Conjunction 'that' is not used in the following cases
(a) Direct narration.
e.g. - He said, "I am smart".
(b) Indirect speech, if the sentence is interrogative.
e.g. - He asked who he was?
- In a 'not only.....but also' sentence, the verb should agree with the noun or pronoun mentioned second, because this is the part being emphasised.
e.g. - *Not only* the teacher *but also* the students are enjoying themselves.
- 'Such as' is used to denote a category, whereas 'such that' emphasises the degree of something by mentioning its consequences.
e.g. - Yuvraj played *such* an innings *as* played by the best batsman.
- Yuvraj played *such* an innings *that* it took the match away from the opposition.

10. 'Both' is followed by *and* not by *as well as*. Besides, both has positive sense and cannot be used in negative sentences.
 e.g. - *Both* Amit ~~*as well as*~~ / *and* his friends are coming.
 - *Both* Amit *and* his friends are *not* coming. (X)
 - Neither Amit nor his friends are coming. (✓)
11. 'Unless' means if not and therefore, it should not be used in a sentence or clause which is already negative.
 e.g. - *Unless* you *do not* work hard, you will fail. (X)
 - *Unless* you work hard, you will fail. (✓)
12. 'Lest' expresses a negative sense and therefore cannot be used with not. 'Should' is always used with 'lest'.
 e.g. - Walk steadily, *lest* you should *not* fall. (X)
 - Walk steadily, *lest* you should fall. (✓)
13. When 'suppose' is used in the beginning of a sentence to denote a command or a request, it is not followed by *if*.
 e.g. - *Suppose if* you are caught, what will happen? (X)
 - *Suppose* you are caught, what will happen? (✓)
14. Avoid the error of using 'than' for 'from' after the adjective *different*.
 e.g. - He took a different role ~~*than*~~ / *from* the ones he has been doing for long.
15. 'Nothing else' should be followed by *but*, not by *than*.
 e.g. - It is nothing else ~~*but/than*~~ your carelessness, that you have failed in the exam.
16. The use of Present tense after *as if* and *as though* should be avoided. [Subjunctive Mood].
 e.g. - He looks as if he *suspects* something. (X)
 - He looks as if he *suspected* something. (✓)

SPOTTING THE ERRORS **SET 7**

ERRORS OF CONJUNCTION

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

1. Although they listen to me (a)/ but their actions (b)/ prove otherwise. (c)/ No error (d)
2. He treats (a)/ us as (b)/ slaves. (c)/ No error (d)
3. Most of the girls are doing (a)/ their post graduation because (b)/ they may get good husbands. (c)/ No error (d)
4. Such was his pronunciation (a)/ as (b)/ I could not understand him. (c)/ No error (d)
5. He asked (a)/ that who (b)/ I was. (c)/ No error (d)
6. I am interested (a)/ in such books (b)/ that are interesting. (c)/ No error (d)
7. Each member of the alliance (a)/ agrees to take such action (b)/ that it deems necessary. (c)/ No error (d)
8. She looked at him (a)/ in such distress (b)/ as he had to look away. (c)/ No error (d)
9. This film is interesting (a)/ and the previous one (b)/ was boring. (c)/ No error (d)
10. It is difficult to know (a)/ whether (b)/ you are selected or not. (c)/ No error (d)
11. He has no chance (a)/ than to start (b)/ his own business. (c)/ No error. (d)
12. They had hardly finished (a)/ their meals that at once (b)/ they resumed their duty. (c)/ No error (d)
13. I don't know whether (a)/ Raj is equally (b)/ good as Vimal. (c)/ No error (d)
14. He (a)/ will return (b)/ on either Monday or Tuesday. (c)/ No error (d)
15. He is (a)/ not honest and not (b)/ truthful. (c)/ No error (d)
16. He has no other business (a)/ but to play (b)/ with computers. (c)/ No error (d)
17. Be smart (a)/ not only in dress (b)/ and also in action. (c)/ No error (d)
18. Hardly had I reached the airport (a)/ where I learned about (b)/ the powerful bomb explosion. (c)/ No error (d)
19. My book has been missing (a)/ from my room (b)/ till yesterday. (c)/ No error (d)
20. The manager of the bank was busy; (a)/ so he asked them to come and see him (b)/ between two to three in the afternoon. (c)/ No error (d)

> EXPLANATIONS

1. (b) The correlative of 'Although' is 'yet' and not 'but'. Hence, we should remove 'but' and use 'yet' in place of it.
2. (d) The sentence is correct.
3. (b) As the sentence starts with 'Most of', 'because' will not be used. We would replace it by 'so that'.
4. (b) As per the rule, 'such...that' is used for mentioning consequences. Hence, we would use 'that' in place of 'as'.
5. (b) As per the rule, 'that' is not used in Indirect speech if the sentence is interrogative. Hence, we would remove 'that' from the sentence.
6. (b) The conjunction 'such' is not needed in the sentence. We need to delete it from the sentence.
7. (d) The sentence is correct.
8. (c) In the given sentence, 'that' would be used in place of 'as'. (For explanation refer to Ans. 4)
9. (b) As a comparison is made in the given sentence, we would use 'but' in place of 'and'.
10. (d) The sentence is correct.
11. (b) We would use 'but' in place of 'than' as 'but' is used for the work of setting one statement ('He has no chance') against another ('to start his own business').
12. (b) 'That at once' needs to be deleted from the sentence and should be replaced by 'when'.
13. (b) In the given sentence, 'as' should be used in place of 'equally' as 'equally' is an adverb.
14. (c) 'On either' is not the correct usage. As per the rule 'Either ...or' should be followed by same parts of speech. Hence, the sentence should be : 'He will return either on Monday or on Tuesday.'
15. (b) Instead of using 'not' two times in the given sentence, we should use 'neither...nor'. So, part (b) would become 'neither honest nor'.
16. (b) As per the rule, after 'other' the only word that can be correctly used for contrasting one thing with another is 'than'. Hence, we should use 'than' in place of 'but'.
17. (c) The correct usage is 'not only ...but also'. Hence, we would use 'but' in place of 'and'.
18. (b) As per the rule, 'hardly' should be followed by 'when'. Hence, we would use 'when' in place of 'where'.
19. (c) 'Till' does not make sense in the sentence. It should be changed to 'since'.
20. (c) 'Between' takes 'and' and not 'to'. So, we would replace 'to' by 'and' in the sentence.

PREPOSITION

These are the words used with nouns/pronouns to show their relationship.

Some Important Prepositions

1. 'In' is used for bigger places (towns, cities, countries) while 'at' is used for smaller places.
e.g. - I live *at* Shastri Nagar in Meerut.
2. **In / Into** 'In' is used in speaking of things at rest. 'Into' is used in speaking of things in motion.
e.g. - He is shopping *in* the market.
- He jumped *into* the well.
- He has fallen *in* love.
- He is *in* the office.
- The snake crawled *into* the hole.
- The cup broke-off *into* a hundred pieces.
3. 'On' denotes position, 'upon' denotes movement.
e.g. - The cat is *on* the table.
- The cat pounced *upon* the mouse.
4. 'With' denotes the 'instrument' and 'by' denotes the 'agent'.
e.g. - The letter was written *by* him *with* his pen.
- The music was generated *by* /*with* a guitar.
- The murder was committed *by* him *with* a pistol.
- The ball was hit *by* the batsman *with* his bat.
5. 'Ago' refers to past time while 'before' denotes precedence between two events.
e.g. - Long *ago*, there was a king named Rama.
- Ram existed *before* Mahabharata was fought.
- He came *before* me.
- The train arrived *before* the scheduled time.
- India achieved independence 69 years *ago*.
6. 'Above' and 'below' merely denote position while 'over' and 'under' also carry a sense of covering or movement.
e.g. - We live *below* the roof.
- Sky is *above* us.
- Train is running *under* the bridge.
- The train is standing *below* the bridge.
- The bird is flying *over* the pond.
- A wire is passing *above* the building.
- I was wearing two sweaters *under* the jacket.
- 'Under' is used before a noun to indicate that a person or thing is being affected by something or is going through a particular process.
e.g. - I'm rarely *under* pressure and my co-workers are always nice to me.

- ‘Under’ can mean junior in ranks.
e.g. - He is *under* me.
 - If something happens ‘under’ a particular person or government, it happens when that person or government is in power.
e.g. - There will be no new taxes *under* his leadership.
 - If someone does something ‘under’ a particular name, he uses that name instead of his real name.
e.g. - The patient was registered *under* a false name.
 - ‘Beneath’ has the same meaning as ‘under’, but it is better to use it for abstract meanings.
e.g. - *Beneath* the festive mood, there is an underlying apprehension.
- Everybody thought that she was marrying *beneath* her.
- Many find themselves having to take jobs far *beneath* them.
7. Difference between On time, In time and In good time.
- ‘On time’ signifies absolutely right time, neither before nor after.
e.g. - The flight is *on time*.
 - ‘In time’ means you are not late for the event.
e.g. - I arrived just *in time* for my flight.
 - ‘In good time’ means with comfortable margin.
e.g. - I arrived at the airport *in good time*.
8. Difference between at the beginning/at the end and in the beginning/in the end
- ‘At the beginning’ means literally at the beginning.
e.g. - India scored fast *at the beginning* of the match.
 - ‘At the end’ means literally at the end.
e.g. - *At the end* of the book, you’ll find the bibliography.
 - ‘In the beginning’ (or at first) means in the early stage. It implies that later there was a change.
e.g. - Sachin was nervous *in the beginning*, later he settled down.
 - ‘In the end’ (or at last) means eventually/after sometime.
e.g. - At first he was scared, but *in the end* he started enjoying.
9. No preposition is placed after the following verbs when they are used in active voice. Order, request, reach, attack, resemble, emphasise, accompany, discuss, investigate, comprise, enter (come into), flee (a place), join, affect, board, etc.
- e.g. - Our forces attacked ~~on~~ the enemy fort.
- We reached ~~at~~ the station on time.
- We ordered ~~for~~ a cup of tea.
- He resembles ~~to~~ his father.
 - He accompanies ~~with~~ her wherever she goes.
- The police are investigating ~~into~~ the case.
- The teacher emphasised ~~on~~ morality.
- I don’t want to discuss ~~about~~ the problem with you.
10. Omit ‘to’ after verb of communication such as advise, tell, ask, beg, command, encourage, request, inform, order.
- e.g. - I advised ~~to~~ him to study hard.
- I commanded ~~to~~ him to leave.
- I ordered ~~to~~ him to bring me something to eat.
11. ‘Till’ is used in particular time while ‘until’ is used for indefinite time.
- But whenever ‘till’ and ‘until’ are being used as the first word of a sentence, only until is used.
- e.g. - We shall work *until* we fell down.
- We shall work *till* 15 hrs.
- ~~Till~~ / *Until* 30, he was a bachelor.
12. ‘Till’ is used for time while *to* for place.
- e.g. - We shall work *till* 5 pm.
- We walked ~~till~~/*upto* the station.
13. The same preposition should not be used with two words unless it is appropriate to each of them.
- e.g. - It is different and inferior *to* the other. (X)
- It is different *from* and inferior *to* the other. (✓)
- Her dress does not add but detract *from* her appearance. (X)
- Her dress does not add *to* but detract *from* her appearance. (✓)
14. ‘Since’ and ‘from’ are used before a noun or phrase denoting some point of time but whereas ‘since’ is preceded by a verb in some perfect tense, ‘from’ is used with other tenses except the perfect tense. *For* refers to a period of time, not to a point of time, and should not be replaced by *since* or *from*.
- e.g. - I haven’t taken anything *since* yesterday.
- He has been here *since* nine o’clock.
- I started my work *from* 1st January.
- I shall start work *from* July.
- He will join the office *from* tomorrow.
- I have been practising *for* ten days.
15. Regarding the phrases of time, *morning*, *afternoon* and *evening* are preceded by the preposition ‘in’ whereas *dawn*, *daybreak*, *noon*, *midday* and *midnight* are preceded by the preposition ‘at’. Besides, when these time phrases are qualified by ‘last’ or ‘next’, they are not preceded by any preposition.
- e.g. - I like to roam around *in* the evening.
- I’ll see you *at* night.
- The sun is hottest *at* midday.
- I met him *last* evening.

16. Across / Through

e.g. - Walk *across* the road and pass *through* a tunnel.

17. Between/Among 'Between' is used while referring to two persons/things whereas 'Among' is used for more than two.

e.g. - *Between* the two of you, who is stronger?
- The sweets are to be distributed *among* ten friends.

18. Beside/Besides 'Beside' means by the side of, whereas 'Besides' means in addition to.

e.g. - *Besides* eating, he is also watching T.V.
- You were sitting *beside* him.

19. From/Between 'From' is normally used with to/till, whereas 'Between' is used with and.

e.g. - He works *from* nine to six (or nine till six).
- The meeting was scheduled to be held *between* 2 PM and 3 PM.

20. Within/In 'Within' means before the end of time, whereas 'In' means at the end of time.

e.g. - He will return *in* five minutes.
- He will return *within* five minutes.

Some Usage

Fire <i>at</i>	:	Not killed
Fire <i>on</i>	:	Killed
Key <i>of</i>	:	A door
Key <i>to</i>	:	A problem
Deal <i>with</i>	:	Someone
Deal <i>in</i>	:	Business
Die <i>of</i>	:	Any disease
Die <i>from</i>	:	Any other reason
Buy <i>in</i>	:	A market
Buy <i>at</i>	:	A shop
Come <i>by</i>	:	Any vehicle
Come <i>on</i>	:	Foot
Come <i>into</i>	:	A conflict

SPOTTING THE ERRORS **SET 8****ERRORS OF PREPOSITION**

Directions (Q. Nos. 1-20) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

- The widely publicised manifesto (a)/ of the new party is not (b)/ much different than ours. (c)/ No error (d)
- I was taken with surprise (a)/ when I saw (b)/ the glamorous Appu Ghar. (c)/ No error (d)
- Man needs security (a)/ and leisure (b)/ of free thinking. (c)/ No error (d)
- This watch is (a)/ superior and more expensive (b)/ than that. (c)/ No error (d)
- It was apparent for everyone (a)/ present that if the patient did not receive (b)/ medical attention fast he would die. (c)/ No error (d)
- He knows very well (a)/ what is expected from him (b)/ but he is not able to fulfil all the expectations. (c)/ No error (d)
- My brother has (a)/ ordered for (b)/ a new book. (c)/ No error (d)
- That Brutus, who was his trusted friend (a)/ had attacked on him (b)/ caused heart break to Julius Caesar. (c)/ No error (d)
- Rana Pratap was (a)/ blind with (b)/ one eye. (c)/ No error (d)
- The doctor attended (a)/ to (b)/ the patient very quietly. (c)/ No error (d)
- I was shocked to hear (a)/ that his father (b)/ died of an accident. (c)/ No error (d)
- I must start at dawn (a)/ to reach the station (b)/ in time. (c)/ No error (d)
- I shall put on (a)/ a note in this regard (b)/ for your consideration and necessary decision. (c)/ No error (d)
- None could dare (a)/ to encroach (b)/ on his rights. (c)/ No error (d)
- The father brought the sweets (a)/ and distributed them (b)/ between his five children. (c)/ No error (d)
- Raman developed the habit (a)/ for sleeping late (b)/ when he was staying in the hostel. (c)/ No error (d)
- It is the duty of every right thinking citizen (a)/ to try to make (b)/ the whole world a happier place to live. (c)/ No error (d)
- The top-ranking candidates (a)/ will be appointed in senior jobs (b)/ in good companies. (c)/ No error (d)
- My niece has been married (a)/ with (b)/ the richest man of the town. (c)/ No error (d)
- The venue of examination (a)/ is one mile (b)/ further up the hill. (c)/ No error (d)

> EXPLANATIONS

1. (c) In formal writing, 'different from' is generally preferred, to 'different than'. Hence, we would replace 'than' by 'from'.
2. (a) The preposition 'with' should be replaced by 'by' to make the sentence correct.
3. (c) 'security' and 'leisure' are needed 'for' free thinking. Hence, we would replace 'of' by 'for'.
4. (b) The preposition 'to' must follow the word 'superior' in the given sentence to make it grammatically correct.
5. (a) The preposition 'for' in part (a) of the sentence does not make sense. It should be replaced by 'to' to make the sentence correct.
6. (b) The preposition 'of' should be used instead of 'from' in the given sentence.
7. (b) 'For' in part (b) of the sentence is not needed. It should be deleted.
8. (b) The preposition 'on' in the sentence is not needed. We need to delete it to convey the correct meaning of the sentence.
9. (b) 'Blind in one eye' is the correct usage. Hence, we should replace 'with' by 'in'.
10. (b) The preposition 'upon' is more appropriate than 'to'. Hence, we replace 'to' by 'upon'.
11. (c) 'Of' is used when the cause is a disease. In the given sentence, we should use 'in' in place of 'of'.
12. (d) The sentence is correct.
13. (a) 'Put on' should be replaced by 'put in' to convey the right meaning.
14. (c) 'Upon' is the right preposition that should be used with 'rights'. Hence, we replace 'on' by 'upon'.
15. (c) As per the rule, 'among' should be used when more than two persons are involved. Hence, we replace 'between' in the given sentence by 'among'.
16. (b) 'For sleeping late' does not make sense in the given sentence. It should be replaced with 'of sleeping late'.
17. (c) The sentence is not complete unless we add 'in' after 'live'.
18. (b) The correct usage is 'appointed to'. Hence, we would replace 'in' by 'to'.
19. (b) As per the right usage, 'you are married to someone' and not 'with someone'. Hence, we replace the preposition 'with' by 'to'.
20. (a) The preposition 'of' needs to be replaced by 'for' to make the sentence grammatically correct.

SPOTTING THE ERRORS

COMPLETE EXERCISE

Directions (Q. Nos 1-119) Which part of the given sentences is erroneous? In case, there is no error, choose option (d).

EXPLANATIONS

Complete Exercise

1. (b) The phrase 'one of the' takes a plural noun. So, 'bad habit' should be replaced by 'bad habits'.
2. (b) The word 'scenery' is always used in a singular form. Hence, in the given sentence, 'scenery' should be used in place of 'sceneries'.
3. (a) The word 'furniture' is always used in a singular form. So, part (a) would become 'All the furniture has been.'
4. (a) 'Mob' is a 'group of people with one common thought of criminal consequence'. Hence, in the given sentence, 'mob' should be used in place of 'crowd'.
5. (b) The word 'luggage' is always used in a singular form. The correct sentence would be 'They left their luggage.....'
6. (c) In this sentence, 'gears' is used incorrectly. It should be changed to 'gear'.
7. (a) The sentence means to convey the message that the Indian Military drove away the Chinese. To convey this meaning, 'force' needs to be changed to 'forces'.
8. (c) 'Bouquet' is used with flowers. For grapes, we use 'bunch'.
9. (a) The plural of 'brother-in-law' is 'brothers-in-law'.
10. (a) The sentence refers to a number of shirts. So, the word 'kind' must be replaced by 'kinds'.
11. (a) As the sentence refers to a number of persons i.e. 'people', 'sorts' will be used instead of 'sort'.
12. (a) The pronoun 'It' comes before the phrase or clause to which it refers. So, 'It' will come at the starting of the sentence.
13. (c) The question 'Helped whom?' remains unanswered until we add 'him' at the end of the sentence.
14. (b) As the sentence refers to one person i.e. 'One of them' so it would have a singular pronoun. Hence, we would replace 'their' by 'his' to make the sentence correct.
15. (b) The pronoun 'he' in the sentence is not needed. Without 'he' the sentence is self-explanatory.
16. (c) The sentence refers to one teacher i.e. singular form. Hence, it should accompany a singular pronoun. Therefore, we will replace 'them' by 'him'.
17. (c) The pronoun 'he' in the sentence is not needed.
18. (c) 'Each girl' means a number of girls. Hence, the pronoun used for it will be plural. So, 'them' would replace 'her' in the sentence.
19. (b) This sentence would contain a reflexive pronoun. Hence, 'him' in the sentence would be replaced by 'himself'.
20. (a) The pronoun 'myself' used in the sentence is erroneous. Instead of 'myself', 'I' would be used.
21. (c) As per the rule, 'many a' takes a singular verb. So, in the given sentence we would replace 'were' by 'was' to make it grammatically correct.
22. (a) In the given sentence, 'dozen of geography books' is considered as a single entity. Hence, the verb 'are' in the sentence would be replaced by 'is'.
23. (b) When the subject of the sentence is 'The number of' is singular. Hence, 'have' in the given sentence would be replaced by 'has'.
24. (b) 'The Himalayas' are a mountain range and hence, should take a plural verb. Therefore, 'is' in the given sentence would be replaced by 'are'.
25. (b) In the given sentence, 'was' would be used after 'and'.
26. (a) As per the sentence structure, it mentions an activity (going to Delhi) that has already completed. So, 'had been' in the sentence would be replaced by 'went'.
27. (a) As per the rule, second person must be followed by third person. So, the sentence should start as 'Either you or she' instead of 'Either she or you'.
28. (a) 'The children' in the given sentence did a common thing (action) of troubling their parents. So, 'the children' would be taken as a single entity (singular) and hence would take a singular verb i.e. 'was'.
29. (a) As the sentence states an event in the past tense (last year), 'will be' should be replaced by 'was'.
30. (b) In the sentences with 'along with', the verb should agree with the first subject. Therefore, the given sentence will take a plural verb 'were' as 'The soldiers' is plural.
31. (b) The word 'other' is missing in the sentence. Hence, we will add 'other' after 'any' in the sentence.
32. (a) 'Latest chapter of this novel' does not make any sense. Hence, we replace it by 'last chapter'.
33. (c) 'Latter' is not the correct word to be used as per the sentence. Hence, we would use 'later' instead of it.
34. (b) As per the rule, when two adjectives qualify the same noun, both the adjectives should be represented in the same degree. So, we would change 'beautiful' in the given sentence to 'the most beautiful'.
35. (b) As per the rule 'superior' is followed by 'to'. So, we would replace 'than' by 'to'.
36. (a) The word 'other' in the given sentence is not needed. So, we will remove it.
37. (c) 'Those of' would be added before 'any other English dramatist'.
38. (a) To make the sentence meaningful, we would remove 'all the more' from the sentence.

39. (a) As per the rule, the adjectives 'little' and 'few' are not made to qualify the nouns 'quantity' and 'number'. Hence, we would use 'A small' instead of 'A little'.
40. (c) 'Too' is not the correct word to be used with 'intelligent' in the sentence. Hence, we would use 'very' instead of 'too'.
41. (b) 'The' is not used before a comparative adjective like 'greater'. So, we would remove 'the' before 'greater'.
42. (b) Here, 'fact' mentioned in the given sentence is a particular fact that 'we did not receive pay on time'. So, we should use 'the' before 'fact'.
43. (b) 'An' is not used with unique, so use 'a' with unique.
44. (c) As per the rule, articles are not used before abstract nouns. 'Silence' in the given sentence is an abstract noun. Hence, we would remove 'a' before 'silence'.
45. (b) 'Little' means 'no'. Hence, to make sense we would add the article 'a' before 'little'.
46. (b) 'Little sugar' means 'no sugar'. Hence, to make sense, we would add 'a' before 'little'.
47. (a) 'Gita' is a religious book of the Hindus. So, as per the rule, it should be written as 'the Gita'.
48. (a) 'Greeks' in the sentence is written incorrectly. It should be written as 'the Greeks' as it intends to mention 'people of Greece' in the given sentence.
49. (b) To make the sentence correct, the article 'a' should be added before 'hand'.
50. (c) In the sentence, we speak about a particular thing, 'infant mortality rate'. So, we would use 'the' before it.
51. (c) 'Very' should be used instead of 'too' as 'too' must be followed by 'to' to make the syntax correct.
52. (a) 'Did not know hardly' should be replaced by 'hardly knew' to make the sentence grammatically correct.
53. (a) 'Something' is used in a positive sense. It should be replaced by 'anything' in the given sentence to convey the right meaning.
54. (b) 'Nobler' does not make sense. It should be replaced by 'more nobly' in the given sentence.
55. (c) 'Direct' means 'straight' and 'directly' means 'at once'. Therefore, we must use 'direct' instead of 'directly' in the given sentence.
56. (c) 'Neither' should be replaced by 'either' to make the sentence meaningful.
57. (a) 'Not' in the given sentence is not needed as per the rule two negatives 'not' and 'seldom' are not used in a single sentence. Hence, we would remove 'not'.
58. (a) 'Much' should be replaced by 'very' in the sentence to make it meaningful.
59. (a) As per the rule, it should be 'often meet him' instead of 'meet him often'.
60. (b) 'Blunt' needs to be replaced by the adverb 'bluntly' to make the sentence meaningful.
61. (b) 'No sooner' is followed by 'than' and not by 'when'. Hence, we would replace 'when' by 'than'.
62. (b) The word 'therefore' is not needed in the sentence. Hence, we would delete that.
63. (b) 'Because' is not needed in the sentence as the sentence starts with stating the reason for failure. We should replace 'because' by 'that' to make the sentence correct.
64. (b) 'That' is not used in the indirect speech when the sentence is interrogative. Hence, we would remove 'that'.
65. (a) As per the rule 'unless' is not used with negatives like 'not'. Hence, we would remove 'do not' from the sentence.
66. (b) 'Neither' is used with 'nor'. Hence, we would replace 'or' by 'nor' in the sentence.
67. (b) The conjunction 'if' needs to be replaced by 'that'.
68. (a) Part (a) is incorrect. 'No' should be added before 'sooner'. The sentence would become 'No sooner had he arrived than'
69. (b) 'Because' is the incorrect conjunction used in the sentence. It should be replaced by 'so that'.
70. (a) 'No' in the sentence should be removed as it is not needed in the sentence.
71. (b) The right usage is 'referred to' and not 'referred for'. Hence, we would replace 'for' by 'to'.
72. (b) The word 'connive' is used with 'at'. Hence, we would replace 'on' by 'at' to make the sentence grammatically correct.
73. (c) The right usage is 'angry with' and not 'angry at'. Hence, we replace 'at' by 'with' in the sentence.
74. (a) 'Am hearing' should be changed to 'hear'.
75. (c) 'Distinguish' uses the preposition 'from'. Hence, we would replace 'for' by 'from'.
76. (b) As per the rule, no preposition is used after 'enter', so we would remove the word 'into' from part (b).
77. (c) 'To ask' should be replaced by 'on asking' to make the sentence grammatically correct.
78. (b) 'Inform of' means the information about something and 'inform about' means the information with the details. Hence, we would use 'of' instead of 'about'.
79. (b) 'Invited to' is the correct usage. Hence, we would not use 'for'.
80. (a) 'Came out with' is the correct usage. Hence, we would replace 'to' by 'with' in the given sentence.
81. (a) 'Today' should not be used. It should be replaced by 'this'.
82. (b) The verb in the sentence must agree with 'you'. Hence, we would change 'is' to 'are'.
83. (d) The sentence is correct.
84. (b) 'I have finished' is incorrect as per the sentence structure. It should be changed to 'I will have finished.'
85. (d) The sentence is correct.

86. (b) The verb in the sentence should agree with the noun 'captain'. Hence, we should change 'are' to 'is'.
87. (c) The word 'about' is not needed in the sentence. Hence, we would remove 'about'.
88. (c) 'Either of' is used for two things. Hence, we would use 'any of' in the given sentence.
89. (a) 'Had been' should be used in place of 'are' to convey the correct meaning of the sentence.
90. (a) The word 'know' should be replaced by 'remember' to convey the proper meaning of the sentence.
91. (a) 'Losses' is the incorrect word. It should be changed to 'loses'.
92. (c) 'Through' is not the right word. It should be replaced by 'with'.
93. (d) The sentence is correct.
94. (c) 'Say' should be used in place of 'do' as 'do' is not used with 'prayer'.
95. (c) We need to add 'had' before 'left' to make the sentence grammatically correct.
96. (b) 'Enough old' should be changed to 'old enough'.
97. (d) The sentence is correct.
98. (b) We should use 'impartial' in place of 'partial'.
99. (b) 'For' should be replaced by 'on' to convey the correct meaning of the sentence.
100. (b) 'By the road' is incorrect. We should use 'by road'.
101. (a) 'In' in the given sentence needs to be replaced by 'with'.
102. (c) 'The' in the part (c) of the sentence should be replaced by 'an' as the next word 'infant's' starts with a vowel.
103. (a) As per the given sentence, the verb 'were' should be replaced by 'was' to make the sentence grammatically correct.
104. (c) 'As well' is not needed in the sentence. Hence, we delete it.
105. (b) The right phrase to use is 'catch a glimpse'. Hence, we replace 'have' by 'catch' in the given sentence.
106. (a) We need to use 'distinct' in place of 'distinctive' to make the sentence meaningful.
107. (b) 'Many a' uses a singular verb. Hence, we replace 'are' in the given sentence by 'is'.
108. (c) 'Work it out' does not convey the right meaning it should be changed to 'work out'.
109. (b) 'Did not think' needs to be replaced by 'thought' to make the sentence correct.
110. (b) 'Either' is used two things. For more than two, we use 'any'. Hence, we would replace 'either' by 'any' to make the sentence correct.
111. (a) 'Am' needs to be replaced by 'have been' as the task in the sentence ('learning English') is continuous.
112. (b) 'With' is not needed as 'to marry the girl' makes right sense. Hence, we would remove 'with'.
113. (b) 'He had left' needs to be changed to 'had he left' to make the sentence grammatically correct.
114. (a) 'Was arriving' is not correct as per the sentence structure and tense. It should be change to past tense i.e., 'When he arrived'.
115. (a) The sentence refers to a past event. Hence, the verb 'constituted' should be changed to 'had constituted'.
116. (a) We should remove 'to' and change 'sneeze' to 'sneezing' to make the sentence correct.
117. (b) 'Hand to the mouth' is incorrect. The correct phrase/idiom is 'hand to mouth' which means 'to have just enough money to live on and nothing extra'.
118. (a) As per the rule 'as well as' is not used in place of 'and'. Hence, we replace 'as well as' by 'and' to make the sentence correct.
119. (b) The preposition 'by' is incorrect. It should be replaced by 'to' to make the sentence meaningful.

Questions from NDA/NA Exam (2012-2016)

1. (c) 'To close' does not convey the right meaning. It should be changed to 'to an end' or 'to conclusion' to make the sentence meaningful.
2. (b) 'Each of' takes a singular verb. Hence, 'have' in the given sentence should be changed to 'has'.
3. (a) As per the rules, 3rd person should come before 1st person. Hence, part (a) of the sentence would be changed to 'Gopal and I'.
4. (c) The word 'hard' should be added before 'to read' to make the sentence meaningful.
5. (c) The question tag 'isn't it?' should be replaced by 'aren't they?' to make the sentence correct.
6. (a) 'Despite' is not followed by preposition 'of' so to make the given sentence correct, remove 'of' from part (a) of the sentence.
7. (a) 'As soon as' is the correct usage. Hence, we should add 'as' after 'soon'.
8. (a) 'For an employment' should be changed to 'for employment'. This is done because articles are not used before abstract nouns.
9. (a) In the sentence, 'the train left' would be changed to 'the train had left'.
10. (c) The sentence refers to present tense. Hence, 'was' in the sentence should be changed to 'is'.
11. (a) 'Will' is not needed in part (a) of the sentence. Hence, we should remove 'will' to make the sentence grammatically correct.
12. (c) As per the rule, 'for' is used to express duration while 'since' is used for a starting point. Hence, we would use 'for' in the sentence in place of 'since'.
13. (a) 'Many a' takes a singular verb. Hence, we would use 'was' in place of 'were'.
14. (c) The verb 'talk' is used incorrectly in the sentence. It should be changed to 'talking' to make the sentence correct.
15. (c) 'Died by cancer' is incorrect as in case of diseases we use 'died of'. Hence, the word 'by' should be changed to 'of'.

16. (c) The adverb form of the word 'profound' i.e., 'profoundly' should be used instead of 'profound' to make the sentence meaningful.
17. (b) 'More' is used incorrectly in the sentence. It should be replaced by 'much' to make the sentence meaningful.
18. (c) 'It is' is not needed in the sentence. It should be deleted to make the sentence grammatically correct.
19. (b) The preposition 'in' in the given sentence is incorrect. It should be replaced by 'on' to make the sentence meaningful.
20. (a) The preposition 'despite' is not followed by 'of'. Hence, we delete 'of' from the given sentence.
21. (a) 'None of' uses singular verb. Hence, we would change 'have' to 'has' to make the sentence correct.
22. (c) 'Was she' is incorrect as per the given sentence. It should be replaced by 'she was'.
23. (d) The sentence is correct.
24. (c) 'Oneself' is incorrectly used. It should be changed to 'themselves'. So that it complements with the pronoun 'them' used in the given sentence.
25. (a) 'Would have arrived' is not correct as per the sentence structure. It should be 'had arrived'.
26. (a) 'Risen' is the incorrect form of the verb 'rise'. It should be changed to 'raised'.
27. (a) The sentence refers to a past event. Hence, 'have seen' should be changed to 'saw'.
28. (a) 'Charged with' means 'to place criminal charges against someone'. Hence, 'of' in the given sentence would be replaced by 'with'.
29. (d) The sentence is correct.
30. (a) As per the sentence structure, 'has taken' should be changed to 'took'.
31. (a) 'If' is not used with 'suppose'. Hence, we should delete 'if' from the sentence.
32. (a) 'That' is not needed in the sentence. Hence, we should remove it.
33. (a) 'Greatful' is incorrect. We should use 'grateful' in place of 'greatful' to convey the correct meaning of the sentence.
34. (b) 'Is he' should be changed to 'he is' to make the sentence grammatically correct. ('is he' is used in interrogative sentences.)
35. (c) 'The' should not be used in the sentence. It should be 'to go to bed at 10 pm daily'.
36. (b) The word 'down' is not needed in the sentence. Hence, we should remove it.
37. (c) The phrase 'call into question' means 'to cause doubt about something'. Hence, we would replace 'called to question' by 'called into question'.
38. (c) The part (c) of the sentence should be changed to 'but not very often in between' to make the sentence meaningful.
39. (c) 'At' should be used in place of 'on' in the given sentence.
40. (a) 'Of' is used with the word 'deliberations'. Hence, we would use 'of' in place of 'by'.
41. (b) 'Is' will be used in place of 'are'. Here subject 'The pile of books' is singular.
42. (c) 'Am wrong' is to be used instead of 'are wrong'. Helping verb is used according to the nearer subject which is 'I' in the given sentence.
43. (b) Remove 'to' after 'tell'. It is wrong use of preposition.
44. (b) Add 'yet' before he. 'Yet' is used in a sentence, starting with 'though/although'.
45. (c) Part (c) should be 'hard suddenly' to make the sentence meaningful.
46. (d) The sentence is correct.
47. (c) 'Till I give the order' is the right usage.
48. (b) Replace 'are' with 'is'. Singular form is used after neither.
49. (c) Write 'equipment' in place of 'equipments'. After 'any other' singular noun is used.
50. (c) Replace 'into' with 'in the'. 'Into' shows the motion of subject and here 'in the' will make sense.
51. (c) Replace 'to' with 'from'.
52. (a) Use 'about' in place of 'nearly'. 'Nearly' is used when the sense is vague, incomplete and uncertain but here the duration has been definite as to be thirty years.
53. (d) The sentence is correct.
54. (c) 'Insisted on asking several questions' should be used.
55. (a) Use of 'into' is not required here as we know that 'enter' agrees with no preposition.
56. (b) Use of infinitive is required here, so according to the structure of sentence, use 'to see' in place of 'for seeing' to make the sentence completely correct.
57. (c) Here, subject is singular. So, we would use 'is small' in part (c).
58. (b) Use 'who' in place of 'whom' as the sentence is in need of adjective clause to make it correct.
59. (b) 'Why' should be replaced by 'that' to make the sentence correct.
60. (c) Use 'being' before 'followed' because a complete sense can be given only by using this word.
61. (b) Use 'prepared to act promptly' in place of 'prepared promptly to act' which gives a proper meaning here.
62. (a) 'Unless you stop making noise at once' is better expression. We have to remove 'to make'.
63. (a) 'But' will come after 'help' because 'but' is the conjunction which add two words, sentences, etc.
64. (c) In this option 'had' should come in between 'he' and 'promised' i.e. the benefits he had promised.
65. (c) Here, 'in particular' will be replaced by the adverb 'particularly'.
66. (b) In this part, only 'when' should be replaced with 'than'.
67. (b) Use of preposition (into) is not required with 'enter'.

68. (b) 'was' would not be used in part (b).
69. (b) The verb 'ensures' does not take 'for' after it, so it has to be removed.
70. (b) 'For' would not be used in the sentence.
71. (c) 'Isn't' is wrong as it should be 'won't you'?
72. (c) 'About' should not be used here. Part (c) would be 'his dream now is to visit the Moon'.
73. (a) 'The meeting was adjourned abruptly' is the correct sentence.
74. (c) Here, subject one is singular so the verb should also be singular. Therefore, 'were' is incorrect and 'was' should be used.
75. (c) The sentence is an imaginative sentence in past, so 'will' has to be replaced by 'would'.
76. (a) 'Accused of' is the right usage as 'accused for' does not make sense in the given sentence.
77. (b) Use 'John has been ill' in place of 'John is ill' to make the syntax correct as there is a time reference.
78. (c) Remove 'shall' from the part of the sentence to make it correct. See the syntax:
sub+shall/will +...+sub+v₁/v₁ + s/es... .
79. (b) 'He is owning' is to be replaced by 'He owns'. 'Own' is not used in progressive form.
80. (d) The sentence is correct.
81. (b) 'Neither' is followed by singular verb. So, 'was' should be used in place of 'were'.
82. (a) Part (a) is erroneous. It should be 'Little did he realise'.
83. (c) 'minds' should be used in place of 'mind'.
84. (b) Use 'is' in place of 'are'. When two things are meant for same thing then singular verb is used.
85. (c) As per the rules of tag, we should use 'weren't you'. A tag takes the verb of the main sentence. Here, 'were' is the verb of the main sentence.
86. (a) Part (a) has error of tense. As the sentence is in Past Tense, the part (a) of the sentence would become 'She said that she had understood '
87. (b) Part (b) has error of use of preposition. Instead of 'by' we should write 'due to'.
88. (a) 'Ourselves' should be used after 'familiarise'.
89. (b) Part (b) has error in usage of tense 'why did she cry out' should not be used. It should be 'why had she cried out'.
90. (a) Part (a) has error. 'That' should not be used.
91. (a) Part (a) has error, the part (a) should be 'Had I not fallen ill'.
92. (d) The sentence is correct.
93. (a) Part (a) has error of use of Past Tense. Here, simple Past Tense is to be used and it should be 'He went home'.
94. (b) Part (b) has error in usage of preposition. 'With' should be used in place of 'for'.
95. (b) Present Continuous tense should be used in part (b). Part (b) would become 'have been trying for long'.

02

VOCABULARY

Vocabulary comprises one of the most scoring bunch of questions in NDA/NA exam. A sound vocabulary is always anticipated to crack the questions based on synonyms and antonyms. The following chapter gives you an edge in mastering the words that have importance in the examination.

Vocabulary is a broad concept in itself. One can enhance one's language skills by acquiring a good hold over **vocabulary**. To score high in the NDA/NA exam (English Paper), a candidate should improve his/her vocabulary skills. It helps one in solving questions of Comprehension, Cloze Test, Antonyms and Synonyms etc.

Here, we illustrate some steps to enrich vocabulary.

- Step I Identify the Word** Whenever we come across a new word in a sentence while reading a textbook, newspaper or a magazine, we should look up its meaning. This is the best way to enhance one's vocabulary. Suppose you come across a word 'Antique' and you don't know its meaning, you consult a dictionary and find its meaning which is 'old and often valuable'.
- Step II Identify the Antonyms of that Word** Along with the meaning of a word, its antonyms (words with opposite meaning) to it should also be taken into consideration. A good knowledge of words and their antonyms is very beneficial from the examination point of view. e.g. Opposite of Antique is modern. Antique can also be replaced by Modern, Renovated and Recent etc.
- Step III Identify the Synonyms of that Word** The knowledge of words that are similar or closer in meaning to a word is very useful. It makes a student efficient enough to have a strong sense of the language. Example: 'Antique' can be replaced by Traditional or Ancient.
- Step IV Form a Proper Sentence** This is one of the most important parts in vocabulary building. It serves to stimulate memory by recalling the words as and when needed, apart from making the proper sense and the use of words clear. e.g. To be more familiar with a word, we should use it in sentence form. For 'Antique' a proper sentence is 'People love to purchase the antique items.'

A

Aback Taken by surprise

Synonyms Surprised, thrown off guard

Antonyms Relax, Contended

- *Everyone was taken aback by Sachin's decision to quit.*

Abandon To leave something and never return to it

- *His humour added zest to the performance.*

03

ANTONYMS

The importance of vocabulary brings the candidate to the questions based on antonyms. Generally, a good number of 8 to 10 questions are there in this type of question. The questions may be either in direct format or in sentence format. If the question is in the sentence format, then answer must be given according to the context there within.

An **Antonym** is a word that is directly opposite in meaning to a given word.

e.g. The word 'close' has its antonym as 'open'.

Here, both the words are opposite in meaning to each other.

Questions on antonyms are based on direct and sentence format, which are as follow

1. Direct Format

In this format a word is given and out of the given four options, a word is to be selected which is opposite in meaning to the given word.

e.g. Which of the given word is **opposite** in meaning of the words provided?

DEAD

- (a) Moving (b) Life (c) Alive (d) Decease

Explanation (c) 'Dead' means no longer alive. To find the antonym of dead, we have to consider its opposite meaning i.e., not dead or living. 'Alive' means 'living or not dead'. So, option (c) is the correct choice.

2. Sentence Format

In this format one word of a sentence is highlighted and out of the given four options, a word is to be selected which is opposite in meaning to that of the highlighted word.

e.g. Which of the given words is the antonym of the word written in capital letters?

Police took the ILL man to a hospital.

- (a) decease (b) moving (c) life (d) healthy

Explanation (d) The opposite of 'ill' is 'healthy'. So, the right answer is (d).

SYNONYMS

Another aspect of vocabulary is questions based on similar words. These questions are 8 to 10 in number and may be either in sentence format or in direct format. To answer the questions based on sentence format, the candidate is required to answer according to the context within.

Synonyms are the words which have a similar meaning to that of a given word.

e.g. The synonyms of the word 'reside' is abode, dwell, to live, etc.

Here, all the underlined words have the same meaning in context to the given word.

Questions on synonyms are based on direct and sentence format, which are as follow

1. Direct Format

In this format a word is given and out of the given four options, a word is to be selected which is the correct meaning of the given word.

e.g. Which of the given words is **closest** in meaning of the words provided?

REMOTE

- (a) Automatic (b) Distant (c) Mean (d) Savage

Explanation (b) Remote means located far away and 'Distant' also means 'far away in space or time'. While, Automatic means done or occurring spontaneously, Mean means intend to convey or refer to and Savage means cruel and vicious. So, the right synonym for 'Remote' is 'Distant'. Hence, option (b) is the correct choice.

2. Sentence Format

In this format one word of a sentence is highlighted and out of the given four options, a word is to be selected which is similar in meaning to the highlighted word.

e.g. Which of the given word have the same meaning to the word written in **capital** letters?

A person gets **WEAK** mobile signal in remote area.

- (a) fluctuating (b) falling (c) low (d) distant

Explanation (c) In this sentence 'Weak' is used as 'Low' mobile signal. While, Fluctuating (rise and fall), Falling (drop down) and Distant (faraway) are different in meaning to the given word. Hence, option (c) is the correct choice.

27. (c) Eulogy means 'to appreciate somebody', that means 'praise' is the synonym of eulogy.
28. (b) Unique and 'exceptional' both mean unusual. So, they both are synonyms.
29. (a) Intervention and 'interference' both mean 'unwanted involvement'. So, they both are synonyms.
30. (c) Discern and 'determine' both mean 'to decide'. So, they both are synonyms.

31. (b) Rancour and 'hatred' both mean 'bitterness or resentfulness'. So, they both are synonyms.
32. (b) Isolated means 'to separate somebody physically or socially from other people or things'. Hence, option (b) is correct.
33. (c) Columns means tall, solid, vertical post and 'pillars' has exactly the same meaning. So, they both are synonyms.
34. (b) Block and 'obstruct' mean 'to stop from seeing'. So, they both are synonyms.
35. (a) Abruptly and 'suddenly' mean 'unexpectedly' and 'changing without knowledge'. So, they both are synonyms.
36. (d) Scintillating and 'sparkling' mean 'twinkling and shining brightly'. So, they both are synonyms.
37. (a) Pact and 'treaty' both mean 'a formal agreement'. So, they both are synonyms.
38. (c) Prudent and 'careful' both mean 'showing care and thought for the future'. So, they both are synonyms.
39. (b) Converge and 'intersect' both mean 'to move towards each other and meet at a point'. So, they both are synonyms.
40. (d) Zealot and 'fanatic' both mean 'a person who is extremely enthusiastic about something'. So, they both are synonyms.
41. (c) 'Amity' is the exact and appropriate synonym of 'friendship'.
42. (b) 'Extinct' and 'Non-existent' both mean 'having no living members' (like dinosaurs) which is exactly what the statement is talking about. So, 'non-existent' is its synonym.
43. (d) Proselytise directly implies 'to convert or attempt to convert from one religion to another'. So, 'convert' is its synonym.
44. (c) 'Preposterous' means unreasonable and 'absurd' is the nearest in the meaning of the word, fitting best to the statement.
45. (d) Callous means 'not caring about other people's feelings or suffering'. The best synonym to the word is 'unfeeling' which means 'lacking sensitivity towards others'.
46. (a) Verdict means a formal answer or decision of the jury given to the court. 'Judgement' also means 'the decision of a court'. So, it is the nearest in the meaning of the word verdict.
47. (a) Corroborated means 'to provide evidence to support a statement'. So, 'confirmed' is the correct answer among the given options.
48. (a) 'Rational' means 'logical or sane' is the appropriate answer among the given options.
49. (a) Credible directly relates to 'believable or convincing'. So, 'believable' is the appropriate answer.
50. (d) Hazardous means 'that can be dangerous or cause damage'.
51. (c) Erase is most suitable synonym here in the context of the sentence as 'obliterate' and 'erase' both mean 'wipe out'.
52. (c) Here, ineffable means 'too great to be expressed in words'. Hence, option (c) indescribable is correct.
53. (c) 'Instructive' as well as edifying both mean 'providing intellectual instruction'.
54. (b) Garrulous as well as 'talkative' means 'one who talks much'. So, both are synonyms.
55. (d) Fortitude and 'forbearance' are synonyms as both mean 'mental strength and courage to face danger, pain etc'.
56. (d) Tacit and 'implied' are synonyms to each other as both mean 'not understood'.
57. (b) Meagre and 'scanty' both have a meaning 'less in amount'. So, these are synonyms.
58. (d) Exhilarated and 'overjoyed' are the similar words as both have same meaning, i.e. 'extremely happy'.
59. (a) Fired means 'relieved of his job'. Hence, option (a) is correct.
60. (d) Deafening means 'very loud'.
61. (c) Exemplary means very good and suitable to be copied by others. 'Commendable' means 'praise worthy', therefore, option (c) is its synonym.
62. (d) Restive means 'unable to stay still or being controlled'. Therefore, option (d) 'impatient' is its synonym.
63. (a) Dearth means 'a lack or scarcity of something'. Therefore, option (a) is its synonym.
64. (b) Retired means 'to go to a place'. According to the context of the sentence option (b) 'went away' is most similar in meaning to the word 'retired'.
65. (b) Tactical means 'careful planning in order to achieve something'. Therefore, option (b) 'strategic' is most similar in meaning to the word tactical.
66. (d) Deviate means 'to be different from the rest'. Therefore, option (d) 'different' is its synonym.
67. (b) Debilitated means 'to weaken as a result of an illness'. Therefore, option (b) 'weakened' is most similar to the word 'debilitate'.
68. (d) Laudable means 'worth appreciation'. Therefore, 'praiseworthy' is its correct synonym.
69. (a) Reproach means 'expressing blame or criticism'. Therefore, option (a) 'rebuke' is its synonym.

SENTENCE IMPROVEMENT

Generally, 10 to 15 questions based on sentence improvement are asked in NDA/NA exam. In these questions, a part of the given sentences is underlined. Out of the given options, an option is chosen for underlined portion, which may improve the sentence.

Questions based on sentence improvement are designed to test a candidate's knowledge of **English grammar and vocabulary**. A sound knowledge of **grammatical rules** is highly beneficial in solving such questions. **Study of grammar** along with constant practice is sure to give the desired result.

In the questions given below, a part of the sentence is **underlined**. Below are given alternatives to the **underlined** part which may improve the sentence. Choose the correct alternative. In case, no improvement is needed, option (d) is the answer.

e.g. The girl is wise despite her age.

- (a) is her
- (b) than her
- (c) for her
- (d) No improvement

Explanation (c) In the above given sentence underlined word is despite her, we have to choose the correct option which will improve the sentence. Among the given options 'for her' is best option which improves the sentence and makes it grammatically correct while 'is her', 'than her' and 'at her' are incorrect choices that are not grammatically correct. Hence, option (c) is the correct choice.

IMPROVE THE SENTENCES

✓ QUESTIONS FROM NDA/NA EXAM (2012-2016)

Directions (Q. Nos.1-57) *In this section, look at the underlined part of each sentence. Below each sentence are given three possible substitutions for the **underlined** part. If one of them (a), (b) or (c) is better than the **underlined** part, indicate your response against the corresponding letter (a), (b) or (c). If none of the substitutions improves the sentence, indicate (d) as your response. Thus, a 'No improvement' response will be signified by the letter (d).*

EXPLANATIONS

Improve the Sentences

- (b) 'Look' does not make sense in the sentence. It should be changed to 'see'.
- (d) No improvement
- (d) No improvement
- (b) 'Me' should be replaced by 'I' to make the sentence grammatically correct.
- (a) The word 'untie' is used with 'knot'. So, we would replace 'open' by 'untie'.
- (b) 'Laid aside' does not make sense. It should be replaced by 'set aside'.
- (a) As the sentence is in past tense, we will use 'eradicated' in place of 'have eradicated'. Because the time is also given of the completion of the task.
- (a) 'None the wiser' is an idiom which means 'to still be confused about something even after it has been explained to you'. So, we would replace 'not' by 'none'.
- (b) As the verb in the first part of the sentence is in past tense, we would change 'is banded' to 'were banded' to make the sentence correct.
- (a) 'Touch upon' makes the correct sense in the given sentence.
- (c) 'Has not been and can never be' should be used as the incident in the given sentence refers to a continuous event in the past.
- (d) No improvement
- (b) 'To' should be replaced by 'of' and 'insult' by 'insulting' to make the sentence grammatically correct.
- (b) 'Little about life's secrets' makes proper sense with the given sentence as it means 'negligible'. So, remove 'a'.
- (a) As the sentence is in the past tense, 'did they speak' would be used.
- (a) As the given sentence mentions plural ('more than one person'), the plural verb 'were' would be used in place of 'was'.
- (c) The sentence mentions an incident in present tense, so 'has' should be used in place of 'had'.
- (b) 'His desire for power' makes sense with the given sentence.
- (a) In the given sentence, subject pronoun 'she' should be used in place of object pronoun 'her' to make the sentence grammatically correct.

20. (c) The correct sequence should be 3rd person, 2nd person and 1st person. So, 'my wife, you and I would be used.
21. (c) 'Took off' is the right phrase that should be used with 'rocket'.
22. (b) 'Opinion about' makes the right sense in the given sentence.
23. (a) The phrase 'send word to someone' means to convey a message to someone. So, 'sent a word' in the given sentence would be changed to 'sent word'.
24. (b) 'Towards' is the right word to be used with 'heading'.
25. (a) 'Is not a great distance' should be used as 'fifty kilometres' in the given sentence is taken as a whole (i.e. singular).
26. (d) No improvement
27. (a) The sentence talks about a point in time ('It was indeed a shock for her'). So, we would use 'since' in place of 'later'.
28. (b) 'Woman doctors' should be used to convey the correct meaning of the sentence.
29. (a) The sentence refers to a continuous activity (waiting). So 'have been waiting' should be used.
30. (a) 'Protest' does not make sense in the sentence. It should be replaced by 'protest against'.
31. (a) 'A use' does not convey any meaning. It should be replaced by 'knowledge'.
32. (d) No improvement
33. (b) 'Burning' goes with 'ambition'. Hence, we would replace 'hot' by 'burning'.
34. (d) No improvement
35. (b) As one activity in the given sentence (being in hospital) follows another (accident), we would use 'following'.
36. (d) No improvement
37. (d) No improvement
38. (c) 'No sooner' is followed by 'than'. Hence, we would use 'did he return home than'.
39. (b) 'There is no more space' would convey the correct meaning of the sentence.
40. (a) 'Used' can be used in place of 'habituated' to improve the sentence.
41. (c) 'Knocked out' does not make sense with the given sentence. 'out' should be replaced by 'down'.
42. (c) 'Take a lift' should be used in place of 'go in a lift'.
43. (b) 'Broken wooden chair' conveys the right meaning.
44. (c) 'Had the room been brighter' makes the sentence grammatically correct.
45. (d) No improvement
46. (a) The sentence refers to an event in the past (won as a prize). So, we would use 'I had won as a prize'.
47. (a) 'Until they arrive' should be used to make the sentence grammatically correct.
48. (a) 'Are comfortable' should be used to make the sentence meaningful.
49. (c) 'Because' would not be used in the sentence as it states a reason. Hence, 'why he wrote the letter was that' would be used.
50. (b) 'Would help' should be used to convey the right meaning of the sentence.
51. (c) 'Lend me a few rupees' should be used as 'lend me few rupees' is equivalent to no money.
52. (c) 'Harp upon one string only' should be used to convey the correct meaning of the sentence.
53. (b) 'To' should be used in place of 'at'.
54. (d) No improvement
55. (b) 'Does not exist' makes the sentence meaningful.
56. (b) 'To look them up' means 'to find their meaning'. So, we would use option (b).
57. (b) 'To post' is the right usage. It should be used in place of 'of posting'.
58. (b) 'To bear with' should be used in place of 'to bear'.
59. (b) 'Unless I am invited' should be used.
60. (c) 'That he had bought yesterday' uses the correct tenses as per the given sentence.
61. (d) No improvement
62. (a) 'Over' would make right sense with 'blown'.
63. (a) 'Have had nothing' fits properly as per the sentence structure.
64. (c) 'Look up' means 'to find'. So, 'look up' should be used in place of 'look into'.
65. (d) No improvement
66. (c) 'Pose' should be used in place of 'hold'.
67. (b) 'Infected' makes sense with the given sentence.
68. (c) 'Take' goes with 'examination'. So, we would replace 'face' by 'take'.
69. (a) 'After' should be used in place of 'for' to make the sentence meaningful.
70. (d) No improvement
71. (a) 'To try to find' should be used to make the sentence meaningful.
72. (b) 'Have not seen' should be used instead of 'did not see'.
73. (d) No improvement
74. (c) 'Lest' is always followed by 'should'.
75. (c) 'Call for something' means 'to need something'.
76. (c) 'Occasion' is the right word that should be used in the given sentence.
77. (c) 'Accurate' is the right word. It should be used in place of 'correct'.
78. (c) 'Him to leave' makes sense with the given sentence.
79. (c) 'To my watching' makes correct sense.
80. (b) Refused should be replaced by 'denied' to make it correct.
81. (b) It should be 'doubtful' in place of 'redoubtable'.
82. (d) No improvement
83. (b) It should be 'alternative' in place of 'alternate'.
84. (a) It should be 'hear what' in place of 'listen what'.
85. (a) It should be 'wrong'. Right implies 'less'.

Questions from NDA/NA Exam (2012-2016)

1. (c) 'When I went' will be used in the sentence in place of 'when did I go'.
2. (b) 'Although' should be used in place of 'even'.
3. (a) 'To arbitrate between' makes the sentence grammatically correct.
4. (b) 'Of' will be used instead of 'among'.
5. (c) 'Resembles' will be used instead of 'is resembling'.
6. (d) No improvement
7. (a) 'Would be' is the correct usage as 'would' is used for polite requests.
8. (d) No improvement
9. (c) 'Has been living' will be used in place of 'is living'.
10. (a) 'Knows' is the most appropriate choice.
11. (d) No improvement
12. (a) 'Come with me' will be used in the sentence.
13. (c) If a meeting 'breaks up' it ends and people leave. So, (c) is the right option.
14. (b) 'Reach' should be used in place of 'have reached' to make the sentence grammatically correct.
15. (b) Use of 'was looking' is appropriate here according to correct tense structure.
16. (a) 'For' should be used in place of 'towards'.
17. (c) Use of 'had got' is suitable here because here Past Perfect tense is required.
18. (c) 'Turn off' means to switch the radio off. Here, there is a sense of low sound with radio still playing. Hence, 'turn down' is suitable because it means to lower the volume.
19. (a) 'Had worked' should be used in the given sentence.
20. (d) No improvement
21. (a) 'She wants' should be used to make the sentence grammatically correct.
22. (c) We would use Present Perfect tense here. So, use 'has finished' in place of finished.
23. (b) 'By and large' should be used in place of 'by far' as 'by far' does not convey the right meaning.
24. (c) Use 'The more they earn, the more they spend' which is grammatically correct.
25. (b) 'Are well-formulated' should be used in place of 'have well-formulated'.
26. (a) The sentence is about past, so verb should also be in Past tense. Hence, 'was sitting' is correct.
27. (b) 'Hardly no effort' is wrong. It should be replaced with 'hardly any effort'.
28. (b) 'To take someone at his/her word' means 'to accept what someone says on trust'.
29. (a) 'Hell bent on getting' is correct, so it should replace 'hell bent at getting' in the sentence.
30. (d) No improvement.
31. (c) Remove 'that' before 'all Indian children' to make it correct.
32. (b) 'For these reasons' is better expression, so it should replace 'Due to these reasons' in the sentence.
33. (b) Use of preposition 'at' is wrong, option (b) i.e. 'in crushing' is correct expression.
34. (d) The sentence cannot be improved further.
35. (a) 'Have to' should be used in place of 'are to'.
36. (a) If I 'had known' (past imaginative case) is the correct expression.
37. (b) Use of 'penetrate' is wrong, which means 'to go inside'. It should be 'perpetrate' which means 'to commit a crime or a violent or harmful act'.
38. (d) No improvement
39. (c) Use 'Until you finish'. We do not use 'don't' when 'until' and 'unless' are used in the sentence.
40. (c) The correct verb to be used here is 'strike off'. 'Strike off' means to erase from a list. Its past tense is 'struck off'.
41. (a) We need a sentence connector. So, 'of which' is used here as a proper connector.
42. (b) 'Only when ...' is an adverbial phrase here and for this, we have to use inversion form of the verb. So, 'did I sleep' is correct.
43. (a) Use 'buy' here as the conditional clause needs to be in Simple Present tense.
44. (c) 'Saved' should be replaced with 'have saved' to show the consequence of the action.
45. (b) 'Arrange for the car' is suitable replacement for this sentence. 'Arrange for' is an idiomatic expression which means 'to make plans for someone to do something'.
46. (d) No improvement
47. (c) Use 'by a sweeping majority' which is grammatically correct.
48. (c) From the given options, the idiom 'carried away' is appropriate. 'carried away' means 'to become overly excited or involved in something'.
49. (a) The sentence is in the past tense. The past tense of the verb 'rise' is 'rose'. Therefore, option (a) is correct.
50. (c) The word 'ever' is an appropriate substitution of 'never'.
51. (d) No improvement
52. (c) The sentence is in past tense. Therefore, option (c) is correct.
53. (a) The preposition 'of' is used with the word 'notice' to form a meaningful expression.
54. (b) 'Tall claims' is the correct expression. It means 'over statement'.
55. (c) The phrase 'stand up for' means to defend or support someone or something. So, option (c) would be used.
56. (b) 'Telling stories' should be used in place of 'to tell stories'.
57. (b) The sentence is in future perfect continuous tense. Therefore, option (b) should be used.

06

SENTENCE COMPLETION

Generally, 10 to 15 questions based on sentence completion are asked in NDA/NA exam. The question can be based on a sentence or on a paragraph format. The candidate has to choose the correct option to fill the blank from the given options.

Sentence Completion comprises of filling up of the gaps given in a particular sentence individually or in a passage. The sentence has a blank and is followed by four options. The candidate has to pick the correct option to fill the blank. A candidate should read the given sentence first and try to deduce the meaning of the statement. After that, the inferred meaning should be matched with the given options. The close inferential word is to be selected as the choice.

Types of Questions

Generally, two types of questions are asked in the exam

Type 1 Single Sentence Completion

Here only a single sentence is given with a blank. Candidate has to select the most appropriate word out of the given choices. For Example

The crows appear to behave, actively helping one another to find food.

(a) mysteriously (b) warily (c) aggressively (d) cooperatively

Ans. (d) Cooperatively as it stands for the quality of helping actively helping one another to find food.

Type 2 Sentence Completion in Passage

A small passage is given with many blanks. Each blank is to be filled with appropriate word. For each blank, three or four choice words are given out of which correct word is to be chosen keeping in mind the context of the passage. e.g.

In recent years I've come across a number of instances in which students have developed devices and apps to help seniors and the disabled. But I was **1.** (a) genuine impressed by a creation of a **12** **2.** (a) years old.

(b) genuinely

(b) ear

(c) gainly

(c) year

Ans. 1. (b), 2. (c)

SENTENCE COMPLETION EXERCISE

SET 1 SINGLE SENTENCE COMPLETION

Directions (Q.Nos. 1-83) *Pick out the most effective word from the given words to fill in the blank to make the sentence **meaningfully** complete.*

JUMBLLED SENTENCES AND PARAGRAPHS

Generally, 10 to 15 questions based on jumbled sentences and paragraphs are asked in NDA/NA exam. In these questions, the candidate has to rearrange the jumbled words or phrases to make a meaningful sentence or paragraph.

Ordering of words/sentences is a necessary and indispensable part of the NDA examination. The candidates are required to place these words or sentences in a proper sequence. This test may have several words, phrases or sentences in a jumbled up manner.

In some questions, first and the last sentences of the paragraph are given and the rest are jumbled. The candidate is needed to place the middle sentences in a proper sequence. However, in simple questions, you have to rearrange the words and phrases so that a relevant and meaningful sentence is obtained. The sentences should form a coherent order in a logical sequence.

Arranging the Sentence in Correct Order

The correct sequence is formed when all the sentences are organically linked. A sort of cause-effect relationship is also implicit in such exercises because a sentence will follow another only when the former leads to the latter. Thus, taking into consideration this aspect, sentences can be easily sequenced.

Sound knowledge of language, helping verbs and conjunctions enables a candidate to solve these questions easily.

Tips for Attempting Questions

- Frame the sentences logically to get a meaningful order.
- Rearrangement of sentences should be grammatically correct.
- Use simple and linear approach to frame the sentence to obtain a logical meaning.

Types of Questions

Usually two types of questions are asked in the exam

TYPE 1

Reordering of words to form a meaningful sentence

In this type, the initial part of the sentence is given as a hint. The rest of the sentence is divided into a number of phrases (labelled as P, Q, R, S) and given in a jumbled form.

The candidate has to rearrange the jumbled parts of the sentence to form a meaningful sentence. The initial part of the sentence serves as a hint for arranging the given phrases into a sentence.

Some examples are given below of this type

Directions (Q. Nos. 1 and 2) *In the questions given below, there is a sentence of which some parts have been jumbled up. Rearrange these parts which are labelled as P, Q, R and S to produce a correct sentence. Choose the **proper sequence** among the alternatives.*

- 1.** P : himself
Q : a child
R : can usually feed
S : by the age of six months

The correct sequence should be

- (a) QPRS (b) SRQP
(c) PQRS (d) QRPS

Explanation *The correct sequence is QRPS [option (d)] i.e. A child can usually feed himself by the age of six months.*

- 2.** The boy
P : in the competition
Q : who was wearing spectacles
R : won many prizes
S : held in our college

The correct sequence should be

- (a) PQRS (b) RPSQ
(c) QRPS (d) QPSR

Explanation *The correct sequence is QRPS [option (c)] i.e. The boy who was wearing spectacles won many prizes in the competition held in our college.*

TYPE 2

Reordering of sentences to form a meaningful paragraph

In this type, the initial and final part of the paragraph is given and labelled as S1 and S6. The rest of the paragraph is broken into 4 parts (labelled as P, Q, R and S) and given in a jumbled form.

The candidate needs to arrange the jumbled parts (P, Q, R and S) in a way that the resultant paragraph is coherent and meaningful.

Some examples are given below of this type

Directions (Q. Nos. 3 and 4) *In the questions given below, each passage consists of six sentences. The first and the sixth sentences are given in the beginning. The middle four sentences in each have been removed and jumbled up. These are labelled as P, Q, R and S. Find out the **proper order** of the four sentences.*

3. S1 : She said on the phone that she would report for duty next day.

S6 : Eventually we reported to the police.

P : We waited for few days then we decided to go to her place.

Q : But she did not.

R : We found it locked.

S : Even after that we waited for her for quite a few days.

The proper sequence should be

- (a) PRSQ (b) QPSR (c) QPRS (d) SQPR

Explanation *The correct sequence is QPRS [option (c)] i.e.*

She said on the phone that she would report for duty next day. But she did not. We waited for few days then we decided to go to her place. We found it locked. Even after that we waited for her for quite a few days, eventually we reported to the police.

4. S1 : Throughout history, man has used energy from the Sun.

S6 : This energy comes from inside atoms.

P : Today, when we burn wood or use electric current, we are drawing energy.

Q : However, we now have a new supply of energy.

R : All our ordinary life depends on Sun.

S : This has come from the Sun.

The proper sequence should be

- (a) SQPR (b) RQPS (c) QSRP (d) PSRQ

Explanation *The correct sequence is PSRQ [option (d)] i.e.*

Throughout history, man has used energy from the Sun. Today, when we burn wood or use electric current, we are drawing energy. This has come from the Sun. All our ordinary life depends on Sun. However, we now have a new supply of energy, this energy come from inside atoms.

REARRANGEMENT EXERCISE

SET 1 REARRANGE THE JUMBLED SENTENCES

Directions (Q. Nos. 1-51) *In the given questions, there is a sentence of which some parts have been jumbled up. Rearrange these parts which are labelled as P, Q, R and S to produce the **correct** sentence. Choose the among the alternatives.*

1. Little

P : that he had been let down
Q : stood by all these years
R : did he realise
S : by a colleague whom he had

The proper sequence should be

- (a) RPSQ (b) RSQP
(c) QSRP (d) QSPR

2. There was

P : needed for its everyday life
Q : a time when each family
R : for itself most of the things
it
S : actually produced

The proper sequence should be

- (a) QRSP (b) RQPS
(c) RSPQ (d) QSRP

3. Then

P : it struck me
Q : of course
R : suitable it was
S : how eminently

The proper sequence should be

- (a) SPQR (b) QSRP
(c) PSRQ (d) QPSR

4. The grocer

P : did not listen to the
protests of customer
Q : who was in the habit of
weighing less
R : whom he had cheated
S : with great audacity

The proper sequence should be

- (a) PRSQ (b) QSPR
(c) QPRS (d) PQSR

5. Though he dialled frequently

P : on telephone
Q : my brother could not
contact me
R : and had left no information
S : as I had gone out of office

The proper sequence should be

- (a) QPRS (b) SQRP
(c) QPSR (d) SPQR

6. Education is

P : of the proper sense of
responsibilities
Q : the first need
R : in a citizen
S : for the development

The proper sequence should be

- (a) SQPR (b) QSRP
(c) QSPR (d) PQRS

7. It was

P : in keeping with my mood
Q : a soft summer evening
R : as I walked sedately
S : in the direction of new
house

The proper sequence should be

- (a) SRPQ (b) QRPS
(c) QPRS (d) SQPR

8. With her body

P : dragging her unwilling feet
Q : weak and infirm
R : doubled with age
S : she persisted in her mission

The proper sequence should be

- (a) PQRS (b) QPRS
(c) RQPS (d) SRPQ

9. When he

P : did not know
Q : he was nervous and
R : heard the hue and cry at
midnight
S : what to do

The proper sequence should be

- (a) RQPS (b) QSPR
(c) SQPR (d) PQRS

10. A French woman

P : committed suicide
Q : where she had put up
R : who had come to Kolkata
S : by jumping from the balcony
of the hotel

The proper sequence should be

- (a) PRQS (b) QSRP
(c) RPSQ (d) SRQP

11. I saw that

P : but seeing my host in this
mood
Q : I deemed it proper to take
leave
R : as I had frequently done
before
S : it had been my intention to
pass the night there

The proper sequence should be

- (a) QPSR (b) QRPS
(c) SPQR (d) SRPQ

12. It was to be

P : before their school
examination
Q : which was due to start
R : the last expedition
S : in a month

The proper sequence should be

- (a) SRQP (b) RQSP
(c) RPQS (d) SPRQ

13. They felt safer

P : to watch the mountain
Q : of more than five miles
R : as they settled down
S : from a distance

The proper sequence should be

- (a) RPSQ (b) RSQP
(c) PQSR (d) PRSQ

14. If you need help

P : promptly and politely
Q : ask for attendants
R : to help our customers
S : who have instructions

The proper sequence should be

- (a) SQPR (b) QPSR
(c) QSRP (d) SQRP

15. He was so kind and generous
that

P : he not only
Q : made others do so
R : but also
S : helped them himself

The proper sequence should be

- (a) PSRQ (b) SPQR
(c) PRSQ (d) QPRS

16. Work is the one thing
 P : and without it
 Q : that is necessary
 R : to keep the world going
 S : we should all die

The proper sequence should be
 (a) QPSR (b) RPQS
 (c) SRPQ (d) QRPS

17. I read an advertisement that said
 P : posh, air-conditioned
 Q : gentleman of taste
 R : are available for
 S : fully furnished rooms

The proper sequence should be
 (a) PQRS (b) PSRQ
 (c) PSQR (d) SRPQ

18. It has been established that
 P : Einstein was
 Q : although a great scientist
 R : weak in arithmetic
 S : right from his school days

The proper sequence should be
 (a) SRPQ (b) QPRS
 (c) QPSR (d) RQPS

19. I was
 P : and stay for few days in Delhi
 Q : when my father told me
 R : very excited
 S : that I could go with him

The proper sequence should be
 (a) PQRS (b) RQSP
 (c) QRSP (d) SPQR

20. All such students
 P : get success
 Q : who are honest and hard-working
 R : and recognition
 S : in every walk of life

The proper sequence should be
 (a) SPRQ (b) PRQS
 (c) QPRS (d) PSRQ

21. P : they marched
 Q : for a while under a tree
 R : after they had rested
 S : on to their journey

The correct sequence should be
 (a) SRQP (b) PSRQ
 (c) QRPS (d) RQPS

22. P : as the President entered the hall
 Q : from his seat
 R : to greet him
 S : everyone got up

The correct sequence should be
 (a) RQPS (b) QPRS
 (c) PSQR (d) SQRP

23. P : he took shelter
 Q : near the lake
 R : when there was a heavy downpour
 S : under the large mango tree

The correct sequence should be
 (a) PRQS (b) PSRQ
 (c) RSPQ (d) RPSQ

24. Our educationalists are
 P : to teach children
 Q : too often anxious
 R : without any utility
 S : so many languages

The correct sequence should be
 (a) PQRS (b) QRSP
 (c) SRQP (d) QPSR

25. P : the rain did not prevent
 Q : from being played
 R : to finish
 S : the match

The correct sequence should be
 (a) PQRS (b) PSQR
 (c) PSRQ (d) SQPR

26. It has been like
 P : inheriting some money
 Q : and afterwards
 R : marrying for love
 S : through the wife

The correct sequence should be
 (a) RQPS (b) PSQR
 (c) SPQR (d) PQSR

27. His mother
 P : when he was hungry
 Q : last evening
 R : could not feed
 S : the baby

The correct sequence should be
 (a) RSPQ (b) PQRS
 (c) SPQR (d) QPRS

28. P : whenever he heard the question, the old man
 Q : answered

R : who lived in that house
 S : that the Earth is flat

The correct sequence should be
 (a) PQRS (b) PQSR
 (c) PRQS (d) SPQR

29. In the Middle Ages,
 P : there was little progress
 Q : either intellectual or social
 R : with the result that
 S : teaching became the exclusive prerogative of the church

The correct sequence should be
 (a) PQRS (b) SRPQ
 (c) PRSQ (d) QPRS

30. A scientist has shown that,
 P : when anyone holds
 Q : a burning cigarette
 R : near their leaves
 S : plants react with fear

The correct sequence should be
 (a) PQRS (b) QRSP
 (c) SPQR (d) PQSR

31. P : because the driver lost control
 Q : and hit a lamp post
 R : the bus fell into a ditch
 S : at a turning

The correct sequence should be
 (a) RQPS (b) RPSQ
 (c) PQSR (d) SPRQ

32. P : we want every country
 Q : or a foreign policy
 R : to have a population policy
 S : as it has an economic policy

The correct sequence should be
 (a) PQRS (b) QRSP
 (c) PRSQ (d) RQPS

33. The teacher
 P : and the pupils continued likewise with their repetition
 Q : read the sentence again
 R : the pupils knew the sentence by heart
 S : until the teacher thought

The correct sequence should be
 (a) PQSR
 (b) PSRQ
 (c) QPSR
 (d) QSRP

- 34.** For dropping kilos
 P : it is safe to cut your fat intake
 Q : and maintaining weight loss
 R : to 20% of your calories
 S : even further
The correct sequence should be
 (a) PRQS (b) QSPR
 (c) SPRQ (d) QPRS
- 35.** His uncle
 P : after he joined
 Q : did not send
 R : the college
 S : money for his expenses
The correct sequence should be
 (a) QRSP (b) RSQP
 (c) QSPR (d) SRPQ
- 36.** Language is
 P : to the other person
 Q : communicating
 R : only a means of
 S : one's thoughts and emotions
The correct sequence should be
 (a) PQSR (b) RQSP
 (c) QRSP (d) SPQR
- 37.** Whenever I see the model
 P : who started it
 Q : is the face of the man
 R : of our factory
 S : what comes to my mind
The correct sequence should be
 (a) SRQP (b) RSQP
 (c) QPRS (d) PQRS
- 38.** P : I bought from your shop
 Q : a week ago
 R : to send the books
 S : you have not cared
The correct sequence should be
 (a) QPSR (b) QPRS
 (c) SRPQ (d) PQSR
- 39.** P : at the door that he would have the door broken open
 Q : the guard shouted
 R : if the persons inside did not heed his call
 S : at the top of his voice
The correct sequence should be
 (a) SPRQ
 (b) QSPR
 (c) PRSQ
 (d) PQRS

- 40.** P : by bandits
 Q : were driving through a desert area
 R : a man and his daughter
 S : when they were held up
The correct sequence should be
 (a) SPRQ (b) RQSP
 (c) SRPQ (d) PQRS
- 41.** Our finest contemporary achievement
 P : and toil
 Q : in the provision of higher education
 R : is our unprecedented expenditure of wealth
 S : for all
The correct sequence should be
 (a) PQRS (b) RQPS
 (c) RPQS (d) PRQS
- 42.** It seemed to him like
 P : seeing one's reflection
 Q : an endless quest
 R : two mirrors
 S : while standing between
The correct sequence should be
 (a) PRSQ (b) SPQR
 (c) RSPQ (d) QPSR
- 43.** P : a series of shocks is known as earthquake
 Q : which can be recognised through seismic waves
 R : that result from sudden Earth movements or tremors
 S : causing widespread destruction of life and property
The correct sequence should be
 (a) PQRS (b) RPQS
 (c) RSPQ (d) RQSP
- 44.** P : in this world
 Q : a man has
 R : it is possible that the best friend
 S : may turn against him
The correct sequence should be
 (a) QPRS (b) PQRS
 (c) RQPS (d) QRSP
- 45.** We are doing
 P : to the people
 Q : to give relief
 R : all we can
 S : but more funds are needed

- The correct sequence should be*
 (a) PQRS (b) RQPS
 (c) QPRS (d) SPQR
- 46.** The man
 P : when he was
 Q : in the office last evening
 R : could not finish
 S : all his work
The correct sequence should be
 (a) PQRS (b) QRSP
 (c) RQPS (d) RSPQ
- 47.** The people decided
 P : they were going
 Q : how much
 R : to spend
 S : on the construction of the school building
The correct sequence should be
 (a) QPRS (b) PQRS
 (c) PRQS (d) SQPR
- 48.** P : the man said that those workers
 Q : would be given a raise
 R : who did not go on
 S : strike last month
The correct sequence should be
 (a) PQRS (b) PRSQ
 (c) QPRS (d) RSPQ
- 49.** P : I think the members
 Q : are basically in agreement
 R : of the group
 S : on the following points
The correct sequence should be
 (a) RQPS (b) SQRP
 (c) PRQS (d) PQSR
- 50.** While it was true that
 P : I had
 Q : to invest in industry
 R : some lands and houses
 S : I did not have ready cash
The correct sequence should be
 (a) PQRS (b) PRSQ
 (c) SQPR (d) QPRS
- 51.** P : but for your help
 Q : to finish this work
 R : it would not have been possible
 S : in time
The correct sequence should be
 (a) PRQS (b) SPQR
 (c) RPQS (d) PQRS

SET 2 REARRANGE THE JUMBLED PARAGRAPHS

Directions (Q. Nos. 52-90) *In the questions given below, each passage consists of six sentences. The first and the sixth sentences are given in the beginning. The middle four sentences in each have been removed and jumbled up. These are labelled as P, Q, R and S. Find out the proper order of the four sentences.*

52. S1 : Since the sixties, there has been an increasing interest in neurophysiology which deals with the neural bases of mental activity and behaviour.

S6 : So far, the journal has published the mixture of articles including reports and investigations.

P : It has format which is very similar to that of brain and language, a sister journal.

Q : Since then, a number of journals devoted entirely to this area of research have appeared.

R : Before the 1960's, when this was the concern of a small number of investigators, research articles were scattered in various neurological journals.

S : Brain and cognition is one such journal.

The proper sequence should be

- (a) RQSP (b) QRSP
(c) QSPR (d) RSPQ

53. S1: She said on the phone that she would report for duty next day.

S6 : Eventually, we reported to the police.

P : We waited for few days then we decided to go to her place.

Q : But she did not.

R : We found it locked.

S : Even after that we waited for her for quite a few days.

The proper sequence should be

- (a) PRSQ (b) QPSR
(c) QPRS (d) SQPR

54. S1 : A force exists between everybody in the universe.

S6 : The greater the mass, the greater is the Earth's force of attraction on it. We can call this force of attraction as gravity.

P : Normally, it is very small but when the one of the bodies is a planet like Earth, the force is considerable.

Q : It has been investigated by many scientists including Galileo and Newton.

R : Everything on or near the surface of the Earth is attracted by the mass of Earth.

S : This gravitational force depends on the mass of the bodies involved.

The proper sequence should be

- (a) PRQS (b) PRSQ
(c) QSRP (d) QSPR

55. S1: Metals are today being replaced by polymers in many applications.

S6 : Many Indian institutes of science and technology run special programmes on polymer science.

P : Above all, they are cheaper and easier to process making them a viable alternative to metals.

Q : Polymers are essentially a long chains of hydrocarbon molecules.

R : Today, polymers as strong as metals have been developed.

S : These have replaced the traditional chromium-plated metallic bumpers in cars.

The proper sequence should be

- (a) QRSP (b) RSQP
(c) RQSP (d) QRPS

56. S1 : Biological evolution has not fitted man to any specific environment.

S6 : That brilliant sequence of cultural peaks can most appropriately be termed the ascent of man.

P : It is by no means a biological evolution, but it is a cultural one.

Q : His imagination, his reason, his emotional subtlety and toughness, make it possible for him not to accept the environment but to change.

R : And that series of inventions by which man from age by age has re-shaped his environment is a different kind of evolution.

S : Among the multitude of animals which scamper, burrow, swim around us he is the only one who is not locked into his environment.

The proper sequence should be

- (a) QPRS (b) SRQP
(c) QRSP (d) SQRP

57. S1 : Growing up means not only getting larger, but also using our sense and our brain is to become more aware of things around us.

S6 : In other words, we must develop and use our ability to reason because the destruction or the preservation of the places in which we live depends on us.

P : Not only does he have a memory but he is able to think and reason.

Q : In this, man differs from all other animals.

R : Before we spray our roadside plants or turn sewage into our rivers, we should pause to think what the results of our action are likely to do.

S : This is to say, he is able to plan what he is going to do in the light of his experience before he does it.

The proper sequence should be

- (a) QRSP (b) SPQR
(c) SPRQ (d) QPSR

- 58.** S1 : All the land was covered by the ocean.
 S6 : The God moulded the first people out of clay according to his own image and mind.
 P : The leading God fought the monster, killed it and chopped its body into two halves.
 Q : A terrible monster prevented the Gods from separating the land from the water.
 R : The God made the sky out of the upper part of the body and ornamented it with stars.
 S : The God created the Earth from the lower part, grew plants on it and populated it with animals.

The proper sequence should be

- (a) PQRS (b) PQSR
 (c) QPSR (d) QPRS

- 59.** S1 : Payment for imports and exports is made through a system called foreign exchange.
 S6 : Another time, it may be worth eight pesos.
 P : The value of the money of one country in relation to the money of other countries is agreed upon.
 Q : These rates of exchange vary from time to time.
 R : For instance, an American dollar or a British pound sterling is worth certain amounts in the money of other countries.
 S : Sometimes, a United States dollar is worth 12 pesos in Mexico.

The proper sequence should be

- (a) PQRS (b) QPRS
 (c) PRQS (d) RPQS

- 60.** S1 : Jawaharlal Nehru was the greatest plan-enthusiast.
 S6 : Nehru himself became the Chairman of the commission.
 P : Under Nehru's advice, the pre-independent Congress set-up National Planning Commission in 1938.

Q : But he forgot that what could be achieved by force under the communist dictatorship of Russia was not possible under the democratic set-up of India.

R : He took the idea from Russia where Five Year Plans transformed a very backward country into a top power of the world.

S : No free government can call for compulsory sacrifice and suffering from the whole people.

The proper sequence should be

- (a) PSQR (b) SRQP
 (c) QPRS (d) RQSP

- 61.** S1 : What are the causes of our chronic food shortage?
 S6 : This unprecedented growth can drag us to the doors of starvation very soon.
 P : To feed for these growing new millions is desperate task.
 Q : Every year, we add more than a crore of persons to our population.
 R : Despite stupendous efforts by our government, the population is growing unabated.
 S : The chief cause is the population explosion.

The proper sequence should be

- (a) QRSP (b) SQPR
 (c) QPRS (d) PSQR

- 62.** S1 : There is difference between Gandhiji's concept of secularism and that of Nehru's.
 S6 : Instead of doing any good, such secularism can do harm instead of good.
 P : Nehru's idea of secularism was equal indifference to all religions and bothering about none of them.
 Q : According to Gandhiji, all religions are equally true and each scripture is worthy of respect.
 R : Such secularism which means the rejection of all religions is contrary to our culture and tradition.

S : In Gandhiji's view, secularism stands for equal respect for all religions.

The proper sequence should be

- (a) SQPR (b) PSQR
 (c) QSPR (d) PRSQ

- 63.** S1 : A ceiling on urban property.
 S6 : Since their value would exceed the ceiling fixed by the government.
 P : no mill-owner could own factories or mills or plants
 Q : and mass circulation papers
 R : would mean that
 S : no press magnate could own printing presses

The proper sequence should be

- (a) QSRP (b) RPSQ
 (c) SRPQ (d) QPSR

- 64.** S1 : This weather-vane often tops a church spire, tower or high building.
 S6 : The weather-vane can, however give us some indication of other.
 P : They are only wind-vanes.
 Q : Neither alone can tell us what the weather will be.
 R : They are designed to point to direction from which the wind is coming.
 S : Just as the barometer only tells us the pressure of air, the weather-vane tells us the direction of wind.

The proper sequence should be

- (a) PQRS (b) PSRQ
 (c) PRSQ (d) SPQR

- 65.** S1 : Most of the universities in the country are now facing financial crisis.
 S6 : The government should realise this before it is too late.
 P : Cost benefit yardstick thus should not be applied in the case of universities.
 Q : The current state of affairs cannot be allowed to continue for long.
 R : Universities cannot be equated with commercial enterprises.

S : Proper development of universities and colleges must be ensured.

The proper sequence should be

- (a) QRPS (b) QSPR
(c) QRSP (d) QPRS

66. S1 : I keep on flapping my big ears all day.

S6 : Am I not a smart, intelligent elephant?

P : They also fear that I will flip them all away.

Q : But children wonder why I flap them so.

R : I flap them so to make sure they are safely there on either side of my head.

S : But I know what I am doing.

The proper sequence should be

- (a) SRQP (b) QPSR
(c) QPRS (d) PSRQ

67. S1 : A father having offered to take the baby out in a perambulator, was tempted by the sunny morning to slip into a pub for a glass of beer.

S6 : She waited for him, anticipating the white face and quivering lips which would soon appear with the news that the baby had been stolen.

P : Indignant at her husband's behaviour, she decided to teach him a lesson.

Q : She wheeled away the pram.

R : A little later, his wife came by, where to her horror, she discovered her sleeping baby.

S : Leaving the pram outside, he disappeared inside the bar.

The proper sequence should be

- (a) SRPQ (b) RQPS
(c) SPQR (d) PQSR

68. S1 : A gentleman who lived alone always had two plates placed on the table at dinner time.

S6 : In this way, the cat showed her gratitude to her master.

P : One day just as he sat down to dine, the cat rushed into the room.

Q : One plate was for himself and other was for his cat.

R : She dropped a mouse into her own plate and another into her master's plate.

S : He used to give the cat a piece of meat from his own plate.

The proper sequence should be

- (a) QSPR (b) PSRQ
(c) QRSP (d) RPQS

69. S1 : The study of speech disorders due to brain injury suggests that patients can think without having adequate control over their language.

S6 : How they manage to do this we do not know.

P : But they succeed in playing games of chess.

Q : Some patients, for example fail to find the names of objects presented to them.

R : They can even use the concepts needed for chess playing, though they are unable to express many of the concepts in ordinary language.

S : They even find it difficult to interpret long written notices.

The proper sequence should be

- (a) PSQR (b) RPSQ
(c) QSPR (d) SRPQ

70. S1 : And then Gandhi came.

S6 : Political freedom took new shape and then acquired a new content.

P : Get off the backs of these peasants and workers, he told us, all you who live by their exploitation.

Q : He was like a powerful current of fresh air, like a beam of light, like a whirlwind that upset many things.

R : He spoke their language and constantly drew their attention to their appalling conditions.

S : He didn't descent from the top, he seemed to emerge from the masses of India.

The proper sequence should be

- (a) QSRP (b) SRQP
(c) RSQP (d) PRSQ

71. S1 : Ants eat worms, centipedes and spiders.

S6 : Some jump, and some give out a pungent repellent substance.

P : They are usually much quicker than the ant itself.

Q : Nevertheless, these animals do not make easy game for ants.

R : Besides, they have an extraordinary number of ways of escaping.

S : They also eat larvae and insect adults such as flies, moths and spring tails.

The proper sequence should be

- (a) SQPR (b) SPRQ
(c) SRPQ (d) SRQP

72. S1 : The future beckons to us.

S6 : There is no resting for anyone of us till we redeem our pledge in full.

P : Infact we have hard work ahead.

Q : Where do we go and what shall be our endeavour?

R : We shall also have to fight and end poverty, ignorance and disease.

S : It will be to bring freedom and opportunity to the common man.

The proper sequence should be

- (a) PSRQ (b) QPSR
(c) QSRP (d) SRPQ

73. S1 : Once upon a time an ant lived on the bank of a river.

S6 : She was touched.

P : The dove saw the ant struggling in water in a helpless condition.

Q : All its efforts to come up are failed.

R : One day, it suddenly slipped into water.

S : A dove lived in the tree on the bank not far from the spot.

The proper sequence should be

- (a) RQSP (b) QRPS
(c) SRPQ (d) PQRS

- 74.** S1 : It is regrettable that there is widespread corruption in the country at all levels.
S6 : This is indeed a tragedy of great magnitude.
P : So there is hardly anything that the government can do about it now.
Q : And there are graft and other malpractices too.
R : The impression that corruption is universal phenomenon persists and the people not cooperate in checking this evil.
S : Recently, several offenders were brought to book, but they were not given deterrent punishment.

The proper sequence should be

- (a) QSRP (b) SQRP
(c) RSQP (d) PQSR

- 75.** S1 : Smoke oozed up between the planks.
S6 : Most people bore the shock bravely.
P : Passengers were told to be ready to quit the ship.
Q : The rising gale fanned the smouldering fire.
R : Everyone now knew there was fire on board.
S : Flames broke out here and there.

The proper sequence should be

- (a) SRQP (b) QSPR
(c) RSPQ (d) QSRP

- 76.** S1 : It was a dark moonless night.
S6 : They all seemed to him to be poor and ordinary mere childish words.
P : He turned over the pages, reading passages here and there.
Q : He heard them on the floor.
R : The poet took down his books of poems from his shelves.
S : Some of them contained his earliest writings which he had almost forgotten.

The proper sequence should be

- (a) RPQS (b) RQSP
(c) RSPQ (d) RPSQ

- 77.** S1 : A noise started above their heads.
S6 : Nearly 200 lives were lost on the fateful day.
P : But people did not take it seriously.
Q : That was to show everyone that there was something wrong.
R : It was a dangerous thing to do.
S : For, within minutes the ship began to sink.

The proper sequence should be

- (a) PQSR (b) PRQS
(c) QPRS (d) QPSR

- 78.** S1 : The cooperative system of doing business is a good way of encouraging ordinary workers to work hard.
S6 : The main object is to maintain the interest of every member of the society and to ensure that the members participate actively in the projects of society.
P : If the society is to be well run, it is necessary to prevent insincere officials being elected to the committee which is responsible for the running of business.
Q : They get this from experienced and professional workers who are not only familiar with the cooperative system, but also with efficient method of doing business.
R : To a large extent, many cooperative societies need advice and guidance.
S : The capital necessary to start a business venture is obtained by the workers contributions.

The proper sequence should be

- (a) SQPR
(b) PQSR
(c) SRQP
(d) PSRQ

- 79.** S1 : American private lies may seem shallow.
S6 : This would not happen in China, he said.
P : Students would walk away with books they had not paid for.
Q : A Chinese journalist commented on a curious institution the library.
R : Their public morality, however, impressed visitors.
S : But in general, they returned them.

The proper sequence should be

- (a) PSQR (b) QPSR
(c) RQPS (d) RPSQ

- 80.** S1 : For sometime in his youth, Abraham Lincoln was manager for a shop.
S6 : Never before Lincoln had so much time for reading as had then.
P : Then a chance customer would come.
Q : Young Lincoln's way to keeping shop was entirely unlike anyone else's.
R : Lincoln would jump up and attend to his needs and then revert to his reading.
S : He used to lay full length on the counter of the shop eagerly reading a book.

The proper sequence should be

- (a) SRQP (b) QSPR
(c) SQRP (d) QPSR

- 81.** S1 : Manisha went shopping one morning.
S6 : She drove home with an empty basket.
P : Disappointed she turned around and returned to the parking lot.
Q : She got out and walked to the nearest shop.
R : She drove her car into the parking lot and stopped.
S : It was there that she realised that she'd forgotten her purse at home.

The proper sequence should be

- (a) RSQP (b) RQSP
(c) PQRS (d) QPRS

- 82.** S1 : Several sub-cities have been planned around capital.
 S6 : Hopefully, the housing problem will not be as acute at present after these sub-cities are built.
 P : Dwarka is the first among them.
 Q : They are expected to alleviate the problem of housing.
 R : It is coming up in the South-West of capital.
 S : It will cater to over one million people when completed.

The proper sequence should be
 (a) QPRS (b) PRSQ
 (c) PQRS (d) QRSP

- 83.** S1 : Your letter was big relief.
 S6 : But don't forget to bring chocolate for Garima.
 P : How did your exams go?
 Q : After your result, you must come here for a week.
 R : You hadn't written for over a month.
 S : I am sure you will come out with flying colours.

The proper sequence should be
 (a) PSRQ (b) QRPS
 (c) RPSQ (d) PSQP

- 84.** S1 : While crossing a busy road, we should obey the policeman on duty.
 S6 : We should never run while crossing the road.
 P : We should always cross the road at the zebra crossing.
 Q : We must look to the signal lights and cross the road only when the road is clear.
 R : If there are no signal lights at the crossing, we should look to the right, then to left and again the right before crossing the road.
 S : If the road is not clear we should wait.

The proper sequence should be
 (a) PSRQ (b) PQRS
 (c) RQSP (d) QRPS

- 85.** S1 : As a dramatist, Rabindranath was not what might be called a success.
 S6 : Therefore, drama forms the essential part of the traditional Indian culture.
 P : His dramas were moulded on the lines of the traditional Indian village dramas than the dramas of modern world.
 Q : His plays were more a catalogue of ideas than a vehicle of the expression of action.
 R : Actually, the drama has always been the life of Indian people, as it deals with legends of Gods and Goddesses.
 S : Although in his short stories and novels, he was able to create living and well-defined characters, he did not seem to be able to do so in dramas.

The proper sequence should be
 (a) SRQP (b) QPSR
 (c) QSPR (d) RSQP

- 86.** S1 : The Hound of Baskervilles was feared by the people of the area.
 S6 : The Hound of Baskervilles remains an unsolved mystery.
 P : Some people spoke of seeing a huge, shadowy form of a hound at midnight on the moor.
 Q : But they spoke of it in tones of horror.
 R : Nobody had actually seen the hound.
 S : This shadowy form did not reveal any details about the animal.

The proper sequence should be
 (a) SPQR (b) SPRQ
 (c) PSRQ (d) PQRS

- 87.** S1 : The art of growing old is one which the passage of time has forced upon my attention.
 S6 : This is not always easy one's own past is gradually increasing weight.

- P : One of these is undue absorption in the past.
 Q : One's thought must be directed to the future and to things about which there is something to be done.
 R : Psychologically, there are two dangers to be guarded against in old age.
 S : It does not do good to live in memories, in regrets for the good old days or in sadness about friend who are dead.

The proper sequence should be
 (a) QSRP (b) RPQS
 (c) RPSQ (d) QPRS

- 88.** S1 : We speak today of self-determination in politics.
 S6 : Cultural subjection is ordinarily of an unconscious character and it implies slavery from the very start.
 P : So long as one is conscious of a restraint, it is possible to resist it or to near it as a necessary evil and to keep free in spirit.
 Q : Slavery begins when one ceases to feel that restraint and it depends on if the evil is accepted as good.
 R : There is, however, a subtler domination exercised in the sphere of ideas by one culture to another.
 S : Political subjection primarily means restraint on the outer life of people.

The proper sequence should be
 (a) SPRQ (b) RSQP
 (c) SPQR (d) RSPQ

- 89.** S1 : The city is almost a slum and stinks most of time.
 S6 : But some visitors came away with the unforgettable sight of young labours scantily clad.
 P : The slush on the road did not deter them.
 Q : The occasional slips and falls were considered a small price to pay for the trip.

- R : They were excited,
fascinated by the sight of
fresh snow on the roads.
- S : Even so, it looked beautiful
to tourists of various
categories.

The proper sequence should be

- (a) RQPS
(b) QPRS
(c) RSQP
(d) SPQR

90. S1 : Politeness is not a quality
possessed by only one
nation or race.
- S6 : In any case, we should not
mock at others habits.
- P : One may observe that a
man of one nation will
remove his hat or fold his
hands by way of greetings
when he meets someone he
knows.

- Q : A man of another country
will not do so.
- R : It is a quality to be found
among all people and
nations in every corner of
the Earth.
- S : Obviously, each person
follows the custom of his
particular country.

The proper sequence should be

- (a) RPQS (b) RPSQ
(c) PRQS (d) QPRS

QUESTIONS FROM NDA/NA EXAM (2012-2016)

Directions (Q. Nos. 1-28) *In the questions given below, there is a sentence of which some parts have been jumbled up. Rearrange these parts which are labelled as P, Q, R and S to produce the **correct sentence**. Choose the among the alternatives.*

2012 (I)

1. P : even when
Q : are well informed
R : people engaged in a
conversation
S : their conversation may be
dull
- The correct sequence should be*
(a) QSPR (b) PRQS
(c) SRQP (d) SQRP
2. P : a pressure cooker
Q : fits tightly on the top
R : consists of a very strong
vessel
S : made of an aluminium alloy
with a lid that
- The correct sequence should be*
(a) PRSQ (b) RSPQ
(c) QSPR (d) PQSR
3. P : is to convince your reader
Q : the aim of an
argumentative essay
R : you have taken on a subject
is right
S : that the position

The correct sequence should be

- (a) SQPR (b) RQSP
(c) PQSR (d) QPSR

4. P : there is only one way
Q : the world can be
R : in which
S : made safe from the war

The correct sequence should be

- (a) RQSP (b) PRQS
(c) PQSR (d) SPRQ

5. P : the conspiracy
Q : got wind of
R : the Government
S : against the king's life

The correct sequence should be

- (a) PQRS (b) RQPS
(c) PSQR (d) SPQR

6. P : to death penalty is that
Q : in preventing the crime
R : the important objection
S : it has not succeeded

The correct sequence should be

- (a) PRSQ (b) PSRQ
(c) RPSQ (d) QSPR

7. P : choice carefully
Q : when you want
R : make your
S : a graphic representation
for your data,

The correct sequence should be

- (a) QRSP (b) SRQP
(c) PRQS (d) QSRP

8. P : he would like to see some
changes

- Q : but as a junior lecturer
R : he does not cut much ice
S : in the curriculum

The correct sequence should be

- (a) PQRS (b) QPSR
(c) QRPS (d) PSQR

9. P : he simply starves
Q : even when there are good
crops,
R : but if the crops fail
S : he lives from hand to mouth

The correct sequence should be

- (a) SQRP (b) PQRS
(c) SRQP (d) SPQR

10. P : providence had helped me
Q : to retain my true identity and
R : changed the course of my life
S : in the process

The correct sequence should be

- (a) PSQR (b) PQSR
(c) RSQP (d) PRQS

2012 (II)

11. P : he had
Q : no to him
R : such a winning smile
S : that I could not say

The correct sequence should be

- (a) QPRS (b) R PQS
(c) SPQR (d) PRSQ

- 12.** P : he nodded
Q : he understood
R : as though
S : everything
The correct sequence should be
(a) PRQS (b) PSQR
(c) QRSP (d) SPRQ
- 13.** P : the child burned down
Q : the house
R : by playing
S : with matches
The correct sequence should be
(a) RSPQ (b) QSPR
(c) RPSQ (d) QPSR
- 14.** P : in his innocence
Q : I believed
R : of the charge
S : and acquittal
The correct sequence should be
(a) SQRP (b) QPSR
(c) PRSQ (d) RPQS
- 15.** My little sister
P : in school
Q : instead of reading books
R : who was quite intelligent
S : played with dolls
The correct sequence should be
(a) PRSQ (b) RSPQ
(c) QPSR (d) PRQS
- 16.** P : for having stood first
Q : last year
R : at the BA examination
S : he was awarded gold medal
The correct sequence should be
(a) PQRS (b) SPRQ
(c) PRQS (d) SRQP
- 17.** We are proud that
P : as our chief guest
Q : our Mayor
R : is a former student of this college
S : who is presiding over today's function
The correct sequence should be
(a) PQRS (b) QPSR
(c) PQSR (d) QSPR
- 18.** At the end of the morning exercise,
P : the soldiers
Q : to get ready to leave
R : were asked
S : for an unknown destination

- The correct sequence should be*
(a) PQRS (b) RSPQ
(c) SRQP (d) PRQS
- 19.** After having got up from bed
P : the Magistrate
Q : to bring coffee
R : ordered the attendant
S : immediately
The correct sequence should be
(a) PQRS (b) SPQR
(c) SPRQ (d) PRQS
- 20.** P : to resolve it
Q : than
R : it is easier
S : to talk about a problem
The correct sequence should be
(a) RPQS (b) QPRS
(c) PQSR (d) RSQP
- 21.** P : to my client
Q : that I speak
R : immediately
S : it is important
The correct sequence should be
(a) SRQP (b) SQPR
(c) SPQR (d) PSQR
- 22.** You had better
P : of getting a good response
Q : so that
R : we will be sure
S : work hard
The correct sequence should be
(a) RSQP (b) SQRP
(c) SQPR (d) RPQS

2013 (II)

- 23.** P : she
Q : and neither have I
R : the assignment yet
S : hasn't finished
The correct sequence should be
(a) QRSP (b) QPSR
(c) PQSR (d) PSRQ
- 24.** P : himself
Q : a child
R : can usually feed
S : by the age of six months
The correct sequence should be
(a) QPRS
(b) SRQP
(c) PQRS
(d) QRPS

- 25.** Every experience in life makes
P : on some of the cells
Q : or other nerve centres
R : of the brain
S : an impression
The correct sequence should be
(a) SPRQ (b) QRSP
(c) RSPQ (d) PSQR
- 26.** You'll
P : know how to do it
Q : have to
R : because she does not
S : help her
The correct sequence should be
(a) QSPR (b) SRPQ
(c) QPRS (d) QSRP
- 27.** P : would you like to come
Q : on Saturday
R : at the International House
S : to a concert
The correct sequence should be
(a) PQRS (b) PSQR
(c) RSPQ (d) PQSR
- 28.** It is
P : to be admitted
Q : not necessary that to be admitted
R : to an engineering college
S : you qualify an entrance examination
The correct sequence should be
(a) SRQP (b) QSPR
(c) QRPS (d) SRPQ

Directions (Q. Nos. 29-34) *In the questions given below, each passage consists of six sentences. The first and the sixth sentences are given in the beginning. The middle four sentences in each have been removed and jumbled up. These are labelled as P, Q, R and S. Find out the proper order of the four sentences.*

2015 (I)

- 29.** S1 : At the roadside, the driver will be asked to blow through a small glass tube into a plastic bag.
S6 : The driver will be asked to go to the police station.
P : and if the colour change does not reach the line, the driver cannot be punished under the new law

Q : Inside the tube are chemically treated crystals which change colour if the driver has alcohol on his breath

R : but if the colour change does reach the line then the test has proved positive

S : if the colour change goes beyond a certain line marked on the tube, this indicates that the driver is probably over the specified limit

The proper sequence should be

- (a) PSQR (b) SQRP
(c) RPSQ (d) QSPR

30. S1 : Hope springs eternally in the heart of man.

S6 : This is the central idea of the poem.

P : but hope is everlasting

Q : love, friendship and youth perish

R : it is nursed by the glorious elements of nature

S : man derives hope from nature in his gallant struggle after some noble ideal

The proper sequence should be

- (a) QPRS (b) SRQP
(c) RSQP (d) QPSR

31. S1 : Mr Sherlock Holmes and Dr Watson were spending a weekend in a University town.

S6 : It was clear that something very unusual happened.

P : one evening, they received a visit from an acquaintance, Mr Hilton Soames

Q : on that occasion, he was in a state of great agitation

R : they were staying in furnished rooms, close to the library

S : Mr Soames was a tall, thin man of a nervous and excitable nature

The proper sequence should be

- (a) PRSQ (b) RPSQ
(c) PQRS (d) RPQS

32. S1 : The machines that drive modern civilisation derive their power from coal and oil.

S6 : Nuclear energy may also be effectively used in this respect.

P : but they are not inexhaustible

Q : these sources may not be exhausted very soon

R : a time may come when some other sources have to be tapped and utilised

S : power may, of course, be obtained in future from forests, water, wind and withered vegetables

The proper sequence should be

- (a) PQRS (b) QPRS
(c) SRQP (d) SPQR

33. S1 : The body can never stop.

S6 : It comes from food.

P : to support this endless activity, the body needs all the fuel for action

Q : sometimes, it is more active than at other times, but it is always moving

R : even in the deepest sleep, we must breathe

S : the fuel must come from somewhere

The proper sequence should be

- (a) PQRS (b) PRQS
(c) QRPS (d) SRQP

34. S1 : American idealism is essentially a belief in the idea of progress.

S6 : This sense they have inherited from the English.

P : therefore, he believes that, because of human effort, the future will be better than the past

Q : but if Americans are usually optimistic, they are not wholly unrealistic

R : the Americans tends to view history as a record of human achievement

S : they have some common sense practicality

The proper sequence should be

- (a) PQRS (b) PQSR
(c) RPQS (d) PRQS

Directions (Q. Nos. 35-40) *In the questions given below, there is a sentence of which some parts have been jumbled up. Rearrange these parts which are labelled as P, Q, R and S to produce the **correct sentence**. Choose the among the alternatives.*

2015 (II)

35. His uncle

P : for success in life,

Q : always advised his son,

R : who was a self-made man

S : to depend on his own efforts

The proper sequence should be

- (a) SQPR (b) RQSP
(c) PRSQ (d) QPSR

36. The doctor

P : did not like the behaviour of the patients

Q : who was very competent in his profession

R : when they talked at length

S : about their problems

The proper sequence should be

- (a) RPSQ (b) SRPQ
(c) QPRS (d) PRQS

37. P : from leadership in culture

Q : in military situations and in face-to-face small groups

R : leadership has wide range of expressions

S : to leadership in politics

The proper sequence should be

- (a) RSQP (b) PQRS
(c) RPSQ (d) SQRP

38. He sat

P : glancing occasionally

Q : peering through the window

R : at the figure of the old woman

S : until he was chilled with the cold

The proper sequence should be

- (a) PSRQ
(b) QRPS
(c) SPRQ
(d) PRSQ

39. After the earthquake tremors, the TV showed a haggard man
 P : shaking his fist at the sky
 Q : clambering over the ruins
 R : and collapsing with a howl of revolt
 S : of his house and factory
The proper sequence should be
 (a) SRQP (b) QSPR
 (c) PQRS (d) RPSQ

40. Everyone
 P : acknowledges
 Q : when he considers the case calmly
 R : who knows you
 S : that you have been wronged
The proper sequence should be
 (a) RSQP
 (b) RPSQ
 (c) PQRS
 (d) QRPS

COMPREHENSION

Around 6 to 10 questions based on Comprehension are asked in NDA exam. These questions are based on the given passages. For tips on how to attempt these questions, read the section below.

Verbal comprehension measures your ability to read and understand the written passage. Through the comprehension exercises you are asked to answer questions about the passage.

Answers to the questions based on the reading passage should be only according to the information given in the passage.

If you have information from your own experience and knowledge, you should not use it to answer a question of this type. Even if you think that there is a mistake in the given paragraph, you must still answer the question on the basis of the information given in the passage.

Tips for Attempting Comprehension

1. **Skim** once as rapidly as possible to determine the main idea before you look at the questions. Do not worry about words you do not know at this stage.
2. **Underline the words** that you do not understand to facilitate a complete understanding of the passage. This will enable you to solve the vocabulary questions quickly.
3. **Look through the words carefully** maintain the order in which the questions appear in the test paper. Read intensively the portion relevant to the answer.
4. **Concentrate** on the vocabulary items and find out the meanings of the words you do not know in the context.

Generally, options are tricky or some options are **closely related**. Therefore, analyse the questions and read the options carefully before answering.

Answer strictly on the **basis of the passage** and avoid selecting general answers.

CHECK YOUR COMPREHENSION SKILL

Directions (Q. Nos. 1-41) Read each of the following passages carefully and answer the questions that follow.

PASSAGE 1

Modern economic theory does not differentiate between renewable and non-renewable materials, as its approach is to measure everything by means of a money price. Thus, taking various alternative fuels like coal, oil, wood and water-power; the only difference between them recognised by modern economics is relative cost per equivalent unit. The cheapest is automatically the one to be preferred, as to do otherwise would be irrational and uneconomic. From a Buddhist point of view, of course, this will not do since the essential difference between non-renewable fuels like coal and oil on the one hand and renewable sources like wind-power and water-power on the other cannot be simply overlooked.

Non-renewable goods must be used only if their use is indispensable and then only with the greatest care and highest concern for conservation. To use them carelessly or extravagantly, is an act of violence and while complete non-violence may not be possible on this Earth, it is nonetheless a duty of man to aim at the ideal of non-violence in all he does.

1. Which of the following statements is/are correct on the basis of information in the above passage?
 1. Buddhist economists totally prohibit the use of non-renewable sources.
 2. The attitude of modern economists towards natural resources is uneconomic.
 3. Complete non-violence is not possible.

Select the correct answer using the codes given below.

(a) Only 1	(b) Only 2
(c) Only 3	(d) 1 and 3
2. The Buddhist viewpoint implies
 - (a) conservation should be given the highest consideration
 - (b) hydel projects are highly capital intensive
 - (c) oil is to be preferred since it does not produce ash
 - (d) money economics should govern the choice of energy sources
3. Buddhist economists are not in favour of
 - (a) economic development
 - (b) world economy being governed by oil prices
 - (c) using non-renewable sources indiscriminately
 - (d) harnessing wind energy

4. In this passage, the author has tried to
 - (a) show that the modern economist is concerned only with costs
 - (b) underline the need for conserving natural resources
 - (c) differentiate between the two economic philosophies
 - (d) explain the impact of oil on the world economy

PASSAGE 2

As society becomes more and more affluent, people would prefer to work shorter hours at their regular employment so that they may enjoy longer hours of leisure during which they can indulge in more congenial activities. They will not like to waste their leisure time performing routine domestic chores, which tend to sap their energy. The idea of a robot slave which would be capable of performing many of these monotonous chores is one that will appeal to many. Already robots are used in mines and factories to perform tasks which are too risky for human beings.

It takes a lot of research by dedicated scientists and sufficient financial backing for a model to be developed to perform a new task. This in turn depends on the number of people who feel the need for a robot to perform these specific tasks. The problem of designing a robot capable of performing various routine tasks around the house is not insurmountable. A domestic robot slave with its own computer and response mechanism and source of power, which can be programmed to perform certain specific tasks, is not an impossibility.

5. In an affluent society, people prefer to work shorter hours because
 - (a) they are lazy
 - (b) they do not have the strength to work
 - (c) they want time to carry out other activities
 - (d) they abhor their work
6. Domestic chores
 - (a) are welcome by housewives
 - (b) are too demanding
 - (c) lead to family discord
 - (d) are too time consuming
7. Robots are already used in mines and factories to perform
 - (a) hazardous tasks
 - (b) tasks with greater efficiency than human beings
 - (c) tasks which lead to economy in the operations
 - (d) tasks which are forbidden by the labour laws
8. Developing a robot capable of performing a new task
 - (a) is difficult for the scientists
 - (b) is impossible for the scientists
 - (c) requires huge capital
 - (d) depends on the number of people who require it

PASSAGE 3

The energy crisis has been with us for a long time and will be with us even longer. Whether Arab oil flows freely or not, it is clear that the world industry cannot be allowed to depend on so fragile a base. The supply of oil can be shut off at whim any time. In any case, the oil wells will run dry in about 30 years. New sources of energy must be found and this will take time. But it is not likely to restore that sense of copious energy availability we had in the past.

- 9.** In the writer's opinion, the energy crisis
- is an outcome of unregulated supply of oil to industries
 - will subside as soon as the Arab oil begins to flow again
 - is very likely to lead to the world war
 - will remain with us for an almost indefinite period of time
- 10.** The phrase 'so fragile a base' refers to the
- current energy crisis in the world
 - uncertainty about the flow of Arab oil
 - delay in finding the new energy sources
 - drying up of the oil wells in future
- 11.** The type of writing in the given passage could be called
- official
 - scientific
 - popular
 - political

PASSAGE 4

All who have gone before you have submitted to the stroke of death. All who come after you shall undergo the same fate. The great and the good, the prince and the peasant, the renowned and the obscure travel alike the road which leads to the grave. At the moment when you expire, thousands throughout the world shall with you, be yielding up their breath. Can that be held to be a great calamity which is common to you with everything that lives on the Earth, which is an event as much according to the course of the nature, as it is that leaves shall fall in autumn or that fruit should drop from the tree when it is fully ripe.

- 12.** Death is a natural phenomenon because
- the moment you die, thousands of people all over the world die with you
 - it is as natural as the fall of leaves of fruits from the trees
 - many people have died in the past
 - the great and the good, the prince and the peasant, the renowned and the obscure, all die
- 13.** The author compares death with the fall of the ripe fruit from a tree to show that death
- occurs in nature also
 - is a kind of fall from a great height
 - gives freedom from the ordeals of life
 - occurs with the achievement of fullness

- 14.** Which one of the following sentences shows that death is a great leveller?
- All who come after you shall undergo the same fate
 - The great and the good, the prince and the peasant, the renowned and the obscure travel alike the road which leads to the grave
 - At the moment when you expire, thousands throughout the world shall with you, be yielding up their breath
 - All who have gone before you have submitted to the stroke of death

PASSAGE 5

I was late bloomer and always envied those people who stood out in high school because I didn't. I learned early on, although, that it's essential to set yourself apart from the group. Life is one struggle after another to succeed, particularly when you're starting out. If your biodata is sitting at the bottom of a pile of junk mail, sometimes a distinctive approach will get you noticed, especially if the competition is fierce.

Once my partner Jerry and I asked the other freelance writers of a TV serial what characters they hated to write for the most. Everybody said the same thing—they disliked writing for the minor characters because they thought that writing for them wouldn't help them to get other jobs. Jerry and I decided that we would write scripts for the minor character because that's what was needed and we needed to set ourselves apart.

In the first script, Jerry and I wrote a school-girl falls in love with a boy in her class. The producers loved the story. And with that one script, Jerry and I were no longer just another comedy-writing team.

- 15.** The author is of the opinion that
- one should be part of the group
 - one should be different from others
 - it is important to do well in high school
 - one should need to the advice of the seniors
- 16.** The author had been
- into advertising business
 - a comedy writer
 - a music director
 - a news reader
- 17.** According to the author,
- one should be very meticulous in preparing his biodata
 - competition in the job-market is very fierce
 - one should follow a conservative approach in preparing his biodata
 - one should try to get noticed by being innovative
- 18.** Jerry and the author wrote scripts for the minor characters
- to realise their creative potential
 - to earn more money
 - to establish a different image
 - because they did not have enough work

PASSAGE 6

Wind-power has obvious advantage as it is non-polluting, causes no ecological imbalance, requires no throughput fuel and has extremely low gestation period. After almost a decade of sporadic growth, wind energy finally seems to be stepping out from shadows of alternative technology into the commercial mainstream, worldwide. Even though, India now has an installed base of just over 1600 MW, this is nothing compared to countries such as Germany which meets around 20% of its energy requirements from wind energy.

Wind-power offers long-term price stability too. Not only are generation costs of such projects low, the capital expenditure is comparable to fossil fuel based stations. Wind-power plants have low operating and maintenance costs. Long-term economics work out to be quite favourable for the wind energy. Infact, it is being seen as a solution to sustainable development. By the end of 2001, the installed wind-power was almost 25000 MW.

- 19.** Which one of the following statements is correct?
- Wind-power plants take a long time to get commissioned
 - Maintenance cost of wind-power plants is high
 - Wind-power plants lead to violent vibrations
 - Wind-power plants require no fuel
- 20.** Which one of the following statements is correct?
- Installation of wind-power is resisted by environmentalists
 - Generation cost of wind-power plants is high
 - Installation cost of wind-power plants is much higher than of fossil fuel based plants
 - Wind-power is now being commercially harnessed
- 21.** Which one of the following statements is correct?
- In Germany, 25000 MW of electricity is generated by using wind-power
 - Wind-power plants offer no price stability
 - Wind-power is economically viable on long-term basis
 - In America, 20% of the power requirements are met through wind-power

PASSAGE 7

Personally, I have been very fortunate and almost inevitably, I have received courtesy from my own countrymen as well as from the English. Even my goalers and the policemen, from place to place have been kind to me and much of the bitterness of conflict and the sting of goal-life has been toned down because of this human touch. It was not surprising that my own countrymen should treat me so for I had gained a measure of notoriety and popularity among them. Even for Englishmen, I was an individual and not merely one of the mass and I imagine the fact that I had received my education in England, brought me nearer to them.

- 22.** The phrase 'almost inevitably' in this passage means
- without precedence
 - unexpectedly
 - invariably
 - considerably
- 23.** The writer is of the opinion that the bitterness of conflict has been toned down because of
- the adversary's courteous behaviour
 - the adversary's diplomatic behaviour
 - his good behaviour
 - the writer being close to the Englishmen
- 24.** The writer's own countrymen treated him with love and regard because of
- a human touch in their nature
 - his good political work
 - his courage and generosity
 - his widespread popularity among the masses

PASSAGE 8

English is generally acknowledged to be the world's most important language. It is perhaps worth trying to understand briefly the basis for that evaluation. There are after all thousands of languages in the world and each seems to be uniquely important to those who speak it as their native language, the language they acquired at their mother's knee. But there are some objective standards to judge their relative importance.

One criterion is the number of speakers of the language. A second is the extent to which a language is geographically dispersed : in how many continents and countries is it used or its knowledge necessary? A third is its functional load : how extensive is the range of purposes for which it is used? In particular, to what extent is it the medium for highly valued cultural manifestations such as science or literature? A fourth is the economic and political influence of the native speakers of the language.

- 25.** The author wants to evaluate the importance of the English language because it is
- the language of the Britishers
 - studied as second language in India
 - the most useful language of the world
 - used in many countries
- 26.** The speakers of every language
- consider their language as the most important
 - do not like other languages
 - treat all the languages alike
 - want to learn English
- 27.** The writer's evaluation of the importance of the English language is based on
- general notions
 - linguistic assumptions
 - subjective feelings
 - objective criteria

PASSAGE 9

The spectre of unemployment is looming large on almost every graduate with a general purpose degree. This education has very little relevance to life and therefore, the young generation is getting frustrated. If we look deeper into the problems of extremism and terrorism, perhaps unemployment and frustration of young people is one of the chief reasons for this malaise. The most dangerous trend is the growing violence in the human heart. The first task of every university is to ensure that violence to each other does not become the new human culture. The sociologists have a lot to contribute by analysing the thought processes of the young persons and evolving the remedial measures.

- 28.** The young generation is getting frustrated because
- they have taken general purpose degrees
 - they remain unemployed
 - they are drawn to terrorism
 - there is violence around them
- 29.** Enormous responsibility to comprehend the problems of young generation lies with
- the press and TV media
 - our political leaders
 - the sociologists
 - education administrators
- 30.** The increase in violence in our society is
- a sign of revolutionary zeal
 - the result of modern system of education
 - the urge to surpass others in life
 - the result of frustration in life

PASSAGE 10

There is a natural tendency in every animate being to resent restrictions. If you block the growth of a plant, it will try to pierce through the blockade. If you enclose a worm or fish in a glass jar, you will find it restlessly moving hither and thither to find a way out. Similarly, if you confine a bird or an animal in a cage or a room, you will find it gets constantly trying to break through the cage or the room in a fit of escape. Only when it gets tired or identifies itself with the environment of the prison, it will sit silent. Thus, the urge to be free is inborn in all animate beings. It gets suppressed only on its identification with the situation. The urge to be free is also reason present in inanimate objects but it is latent and ultimately gets fulfilled. It is for this reason that matter constantly changes its shape. The change is in a way a fulfillment of that urge.

- 31.** The natural tendency among the living beings is to
- submit to the circumstances
 - strive for freedom
 - place restrictions in the way of others
 - create blockades

- 32.** A worm in a glass jar first tries to
- adjust itself
 - break the jar
 - move out of it
 - ignore the change
- 33.** An animal will sit quietly in a cage after it has
- eaten well
 - struggled enough
 - identified itself with the changed circumstances
 - given up hope of freedom
- 34.** Matter constantly changes its shape because it
- is inanimate
 - also has an urge to be free
 - is moulded into different shapes by men
 - has not soul

PASSAGE 11

If you want your mate to stop guessing about your feelings and motives, you have to be prepared to reveal yourself. And in order to reveal yourself, you have to know yourself profoundly. You can't talk openly and honestly with your mate until you have tried being honest with yourself first. Take time off to be alone. Use that time not simply to engage in passive meditation, but to carry on an active inner dialogue with yourself. Between the person you think you are and the inner you that operates at gut level. Communicating with yourself involves revelation, self-analysis and re-evaluation. Change is impossible otherwise. No architect in any field will attempt to make new plans without assessing the present situation. So too, each of us can and must make an assessment of our own assets or liabilities.

- 35.** Your mate shall stop guessing about your feelings when
- you are honest
 - you know yourself
 - he reveals himself to you
 - you talk openly
- 36.** You can talk openly and honestly to your mate only when you
- reveal your emotions and feelings
 - are honest with him
 - do not engage yourself in passive meditation
 - are honest with yourself
- 37.** You should take time off to be alone so that
- you talk to yourself
 - you engage yourself in passive meditation
 - your motives and feelings are clear
 - you do not change yourself
- 38.** No architect plans without assessing the present situation because
- each of us can and must make an assessment
 - self-analysis and re-evaluation are necessary factors for him
 - change is impossible otherwise
 - no assessment of our own assets or liabilities is possible

PASSAGE 12

There is a widely held but mistaken belief that meetings are for solving the problems and making the decisions. For a start, the number of people attending a meeting tends to be inversely proportional to their collective ability to reach conclusions and make decisions. And these are the least important elements. Instead hours are spent in side issues, playing elaborate games with one another.

- 39.** According to the author, meetings
- are a waste of time
 - help to solve problems
 - are a form of playing elaborate games
 - allow decisions to be made

- 40.** The words that show that many people believe meetings are important are
- widely held
 - collective ability
 - number of people
 - solving problems
- 41.** The author believes in the sanctity of holding meetings for
- practical value
 - transactional features
 - collective opinion
 - decision-making

QUESTIONS FROM NDA/NA EXAM (2012-2016)

Directions (Q. Nos. 1-29) Read each of the following passages carefully and answer the questions that follow.

2012 (I)

PASSAGE 1

Even in the most primitive societies, the great majority of people satisfy a large part of their material needs by exchanging goods and services. Very few people indeed can make for themselves everything they need—all their food, their clothes, their housing, their tools. Ever since men started living in communities, they have been satisfying their needs by means of specialisation and exchange; increasingly each individual has concentrated on what he can do best and has produced more of the special goods or services in which he has concentrated, than he can consume himself. The surplus he has exchanged with other members of the community, acquiring in exchange the things he needs that others have produced.

- According to the passage, the great majority of people can satisfy their needs today by
 - providing things for themselves
 - exchanging goods and services
 - concentrating on what they can do best
 - individual specialisation
- Exchange of goods becomes possible only when
 - there is no specialisation
 - goods are produced in surplus
 - primitive societies become modern
 - individuals make things for themselves
- Specialisation and exchange began when men started
 - big industries
 - concentrating on their work
 - producing things for individual use
 - living in communities

- Exchange of goods and services becomes necessary because
 - man is a social being
 - reciprocity is the law of life
 - trade and commerce are means of progress
 - we cannot produce everything we need for ourselves

PASSAGE 2

What interests many people is the possibility of finding an Earth-like planet and many science fiction stories have been woven around the possibility of there existing a planet somewhere in the universe which is an exact replica of the Earth. There are too many variable quantities for this to be a possibility worth considering. What is possible, if planetary systems are common as they seem to be, is the existence of planets where the conditions are similar to conditions on the Earth and to which our form of life could rapidly adapt. If life had gained a foothold on such a planet, it is possible that life closely paralleling our own planet could have developed.

What sorts of conditions is necessary for life as we know it to develop? First of all, of course a suitable planetary body is essential. Given this, then two vital conditions must be satisfied. The temperature must be neither too hot nor too cold, since intense heat breaks down organic molecules and severe cold prevents activity from going on. Too much short-wave radiation also upsets living organisms. The other prerequisite is a suitable atmosphere sufficiently dense to give protection from radiation and meteorites and containing oxygen and water vapour in reasonable quantities.

5. This passage suggests that there
- cannot be another planet like the Earth
 - are other planets like the Earth mentioned only in stories
 - may be other planets like the Earth in this universe
 - is a planet which is exactly like the Earth
6. The hypothesis about the possibility of planets parallel to the Earth gets its strength from the fact that
- the scientists have discovered them
 - books have been written about them
 - the planetary system exists
 - many people have shown interest in it
7. The statement, 'If life had gained a foothold on such a planet' means that
- if there is life on the planet, it would be like ours
 - if we go there, we can develop it like this Earth
 - even if we try, we cannot go and live there
 - it is impossible for life to develop there

PASSAGE 3

'The doctor's coming in a minute, Inspector,' said Miss Smith.

'Yes, thank you for phoning, Miss Smith. It was very kind of you the lady's name is Mrs West, you say,'

'Yes, that's right.' 'And what about Mr West?'

'Doctor West, Inspector.'

'Oh, I see Well, Doctor West, then. 'Do you know where he is?'

'Not exactly, Inspector. He never told Mrs West where he was going. You see, they hated each other.'

'What do you mean?'

'Well, Doctor West thought that Mrs West was in love with another man and everyone knows Doctor West went to see another woman.'

8. The conversation appears to be taking place
- in a street where an accident has just occurred
 - in a hotel where Mrs West suddenly became ill
 - in Mrs West's house where the police are enquiring into lady's murder
 - in Mrs West's house where a theft has taken place the night before
9. The questions the Inspector asks are
- inquisitive
 - foolish
 - disturbing
 - searching
10. 'You see, they hated each other.' 'What do you mean?' The Inspector seems
- to know Doctor West's secret
 - surprised to get the information
 - not to have understood Miss Smith
 - not impressed by Miss Smith's information

2012 (II)

PASSAGE 4

There was a farewell ceremony on her last day at school, to which my parents and I were invited. It was a touching ceremony in a solemn kind of way. The City Corporation sent a representative and so did the two main political parties. There were many speeches and my grandmother was garlanded by a girl from every class. Then the head girl, a particular favourite of hers, unveiled the farewell present the girls had bought for her by subscription. It was a large marble model of the Taj Mahal; it had a bulb inside and could be lit up like a table lamp. My grandmother made a speech too but she couldn't finish it properly, for she began to cry before she got to the end of it and to stop to wipe away her tears. I turned away when she began dabbing at her eyes with a huge green handkerchief and discovered, to my surprise, that many of the girls sitting around me were wiping their eyes too. I was very jealous, I remember. I had always taken it for granted that it was my own special right to love her; I did not know how to cope with the discovery that my right had been infringed by a whole school.

11. The farewell ceremony described in the passage is for the
- author's mother used to teach at his/her school
 - mother of head girl teaching at her school
 - grandmother of head girl no longer teaching at her school
 - grandmother of the author who used to teach at his/her school
12. The farewell ceremony made everyone feel
- sad
 - unhappy
 - happy
 - bad
13. Before the writer attended the ceremony, he/she had thought
- he/she was the only child who loved his/her grandmother
 - all the girls in the school loved his/her grandmother
 - only a few girls in the school loved his/her grandmother
 - only the headgirl loved her grandmother

PASSAGE 5

It is no doubt true that we cannot go through life without sorrow. There can be no sunshine without shadow, we must not complain that roses have thorns but rather be grateful that thorns bear flowers. Our existence here is so complex that we must expect much sorrow and suffering. Yet, it is certain that no man was ever discontented with the world who did his duty in it. The world is like a looking glass; if you smile, it smiles; if you frown, it frowns back. Always try, then, to look at the bright side of things. There are some persons whose very presence seems like a ray of sunshine and brightens the whole room. Life has been described as a comedy to those who think and a tragedy to those who feel.

14. The author says that we cannot go through life without sorrow because
- it is our fate
 - we are always discontented
 - life is a tragedy
 - human life is very complex

- 15.** According to the author, no man can be discontented with the world if he
 (a) is determined to be happy
 (b) is sincere in discharging his duties
 (c) has a healthy attitude to life
 (d) likes sunshine
- 16.** The expression 'Life is a tragedy to those who feel' means that it is a tragedy to those who
 (a) think about the world
 (b) believe in fate
 (c) do not understand the world
 (d) are sensitive and emotional
- 17.** The author says, "There are some persons whose very presence seems like a ray of sunshine and brightens the whole room". The reason for this is that, they
 (a) have the capacity to love
 (b) talk more of roses and less of thorns
 (c) are happy and spread happiness
 (d) look good and behave well
- 18.** What is the author's message in this passage?
 (a) Look at the bright side of things
 (b) Our existence is so complex
 (c) The world is a looking glass
 (d) Expect much sorrow and suffering

2013 (II)**PASSAGE 6**

It has often been said that the scale of natural phenomena in India and her total dependence on the monsoon, have helped to form the character of her people. Even today, major disasters, such as flood, famine and plague are hard to check and in older times, their control was almost impossible. Many other ancient civilisations, such as those of the Greeks, Romans and Chinese had to contend with hard winters, which encouraged sturdiness and resourcefulness. India, on the other hand, was blessed by a bounteous nature, who demanded little of man in return for sustenance, but in her terrible anger could not be appeased by any human effort. Hence, it has been suggested, the Indian character has tended to quietism, accepting fortune and misfortune alike without complaint.

- 19.** The author's main argument is
 (a) description of natural phenomena of India
 (b) unpredictability of Indian monsoon
 (c) correlation between the climate and the character of the inhabitants of a region
 (d) hardships caused by natural calamities

- 20.** Which one of the following civilisations did not have to face hardships due to bad winter?
 (a) Indian (b) Greeks
 (c) Chinese (d) Romans
- 21.** The expression 'India, on the other hand, was blessed by a bounteous nature ' means
 (a) Indian soil is fertile
 (b) India is a land of flora and fauna
 (c) Indian people have been rewarded more generously by nature in proportion to their efforts
 (d) Indian soil is suited for growing a variety of crops
- 22.** Which trait of Indian character has been formed by the monsoon?
 (a) Fatalism (b) Sturdiness
 (c) Asceticism (d) Epicureanism

2014 (I)**PASSAGE 7**

In a free country, the man who reaches the position of leader is usually one of outstanding character and ability. Moreover, it is usually possible to foresee that he will reach such a position, since early in life one can see his qualities of character. But this is not always true in the case of a dictator, often he reaches his position of power through chance, very often through the unhappy state of his country. It is possible that Hitler would never have become the leader of Germany if that country had not been driven to despair.

- 23.** In a free country, one who becomes a leader
 (a) must be of outstanding character and ability
 (b) must show qualities of character from an early age
 (c) is generally of a remarkable character and ability
 (d) must see that his country is free from despair
- 24.** Hitler became a leader because
 (a) he exhibited leadership qualities
 (b) Germany was a free country
 (c) Germany was in despair
 (d) Germans wanted a dictator
- 25.** The passage seems to suggest that
 (a) despair sometimes leads to dictatorship
 (b) Hitler was no leader
 (c) a leader is chosen only by a free country
 (d) a leader foresees his future position

PASSAGE 8

The dog is a very intelligent animal and it can be trained for many duties. Some dogs work with the police and the army as sentries and trackers and there are medals that are awarded to dogs for bravery in action. Other dogs act as seeing-eyes for the blind and some breeds are specially trained for rescue work among mountains and snow. Jobs like herding sheep and cattle and guarding homes are also done by them. Whenever man lives and works in the Arctic Circle, in the desert, in the jungle, in the moors or mountains, the dog is his faithful companion and help. A common mongrel may possess these qualities just as much as the aristocratic bloodhound.

- 26.** The passage tells us that dogs
 (a) can be trained to do different kinds of work
 (b) are capable of difficult work
 (c) are of different types
 (d) alone are a great help to man
- 27.** Medals are awarded to some dogs for
 (a) their brave deeds
 (b) working with the police
 (c) serving as sentries
 (d) being able to perform difficult work
- 28.** The passage implies that
 (a) only dogs are faithful but not man
 (b) man would have felt helpless without dogs
 (c) the dog has certain qualities that make it man's trustworthy companion
 (d) dogs can do almost anything
- 29.** The phrase 'aristocratic bloodhound' in the passage means
 (a) the dog kept by wealthy people
 (b) a pedigree dog
 (c) a dog fond of blood
 (d) any big dog

MEASUREMENT, MOTION AND FORCE

Generally 4 to 5 questions are asked from this chapter. These questions are mostly based on linear motion, speed, distance, displacement and velocity. Some of the questions are asked about units of quantities. So, this chapter is very important for examination.

PHYSICAL QUANTITIES

The quantities which can be measured directly or indirectly and by means of which we can describe the laws of physics are called physical quantities.

e.g. length, mass, volume etc. Physical quantities are of two types

(i) **Fundamental Quantities** The quantities which do not depend upon other quantities for their complete definition are known as fundamental or base quantities. There are seven fundamental quantities Length, Mass, Time, Electric current, Thermodynamic temperature, Luminous intensity, Amount of substance.

(ii) **Derived Quantities** The quantities which can be expressed in terms of the fundamental quantities are called derived quantities.

e.g., speed, volume, acceleration, force, etc.

► **Note** Other than fundamental and derived quantities there are two more quantities called as supplementary quantities. e.g., plane angle and solid angle.

UNIT

Measurement is a process of determining how large or small a physical quantity is as compared to a basic reference standard. This reference standard is called the unit of the particular physical quantity. Units are of two types

(i) **Fundamental Units** The units of fundamental quantities are called fundamental or base units.

Fundamental units of some physical quantities are as follows

Name of Quantities	Name of Units	Name of Quantities	Name of Units
Length	metre	Thermodynamics temperature	kelvin
Mass	kilogram	Luminous intensity	candela
Time	second	Amount of substance	mole
Electric current	ampere		

(ii) **Derived Units** The units of derived quantities are called derived units. e.g., Let us consider the unit of speed.

$$\text{speed} = \frac{\text{distance travelled}}{\text{time taken}}$$

$$\therefore \text{Unit of Speed} = \frac{\text{unit of distance}}{\text{unit of time}} = \frac{\text{metre}}{\text{second}} = \text{ms}^{-1}$$

Thus, the unit of speed is derived from fundamental units of length and time.

Derived units of some physical quantities are as follows

S.No.	Physical Quantities	Derived Unit
1.	Area	metre ² (m ²)
2.	Volume	metre ³ (m ³)
3.	Density	kg/m ³
4.	Potential	joule/coulomb or volt
5.	Resistance	volt/ampere or ohm

System of Units

A complete set of units which is used to measure all kinds of fundamental and derived quantities is called a system of units.

Some of the commonly used system of units are as follows

- (i) **CGS System** This is also known as Gaussian system of units which uses centimetre (cm), gram (g) and second (s) as the fundamental units of length, mass and time, respectively. The unit of force in this system is dyne.
- (ii) **FPS System** It is the British Engineering System of units which uses foot (ft), pound (lb) and second (s) as the fundamental units of length, mass and time, respectively. The unit of force in this system is poundal.
- (iii) **MKS System** In this system, the units of length, mass and time are metre (m), kilogram (kg) and second (s) respectively. The unit of force in this system is Newton (N).
- (iv) **International System (SI) of Units** It is modernised and extended form of metric systems like CGS and MKS system. This system contain seven fundamental units (See previous page) and two supplementary units.

Supplementary Units

S. No.	Supplementary Quantities	Units	Symbol
1.	Angle	Radian	rad
2.	Solid angle	steradian	sr

Units Used for Measuring Small Distances

- 1 cm = 10⁻² m
- 1 mm = 10⁻³ m
- 1 micron (m) = 10⁻⁴ cm = 10⁻⁶ m
- 1 nanometre = 10⁻⁷ cm = 10⁻⁹ m
- 1 angstrom (Å) = 10⁻⁸ cm = 10⁻¹⁰ m
- 1 fermi = 10⁻¹³ cm = 10⁻¹⁵ m

Units Used for Measuring Large Distances

- 1 Light year = 9.46 × 10¹⁵ m
- 1 Parsec = 3.08 × 10¹⁶ m = 3.26 light year
- 1 Astronomical units (AU) = 1.496 × 10¹¹ m

DIMENSIONS OF PHYSICAL QUANTITY

Dimensions of a physical quantity are the powers to which the fundamental quantities are raised to represent the unit of that physical quantity.

$$\text{e.g., density} = \frac{\text{mass}}{\text{volume}} = (\text{mass}) (\text{length})^{-3}$$

Thus, the dimensions of density are 1 in mass and -3 in length. The expression of a physical quantity in terms of its dimensions is called its dimensional formula. e.g., the dimensional formula of density is [ML⁻³] and that for force is [MLT⁻²].

Dimensions of fundamental quantities

S.No.	Fundamental Quantity	Dimension
1.	Length	[L]
2.	Mass	[M]
3.	Time	[T]
4.	Electric current	[A]
5.	Thermodynamic temperature	[K]
6.	Luminous intensity	[cd]
7.	Amount of substance	[mol]

Dimensional formulae and SI units of some physical quantities

S. No.	Physical Quantity with Formula	Dimensional Formula	SI Units
1.	Velocity = displacement/time	[L] / [T] = [M ⁰ L ¹ T ⁻¹]	m/s
2.	Acceleration = velocity/time	[LT ⁻¹] / [T] = [M ⁰ L ¹ T ⁻²]	m/s ²
3.	Force = mass × acceleration	[M][LT ⁻²] = [MLT ⁻²]	kg·m/s ² → Newton → N
4.	Work = Fs cos θ	[MLT ⁻²][L] = [ML ² T ⁻²]	kg·m ² /s ² → joule → J
5.	Kinetic energy = $\frac{1}{2}mv^2$	[M][LT ⁻¹] ² = [ML ² T ⁻²]	joule
6.	Potential energy = mgh	[M][LT ⁻²][L] = [ML ² T ⁻²]	joule
7.	Torque = Fr sin θ	[MLT ⁻²][L] = [ML ² T ⁻²]	N·m
8.	Power = work/time	[ML ² T ⁻²] / [T] = [ML ² T ⁻³]	kg·m ² /s ³ → J/s → watt → W
9.	Momentum = mass × velocity	[M][LT ⁻¹] = [MLT ⁻¹]	kg·m/s or N·s
10.	Impulse = FΔt	[MLT ⁻²][T] = [MLT ⁻¹]	N·s
11.	Angle = arc/radius	[L] / [L] = [M ⁰ L ⁰ T ⁰]	radian → rad
12.	Strain = ΔL / L or $\frac{\Delta V}{V}$	[L] / [L] Dimensionless	no units
13.	Frequency = 1/time period	1 / [T] = [M ⁰ L ⁰ T ⁻¹]	hertz → Hz

S. No.	Physical Quantity with Formula	Dimensional Formula	SI Units
14.	Angular velocity = angle/time	$1/[T] = [M^0L^0T^{-1}]$	rad/s
15.	Moment of inertia, $I = \Sigma mr^2$	$[M][L]^2 = [ML^2T^0]$	kg-m ²
16.	Angular momentum = $I\omega$	$[ML^2][T^{-1}] = [ML^2T^{-1}]$	kg-m ² /s or J-s
17.	Surface tension = force/length	$[MLT^{-2}]/[L] = [ML^0T^{-2}]$	N/m
18.	Spring constant, $k = F/x$	$[MLT^{-2}]/[L] = [ML^0T^{-2}]$	N/m
19.	Surface energy = energy/area	$[ML^2T^{-2}]/[L^2] = [ML^0T^{-2}]$	J/m ²
20.	Intensity = $\frac{\text{energy}}{\text{area} \times \text{time}}$	$\frac{[ML^2T^{-2}]}{[L^2][T]} = [ML^0T^{-3}]$	J/m ² -s → W/m ²
21.	Planck's constant, $h = \frac{E}{\nu} = \frac{\text{energy}}{\text{frequency}}$	$[ML^2T^{-2}]/[T^{-1}] = [ML^2T^{-1}]$	J-s
22.	Coefficient of viscosity = $\frac{\text{force} \times \text{distance}}{\text{area} \times \text{velocity}}$	$\frac{[ML^2T^{-2}]}{[L^2][LT^{-1}]} = [ML^{-1}T^{-1}]$	Nm ⁻² s or Pa-s

SCALAR AND VECTOR QUANTITIES

- Physical quantities which have only magnitude but no direction are called **scalar quantities**. e.g., mass, speed, volume, work, time, power, energy, etc.
- Physical quantities which have both magnitude and direction and obey all the laws of vector algebra are called **vector quantities**. e.g., displacement, velocity, acceleration, force, momentum, torque, etc.

Representation of a Vector

Any vector **r** can be written as $\mathbf{r} = x\hat{i} + y\hat{j} + z\hat{k}$

where, \hat{i} , \hat{j} and \hat{k} are unit vectors along the perpendicular axes OX, OY and OZ, respectively.

The magnitude of vector **r** is given by $|\mathbf{r}| = \sqrt{x^2 + y^2 + z^2}$

Product of Vector Quantities

- (i) **Scalar product or Dot product** The scalar product or dot product of two vectors **A** and **B** is defined as the product of the magnitude of two vectors **A** and **B** and the cosine of the angle between them.

$$\mathbf{A} \cdot \mathbf{B} = AB \cos \theta$$

where, *A* is magnitude of **A** and *B* is the magnitude of **B**.

- (ii) **Cross product or Vector product** The cross product or vector product of two vectors **A** and **B** is defined as the product of the magnitude of vectors **A** and **B** and sine of the angle between them.

$$\mathbf{A} \times \mathbf{B} = AB \sin \theta \hat{n}$$

where, \hat{n} is a unit vector perpendicular to **A** and **B**.

MOTION

If an object is continuously changing its position with respect to a fixed point, then the object is said to be in motion. Some definitions related to motion are given below

Distance

The length of the actual path travelled by an object during motion in a given interval of time is called the distance travelled by the object. It is a scalar quantity, i.e. it does not depend on direction.

Displacement

The shortest distance between the initial and final positions of any object during its motion is called the displacement of the object. It is a vector quantity i.e. it depends on direction.

Speed

The distance travelled by the object per unit time is called the speed of the object.

$$\text{Speed} = \frac{\text{Distance travelled}}{\text{Time taken}}$$

Types of speed are given below

- Uniform Speed** An object is said to be moving with a uniform speed, if it covers equal distances in equal intervals of time.
- Non-uniform Speed** An object is said to be moving with a non-uniform or variable speed, if it covers equal distances in equal intervals of time or unequal distances in equal intervals of time.
- Average Speed** The ratio of the total distance travelled by the object to the total time taken is called the average speed of the object.

$$\begin{aligned} \text{Average speed} &= \frac{\text{Total distance travelled}}{\text{Total time taken}} \\ &= \frac{s_1 + s_2 + s_3 + \dots}{t_1 + t_2 + t_3 + \dots} \end{aligned}$$

where s_1, s_2, s_3, \dots are the distances travelled by the object with speed v_1, v_2, v_3, \dots respectively.

- (a) If an object travels equal distances with speeds v_1 and v_2 , then

$$\text{average speed} = \frac{2v_1v_2}{v_1 + v_2}$$

- (b) If an object covers first one-third distance with speed *a*, other one-third distance with speed *b* and last one-third distance with speed *c*, then

$$\text{average speed} = \frac{3abc}{ab + bc + ca}$$

- (iv) **Instantaneous Speed** When an object is travelling with variable speed, then its speed at a given instant of time is called as instantaneous speed of the object.

$$\text{Instantaneous speed} = \lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}$$

Velocity

The time rate of change of displacement an object in a particular direction is called the velocity of the object.

$$\text{Velocity} = \frac{\text{Displacement}}{\text{Time taken}}$$

Types of velocity are given below

- (i) **Uniform Velocity** If an object undergoes equal displacements in equal intervals of time, then it is said to be moving with uniform velocity
- (ii) **Non-uniform Velocity** If an object undergoes unequal displacements in equal intervals of time, then it is said to be moving with a non-uniform or variable velocity.
- (iii) **Average Velocity** The ratio of the total displacement to the total time taken by an object is called the average velocity of the object.

$$\text{Average velocity} = \frac{\text{Total displacement}}{\text{Total time taken}}$$

- (iv) **Instantaneous Velocity** when an object is travelling with variable velocity, then its velocity at given instant of time is called as instantaneous velocity.

$$\text{Instantaneous velocity, } v = \lim_{\Delta t \rightarrow 0} \frac{\Delta r}{\Delta t} = \frac{dr}{dt}$$

Acceleration

The time rate of change of velocity of an object is called the acceleration of the object.

$$\text{Acceleration (a)} = \frac{\text{Change in velocity}}{\text{Time taken}}$$

It is a vector quantity.

Types of acceleration are given below

- (i) **Uniform Acceleration** An object is said to be moving with uniform acceleration, if its velocity changes by equal amounts in equal interval of time.
- (ii) **Non-Uniform Acceleration** An object is said to be moving with a non-uniform or variable acceleration, if its velocity changes by unequal amount in equal intervals of time.
- (iii) **Average Acceleration** If a body travels with uniform acceleration a_1 and a_2 in time t_1 and t_2 , respectively, then the average acceleration can be written as $a = \frac{a_1 t_1 + a_2 t_2}{t_1 + t_2}$.
- (iv) **Instantaneous Acceleration** Acceleration at any instant of time is known as instantaneous acceleration.

$$\text{i.e. } a = \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt}$$

- If the velocity of an object decreases with time its acceleration is negative otherwise it is positive.
- Negative acceleration is also called retardation or deceleration.
- Velocity and acceleration of an object need not be zero simultaneously.

ONE-DIMENSIONAL MOTION

If only one out of three coordinates specifying the position of the object changes with respect to time, then the motion is called one-dimensional motion. It is also known as rectilinear or linear motion.

- e.g. (i) Motion of a train along a straight line.
(ii) Motion of freely falling objects.

Equations for One-dimensional Motion

Consider an object moving along a straight line path with velocity (u) and after time t its velocity changes to (v), if the uniform acceleration is (a) and the distance travelled by the object in time (t) is (s), then the following relations are obtained, which are called equations of one-dimensional motion.

$$(i) v = u + at \quad (ii) s = ut + \frac{1}{2}at^2 \quad (iii) v^2 = u^2 + 2as$$

- If an object starts from rest, then $u=0$.
- If an object comes to rest (i.e. it stops), then $v=0$.
- If an object moves with uniform velocity, then its acceleration, $a=0$.

Graphs Related to One-dimensional Motion

Displacement-Time Graph

Case I When an object is at rest

Then the ($s-t$) graph is a straight line parallel to time axis.

From the graph, it is clear that with the passage of time, there is no change in the position of the body, it remains at point A, i.e. the body is stationary.

Case II When an object is moving with zero acceleration

Then the ($s-t$) graph is a straight line with positive slope and the object is initially at some distance from the origin.

From the graph, it is clear that in equal intervals of time, the body covers equal distances, so the motion is uniform and graph is a straight line.

Case III When an object is moving with uniform positive acceleration

Then the ($s-t$) graph is a curve with positive slope and the object is initially at some distance from the origin.

From the graph, it is clear that in equal intervals of time of one second, the body is covering unequal distances and

this distance goes on increasing. That means, with the passage of time, the body is covering more and more distance in equal time i.e. the speed of the body is increasing. Hence, the slope of graph is positive.

Case IV When an object is moving with negative acceleration

Then the ($s-t$) graph is a curve with negative slope and the object is initially at some distance from the origin. From the graph, it is clear that in equal intervals of time of one second, the body is covering unequal distances and this distance is goes on decreasing.

That means, with the passage of time, the body is covering lesser and lesser distance in equal time i.e., the speed of the body is decreasing. Hence, the slope of the graph is negative. Slope of displacement-time graph gives average velocity.

Velocity-Time Graph

Case I When an object is moving with constant velocity (zero acceleration)

Then the ($v-t$) graph is a straight line parallel to time axis.

From the graph, it is clear that with the change of time, there is no change in the velocity. Hence, the slope of the graph is zero.

Case II When an object is moving with positive constant acceleration having some initial velocity

Then the ($v-t$) graph is a straight line.

From the graph, it is clear that for equal change in time, velocity changes by equal amount.

Case III When an object is moving with constant positive acceleration having zero initial velocity

Then the ($v-t$) graph is a straight line passing through the origin.

From the graph, it is clear that for equal change in time, velocity changes by equal amount.

Case IV When an object is moving with increasing acceleration having zero initial velocity

Then the ($v-t$) graph is a curve.

From the graph, it is clear that for equal change in time, the change in velocity are unequal. That is the reason, the graph is curve shaped.

Acceleration-Time Graph

Case I If an object is moving with constant decreasing acceleration

Then acceleration-time graph is a straight line. The object is moving with negative acceleration and slope of straight line which makes an angle $\theta > 90^\circ$ with time axis.

Case II If an object moving with constant increasing acceleration

Then acceleration time graph is a straight line OA . The object is moving with positive acceleration and slope of straight line OA makes an angle $\theta < 90^\circ$ always with time axis.

Equations of Motion of an Object Moving Under Gravity

If an object is thrown upwards or falling downwards, then its motion is called motion under gravity. To obtain these equations we put h (height) in place of s (distance), g (acceleration due to gravity) in place of a (acceleration).

For Upward Motion

If an object is thrown upward, then equations of motion can be written as

(i) $v = u - gt$ (ii) $h = ut - \frac{1}{2}gt^2$

(iii) $v^2 = u^2 - 2gb$

For Downward Motion

If an object is falling freely ($u=0$) under gravity, then equations of motion can be written as

(i) $v = u + gt$ (ii) $h = ut + \frac{1}{2}gt^2$

(iii) $v^2 = u^2 + 2gb$

If an object is dropped vertically downwards with some height and another object is projected horizontally, then both the objects will reach the ground at same time.

Velocity and acceleration of an object may be in different directions.

Two-dimensional Motion

If only one out of three coordinates specifying the position of the object changes with respect to time, then the motion is called two-dimensional motion. e.g.

- (i) Motion of a car on a circular turn.
- (ii) Motion of a billiards ball.

Equations for Two-dimensional Motion

To deal with motion on a plane (xy) we have to break the motion along x and y -directions, then we will apply equation of motion of one-dimension separate for x and y -axes.

PROJECTILE MOTION

When an object is thrown from horizontal making an angle (θ) except 90° , then its motion under gravity is a curved parabolic path, called trajectory and its motion is called projectile motion.

The horizontal component of velocity ($u \cos \theta$) of projectile is responsible for its horizontal motion and remains constant and vertical component of velocity ($u \sin \theta$) is responsible for its vertical motion.

e.g.

- The motion of a bullet shot from the gun.
- The motion of a rocket after burn-out.
- The motion of a bomb dropped from a aeroplane etc.

Some terms related to the projectile motion are given below

Time of flight (T) It is the time taken by the projectile to cover the journey from point of projection (O) to end point (A).

$$\text{It is given by } T = \frac{2u \sin \theta}{g}$$

where, g is acceleration due to gravity.

Maximum Height (H) It is the maximum height attained by the projectile during the journey from O to A as shown in the diagram.

$$\text{It is given by } H = \frac{u^2 \sin^2 \theta}{2g}$$

It can also be expressed as

$$H = \frac{u^2}{2g} \quad (\text{when, } \sin^2 \theta = \max = 1, \text{ i.e. } \theta = 90^\circ)$$

Range (R) It is the distance between starting point (O) and final point (A).

$$\text{It is given by } R = \frac{u^2 \sin 2\theta}{g}$$

$$\text{if } \theta = 45^\circ \text{ then, } R = \frac{u^2}{g}$$

CIRCULAR MOTION

When an object moves circular path with a constant speed then the motion of the object is said to be a uniform circular motion.

Some Terms Related with Uniform Circular Motion

- (i) **Angular Displacement (θ)** The angle turned by an object moving in a circular path from some reference line is called angular displacement.

$$\begin{aligned} \text{Angular displacement } (\theta) &= \frac{\text{length of the arc}}{\text{radius of the circle}} \\ &= \frac{\Delta s}{r} \end{aligned}$$

- (ii) **Angular Velocity** Angular velocity of an object in circular motion is defined as the time rate of change of its angular displacement.

$$\text{angular velocity } (\omega) = \frac{\text{angular displacement}}{\text{time}} = \frac{\Delta \theta}{\Delta t}$$

If time period of uniform circular motion is T , then average angular velocity is given by

$$\omega = \frac{2\pi}{T} = 2\pi f$$

- **Relation between Linear velocity and Angular velocity**
linear velocity = angular velocity \times radius or $v = \omega \times r$

- (iii) **Angular Acceleration** The time rate of change of angular velocity of an object is called the angular acceleration of an object. Its unit is rad/s^2 .

$$\text{angular acceleration } (\alpha) = \frac{d\omega}{dt} = \frac{d^2\theta}{dt^2}$$

- (iv) **Centripetal Acceleration** Acceleration acting on the object undergoing uniform circular motion is called centripetal acceleration. It always act on the object along the radius towards the centre of the circular path.

$$\text{Centripetal acceleration } (a) = \frac{v^2}{r} = \omega^2 r$$

- (v) **Centripetal Force** Centripetal force is that force which is required to move an object along the radius and towards centre.

$$\text{Centripetal force } (F) = \frac{mv^2}{r} = m\omega^2 r.$$

- ➔ **Note** The value of resultant acceleration in non-uniform circulation is, $a = \sqrt{a_R^2 + a_T^2}$

FORCE

Any action which causes pull or push on an object is called force. There are two types of force

- (i) **Balanced Forces** If there are many forces acting on an object but resultant of all of them is zero, then the forces are called balanced forces.
- (ii) **Unbalanced Forces** If the resultant of all the forces acting on an object is not zero, then the forces are called unbalanced forces.

Law of Parallelogram of Forces

If two forces are acting on a point simultaneously, whose magnitudes and directions can be shown by two adjacent sides of parallelogram, then the magnitude and direction of resultant force will be shown by the diagonal which passes through the point of intersection of those sides.

Resultant of these two forces P and Q is

$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\alpha}$$

where, α is the angle between the sides of parallelogram.

where, β is the angle made by the resultant with P .

Inertia

The property of an object to resist any change in its state of motion along a straight line or rest is called inertia.

There are three types of inertia

- (i) **Inertia of Rest** If an object resists the change in its state of rest, its inertia is called inertia of rest.
- (ii) **Inertia of Motion** If an object resists the change in its state of motion, its inertia is called inertia of motion.
- (iii) **Inertia of Direction** If an object resists the change in direction of its motion, its inertia is called inertia of direction.

Linear Momentum

The product of mass and velocity of an object is called the linear momentum of the object. It is represented by p . Its unit is kg-m/s. It is a vector quantity.

$$p = mv$$

NEWTON'S LAWS OF MOTION

Newton studied the ideas of Galileo regarding the motion of an object. He formulated three fundamental laws that govern the motion of object. These three laws are known as Newton's laws of motion, which are as given below:

Newton's First Law of Motion

Any object remains in the state of rest or in a uniform motion along a straight line until it is compelled to change the state by applying an external force. This law is also known as **law of inertia**.

Applications of Newton's First Law of Motion

The following applications are based on Newton's first law of motion

- (i) The passengers in a bus falls backward when it starts suddenly. This is because the sudden start of the bus brings motion to the bus as well as to our feet in contact with the floor of the bus but the rest portion of our body opposes this motion because of inertia, so they fall backwards.
- (ii) When a carpet or a blanket is beaten with a stick, then the dust particles separate out from it.

Newton's Second Law of Motion

The second law of motion states that the rate of change of momentum of an object is proportional to the applied external force and takes place in the direction in which external force acts.

According to the second law of motion, force

$$F \propto \frac{\text{change in momentum}}{\text{time}}$$

$$F = K \frac{p_2 - p_1}{t} = K \frac{m(v-u)}{t} = Kma \quad \left[\because \frac{v-u}{t} = a \right]$$

K = constant of proportionality.

Its value is one in SI and CGS system.

Application of Newton's Second Law of Motion

The following applications are based on Newton's second law of motion

- (i) A cricket player (or fielder) moves his hands backward on catching a fast cricket ball.
- (ii) During athletics meet, a high jumping athlete is provided either a cushion or a heap of sand on the ground to fall upon.

Law of Conservation of Linear Momentum

- When no external force acts on a system of several interacting particles, the total linear momentum of the system is conserved. The total linear momentum is the vector sum of the linear momentum of all the particles of the system.
- Consider an isolated system (the system on which no external force acts) of n particles. Suppose the n particles have masses $m_1, m_2, m_3, \dots, m_n$ and are moving with velocities $\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3, \dots, \mathbf{v}_n$, respectively.

Then total linear momentum of the system is

$$\begin{aligned}\mathbf{p} &= m_1\mathbf{v}_1 + m_2\mathbf{v}_2 + m_3\mathbf{v}_3 + \dots + m_n\mathbf{v}_n \\ &= \mathbf{p}_1 + \mathbf{p}_2 + \mathbf{p}_3 + \dots + \mathbf{p}_n\end{aligned}$$

If \mathbf{F} is the external force acting on the system, then according to Newton's second law, $\mathbf{F} = \frac{d\mathbf{p}}{dt}$

For an isolated system, $\mathbf{F} = 0$ or $\frac{d\mathbf{p}}{dt} = 0$

As the derivative of a constant is zero, so

$$\mathbf{p} = \text{constant.}$$

or $\mathbf{p}_1 + \mathbf{p}_2 + \mathbf{p}_3 + \dots + \mathbf{p}_n = \text{constant}$

Thus in the absence of any external force, the total linear momentum of the system is constant. This is the law of conservation of linear momentum.

Newton's Third Law of Motion

Whenever one object exerts a force on another object, the second object exerts an equal and opposite force on the first object.

Applications of Newton's Third Law of Motion

Some application of Newton's third law are as following

- Walking of a person** A person is able to walk because of the Newton's third law of motion. During walking, a person pushes the ground in backward direction and in the reaction the ground also pushes the person with equal magnitude of force but in opposite direction. This enables him to move in forward direction against the push.
- Recoil of gun** When bullet is fired from a gun, the bullet also pushes the gun in opposite direction with equal magnitude of force. This results gunman feeling a backward push, i.e., recoil force from the butt of gun.

- Propulsion of a boat in forward direction** Sailor pushes water with oar in backward direction resulting water pushes the oar in forward direction.

Consequently, the boat is pushed in forward direction. Force applied by oar and water are of equal magnitude but in opposite directions.

- Rocket propulsion** The propulsion of rocket is based on the principle of action and reaction. The rapid burning of fuel produces hot gases which rush out from the nozzle at the rear end at a very high speed. The equal and opposite reaction force moves the rocket upward at a great speed.

IMPULSE

A large force which acts on an object for a very short interval of time and produces a large change in its momentum is called and impulsive force.

The impulse of a force acting on an object equal to the product of the large force and small time interval for which its acts on the object.

Impulse (I) = Force \times Time

Its unit is newton-second.

FRICTION

Friction is a force which opposes the relative motion between the two objects when one object actually moves or tries to move over the surface of another object.

Types of Friction

There are three types of friction

- Static Friction** It is an opposing force which comes into play when one object tends to move over the surface of another object.
- Limiting Friction** The maximum static frictional force which comes into play when one object just begins to slide over the surface of another object.
- Kinetic Friction** The opposing force that comes into play when one object actually moves over the surface of another object.

Kinetic friction is of two types

- Sliding Friction** It comes into play when one object slides over the surface of another object.
- Rolling Friction** It comes into play when one object rolls over the surface of another object.

> PRACTICE EXERCISE

1. 1 Fermi is equivalent to
(a) 10^{-15}m (b) 10^{-12}m
(c) 10^{-13}m (d) 10^{-19}m
2. What is the dimension of momentum?
(a) Impulse (b) Power
(c) Stress (d) Pressure
3. Wb/m^2 is equal to
(a) dyne (b) tesla
(c) watt (d) henry
4. The dimension of impulse is equal to that of
(a) force (b) linear momentum
(c) pressure (d) angular momentum
5. Dimension of impulse is
(a) $[\text{ML}^{-2}\text{T}^{-3}]$ (b) $[\text{ML}^{-2}]$
(c) $[\text{MLT}^{-1}]$ (d) $[\text{MLT}^{-2}]$
6. The dimensions of coefficient of viscosity is
(a) $[\text{MLT}^{-1}]$ (b) $[\text{ML}^{-1}\text{T}]$
(c) $[\text{ML}^{-1}\text{T}^{-1}]$ (d) $[\text{ML}^{-1}]$
7. Average velocity of an object is equal to the mean of its initial and final velocities, if the acceleration is
(a) uniform
(b) variable
(c) Both (a) and (b)
(d) None of these
8. When the distance, an object travels is directly proportional to the length of time, it is said to travel with
(a) zero velocity (b) uniform velocity
(c) constant velocity
(d) constant acceleration
9. If the displacement of an object is proportional to square of time, then the object moves with
(a) uniform velocity
(b) uniform acceleration
(c) increasing acceleration
(d) decreasing acceleration
10. Newton's second law of motion connects
(a) momentum and acceleration
(b) change of momentum and velocity
(c) rate of change of momentum and external force
(d) rate of change of force and momentum
11. Momentum has the same unit as that of
(a) couple (b) torque
(c) impulse
(d) moment of momentum
12. Frictional force
1. is self-adjusting force.
2. is a non-conservative force.
3. is a necessary evil.
Codes
(a) 1 and 2
(b) 1 and 3
(c) Only 1
(d) All of the above
13. Newton's laws of motion do not hold good for objects
(a) at rest
(b) moving slowly
(c) moving with high velocity
(d) moving with velocity comparable to velocity of light
14. If the energy E of a photon is equal to $h\nu$, where ν is the frequency and h is Planck's constant, then the dimensions of Planck's constant is
(a) $[\text{ML}^2\text{T}^{-3}]$ (b) $[\text{M}^0\text{L}^2\text{T}^{-1}]$
(c) $[\text{ML}^2\text{T}^{-1}]$ (d) $[\text{ML}^2\text{T}^{-2}]$
15. A body goes from P to Q with a velocity of 40 ms^{-1} and comes back from Q to P with a velocity of 60 ms^{-1} . Then, the average velocity of the body during the whole journey is
(a) 50 ms^{-1} (b) 48 ms^{-1}
(c) 45 ms^{-1} (d) zero
16. The area under acceleration-time graph represents
(a) velocity
(b) displacement travelled
(c) distance travelled
(d) change in velocity
17. When a moving bus suddenly applies brakes, then the passengers sitting in it fall in the forward direction. This can be explained by
(a) the theory of relativity
(b) Newton's first law
(c) Newton's second law
(d) Newton's third law
18. A body of mass 6 kg is rotated in circle of radius 3 m with a uniform speed of 10 m/s , the force which must act on the body to maintain the motion is
(a) 100 N (b) 200 N
(c) 300 N (d) 20 N
19. A car travels the first one-third distance at a speed of 10 km/h , the next one-third distance at 20 km/h and the last one-third distance at 60 km/h . Then, the average speed of the car is
(a) 30 km/h (b) 24 km/h
(c) 18 km/h (d) None of these
20. A man travels along a straight road for the first half length with a velocity u and the second half length with a velocity v . Then, the mean velocity is given by
(a) $\frac{u+v}{2}$ (b) $\frac{2uv}{u+v}$
(c) \sqrt{uv} (d) zero
21. A machine is delivering constant power to drive a body along a straight line. What is the relation between the distance travelled by the body against time?
(a) $s^2 \propto t^3$ (b) $s^2 \propto t^{-3}$
(c) $s^3 \propto t^2$ (d) $s^3 \propto t^{1/2}$
22. The displacement y (in metres) of a body varies with time t (in seconds) as
$$y = \frac{-2}{3}t^2 + 16t - 12$$

Then, the body will come to rest in
(a) 16 s (b) 12 s
(c) 8 s (d) None of these
23. A 7 kg object is subjected to two forces $\vec{F}_1 = (20\hat{i} + 30\hat{j})$ and $\vec{F}_2 = (8\hat{i} + 5\hat{j})\text{ N}$. The magnitude of resulting acceleration in m/s^2 will be
(a) 6 (b) 7 (c) 1 (d) 5.3
24. A body has a mass of 50 kg . Its velocity is brought down from 20 m/s to 5 m/s by a resisting force in 5 s . The magnitude of resisting force is
(a) 50 N (b) 150 N
(c) 750 N (d) 375 N
25. A rifle with muzzle velocity of 1500 m/s shoots a bullet at a small target 150 m away. How high above the target must the rifle be aimed, so that bullet hits the target?
(a) Zero (b) 4.9 cm
(c) 9.8 cm (d) 98 cm

26. A mass of 2 kg is whirled in a circle in a horizontal plane, at an initial speed of 5 revolutions per min. Keeping the radius constant, the speed is increased, so that the centripetal force is four times the initial value. The ratio of the final speed to initial speed is

- (a) 1 (b) 2
(c) 3 (d) 4

27. Which one of the following graphs represents uniform motion?

28. Which one of the following characteristics of the particle does the shaded area of the velocity-time graph shown below represent?

- (a) Momentum (b) Acceleration
(c) Distance covered (d) Speed

29. meter

The motion of car along a straight path is shown in above figure. The car starts from O and reaches at point C , back to point A . The distance and the magnitude of the displacement are respectively.

- (a) 160 m, 40 m
(b) 190 m, 50 m
(c) 120 m, 40 m
(d) 140 m, 100 m

30. Which one among the following situation is best represented by the velocity-time graph shown alongside?

- (a) velocity changes by equal amount
(b) slope of graph is zero.
(c) slope of graph is negative
(d) None of the above

31. Which statement is true for shown graph?

- (a) Acceleration have positive and constant value
(b) Initial velocity of particle is negative
(c) velocity of particle is constant
(d) None of the above

32. Select the correct answer using the codes given below

- I. Density is a vector quantity
II. Value of distance is always equal to displacement
III. The distance travelled by the object per unit time is called the speed.

- (a) I and II (b) III and I
(c) Only III (d) I, II and III

33. Select the incorrect statement using the codes given below

- I. Power is a vector quantity.
II. Acceleration is a vector quantity.
III. If an object resists the change in state of rest.

- (a) Only I (b) I, II and III
(c) I and II (d) None of these

> Previous Years' Questions

34. An object is in uniform circular motion on a plane. Suppose that you measure its displacement from the centre along one direction, say along the X -axis. Which one among the following graphs could represent this displacement (x)?

☑ 2012 (I)

35. A staircase has five steps each 10 cm high and 10 cm wide. What is the minimum horizontal velocity

to be given to the ball, so that it hits directly the lowest plane from the top of the staircase?

(Take, $g = 10 \text{ m/s}^2$) ☑ 2012 (II)

- (a) 2 m/s (b) 1 m/s
(c) $\sqrt{2}$ m/s (d) $\frac{1}{2}$ m/s

36. The displacement of a particle at time t is given by

$$x = a\hat{i} + b\hat{j} + \frac{c}{2}t^2\hat{k}$$

where, a , b and c are positive constants. Then, the particle is

☑ 2013 (I)

- (a) accelerated along \hat{k} -direction
(b) decelerated along \hat{k} -direction
(c) decelerated along \hat{i} -direction
(d) accelerated along \hat{i} -direction

37. A force F is applied on a body (which moves on a straight line) for a duration of 3 s. The momentum of the body changes from 10 g cm/s to 40 g cm/s. The magnitude of the force F is

☑ 2013 (I)

- (a) 10 dyne (b) 10 N
(c) 120 dyne (d) 12 dyne

38. If an object undergoes a uniform circular motion, then its ☑ 2013 (I)

- (a) acceleration remains uniform
(b) velocity changes
(c) speed changes
(d) velocity remains uniform

39. If d denotes the distance covered by a car in time t and s denotes the displacement by the car during the same time, then ☑ 2013 (I)

- (a) $d \leq |s|$ (b) $d = |s|$
(c) $d \geq |s|$ (d) $d < |s|$

40. An ant is moving on thin (negligible thickness) circular wire. How many coordinates do you require to completely describe the motion of the ant?

☑ 2013 (I)

- (a) One (b) Two (c) Three (d) Zero

41. A car is moving with a uniform speed. However, its momentum is changing. Then, the car

☑ 2013 (I)

- (a) may be on an elliptical path
(b) is moving on a straight path without acceleration
(c) is moving on a straight path with acceleration
(d) is moving without any acceleration

42. The motion of a particle is given by a straight line in the graph given below drawn with displacement s and time t . Which one among the following statements is correct?

☑ 2013 (I)

- (a) The velocity of the particle is uniform
- (b) The velocity of the particle is non-uniform
- (c) The speed is uniform and the particle is moving on a circular path
- (d) The speed is non-uniform and the particle is moving on a straight line path

43. An object is undergoing a non-accelerated motion. Its rate of change in momentum is ☑ 2013 (I)

- (a) a non-zero constant
- (b) zero
- (c) not a constant
- (d) None of the above

44. A motor vehicle is moving on a circle with a uniform speed. The net acceleration of the vehicle is ☑ 2013 (I)

- (a) zero
- (b) towards the centre of the circle
- (c) away from the centre along the radius of the circle
- (d) perpendicular to the radius and along the velocity

45. Which one among the following situations is best represented by the velocity-time graph shown below?

☑ 2013 (I)

- (a) Uniform motion of a particle on a circle
- (b) Accelerated motion of a particle which has a non-zero initial velocity
- (c) Decelerated motion of a particle which has an initial non-zero velocity
- (d) Decelerated motion of a particle which has no initial velocity

46. The plot given below represents the velocity of a particle (in m/s) with time (in seconds) assuming that the plot represents a semi-circle, distance traversed by the particle at the end of 7 s is approximately ☑ 2013 (II)

- (a) 19 m
- (b) 7 m
- (c) 3.2 m
- (d) 4.75 m

47. Motion of a particle can be described in x -direction by $x = a \sin \omega t$ and y -direction by $y = b \cos \omega t$. The particle is moving on ☑ 2013 (II)

- (a) a circular path of radius a
- (b) a circular path of radius b
- (c) an elliptical path
- (d) a straight line

48. The plot given below represents displacement s of a particle with time t . The particle is ☑ 2013 (I)

- (a) moving with uniform velocity
- (b) moving with acceleration
- (c) moving with deceleration
- (d) executing a periodic motion

49. A bullet of mass 20 g is fired in the horizontal direction with a velocity 150 m/s from a pistol of mass 1 kg. Recoil velocity of the pistol is ☑ 2013 (II)

- (a) 3 m/s
- (b) 4 m/s
- (c) 300 m/s
- (d) 1/3 m/s

50. A passenger in a moving train tosses a coin upward which falls behind him. It implies that the motion of the train is ☑ 2014 (I)

- (a) accelerated
- (b) uniform
- (c) retarded
- (d) along the circular tracks

51. Two cars A and B have masses m_A and m_B respectively, with $m_A > m_B$. Both the cars are moving in the same direction with equal kinetic energy. If equal braking force is applied on both, then before coming to rest ☑ 2014 (II)

- (a) A will cover a greater distance
- (b) B will cover a greater distance
- (c) both will cover the same distance
- (d) distance covered by them will depend on their respective velocities

52. If the distance s is covered by a moving car in rectilinear motion with a speed v in time t is given by $s = vt$, then the car undergoes ☑ 2014 (II)

- (a) a uniform acceleration
- (b) a non-uniform acceleration
- (c) a uniform velocity
- (d) a non-uniform velocity

53. A particle is moving with uniform acceleration along a straight line ABC , where $AB = BC$. The average velocity of the particle from A to B is 10 m/s and from B to C is 15 m/s. The average velocity for the whole journey from A to C in m/s is ☑ 2014 (II)

- (a) 12
- (b) 12.5
- (c) 13
- (d) 13.5

54. The dimension of 'impulse' is the same as that of ☑ 2014 (II)

- (a) pressure
- (b) angular momentum
- (c) work
- (d) linear momentum

55. A particle is moving in a circular path of radius r at a constant speed v . Which one of the following graphs correctly represents its acceleration a ? ☑ 2014 (II)

56. A force applied on a body is represented as $\mathbf{F} = 6\hat{i} - 8\hat{j} + 10\hat{k}$ and accelerates it at 1 m/s^2 . The mass of the body is ☑ 2014 (II)

- (a) 10 kg
- (b) $10\sqrt{2}$ kg
- (c) $2\sqrt{10}$ kg
- (d) 8 kg

57. A bullet is fired vertically up from a 400 m tall tower with a speed of 80 m/s. If g is taken as 10 m/s^2 , then the time taken by the bullet to reach the ground will be ☑ 2014 (II)

- (a) 8 s
- (b) 16 s
- (c) 20 s
- (d) 24 s

58. If the motion of an object is represented by a straight line parallel to the time-axis in a distance-time graph, then the object undergoes ☑ 2014 (II)

- (a) an accelerated motion
- (b) a decelerated motion
- (c) a uniform non-zero velocity motion
- (d) a zero velocity motion

59. The displacement-time graph of a particle acted upon by a constant force is ☑ 2015 (I)

- (a) a straight line
- (b) a circle
- (c) a parabola
- (d) any curve depending upon initial conditions

60. The following figure represents the velocity-time graph of a moving car on a road. **2015 (II)**

Which segment of the graph represents the retardation?

- (a) AB
(b) BC
(c) CD
(d) None of the above
61. A man is sitting in a train which is moving with a velocity of 60 km/h. His speed with respect to the train is **2015 (II)**
- (a) $\frac{10}{3}$ m/s
(b) 60 m/s
(c) infinite
(d) zero
62. Two forces, one of 3 N and another of 4 N are applied on a standard 1 kg body, placed on a horizontal and frictionless surface, simultaneously along the X-axis and the Y-axis respectively, as shown below.

The magnitude of the resultant acceleration is **2015 (II)**

- (a) 7 m/s^2 (b) 1 m/s^2
(c) 5 m/s^2 (d) $\sqrt{7} \text{ m/s}$

63. In SI unit of force Newton' (N) is given by (where, m stands for metre and s stands for second)

- 2015 (II)**
(a) $1 \text{ N} = 2 \text{ kg}\cdot\text{m/s}^2$ (b) $1 \text{ N} = 1 \text{ kg}\cdot\text{m/s}^2$
(c) $1 \text{ N} = 4 \text{ kg}\cdot\text{m/s}^2$ (d) $1 \text{ N} = 3 \text{ kg}\cdot\text{m/s}^2$

64. Which one of the following statements is not correct?

- 2015 (II)**
(a) If the velocity and acceleration have opposite sign, then the object is slowing down
(b) If the velocity is zero at an instant, then the acceleration should also be zero at that instant
(c) If the velocity is zero for a time interval, then the acceleration is zero at any instant within the time interval
(d) If the position and velocity have opposite sign, then the object is moving towards the origin

65. A brass ball is tied to a thin wire and swung, so as to move uniformly in a horizontal circle. Which of the following statements in this regard is/are true?

- The ball moves with constant velocity.
- The ball moves with constant speed.
- The ball moves with constant acceleration.
- The magnitude of the acceleration of the ball is constant.

Select the correct answer using the codes given below **2015 (II)**

- (a) Only 1 (b) 1 and 3
(c) 1, 2 and 4 (d) 2 and 4

66. A racing car accelerates on a straight line from rest to a speed of 50 m/s in 25 s. Assuming uniform acceleration of the

throughout, the distance covered in this will be **2016 (I)**

- (a) 625 m (b) 1250 m (c) 2500 m (d) 50 m

67. Two bodies A and B are moving with equal velocities. The mass of B is doubled that of A. In this context, which one of the following statements is correct?

- 2016 (I)**
(a) Momentum of B will be double that of A
(b) Momentum of A will be double that of B
(c) Momentum of B will be four times that of A
(d) Momentum of both A and B will be equal

68. The SI unit of acceleration is

- 2016 (I)**
(a) m/s (b) m/s^2
(c) cm/s^2 (d) km/s^2

69. The impulse on a particle due to a force acting on it during a given time interval is equal to the change in its **2016 (I)**

- (a) force (b) momentum
(c) work done (d) energy

70. The motion of a car along a straight path is shown by the following figure. **2016 (I)**

The car starts from O and reaches at A, B and C at different instant of time. During its motion from O to C and back to B, the distance covered and the magnitude of the displacement are, respectively

- (a) 25 km and 60 km
(b) 95 km and 35 km
(c) 60 km and 25 km
(d) 85 km and 35 km

ANSWERS

1	a	2	a	3	b	4	b	5	c	6	c	7	a	8	b	9	b	10	c
11	c	12	d	13	d	14	c	15	d	16	d	17	b	18	b	19	c	20	b

Solutions

14. (c) Given, $E = h\nu$

where, $E =$ energy of a photon,
 $h =$ Planck's constant,
 $\nu =$ frequency

$$\therefore h = \frac{E}{\nu} = \frac{[\text{ML}^2\text{T}^{-2}]}{[\text{M}^0\text{L}^0\text{T}^{-1}]} = [\text{ML}^2\text{T}^{-1}]$$

15. (d) Average velocity

$$= \frac{\text{Total displacement covered}}{\text{Total time taken}} = 0$$

When the body returns to the starting point, then total displacement covered is zero.

16. (d) Area under acceleration-time graph

= acceleration \times time
 = change in velocity

18. (b) Given, $m = 6$ kg, $v = 10$ m/s,

$r = 3$ m, $F = ?$

$$\therefore F = \frac{mv^2}{r} = \frac{6 \times (10)^2}{3} = 200 \text{ N}$$

19. (c) \therefore Average speed = $\frac{\text{Total distance}}{\text{Total time}}$

$$= \frac{3s}{\frac{s}{10} + \frac{s}{20} + \frac{s}{60}}$$

$$= \frac{60 \times 3}{10} = 18 \text{ km/h}$$

20. (b) Let the total distance travelled be $= s + s = 2s$

Total time taken, $t = t_1 + t_2$

$$= \frac{s}{u} + \frac{s}{v}$$

$$\therefore \text{Average velocity} = \frac{2s}{t_1 + t_2}$$

$$= \frac{2s}{\frac{s}{u} + \frac{s}{v}} = \frac{2uv}{u+v}$$

21. (a) We know that,

$$\text{power} = \frac{\text{work}}{\text{time}}$$

$$= [\text{ML}^2\text{T}^{-3}] = \text{constant}$$

$$\therefore \text{ML}^2\text{T}^{-3} = \text{constant}$$

$$\text{or } L^2 \propto T^3 \Rightarrow s^2 \propto t^3$$

22. (b) Given, $y = -\frac{2}{3}t^2 + 16t - 12$

$$\therefore v = \frac{dy}{dt} = \frac{d}{dt}(-2/3t^2 + 16t - 12)$$

$$= -\frac{2}{3}(2t) + 16 = -\frac{4}{3}t + 16$$

Since, the body comes to rest, $v = 0$

$$\therefore -\frac{4t}{3} + 16 = 0$$

$$\Rightarrow t = 12 \text{ s}$$

23. (d) \therefore Resultant force, $\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2$

$$= (20\hat{i} + 30\hat{j}) + (8\hat{i} - 5\hat{j})$$

$$= (28\hat{i} + 25\hat{j}) \text{ N}$$

$$\therefore \text{Acceleration, } a = \frac{\mathbf{F}}{m} = \frac{(28\hat{i} + 25\hat{j})}{7}$$

$$|\mathbf{a}| = \frac{\sqrt{1409}}{7} \approx 5.3 \text{ m/s}^2$$

24. (b) Given, $m = 50$ kg, $v = 5$ m/s,

$u = 20$ m/s, $t = 5$ s, $F = ?$

\therefore Resisting force, $F = ma$

$$= m \cdot \left(\frac{v-u}{t} \right) \left[\because a = \left(\frac{v-u}{t} \right) \right]$$

$$= 50 \times \left(\frac{5-20}{5} \right)$$

$$= -150 \text{ N}$$

$$\Rightarrow |\mathbf{F}| = 150 \text{ N}$$

25. (b) Time taken to cover 150 m,

$$t = \frac{150}{1500} = \frac{1}{10} \text{ s}$$

Vertical distance travelled by the bullet,

$$h = \frac{1}{2}gt^2 = \frac{1}{2} \times 9.8 \times \left(\frac{1}{10} \right)^2$$

$$= \frac{4.9}{100} \text{ m} = 4.9 \text{ cm}$$

\therefore Rifle must be aimed at 4.9 cm above the target.

26. (b) $\therefore \frac{F_2}{F_1} = 4, \frac{mr\omega_2^2}{mr\omega_1^2} = 4$

$$\Rightarrow \frac{\omega_2^2}{\omega_1^2} = 4, \frac{\omega_2}{\omega_1} = 2$$

35. (c) Given, $x = 10$ cm = $\frac{1}{10}$ m

$$y = 10 \text{ cm} = \frac{1}{10} \text{ m}, n = 5, u = ?$$

Distance covered in vertical direction = $\frac{1}{2}gt^2$

$$ny = \frac{1}{2}gt^2$$

$$= 5 \times \frac{1}{10}$$

$$\Rightarrow gt^2 = 1$$

$$\therefore t^2 = \frac{1}{10}$$

Distance covered in horizontal direction = ut

$$nx = ut$$

$$5 \times \frac{1}{10} = u \times t$$

$$\frac{1}{2} = \frac{u}{\sqrt{10}} \Rightarrow u = \sqrt{25} \approx \sqrt{2} \text{ m/s}$$

36. (a) Given, $x = a\hat{i} + b\hat{j} + \frac{c}{2}t^2\hat{k}$

As we know,

$$v = \frac{dx}{dt} = \frac{d}{dt}(a\hat{i} + b\hat{j} + \frac{c}{2}t^2\hat{k})$$

$$= \frac{c}{2} \cdot 2t\hat{k} = ct\hat{k}$$

$$\text{and } a = \frac{dv}{dt} = \frac{d}{dt} \left(\frac{dx}{dt} \right)$$

$$= \frac{d}{dt}(ct\hat{k}) = c\hat{k}$$

\therefore The particle is accelerated along \hat{k} -direction.

37. (a) Given, $p_1 = 10$ g cm/s.

$p_2 = 40$ g cm/s and time $t = 3$ s, $F = ?$

We know that, $F = \frac{p_2 - p_1}{t}$

$$F = \frac{40 - 10}{3} = \frac{30}{3}$$

$$\Rightarrow F = 10 \text{ dyne}$$

46. (a) Given, $d = 7$, $r = 3.5$

Distance travelled = Area of the graph

$$= \frac{\pi r^2}{2}$$

$$= \frac{3.14 \times 3.5 \times 3.5}{2} \quad [\because \pi = 3.14]$$

$$= 3.14 \times 1.75 \times 3.5 \approx 19.23 \text{ m}$$

49. (a) Given, $m_1 = 20$ g = 20×10^{-3} kg,

$v_1 = 150$ m/s, $m_2 = 1$ kg, $v_2 = v = ?$

From law of conservation of momentum,

$$m_1v_1 = m_2v_2$$

$$20 \times 10^{-3} \times 150 = 1 \times v$$

$$v = 2 \times 15 \times 10^{-1} = 3 \text{ m/s}$$

53. (a) It is given that, $AB = BC$

For A to B, $t_{AB} = \frac{x}{2 \times 10}$ m/s

$$v_1 = 10 \text{ m/s}, v_2 = 15 \text{ m/s}$$

and B to C , $t_{BC} = \frac{x}{2 \times 15} \text{ m/s}$

Average velocity of whole journey

$$v_{av} = \frac{x}{T} \text{ or } v_{av} = \frac{x}{t_{AB} + t_{BC}} = \frac{x}{\frac{x}{20} + \frac{x}{30}}$$

$$\text{or } v_{av} = \frac{20 \times 30}{20 + 30} = \frac{600}{50} = 12 \text{ m/s}$$

- 56.** (b) Given, $\mathbf{F} = 6\hat{i} - 8\hat{j} + 10\hat{k}$
- $$\therefore |\mathbf{F}| = \sqrt{(6)^2 + (-8)^2 + (10)^2}$$
- $$= \sqrt{36 + 64 + 100} = 10\sqrt{2} \text{ N}$$
- Also, $|\mathbf{a}| = 1 \text{ m/s}^2$
- Using, $F = ma$
- $$\Rightarrow 10\sqrt{2} = m \times 1 \Rightarrow m = 10\sqrt{2} \text{ kg}$$

- 57.** (c) \therefore Total time, $T = t_1 + t_2 + t_3$

Velocity of the bullet at point A ,

$$v_A = 0 \text{ m/s}, a = -10 \text{ m/s}^2$$

$$\therefore v = u + at$$

$$0 = 80 - 10t, \text{ or } t_1 = 8 \text{ s}$$

$$t_2 = t_1 \text{ (as there is no air resistance)}$$

Calculation of t_3

Velocity of the bullet at point B ,

$$v_B = u = 80 \text{ m/s}, b = 400 \text{ m}$$

$$\text{Using, } s = ut + \frac{1}{2}at^2$$

$$\Rightarrow 400 = 80 \times t_3 + \frac{1}{2} \times 10 \times t_3^2$$

$$\Rightarrow 5t_3^2 + 80t_3 - 400 = 0$$

$$\Rightarrow t_3^2 + 16t_3 - 80 = 0$$

$$\Rightarrow t_3^2 + 20t_3 - 4t_3 - 80 = 0$$

[by splitting the middle term]

$$\Rightarrow t_3(t_3 + 20) - 4(t_3 + 20) = 0$$

$$\Rightarrow t_3 = -20 \text{ s or } 4 \text{ s}$$

Time cannot be negative, hence $t_3 = 4 \text{ s}$

Total time, $T = 8 + 8 + 4 = 20 \text{ s}$

- 62.** (c) If two forces are applied on a standard body, then the resultant force,

$$F = \sqrt{(F_1)^2 + (F_2)^2} = \sqrt{3^2 + 4^2} = 5 \text{ N}$$

According to Newton's second law of motion,

$$F = ma$$

$$\Rightarrow a = \frac{F}{m} = \frac{5}{1} = 5 \text{ m/s}^2$$

\therefore The magnitude of the resultant acceleration is equal to 5 m/s^2 .

- 63.** (b) As we know, $F = ma$

where, $m =$ mass in kg

and $a =$ acceleration in m/s^2

$$\therefore 1 \text{ N} = (\text{kg}) (\text{m/s}^2) = 1 \text{ kg}\cdot\text{m/s}^2$$

- 66.** (a) Acceleration of the car is uniform. Therefore, according to first equation of motion, $v = u + at$

where, $v =$ final velocity of the car
 $= 50 \text{ m/s}$,

$a =$ acceleration of the car,

$t =$ time interval $= 25 \text{ s}$

and $u =$ initial velocity $= 0$

We know that, $v = u + at$

$$\therefore 50 = 0 + a \times 25 \Rightarrow a = 2 \text{ m/s}^2$$

Now, applying second equation of motion, we get

$$s = ut + \frac{1}{2}at^2 = 0 + \frac{1}{2}at^2$$

$$= \frac{1}{2} \times 2 \times 25 \times 25 = 625 \text{ m}$$

- 67.** (a) Let magnitude of the velocity of each body is v .

\therefore Momentum of A , $p_A = m_A v$

Similarly, momentum of B ,

$$p_B = m_B v$$

$$\therefore \frac{p_A}{p_B} = \frac{m_A}{m_B} = \frac{m_A}{2m_A} \quad [\because m_B = 2m_A]$$

$$\Rightarrow p_B = 2p_A$$

- 70.** (d) During motion from O to C and back to B , distance covered $d =$ actual path taken $= OC + BC$

$$= 60 \text{ km} + (60 - 35) \text{ km}$$

$$= 85 \text{ km}$$

Similarly, displacement,

$x =$ least distance between O and B

$$= OB = 35 \text{ km}$$

02

WORK, ENERGY AND POWER

Generally one question is asked from this chapter. This question is generally based on mechanical energy and newton's law of motion.

WORK

When a force acts on an object and the object actually moves in the direction of force, then the work is said to be done by the force.

Work done by a Constant Force

Work done by a constant force is equal to the product of the force and displacement of the object in the direction of force.

Work done = Force \times Displacement of the object in the direction of force

$$W = F \cdot s$$

or $W = Fs \cos \theta$

Work is a scalar quantity. Its SI unit is joule and CGS unit is erg.

$$1 \text{ joule} = 10^7 \text{ erg}$$

Types of Work

Work can be of three types

- (i) **Positive Work** If a force acting on an object has a component in the direction of displacement, then the work done by the force is positive.
- (ii) **Negative Work** If a force acting on an object has a component in the opposite direction of displacement, then the work done by the force is negative.
- (iii) **Zero Work** Work done by a force is zero, if the object gets displaced along a direction perpendicular to the direction of the applied force.

Conservative Force

A force is conservative, if the work done by the force in displacing an object from one point to another point is independent of the path followed by the object and depends only on the end points. e.g. Gravitational force, electrostatic force and elastic force of a spring are all conservative forces.

Non-conservative Force

If the amount of work done in moving an object against a force from one point to another point depends on the path along which the body moves, then such a force is called a non-conservative force. The work done in moving an object against a non-conservative force along a closed path is not zero.

e.g. Forces of friction and viscosity are non-conservative forces.

ENERGY

The energy of an object is defined as its capacity of doing work. Energy is a scalar quantity and its SI unit is joule.

There are several types of energies such as kinetic energy, potential energy, heat energy, sound energy, etc. Kinetic energy and potential energy are combinedly known as mechanical energy.

1. Kinetic Energy

The energy possessed by an object by virtue of its motion is called kinetic energy.

$$KE = \frac{1}{2}mv^2$$

where, m = mass of the object
and v = final velocity of the object

Relation between Kinetic Energy and Linear Momentum

We know that, $KE = \frac{1}{2}mv^2 = \frac{1}{2}\left(\frac{p}{v}\right)v^2$ [$\because p = mv$]

$$\therefore KE = \frac{1}{2}pv$$

$$\text{or } KE = \frac{p^2}{2m} \quad \left[\because v = \frac{p}{m} \right]$$

From above relation it is clear that an object cannot have kinetic energy without having momentum and *vice-versa*.

Work-Energy Theorem

This theorem states that work done by a force acting on an object is equal to the change in the kinetic energy of the object.

Work done = Change in kinetic energy

$$W = K_f - K_i$$

2. Potential Energy

The energy possessed by an object by virtue of its position or configuration is called potential energy.

There are three types of potential energy

- (i) **Gravitational Potential Energy** It is the potential energy associated with the state of separation of two objects which attract one another through the gravitational force.

For two objects of masses m_1 and m_2 separated by a distance r .

Gravitational potential energy,

$$U = -\frac{Gm_1m_2}{r}$$

- (a) If an object of mass m is at height h relative to surface of the earth, then gravitational potential energy,

$$U = \frac{mgh}{1 + \frac{h}{R}}$$

where, R = radius of the earth

and g = acceleration due to gravity at the surface of the earth

- (b) If $h \ll R$, then above formula reduces to $U = mgh$.

- (ii) **Elastic Potential Energy** It is the potential energy associated with the state of compression or extension of an elastic (spring like) object.

Elastic potential energy,

$$U = \frac{1}{2}kx^2 = \frac{1}{2}Fx = \frac{F^2}{2k}$$

- (iii) **Electrostatic Potential Energy** The energy due to the interaction between two electric charges is called electrostatic potential energy.

Electrostatic potential energy, $U = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2}$.

where, ϵ_0 is the permittivity of vacuum

When the object is projected upwards, then its kinetic energy goes on changing to potential energy and *vice-versa*.

Law of Conservation of Energy

According to law of conservation of energy, energy can only be transformed from one form to another, it can neither be created nor be destroyed. The total energy before and after transformation, always remains constant.

Law of Conservation of Mechanical Energy

This law states that, if only the conservative forces are doing work on an object, then the total mechanical energy (KE + PE) of the object remains constant.

$\therefore KE + PE = \text{constant}$

POWER

The rate of doing work or the rate at which energy is transferred or used or transformed is called power.

If work W is done in time t , then

$$\text{power, } P = \frac{\text{work}}{\text{time}}$$

$$\Rightarrow P = \frac{W}{t} = \frac{F \cdot s}{t} = F \cdot v = Fv \cos \theta$$

The SI unit of power is watt in honour of James Watt having the symbol W. We express larger rate of energy transfer in kilowatt (kW).

$$1 \text{ W} = 1 \text{ Js}^{-1}$$

$$\text{or } 1 \text{ kW} = 1000 \text{ W} = 1000 \text{ Js}^{-1}$$

$$\Rightarrow 1 \text{ MW} = 10^6 \text{ W}$$

$$1 \text{ HP (horse power)} = 746 \text{ (watt) W}$$

Commercial Unit of Energy

The commercial unit of electric energy is kilowatt-hour (kWh).

It is the amount of electric energy consumed by an appliance of power 100 W in one hour.

$$1 \text{ kWh} = 1 \text{ kW} \times 1 \text{ h} = 1000 \text{ W} \times 3600 \text{ s}$$

$$= 1000 \text{ Js}^{-1} \times 3600 \text{ s}$$

$$1 \text{ kWh} = 3.6 \times 10^6 \text{ J}$$

COLLISION

A collision is said to occur between two objects, either if they are physically collide against each other or if the path of one object is affected by the force exerted by the other object.

There are mainly two types of collision

1. **Elastic collision** If there is no loss of kinetic energy during a collision, then it is called an elastic collision.

Characteristics of elastic collisions are as follows

- (i) The kinetic energy is conserved.
- (ii) The momentum is conserved.
- (iii) Total energy is conserved.
- (iv) Forces involved during the collision are conservative.

2. **Inelastic collision** If there is a loss of kinetic energy during a collision, then it is called an inelastic collision.

Characteristics of inelastic collisions are as follows

- (i) The kinetic energy is not conserved.
- (ii) The momentum is conserved.
- (iii) Total energy is conserved.
- (iv) Some or all of the forces involved are non-conservative.

Law of Conservation of Momentum in Collision

If particles of masses m_1 and m_2 move with velocities u_1 and u_2 before collision and after collision with velocities v_1 and v_2 , then from law of conservation of momentum,

$$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$$

If an object of mass m strikes horizontally a wall with velocity v and bounces back with the same velocity, then the change in momentum = $2mv$.

Elastic Collision in One-dimension

Consider two perfectly elastic objects A and B of masses m_1 and m_2 moving along the same straight line with velocities u_1 , and u_2 , respectively.

Let $u_1 > u_2$ after some time, the two objects collide head-on and continue moving in the same direction with velocities v_1 and v_2 , respectively. The two objects will separate after the collision, if $v_2 > v_1$.

As linear momentum is conserved inelastic collision, so

$$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2 \quad \dots(i)$$

Elastic collision in one-dimension

Since, kinetic energy is also conserved in an elastic collision, so

$$\frac{1}{2} m_1 u_1^2 + \frac{1}{2} m_2 u_2^2 = \frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2 \quad \dots(ii)$$

After solving the above two equations, we get

$$v_1 = \left(\frac{m_1 - m_2}{m_1 + m_2} \right) u_1 + \left(\frac{2m_2}{m_1 + m_2} \right) u_2$$

$$v_2 = \left(\frac{m_2 - m_1}{m_1 + m_2} \right) u_2 + \left(\frac{2m_1}{m_1 + m_2} \right) u_1$$

Inelastic Collision in One-dimension

Consider an object of mass m_1 moving with velocity u_1 collides head-on with another object of mass m_2 at rest. After the collision, the two objects move together with a common velocity v .

As the linear momentum is conserved, so

$$m_1 u_1 + m_2 \times 0 = (m_1 + m_2) v \quad \dots(i)$$

or
$$v = \frac{m_1}{(m_1 + m_2)} u_1$$

The loss in kinetic energy on collision is

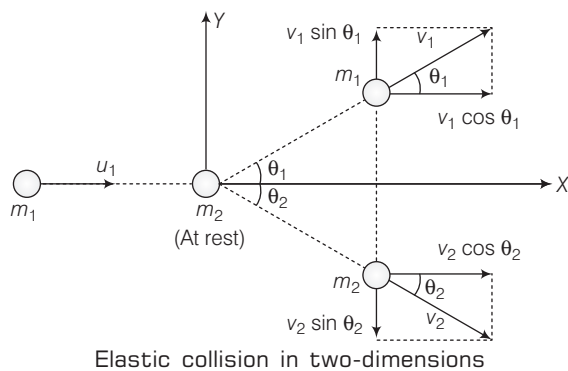

$$\begin{aligned} \Delta K &= K_i - K_f \\ &= \frac{1}{2} m_1 u_1^2 - \frac{1}{2} (m_1 + m_2) v^2 \quad \dots(ii) \end{aligned}$$

After putting the value of v in Eq. (ii), we get

$$\Delta K = \frac{1}{2} \frac{m_1 m_2}{(m_1 + m_2)} u_1^2$$

Elastic Collision in Two-dimensions

Suppose a particle of mass m_1 moving along X -axis with velocity u_1 collides with another particle of mass m_2 at rest. After the collision, let the two particles move with velocities v_1 and v_2 , making angles θ_1 and θ_2 with X -axis.

After the collision, the rectangular components of the momentum of m_1 are as below

- (i) $m_1 v_1 \cos \theta_1$, along +ve X -axis
- (ii) $m_1 v_1 \sin \theta_1$, along +ve Y -axis

After the collision, the rectangular components of the momentum of m_2 are as below

- (i) $m_2 v_2 \cos \theta_2$, along +ve X -axis
- (ii) $m_2 v_2 \sin \theta_2$, along +ve Y -axis

Applying the principle of conservation of momentum along X -axis,

$$m_1 u_1 = m_1 v_1 \cos \theta_1 + m_2 v_2 \cos \theta_2 \quad \dots(i)$$

The initial momentum of m_1 or m_2 along Y -axis is zero.

Applying the principle of conservation of momentum along Y -axis,

$$0 = m_1 v_1 \sin \theta_1 - m_2 v_2 \sin \theta_2 \quad \dots(ii)$$

As the KE is conserved in an elastic collision.

$$\text{So, } \frac{1}{2} m_1 u_1^2 = \frac{1}{2} m_1 v_1^2 + \frac{1}{2} m_2 v_2^2 \quad \dots(iii)$$

The four unknown quantities v_1, v_2, θ_1 and θ_2 can be calculated using the three Eqs. (i), (ii) and (iii). By measuring one of the four unknowns, say θ_1 experimentally the values of other three unknowns can be solved.

Coefficient of Restitution (e)

The ratio of relative velocity of particles after and before collision is known as coefficient of restitution.

$$\begin{aligned} e &= \frac{\text{Relative velocity of separation (after collision)}}{\text{Relative velocity of approach (before collision)}} \\ &= \frac{v_2 - v_1}{u_1 - u_2} \end{aligned}$$

For a perfectly elastic collision, $e = 1$.

For an inelastic collision, $e = 0$.

➤ PRACTICE EXERCISE

- When work is done on the body
 - it gains energy
 - it loses energy
 - its energy remains constant
 - None of the above
- Choose the wrong statement
 - Work done is a scalar quantity
 - Work done by a body does not depend on the time taken to complete the work
 - Work done can never be zero
 - SI unit of work is joule
- An object of mass 2 kg is lifted vertically through a distance of 1.5 m. The work done in process is
 - 29.4 J
 - 19.4 J
 - 17.4 J
 - 20.4 J
- The linear momentum (p) and kinetic energy (E) for a body of mass m are related as
 - $p = \sqrt{2mE}$
 - $p = \sqrt{\frac{2m}{E}}$
 - $p = \sqrt{\frac{E}{2m}}$
 - $p = 2mE$
- The energy associated with state of compression or expansion of an elastic spring is called its
 - rational kinetic energy
 - elastic potential energy
 - total energy
 - magnetic energy
- A body is thrown vertically upwards and then falls back on the ground. Its potential energy is maximum
 - on the ground
 - at the maximum height
 - during the return journey
 - Both on the ground and at the maximum height
- When a body falls freely
 - its PE is converted into KE
 - its KE is converted into PE
 - its mechanical energy is converted into heat energy
 - None of the above
- The SI unit of mechanical energy is
 - Joule
 - Watt
 - Newton-second
 - Joule-second
- A body is falling freely under the action of gravity alone in vacuum. Which one of the following remains constant during the fall?

- Potential energy
- Kinetic energy
- Total linear momentum
- Total mechanical energy

- The work done on an object does not depend upon the
 - displacement
 - force applied
 - final velocity
 - initial velocity
- Which of the following are the characteristics of an inelastic collision?
 - Momentum is conserved.
 - Total energy is conserved.
 - Kinetic energy is conserved.
 - All the forces must be of conservative nature.

Choose the correct answer from the codes given below

- Both III and IV
 - Both I and II
 - I, II and IV
 - Both II and IV
- For a perfectly elastic collision, the coefficient of restitution (e) is
 - 1
 - 1
 - 0
 - infinity
 - A force of 5 N acts through a distance 20 m in the direction of motion. The work done is
 - 50 J
 - 80 J
 - 100 J
 - zero
 - Which one of the following statements correctly defines power?
 - Energy supplied per unit time
 - Energy of an object due to its motion
 - Energy of an object due to its position
 - None of the above
 - Which one of the following diagrams illustrates the relation between kinetic energy (K) and the velocity (v) of a body?

- Mass of B is four times that of A . B moves with a velocity half that of A . Then, B has
 - kinetic energy equal to that of A
 - half the kinetic energy of A
 - twice the kinetic energy of A
 - kinetic energy one-fourth of A
- A 80 kg man runs up a staircase of 4m in 8 s. If the value of acceleration due to gravity is 10 m/s^2 , then his average power output is
 - 400 W
 - 800 W
 - 1600 W
 - 3200 W
- A 4 kg mass and a 1 kg mass are moving with equal kinetic energies. The ratio of their momenta is
 - 3 : 1
 - 1 : 3
 - 4 : 1
 - 2 : 1
- The power output of a machine that lifts a 600 kg weight through a height of 20 m in 1 min is
 - 1.96 kW
 - 0.98 kW
 - 12 kW
 - 3.92 kW
- A small ball is released from a height H as shown in the figure in a vertical circular track, so that it loops inside of the circular track of radius R . The value of H must be

- $\frac{2R}{3}$
- $\frac{3R}{2}$
- R
- $\frac{5R}{2}$

- The work done in time t on a body of mass M which is accelerated from rest to speed v in time t_1 as a function of time t is given by
 - $\frac{mvt^2}{2t_1}$
 - $\frac{mvt^2}{t_1}$
 - $\frac{mv^2t^2}{2t_1^2}$
 - $\frac{mv^2t_1^2}{2t^2}$

- 22.** A unloaded car moving with velocity u on a frictionless road can be stopped in a distance s . If the passengers add 40% to its weight and breaking force remains the same, then the stopping distance at velocity u is now

(a) $(1.4)^3 s$ (b) $\frac{1}{(1.4)^2} s$
 (c) $1.4 s$ (d) $(1.4)^2 s$

➤ Previous Years' Questions

- 23.** Power required by a boy of mass 30 kg to run up a staircase of 40 steps in 10 s is (height of each step is 15 cm) (take, $g = 10 \text{ m/s}^2$)

☑ 2013 (I)

- (a) 1800 W (b) 180 W
 (c) 18000 W (d) 18 W

- 24.** A particle is moving freely. Then, its ☑ 2013 (I)

- (a) kinetic energy is always greater than zero
 (b) potential energy is greater than zero and kinetic energy is less than zero
 (c) potential energy is less than zero and kinetic energy is greater than zero
 (d) potential energy is zero and kinetic energy is less than zero

- 25.** Which one among the following happens when a swing rises to a certain height from its rest position? ☑ 2015 (I)

- (a) Its potential energy decreases while kinetic energy increases
 (b) Its kinetic energy decreases while potential energy increases
 (c) Both potential and kinetic energy decreases
 (d) Both potential and kinetic energy increases

- 26.** Conservation of momentum in a collision between particles can be understood on the basis of

☑ 2015 (II)

- (a) Newton's first law of motion
 (b) Newton's second law of motion
 (c) Both Newton's second law of motion and Newton's third law of motion
 (d) conservation of energy

➤ ANSWERS

➤ Solutions

- 16.** (b) Given, $m_B = 4m_A \Rightarrow v_B = \frac{v_A}{2}$
- $$\therefore (\text{KE})_B = \frac{1}{2} m_B v_B^2 = \frac{1}{2} (4m_A) \left(\frac{v_A}{2}\right)^2$$
- $$= \frac{1}{2} \times 4m_A \times \frac{v_A^2}{4}$$
- $$\Rightarrow (\text{KE})_B = \frac{1}{2} \times \frac{1}{2} m_A v_A^2 = \frac{1}{2} (\text{KE})_A$$
- $$\Rightarrow (\text{KE})_B = \frac{1}{2} (\text{KE})_A$$
- 17.** (a) Given, $m = 80 \text{ kg}$, $g = 10 \text{ m/s}^2$
 $h = 4 \text{ m}$, $t = 8 \text{ s}$, $P = ?$
- $$\therefore \text{Average power} = \frac{\text{Work done}}{\text{Time}} = \frac{mgh}{t}$$
- $$[\because W = mgh]$$
- $$= \frac{80 \times 10 \times 4}{8} = 400 \text{ W}$$
- 18.** (d) Given, $m_1 = 4 \text{ kg}$, $m_2 = 1 \text{ kg}$
- According to question,
- $$K_1 = K_2$$
- The ratio of their momentum is $\frac{p_1}{p_2}$
- $$= \frac{K_1 m_1}{K_2 m_2} \quad \left[\because K = \frac{p^2}{2m} \right]$$
- $$\Rightarrow \frac{p_1}{p_2} = \sqrt{\frac{4}{1}} \Rightarrow p_1 : p_2 = 2 : 1$$

- 19.** (a) Given, $m = 600 \text{ kg}$, $h = 20 \text{ m}$,
 $t = 1 \text{ min} = 60 \text{ s}$, $P = ?$
- We know that,
- $$\text{power} = \frac{\text{work done}}{\text{time}} = \frac{mgh}{t}$$
- $$[\because W = mgh]$$
- $$= \frac{600 \times 9.8 \times 20}{60}$$
- $$= 1960 \text{ W} = 1.96 \text{ kW}$$
- 20.** (d) At the lowest point,
- $$mgH = \frac{1}{2} mv^2$$
- $$mgH = \frac{1}{2} m(\sqrt{5Rg})^2 \quad [\because v = \sqrt{5Rg}]$$
- $$gH = \frac{1}{2} \times 5Rg$$
- $$\Rightarrow H = \frac{5R}{2}$$
- 21.** (c) Using $v = u + at$, we have
- $$v = 0 + at_1 \quad [\because u = 0]$$
- or
- $$a = \frac{v}{t_1} \quad \dots(i)$$
- $$\therefore F = ma = \frac{mv}{t_1} \quad [\text{from Eq.(i)}]$$
- $$\therefore \text{Distance travelled, } s = ut + \frac{1}{2} at^2$$

$$= 0 + \frac{1}{2} \left(\frac{v}{t_1}\right) t^2 \quad [\text{from Eq.(i)}]$$

$$= \frac{vt^2}{2t_1}$$

$$\therefore \text{Work done, } W = Fs$$

$$= \frac{mv}{t_1} \times \frac{vt^2}{2t_1} = \frac{1}{2} \frac{mv^2 t^2}{t_1^2}$$

- 22.** (c) Let initial mass of the passengers be $m \text{ kg}$ and breaking force be F .
- $$\therefore \frac{1}{2} mu^2 = F \times s \quad \dots(i)$$
- On increasing mass by 40%
- $$m' = 1.4 m$$
- Now, $\frac{1}{2} (1.4m)u^2 = F \times s' \quad \dots(ii)$
- On dividing Eq. (i) by Eq. (ii), we get
- $$1.4 = \frac{s'}{s} \text{ or } s' = 1.4 s$$

- 23.** (b) Total height reached by boy
- $$= 40 \times \frac{15}{100} = 6 \text{ cm}$$
- As we know,
- $$\text{power} = \frac{\text{work done}}{\text{time}} = \frac{mgh}{t}$$
- $$= \frac{30 \times 10 \times 6}{10}$$
- Power = 180 W

03

CENTRE OF MASS AND ROTATIONAL MOTION

No question has been asked from this chapter till now, but there is always a possibility that questions may be asked from this chapter. So, pay attention to centre of mass and moment of inertia.

RIGID BODY

A rigid body is defined as that body which does not undergo any change in shape or volume when external forces are applied on it. When a force is applied on a rigid body, then the distance between any two particles of the body will remain unchanged, however larger the forces may be.

Centre of Mass (CM)

The centre of mass of a body is a point, where the whole mass of the body is supposed to be concentrated.

Centre of mass of two particles system consisting of two particles of masses m_1 and m_2 and respective position vectors r_1 and r_2 is given by

$$r_{CM} = \frac{m_1 r_1 + m_2 r_2}{m_1 + m_2}$$

$$\text{If } m_1 = m_2 = m, \text{ then } r_{CM} = \frac{r_1 + r_2}{2}$$

Thus, the centre of mass of two equal masses lies exactly at the centre of the line joining the two masses.

- For a system consisting of N -particles, let the mass of the i th particle be m_i and its coordinates with reference to the chosen axes be x_i, y_i and z_i .

$$\text{Then, } x_{CM} = \frac{1}{M} \sum_i m_i x_i, y_{CM} = \frac{1}{M} \sum_i m_i y_i$$

$$\text{and } z_{CM} = \frac{1}{M} \sum_i m_i z_i$$

$$\text{For continuous bodies, } x = \frac{1}{M} \int x dm, y = \frac{1}{M} \int y dm$$

$$\text{and } z = \frac{1}{M} \int z dm$$

- The centre of mass of sphere, cylinder and ring is at its geometric centre.
- The centre of mass may lie outside the body when there is no material as in case of ring, hollow sphere, hollow cylinder, etc.

Location of Centre of Mass for Different Bodies

Centre of mass for different bodies are given below

- For uniform rod, $x_{CM} = \frac{l}{2}$, $y_{CM} = 0$ and $z_{CM} = 0$
- Centre of mass of a uniform rectangular square or circular plate lies at its centre.
- For uniform semicircular ring, $y_{CM} = \frac{2R}{\pi}$, $x_{CM} = 0$ and $z_{CM} = 0$
- For uniform semicircular disc, $y_{CM} = \frac{4R}{3\pi}$, $x_{CM} = 0$ and $z_{CM} = 0$

- For hemispherical shell, $y_{CM} = \frac{R}{2}$, $x_{CM} = 0$ and $z_{CM} = 0$
- For solid hemisphere, $y_{CM} = \frac{3R}{8}$ and $x_{CM} = 0$ and $z_{CM} = 0$
- If a body falling under gravity explodes into pieces, then the centre of mass of the system remains along the same vertical line.
- Centre of mass and centre of gravity of a regular body coincide.

MOTION OF RIGID BODY

Motion of rigid body have two types

- Translational Motion** Translational motion is the motion by which a body shifts from one point in space to another point. One example of translational motion is the motion of bullet fired from a gun.
- Rotational Motion** A body is said to possess rotational motion, if all its particles move along circles in parallel lines. The centres of these circle lie on a fixed line perpendicular to the parallel lines and this fixed line is called the axis of rotation.

Equivalence between Rotational and Linear Motion

S. No.	Translational Motion	Rotational Motion
1.	Inertia or mass (M)	Moment of inertia (I) = MR^2
2.	Displacement = \mathbf{s} or \mathbf{r}	angular displacement θ
3.	Linear velocity $\mathbf{v} = \frac{d\mathbf{s}}{dt} = \frac{d\mathbf{r}}{dt}$	angular velocity $\omega = \frac{d\theta}{dt}$
4.	Linear acceleration $\mathbf{a} = \frac{d\mathbf{v}}{dt} = \frac{d^2\mathbf{s}}{dt^2}$	angular acceleration $\alpha = \frac{d\omega}{dt} = \frac{d^2\theta}{dt^2}$
5.	Linear momentum (i) $\mathbf{p} = m\mathbf{v}$ (ii) $p = \sqrt{2mE_k}$	angular momentum (i) $\mathbf{L} = I\omega$ (ii) $\mathbf{L} = \mathbf{r} \times \mathbf{p}$ (iii) $\mathbf{L} = \sqrt{2IE_r}$
6.	Force (\mathbf{F}) (i) $\mathbf{F} = m\mathbf{a}$ (ii) $\mathbf{F} = \frac{d\mathbf{p}}{dt}$	Torque (τ) (i) $\tau = I\alpha$ (ii) $\tau = \frac{dL}{dt}$ (iii) $\tau = \mathbf{r} \times \mathbf{F}$
7.	Work (W) (i) $W = \mathbf{F}\mathbf{s} = \int \mathbf{F} \cdot d\mathbf{s}$ (ii) $W = \frac{1}{2}M(v_2^2 - v_1^2)$	work (W_r) (i) $W_r = \tau \cdot \theta = \int \tau \cdot d\theta$ (ii) $W_r = \frac{1}{2}I(\omega_2^2 - \omega_1^2)$
8.	Linear Impulse $\mathbf{F} \cdot (dt) = \Delta\mathbf{p}$	angular Impulse $\tau \cdot (dt) = \Delta L$
9.	Power (P) (i) $P = dW/dt$ (ii) $P = \mathbf{F} \cdot \mathbf{v}$	angular power (P_r) (i) $P_r = \frac{dW_r}{dt}$ (ii) $P = \tau \cdot \omega$
10.	Linear kinetic energy (i) $E_k = \frac{1}{2}Mv^2$ (ii) $E_k = P^2/2M$	angular kinetic energy (i) $E_r = \frac{1}{2}I\omega^2$ (ii) $E_r = \frac{L^2}{2I}$

S. No.	Translational Motion	Rotational Motion
11.	Newton law in linear motion (i) First law when, $F = 0$, then $v = \text{constant}$ (ii) Second law $\mathbf{F} = \frac{d\mathbf{p}}{dt}$, $\mathbf{F} = m\mathbf{a}$ (iii) Third law $\mathbf{F}_{12} = -\mathbf{F}_{21}$	Newton law in angular motion (i) first law, when $\tau = 0$ then $\omega = \text{constant}$ (ii) second law, $\tau = \frac{dL}{dt}$, $\tau = I\alpha$ (iii) third law, $\tau_{12} = -\tau_{21}$
12.	Distance covered in n second $S_n = u + \frac{1}{2}a(2n - 1)$	distance covered in n second $\theta_n = \omega_0 + \frac{1}{2}\alpha(2n - 1)$
13.	Linear motion equaitons (i) $v = u + at$ (ii) $s = ut + \frac{1}{2}at^2$ (iii) $v^2 = u^2 + 2as$	Rotational motion equations (i) $\omega = \omega_0 + \frac{1}{2}\alpha t$ (ii) $\theta = \omega_0 t + \frac{1}{2}\alpha t^2$ (iii) $\omega^2 = \omega_0^2 + 2\alpha\theta$

MOMENT OF INERTIA

Moment of inertia of a body with respect to an axis of rotation is the product of the mass (m) and the square of perpendicular distance from axis of rotation (r). Moment of inertia, $I = mr^2$.

The moment of inertia of the rigid body, $I = \Sigma mr^2$. Its SI unit is kgm^2 . Moment of inertia is the property of a body due to which it opposes any change its state of rest or uniform motion.

The moment of inertia of a body depends on

- Mass of the body.
- Size and shape of the body.
- Distribution of mass about the axis of rotation.
- Position and orientation of the axis of rotation w.r.t. the body.

Radius of Gyration

The radius of gyration of a body about its axis of rotation may be defined as the distance from the axis of rotation at which, if the whole mass of the body were concentrated, its moment of inertia about the given axis would be same as with the actual distribution of mass.

Thus, radius of gyration, $K = \sqrt{\frac{I}{M}}$

$$\text{or } K = \left[\frac{r_1^2 + r_2^2 + r_3^2 + \dots + r_n^2}{n} \right]^{\frac{1}{2}}$$

The SI unit of radius of gyration is metre.

Radius of gyration depends upon the shape and size of the body, position and configuration of the axis of rotation and also on distribution of mass of body w.r.t. axis of rotation.

Theorems on Moment of Inertia

There are two theorems in moment of inertia, i.e. theorem of parallel axes and theorem of perpendicular axes.

1. Theorem of Parallel Axes

Moment of inertia of a body about a given axis I is equal to the sum of moment of inertia of the body about an axis parallel to given axis and passing through centre of mass of the body I_g and Ma^2 , where M is the mass of the body and a is the perpendicular distance between the two axes.

$$I = I_g + Ma^2$$

e.g. Moment of inertia of a disc about an axis through its centre and perpendicular to the plane is $\frac{1}{2}MR^2$, so

moment of inertia of the disc about an axis through its tangent and perpendicular to the plane will be

$$I = I_g + Ma^2$$

$$I = \frac{1}{2}MR^2 + MR^2$$

$$\therefore I = \frac{3}{2}MR^2$$

2. Theorem of Perpendicular Axes

According to this theorem, the sum of moment of inertia of a plane lamina about two mutually perpendicular axes lying in its plane is equal to its moment of inertia about an axis perpendicular to the plane of lamina and passing through the point of intersection of first two axes.

$$I_z = I_x + I_y$$

e.g. Moment of inertia of a disc about an axis through its centre of mass and perpendicular to its plane is $\frac{1}{2}MR^2$, if

the disc is in xy -plane, then by theorem of perpendicular axes,

$$I_z = I_x + I_y$$

where,
$$I_z = \frac{MR^2}{2} \Rightarrow \frac{1}{2}MR^2 = 2I_D$$

[as disc is symmetrical body, so $I_x = I_y = I_D$]

Moment of Inertia of Some Regular Bodies

S. No.	Name of Body	Axis of Rotation	Formula
1.	Circular disc	(i) About diameter	$I = \frac{MR^2}{4}$
		(ii) About an axis passing through its CM and perpendicular to the plane of disc	$I = \frac{MR^2}{2}$
		(iii) About any tangent (parallel to diameter)	$I = \frac{5MR^2}{4}$
2.	Solid cylinder	(i) About its geometrical axis	$I = \frac{MR^2}{2}$
		(ii) About an axis passing through its CM and perpendicular to the length	$I = \left(\frac{ML^2}{12}\right) + \left(\frac{MR^2}{4}\right)$
3.	Hollow cylinder	(i) About its geometrical axis	$I = \frac{1}{2}M(R_1^2 + R_2^2)$
		(ii) About an axis passing through its CM and perpendicular to the length	$I = \frac{1}{4}M(R_1^2 + R_2^2) + \left(\frac{ML^2}{12}\right)$
4.	Hollow sphere	(i) About diameter	$I = \frac{2}{5}M\left(\frac{R_2^5 - R_1^5}{R_2^3 - R_1^3}\right)$
		(ii) About tangent	$I = \frac{2}{5}M\left(\frac{R_2^5 - R_1^5}{R_2^3 - R_1^3}\right) + MR_2^2$
5.	Solid sphere	(i) About diameter	$I = \frac{2}{5}MR^2$
		(ii) About tangent	$I = \frac{7}{5}MR^2$
6.	Thin rod	(i) About the mid-point of the rod perpendicular to length	$I = \frac{ML^2}{12}$
		(ii) About one end of the rod	$I = \frac{ML^2}{3}$
7.	Thin circular ring	(i) About diameter	$I = \frac{MR^2}{2}$
		(ii) About an axis passing through its CM of the ring and perpendicular to the plane of ring	$I = MR^2$
		(iii) About tangent (parallel to diameter)	$I = \frac{3}{2}MR^2$

TORQUE

The turning effect of a force about the axis of rotation is known as torque. It is measured as the product of the magnitude of the force and the perpendicular distance of the line of action of the force from the axis of rotation.

When a force F acts at point, whose position vector is r , then torque due to force is given by

$$\tau = r \times F$$

The torque is also known as moment of force. It is a vector quantity. The SI unit of torque is N-m.

Angular Momentum

The angular momentum of particle is defined as the cross product of position with respect to origin and linear momentum of the particle.

angular momentum (\mathbf{L}) = $\mathbf{r} \times \mathbf{p} = rp \sin \theta \hat{n}$.

Relation between Torque and Angular Momentum

We know that,

torque, $\tau = \mathbf{r} \times \mathbf{F}$

angular momentum, $\mathbf{L} = \mathbf{r} \times \mathbf{p}$

On differentiating both sides w.r.t. time t , we get

$$\begin{aligned} \frac{d\mathbf{L}}{dt} &= \frac{d}{dt}(\mathbf{r} \times \mathbf{p}) = \frac{d\mathbf{r}}{dt} \times \mathbf{p} + \mathbf{r} \times \frac{d\mathbf{p}}{dt} \\ &= \mathbf{v} \times \mathbf{p} + \mathbf{r} \times \mathbf{F} \quad [\because \frac{d\mathbf{p}}{dt} = \mathbf{F}] \end{aligned}$$

$= 0 + \tau$ [$\because \mathbf{v} \times \mathbf{p} = \mathbf{v} \times m\mathbf{v} = 0$]

$\therefore \tau = \frac{d\mathbf{L}}{dt}$

Thus, the torque acting on a particle is equal to its rate of change of angular momentum.

Conservation of Angular Momentum

The law of conservation of angular momentum states that if there is no external torque acting on the body, then the total angular momentum will remain unchanged.

i.e. angular momentum will remain conserved.

If $\tau = \frac{d\mathbf{L}}{dt} = 0$

$\Rightarrow \mathbf{L}_{\text{initial}} = \mathbf{L}_{\text{final}}$

In other form we can also write

$L = I\omega = \text{constant}$

ROTATIONAL KINETIC ENERGY

The energy, which is possessed by the rotation of body, known as rotational kinetic energy. It is represented by K_R .

$K_R = \frac{1}{2}I\omega^2$, where, ω = angular velocity

ROLLING MOTION

In this type of rotational motion, axis of rotation is in motion. Plane motion can be considered as combination of translational motion of the centre of mass and rotational motion of the body about an axis passing through the centre of mass.

Body possess both translational and rotational kinetic energy.

Net kinetic energy = (Translatory + Rotatory) kinetic energy

$K_N = K_T + K_R = \frac{1}{2}mv^2 + \frac{1}{2}I\omega^2 = \frac{1}{2}mv^2 + \frac{1}{2}mv^2 \frac{K^2}{R^2}$

$\therefore K_N = \frac{1}{2}mv^2 \left(1 + \frac{K^2}{R^2} \right)$

Rolling motion on Inclined Plane If the radius and mass of an object are R and m and the vertical height of inclined plane is h . It performs rolling motion on inclined plane, then following conditions occur

Motion / Physical Quantity	Velocity	Acceleration	Time of Descend
Rolling motion	$v_r = \sqrt{\left(\frac{2gh}{\beta} \right)}$ $= \sqrt{\left(\frac{2gh}{1 + K^2/R^2} \right)}$	$a_r = \frac{g \sin \theta}{\beta}$ $= \frac{g \sin \theta}{\left(1 + \frac{K^2}{R^2} \right)}$	$T_r = \frac{1}{\sin \theta} \sqrt{\left(\frac{2h\beta}{g} \right)}$
Sliding motion	$v_s = \sqrt{2gh}$	$a_s = g \sin \theta$	$T_s = \frac{1}{\sin \theta} \sqrt{\left(\frac{2h}{g} \right)}$
Falling motion	$v_f = \sqrt{2gh}$	$a_f = g$	$T_f = \sqrt{\left(\frac{2h}{g} \right)}$

PRACTICE EXERCISE

- Angular momentum is
 - moment of momentum
 - product of mass and angular velocity
 - product of moment of inertia and velocity
 - moment in angular motion
- Radius of gyration of a body depends on
 - mass and size of body
 - mass distribution and axis of rotation
 - size of body
 - mass of body
- A force of $-F \hat{k}$ acts on O , the origin of the coordinate system. The torque about the point $(1, -1)$ is

- $F(\hat{i} - \hat{j})$
 - $-F(\hat{i} + \hat{j})$
 - $F(\hat{i} + \hat{j})$
 - $-F(\hat{i} - \hat{j})$
- The centre of mass of a body
 - lies always outside the body
 - may lie within, outside on the surface of the body
 - lies always inside the body
 - lies always on the surface of the body
 - Moment of inertia of a disc about its own axis is I . Its moment of inertia about a tangential axis in its plane is
 - $\frac{5}{2}I$
 - $3I$
 - $\frac{3}{2}I$
 - $2I$
 - A sphere rolls down on an inclined plane of inclination θ . What is the acceleration as the sphere reaches bottom
 - $\frac{5}{7}g \sin\theta$
 - $\frac{3}{5}g \sin\theta$
 - $\frac{2}{7}g \sin\theta$
 - $\frac{2}{5}g \sin\theta$

- One circular ring and one circular disc, both are having the same mass and radius. The ratio of their moment of inertia about the axes passing through their centres and perpendicular to their planes, will be
 - 1 : 1
 - 2 : 1
 - 1 : 2
 - 4 : 1
- A thin wire of length l and mass m is bent in the form of a semicircle. Its moment of inertia about an axis joining its free ends will be
 - zero
 - ml^2
 - $\frac{ml^2}{\pi^2}$
 - $\frac{ml^2}{2\pi^2}$

- Three masses are placed on the X-axis, 300 g at origin, 500 g at $x = 40$ cm and 400 g at $x = 70$ cm. The distance of mass from the origin is
 - 40 cm
 - 45 cm
 - 50 cm
 - 30 cm
- A sphere of mass 10kg and radius 0.5 m rotates about a tangent. The moment of inertia of the solid sphere is
 - $5 \text{ kg}\cdot\text{m}^2$
 - $2.7 \text{ kg}\cdot\text{m}^2$
 - $3.5 \text{ kg}\cdot\text{m}^2$
 - $4.5 \text{ kg}\cdot\text{m}^2$
- The moment of inertia of a straight line rod of mass M and length l about an axis perpendicular to its length and passing through its one end, is
 - $Ml^2/12$
 - $Ml^2/3$
 - $Ml^2/2$
 - ml^2
- A wheel of mass 10 kg has a moment of inertia of $160 \text{ kg}\cdot\text{m}^2$ about its own axis, the radius of gyration will be
 - 10 m
 - 8 m
 - 6 m
 - 4 m
- A solid cylinder has mass M , length L and radius R . The moment of inertia of this cylinder about a generator is
 - $M\left(\frac{L^2}{12} + \frac{R^2}{4}\right)$
 - $\frac{ML^2}{4}$
 - $\frac{1}{2}MR^2$
 - $\frac{3}{2}MR^2$

- The radius of gyration of a solid cylinder of mass M and radius R about its own axis is
 - $R/\sqrt{2}$
 - $R/2$
 - $R/\sqrt{3}$
 - $R/3$
 - The ratio of the radii of gyration of a circular disc and a circular ring of the same radii about a tangential axis perpendicular to plane of disc of ring is
 - 1 : 2
 - $\sqrt{5} : \sqrt{6}$
 - 2 : 3
 - $\frac{\sqrt{3}}{2}$
 - A particle performing uniform circular motion has angular momentum L . If its angular frequency is doubled and its kinetic energy halved, then the new angular momentum is
 - $\frac{L}{4}$
 - $2L$
 - $4L$
 - $\frac{L}{2}$
 - Consider a two particles system with particles having masses m_1 and m_2 . If the first particle is pushed towards the centre of mass through a distance d , by what distance should the second particle be moved, so as to keep the centre of mass at the same position?
 - $\frac{m_2 d}{m_1}$
 - $\frac{m_1 d}{m_1 + m_2}$
 - $\frac{m_1 d}{m_2}$
 - d
 - A particle of mass 2 kg is moving such that at a time t , its position in metre, is given by $\mathbf{r}(t) = 5\hat{i} - 2t^2\hat{j}$. The angular momentum of the particle at $t = 2\text{s}$ about the origin in $\text{kg m}^{-2}\text{s}^{-1}$ is
 - $-80\hat{k}$
 - $(10\hat{i} - 16\hat{j})$
 - $-40\hat{k}$
 - $40\hat{k}$
- Directions** (Q. Nos. 19 and 20) In each of the following questions a statement of Assertion is given followed by a corresponding statement of Reason just below it. Of the statement mark the correct answer as
- If both Assertion and Reason are true and Reason is the correct explanation of Assertion

- (b) If both Assertion and Reason are true but Reason is not the correct explanation of Assertion
 (c) If Assertion is true but Reason is false
 (d) If both Assertion and Reason are false

- 19. Assertion** For a system of particles under central force field, the total angular momentum is conserved.
Reason The torque acting on such a system is zero.

- 20. Assertion** The total kinetic energy of a rolling solid sphere is the sum of translational and rotational kinetic energies.
Reason For all solid bodies, total kinetic energy is always twice translational kinetic energy.

ANSWERS

1	a	2	b	3	c	4	b	5	a	6	a	7	b	8	d	9	a	10	c
11	b	12	d	13	d	14	a	15	d	16	a	17	a	18	a	19	c	20	c

Solutions

- 5.** (a) Moment of inertia of disc about a tangent in a plane = $\frac{5}{4}MR^2 = \frac{5}{4}(2I) = \frac{5}{2}I$

- 6.** (a) We know that,

$$a = \frac{g \sin \theta}{1 + \frac{K^2}{R^2}} = \frac{g \sin \theta}{1 + \frac{2}{5}} = \frac{5}{7}g \sin \theta$$

- 7.** (b) $\therefore \frac{I_{\text{ring}}}{I_{\text{disc}}} = \frac{MR^2}{1/2MR^2} = 2:1$

- 8.** (d) For semicircle, $\pi r = l$

$$\therefore r = \frac{l}{\pi}$$

Moment of inertia,

$$I = \frac{mr^2}{2} = \frac{m}{2} \left(\frac{l}{\pi} \right)^2 = \frac{m l^2}{2 \pi^2}$$

- 9.** (a) $X_{\text{CM}} = \frac{m_1 x_1 + m_2 x_2 + m_3 x_3}{m_1 + m_2 + m_3}$
 $= \frac{300 \times 0 + 500 \times 40 + 400 \times 70}{300 + 500 + 400}$

$$X_{\text{CM}} = \frac{500 \times 40 + 400 \times 70}{1200}$$

$$X_{\text{CM}} = 40 \text{ cm}$$

- 10.** (c) $I = \frac{7}{5}MR^2 = \frac{7}{5} \times 10 \times (0.5)^2$
 $= 3.5 \text{ kg-m}^2$

- 12.** (d) Given, $M = 10 \text{ kg}$,

$$I = MK^2 = 160 \text{ kg-m}^2$$

$$\Rightarrow K^2 = \frac{160}{M}$$

$$= \frac{160}{10} = 16$$

$$\Rightarrow K = 4 \text{ m}$$

- 13.** (d) Generator axis of a cylinder is a line lying on its surface and parallel to axis of cylinder.

By parallel axes theorem.

$$I = \frac{MR^2}{2} + MR^2 = \frac{3}{2}MR^2$$

- 14.** (a) The moment of inertia of a solid cylinder of mass M and radius R about its own axis is

$$I = \frac{MR^2}{2} \quad \dots(i)$$

$$\text{As, } I = MK^2 \quad \dots(ii)$$

where, K is the radius of gyration

From Eqs. (i) and (ii), we get

$$K^2 = \frac{R^2}{2} \text{ or } K = \frac{R}{\sqrt{2}}$$

- 15.** (d) We know that, radius of gyration,

$$K = \sqrt{\frac{I}{m}}$$

$$\therefore K_{\text{disc}} = \sqrt{\frac{\frac{1}{2}mR^2 + mR^2}{m}} = \sqrt{\frac{3}{2}}R$$

$$\text{and } K_{\text{ring}} = \sqrt{\frac{mR^2 + mR^2}{m}} = \sqrt{2}R$$

$$\therefore \frac{K_{\text{disc}}}{K_{\text{ring}}} = \frac{\sqrt{\frac{3}{2}}R}{\sqrt{2}R} = \frac{\sqrt{3}}{2}$$

- 16.** (a) We know that, angular momentum,

$$L = I\omega \quad \dots(i)$$

$$\text{and kinetic energy, } KE = \frac{1}{2}I\omega^2 = \frac{1}{2}L\omega$$

[from Eq. (i)]

$$\therefore L = \frac{2KE}{\omega}$$

$$\text{Now, } L' = \frac{2 \left(\frac{KE}{2} \right)}{2\omega} \Rightarrow L' = \frac{L}{4}$$

- 17.** (a) To keep the centre of mass at the same position, velocity of centre of mass is zero, so

$$\frac{m_1 \mathbf{v}_1 + m_2 \mathbf{v}_2}{m_1 + m_2} = 0$$

where, \mathbf{v}_1 and \mathbf{v}_2 are velocities of particles 1 and 2, respectively.

$$\Rightarrow m_1 \frac{d\mathbf{r}_1}{dt} + m_2 \frac{d\mathbf{r}_2}{dt} = 0$$

$$\Rightarrow m_1 d\mathbf{r}_1 + m_2 d\mathbf{r}_2 = 0$$

$$\left[\because \mathbf{v}_1 = \frac{d\mathbf{r}_1}{dt} \text{ and } \mathbf{v}_2 = \frac{d\mathbf{r}_2}{dt} \right]$$

$d\mathbf{r}_1$ and $d\mathbf{r}_2$ represent the change in displacement of particles. Let second particle has been displaced by distance x .

$$\Rightarrow m_1(d) + m_2(x) = 0$$

$$\text{or } x = -\frac{m_1 d}{m_2}$$

- 18.** (a) Given, $m = 2 \text{ kg}$, $\mathbf{r}(t) = 5\hat{i} - 2t^2\hat{j}$

We know that, angular momentum, $L = \mathbf{r} \times \mathbf{p}$

$$\therefore \text{Velocity, } \mathbf{v} = \frac{d\mathbf{r}}{dt} = \frac{d}{dt}(5\hat{i} - 2t^2\hat{j}) = -8\hat{j}$$

[at $t = 2\text{s}$]

$$\therefore \mathbf{p} = m\mathbf{v} = 2 \times (-8) = -16\hat{j}$$

Therefore,

$$L = \mathbf{r} \times \mathbf{p} = (5\hat{i} - 2t^2\hat{j}) \times (-16\hat{j})$$

[at $t = 2\text{s}$]

$$= -80\hat{k}$$

04

GRAVITATION

Usually 3 to 4 questions are asked from this chapter. These questions are mainly based on acceleration due to gravity and Newton's law of gravitation. So, this chapter is important for the examination.

GRAVITATION

Every object in the universe attracts every other object with a force which is known as force of gravitation. Gravitation is the force of attraction between any two objects in the universe.

Universal Law of Gravitation (Newton's Law)

The universal law of gravitation was given by **Issac Newton**. According to this law, the attractive force between any two objects in the universe is directly proportional to the product of their masses and inversely proportional to the square of distance between them.

Consider two bodies A and B having masses M and m , whose centres are at a distance r from each other.

i.e. Gravitational force, $F \propto \frac{Mm}{r^2}$

$$F = G \frac{Mm}{r^2}$$

where, $G = 6.67 \times 10^{-11} \text{ N-m}^2/\text{kg}^2$ and is called as universal gravitational constant.

ACCELERATION DUE TO GRAVITY (g)

Whenever an object falls towards the earth an acceleration is involved. This acceleration is due to the earth's gravitational pull and hence is called acceleration due to gravity or acceleration due to the gravitational force of the earth.

Acceleration due to gravity, $g = \frac{GM_e}{R_e^2}$

where, M_e = mass of the earth

R_e = radius of the earth

The value of the g on the surface of the earth is equal to 9.8 m/s^2 .

Variation in the Value of g

1. The value of g is minimum at equator and maximum at poles (it happens due to shape of the earth).
2. The observed value of g at the latitude λ is $g' = g - R_e \omega^2 \cos^2 \lambda$

At equator, $\lambda = 0^\circ$, $\cos \lambda = \cos 0^\circ = 1$, $g' = g_e$

$$g_e = g - R_e \omega^2$$

At pole, $\lambda = 90^\circ$, $\cos x = 0$, $g' = g_p$

3. The value of g at height h above the earth's surface

$$\text{decreases, } g' = \frac{g}{\left(1 + \frac{h}{R_e}\right)^2} \approx g \left(1 - \frac{2h}{R_e}\right)$$

4. The value of g at depth d below the earth's surface

$$\text{decreases, } g' = g \left(1 - \frac{d}{R_e}\right)$$

5. The value of g varies due to non-uniformity of the earth (density of the earth).

Gravitational Field

The space surrounding the material body in which its gravitational force of attraction can be experienced is called gravitational field.

Intensity of Gravitational Field

The intensity of gravitational field at a point is equal to the force acting on the unit mass at that point. Intensity of gravitational field is given by $\frac{GM}{r^2}$.

Its SI unit is N/kg.

Gravitational Potential

Gravitational potential at a point in gravitational field is equal to the work done in carrying a unit mass from infinity to that point. Gravitational potential due to mass m at a distance r is $V = -\frac{GM}{r}$

Gravitational Intensity and Potential due to a Solid and Spherical Shell

Solid Sphere

For these calculations, we will assume the sphere is placed at its own centre.

$$\begin{aligned} \text{(i)} \quad E_{\text{outside}} &= \frac{-GM}{r^2}, & V_{\text{outside}} &= \frac{-GM}{r} \\ \text{(ii)} \quad E_{\text{surface}} &= \frac{-GM}{R^2}, & V_{\text{surface}} &= \frac{-GM}{R} \\ \text{(iii)} \quad E_{\text{inside}} &= \frac{-GM}{R^3}r, & V_{\text{inside}} &= \frac{-GM}{2R^3}(3R^2 - r^2) \end{aligned}$$

Spherical Shell

$$\begin{aligned} \text{(i)} \quad E_{\text{outside}} &= \frac{-GM}{r^2}, & V_{\text{outside}} &= \frac{-GM}{r} \\ \text{(ii)} \quad E_{\text{surface}} &= \frac{-GM}{R^2}, & V_{\text{surface}} &= \frac{-GM}{R} \\ \text{(iii)} \quad V_{\text{inside}} &= 0, & V_{\text{inside}} &= \frac{-GM}{R} \end{aligned}$$

where, r is the distance from the centre and R is the radius.

GRAVITATIONAL POTENTIAL ENERGY

Gravitational potential energy of a body at a point is equal to work done in assembling the system of masses from the infinity to its present configuration.

The gravitational potential energy of masses M and m at a distance r is given by

$$U = -\frac{GM_e m}{r}$$

Potential energy of a particle of mass m on the earth's surface is

$$U = -\frac{GM_e m}{R_e}$$

PLANET

The heavenly body which revolves around the sun is called planet, e.g. the earth.

Kepler's Laws of Planetary Motion

To explain the motion of the planets, Kepler formulated the following three laws

Ist Law Every planet revolves around the sun in an elliptical orbit with the sun situated at one of the two foci.

IInd Law The position vector of the planet from the sun, i.e. the line joining the planet to the sun sweeps out equal areas in equal interval of time, i.e. areal velocity of the planet around the sun always remains constant.

$$\frac{dA}{dt} = \text{constant}$$

IIIrd Law The square of time period of revolution of any planet about the sun is directly proportional to the cube of the semi-major axis of the elliptical orbit.

$$\begin{aligned} \text{i.e.} \quad & T^2 \propto a^3 \\ \Rightarrow & T^2 = Ka^3 \end{aligned}$$

where, a = length of semi-major axis,
 T = time period of the planet
and K = Kepler's constant

SATELLITE

A satellite is a body which is revolving continuously in an orbit around a comparatively much larger body.

Satellite are of two types

1. **Natural Satellite** A satellite created by nature is called a natural satellite. e.g. Moon
2. **Artificial Satellite** A man made satellite is called an artificial satellite. e.g. SPUTNIK-I

Orbital Velocity of a Satellite

Orbital velocity of a satellite is the velocity required to put the satellite into its orbit around the earth.

$$\text{Orbital velocity, } v_o = \sqrt{\frac{GM}{R+h}}$$

where, M = mass of the earth

R = radius of the earth

h = height of the satellite above the earth's surface

and $R+h$ = orbital radius of the satellite

If g is the acceleration due to gravity on the earth's surface, then $g = \frac{GM}{R^2}$ or $gR^2 = GM$

$$\text{Hence, } v_o = \sqrt{\frac{gR^2}{R+h}} = R\sqrt{\frac{g}{R+h}}$$

When the satellite revolves close to the surface of the earth, i.e. $h=0$, then the orbital velocity will become

$$v_o = \sqrt{gR}$$

As $g = 9.5 \text{ m/s}^2$ and $R = 6.4 \times 10^6 \text{ m}$, so

$$v_o = \sqrt{9.8 \times 6.4 \times 10^6} = 7.92 \times 10^3 \text{ m/s} \\ = 7.92 \text{ km/s} \approx 8 \text{ km/s}$$

Time Period of a Satellite

It is the time taken by a satellite to complete one revolution around the earth. It is given by

$$T = \frac{\text{circumference of the orbit}}{\text{orbital velocity}} = \frac{2\pi(R+h)}{v_o}$$

As we know, orbital velocity, $v_o = \sqrt{\frac{GM}{R+h}}$

$$\therefore T = \frac{2\pi(R+h)}{\sqrt{\frac{GM}{R+h}}} = 2\pi\sqrt{\frac{(R+h)^3}{GM}}$$

$$\text{But } g = \frac{GM}{R^2} \text{ or } gR^2 = GM$$

$$\therefore T = 2\pi\sqrt{\frac{(R+h)^3}{gR^2}} \quad \dots(i)$$

When the satellite revolves close to the surface of the earth, i.e. $h=0$, then the time period will be

$$T = 2\pi\sqrt{\frac{R^3}{GM}} = 2\pi\sqrt{\frac{R^3}{gR^2}} = 2\pi\sqrt{\frac{R}{g}} = \sqrt{\frac{3\pi}{G\rho}}$$

Putting $g = 9.8 \text{ m/s}^2$ and $R = 6.4 \times 10^6 \text{ m}$, we get

$$T = 2\pi\sqrt{\frac{6.4 \times 10^6}{9.8}} = 5078 \text{ s} = 84.6 \text{ min}$$

Total Energy of a Satellite

The potential energy of a satellite is due to its position w.r.t. earth. It appears because of gravitational pull acting on satellite due to the earth.

$$\text{Potential energy of a satellite, } U = -\frac{GMm}{r}$$

The kinetic energy of a satellite is due to its orbital motion.

$$\text{Kinetic energy of a satellite, } K = \frac{GMm}{2r}$$

The total energy of a satellite revolving around the earth is equal to the sum of potential energy and kinetic energy of the satellite.

$$\text{Total energy of a satellite, } E = K + U = \frac{GMm}{2r} - \frac{GMm}{r}$$

$$\therefore E = -\frac{GMm}{2r}$$

If the satellite is orbiting close to the earth, then $r \approx R$. Now, total energy of satellite,

$$E = -\frac{GMm}{2r}$$

Binding Energy of a Satellite

The energy required to remove the satellite from its orbit around the earth to infinity is called binding energy of the satellite.

$$\text{The total energy of a satellite is } -\frac{GMm}{2r}$$

In order to escape to infinity, it must be supplied an extra energy equal to $+\frac{GMm}{2r}$.

So that, its total energy E becomes equal to zero. Hence, binding energy of a satellite $= \frac{GMm}{2r}$.

ESCAPE VELOCITY

Escape velocity is the minimum velocity with which a body must be projected vertically upwards in order that it may just escape from the gravitational field of the earth.

Escape velocity, $v_e = \sqrt{2gR}$

The value of escape velocity on the earth's surface is 11.6 km/s.

Relation between orbital velocity of a satellite and escape velocity is $v_e = \sqrt{2} v_o$

MASS AND WEIGHT

Mass of a body is the measure of its inertia, greater the mass of the body greater will be its inertia. While the weight of a body at any place is the product of its mass and the gravitational acceleration at that place.

$$w = mg$$

Mass of a body is always constant but the weight of the body can slightly vary from place to place on the earth. At the pole, the weight of a body will be maximum, whereas at the equator, it is minimum.

Weight of a Body in Elevator or Lift

When a person (or any body) is inside an accelerating lift, then there is a change in its weight called its apparent weight followed by some conditions

- (i) When lift is ascending with an upward acceleration or descending with a downward deceleration, then the body experiences that its weight is increased.
- (ii) When lift is descending with a downward acceleration or ascending with an upward deceleration, then the body experiences that its weight is decreased.
- (iii) When lift is moving downward with the acceleration same as the gravitational acceleration, then the body experiences weightlessness.

Weight of a Body at the Moon

As mass and radius of the moon is less than the earth, so the force of gravity at the moon is also less than the earth. Its value at the moon's surface is $\frac{g}{6}$.

> PRACTICE EXERCISE

1. All objects experience the same acceleration due to gravity on the earth. This is because the gravitational force which is proportional to
 - (a) volume
 - (b) mass
 - (c) density
 - (d) weight
2. Which one of the following lists of four planets in our solar system is arranged according to their distance from the sun?
 - (a) Mercury, venus, earth, mars
 - (b) Earth, venus, mars, mercury
 - (c) Mars, venus, earth, mercury
 - (d) Mercury, earth, mars, venus
3. The weight of the body will increase significantly, if it is taken
 - (a) to the centre of the earth
 - (b) to the top of mountain
 - (c) from the pole to the equator
 - (d) from the equator to the pole
4. A given object has mass m and weight w on the earth's surface. The same object has mass m' and weight w' on the moon. These are related as
 - (a) $m = m', w = w'$
 - (b) $m = m', w \neq w'$
 - (c) $m \neq m', w = w'$
 - (d) $m \neq m', w \neq w'$
5. The earth rotates around an axis pointing towards
 - (a) the pole star
 - (b) the moon
 - (c) the sun
 - (d) the venus
6. When an object is thrown up the force of gravity
 - (a) is opposite to the direction of motion
 - (b) is in the same direction as the direction of motion
 - (c) decreases as it rises up
 - (d) increases as it rises up
7. If the moon is to escape from the gravitational field of the earth forever, it will require a velocity
 - (a) 11.2 km/s
 - (b) less than 11.2 km/s
 - (c) slightly more than 11.2 km/s
 - (d) 22.4 km/s
8. The mean distance from the earth to the sun is
 - (a) 450 million km
 - (b) 250 million km
 - (c) 150 million km
 - (d) 40 million km
9. Which one of the following statements regarding artificial satellite of the earth is incorrect?
 - (a) The orbital velocity depends on the mass of the satellite
 - (b) A minimum velocity of 8 km/s is required by a satellite to orbit quite close to the earth
 - (c) The period of revolution is large, if the radius of its orbit is large
 - (d) The height of a geostationary satellite is about 36000 km from the earth
10. If a piece of rock is brought from the moon to the earth, its
 - (a) volume, density and weight will remain same as it was on the moon
 - (b) volume and weight will remain same as it was on the moon
 - (c) density and weight will remain same as it was on the moon
 - (d) volume and density will remain same as it was on the moon

- 11.** A heavy iron bar of weight w is having its one end on the ground and the other on the shoulder of a man. The rod makes an angle θ with the horizontal. What is the weight experienced by the man?
 (a) w (b) $w \sin \theta$
 (c) $\frac{w}{2}$ (d) $w \cos \theta$
- 12.** The height above the ground of a child on a swing varies from 1m at his lowest point to 2.25 m at his highest point. The maximum speed (in m/s) of the child is approximately
 (a) 3 (b) 5 (c) 7 (d) 10
- 13.** The apparent weight of a body on the surface of the earth at latitude λ will be
 (a) $\frac{mg}{\sin \lambda}$ (b) $mg \sin \lambda$
 (c) $\frac{mg}{\cos \lambda}$ (d) $mg \cos \lambda$
- 14.** A satellite rotating around the earth, has water in a jar kept inside it. A cork is pushed into the water in the jar and then released. The cork will
 (a) remain stable at the pushed position
 (b) stick to the wall of the jar
 (c) stick to the bottom of jar
 (d) rise upto the surface of the water
- 15.** Escape velocity from the earth's surface is
 (a) equal to that from the moon's surface
 (b) greater than that from the moon's surface
 (c) less than that from the moon's surface
 (d) equal to that from the sun's surface
- 16.** If the earth moves round the sun in a circular orbit of radius 150000000 km with an angular velocity of about 0.01745 rad/day. Its linear speed in km/s is approximately
 (a) 30000000 (b) 1800
 (c) 720 (d) 30
- 17.** The escape velocity of a body on the surface of the earth is 11.2 km/s. What is the escape velocity of the body on the surface of a planet which is 32 times as heavy as the earth and whose radius is twice the radius of the earth?
 (a) 11.2 km/s (b) 44.8 km/s
 (c) 31.7 km/s (d) 179.2 km/s
- 18.** The ratio of the radius of the earth to that of the moon is 10. The ratio of acceleration due to gravity on the earth and on the moon is 6. The ratio of the escape velocity from the earth's surface to that from the moon is
 (a) 7 (b) 1.66 (c) 8 (d) 10
- 19.** Consider the following statements
 I. The gravitational force exerted by the sun on the moon is greater than the gravitational force exerted by the earth on the moon.
 II. A heavy body falls at a faster rate than a light body in vacuum.
 Which of the following statements given above is/are correct?
 (a) Only I (b) Only II
 (c) Both I and II (d) Neither I nor II
- 20.** Consider the following conditions in respect of an artificial satellite.
 I. It should revolve in an orbit which is concentric and coplanar with the equatorial plane.
 II. It should be placed at an altitude of about 36000 km from the earth.
 III. Its period of revolution around the earth should be 24 h.
 Which of these conditions must be satisfied by an artificial satellite in order that it becomes a geostationary satellite?
 (a) Both I and II (b) I, II and III
 (c) Both II and III (d) Both I and III
- 21.** The height at which the acceleration due to gravity decreases by 36% of its value on the surface of the earth. (The radius of the earth is R).
 (a) $\frac{R}{6}$ (b) $\frac{R}{4}$
 (c) $\frac{R}{2}$ (d) $\frac{2}{3}R$
- 22.** The radius of the earth is 6400 km and $g = 10 \text{ m/s}^2$ in order that a body of 5 kg weight zero at the equator, the angular speed of the earth is
 (a) 1/80 rad/s (b) 1/400 rad/s
 (c) 1/800 rad/s (d) 1/1600 rad/s
- 23.** At what height above the earth's surface, does the force of gravity decrease by 10%? The radius of the earth is 6400 km?
 (a) 345.60 km (b) 687.20 km
 (c) 1031.8 km (d) 12836.80 km
- 24.** Select the correct answer using the codes given below
 I The gravitational force between two particles is independent of the presence of other bodies or the properties of intervening medium.
 II The gravitational force obeys Newton's third law.
 III The gravitational force obeys Newton's second law.
 (a) I and II (b) I and III
 (c) II and III (d) I only
- 25.** The value of g on the earth's surface is 980 cms^{-2} . Its value at a height of 64 km from the earth surface is
 (a) 960.40 cms^{-2} (b) 984.90 cms^{-2}
 (c) 982.45 cms^{-2} (d) 977.55 cms^{-2}

> Previous Years' Questions

- 26.** A body attached to a spring balance weighs 10 kg on the earth. The body attached to the same spring balance is taken to a planet, where gravity is half that of the earth. The spring balance will read
 (a) 20 kg (b) 10 kg (c) 5 kg (d) 2.5 kg
- 27.** Consider the following figure,
 (a) Only point A (b) Only point B
 (c) Points A and C (d) Points B and D

Which of the following labelled points in the figure given above indicate unstable state of an object?
 (a) Only point A (b) Only point B
 (c) Points A and C (d) Points B and D

- 28.** One feels heavier in a lift when the lift
 (a) is going down steadily (b) just begins to go up
 (c) is moving up steadily (d) descends freely
- 29.** Gravitational force shares a common feature with electromagnetic force. In both cases, the force is
 (a) between massive and neutral objects
 (b) between charged objects
 (c) a short range (d) a long range

Solutions

16. (d) Given, $\omega = 0.01745$ rad/day

$$= \frac{0.01745}{24 \times 60 \times 60} \text{ rad/s,}$$
 $R = 15 \times 10^7 \text{ km, linear speed, } v = ?$
We know that, linear speed, $v = \omega R$

$$= \frac{0.01745}{24 \times 60 \times 60} \times 15 \times 10^7 = 30 \text{ km/s}$$

17. (b) $\therefore v_e = \sqrt{\frac{2GM_e}{R_e}} \dots(i)$
 and $v'_e = \sqrt{\frac{2G \times 32M_e}{2R_e}} \dots(ii)$

On dividing Eq. (i) by Eq. (ii), we get

$$\frac{v_e}{v'_e} = 1/4$$

$$v'_e = 4v_e = 4 \times 11.2 \quad [\because v_e = 11.2 \text{ km/s}]$$

$$= 44.8 \text{ km/s}$$

18. (c) \therefore Escape velocity, $v = \sqrt{2gR}$
 where, R is the radius

$$\therefore \frac{v_e}{v_m} = \frac{\sqrt{2gR_e}}{\sqrt{2g_m R_m}}$$

$$\frac{v_e}{v_m} = \frac{g \times 10}{g/6} = \sqrt{60}$$

$$\frac{v_e}{v_m} = 7.74 \approx 8$$

21. (b) The value of acceleration due to gravity at a height h reduces to

$$= 100 - 36 = 64\% = \frac{64}{100} g$$

$$\therefore \frac{64}{100} g = \frac{gR^2}{(R+h)^2}$$

$$\text{or } \frac{8}{10} = \frac{R}{R+h}$$

$$\text{or } h = \frac{R}{4}$$

22. (c) For the condition of weightlessness at equator

$$w = \sqrt{\frac{g}{R}}$$

$$\therefore w = \sqrt{\frac{10}{6400 \times 10^3}} = \frac{1}{800} \text{ rad/s}$$

23. (a) As, $g' = g - \frac{10g}{100} = \frac{90}{100} g$

$$\therefore g' = g \frac{R^2}{(R+h)^2} \text{ or } \frac{9}{10} = \frac{R^2}{(R+h)^2}$$

$$\text{or } \frac{3}{\sqrt{10}} = \frac{R}{R+h}$$

$$\text{or } h = (\sqrt{10} - 3)R/3$$

$$\frac{(\sqrt{10} - 3) \times 6400}{3} = 345.60 \text{ km}$$

25. (a) As $g' = \frac{gR^2}{(R+h)^2} = 980 \times \left(\frac{6400}{6400 + 64} \right)$

$$= 960 \text{ cms}^{-2}$$

26. (c) Weight will become half because

$$g' = g/2 = 10/2 = 5 \text{ kg}$$

32. (a) Acceleration due to gravity at a height h above the surface of the earth is

$$g_b = \frac{GM}{(R+h)^2}$$

where, symbols have their usual meaning. Clearly, when h increases, g_b decreases. It is inversely proportional to the square of the distance from the centre of the earth that is $(R+h)^2$.

33. (c) Let mass of the object is m . Weight of the object on planet A is $w_A = \frac{GM_A m}{R_A^2}$.

where, M_A and R_A are mass and radius of planet A , respectively

Similarly, weight on planet B is

$$w_B = \frac{GM_B m}{R_B^2}$$

$$\therefore \frac{w_A}{w_B} = \frac{M_A}{M_B} \times \left(\frac{R_B}{R_A} \right)^2 = 4 \times \left(\frac{1}{2} \right)^2 = 1$$

$$\Rightarrow w_A = w_B \quad [\because M_A = 4M_B \text{ and } R_A = 2R_B]$$

35. (b) Acceleration due to gravity (g) at the surface of the earth is given by

$$g = \frac{GM}{R^2}$$

where, R = radius of the earth

M = mass of the earth

and G = gravitational constant

$$\therefore \frac{\Delta g}{g} = \frac{2\Delta R}{R} = 2 \times (-1\%) = -2\%$$

Therefore, g would decrease by nearly 2%.

36. (b) The mass of the earth, $M_e = \frac{gR_e^2}{G}$

The mass of the moon, $M_m = \frac{g'R_m^2}{G}$

$$\therefore \frac{M_e}{M_m} = \frac{gR_e^2}{g'R_m^2} = \frac{g}{g/6} \times \frac{R^2}{\left(\frac{R}{4} \right)^2}$$

$$\Rightarrow \frac{M_e}{M_m} = 96 \approx 100$$

37. (a) Given, $v_e = 1700$ km/h,
 $R_e = 20000$ km

Using, $v_e = R_e \omega$

$$\Rightarrow 1700 \text{ km/h} = 20000 \times \omega$$

$$\text{or } \omega = \frac{1700}{20000} = \frac{17}{200} \text{ rot/h}$$

\therefore Velocity of rotation at pole,

$$v_p = R_p \omega$$

$$\text{As } R_p = 0 \Rightarrow v_p = 0$$

38. (b) The acceleration due to gravity can be derived from law of gravitation.

Gravitational force between mass of the earth (M_E) and a body of mass (m) is given by

$$F = \frac{GMm}{R^2} \dots(i)$$

where, R = radius of the earth

Again, we know the earth attracts anybody with the force,

$$F = mg \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\frac{GMm}{R^2} = mg \text{ or } g = \frac{GM}{R^2}$$

39. (d) Consider the mass of the man in the lift is m when cable breaks as shown in the figure. Now, the man in the lift is in free fall.

Therefore, his acceleration is same as acceleration due to gravity g . Due to this acceleration pseudo force as the man is mg upward. Therefore, weight of the man, $w = mg - mg = 0$

40. (c) Let mass of each body is m and separation between the bodies is r . Gravitational force between the bodies,

$$F = \frac{Gm^2}{r^2} \dots(i)$$

After doubling the mass, gravitational force becomes

$$F' = \frac{G(m')^2}{r^2} = \frac{4Gm^2}{r^2} = 4F \quad [\text{from Eq. (i)}]$$

41. (b) Initial gravitational potential energy of two body,

$$U_1 = mgh = 20mg \quad [\text{given, } h = 20 \text{ m}]$$

\therefore Initial total energy of the body,

$$E = U_1 + K_1 = U_1 + 0 = U_1 = 20mg$$

After falling through 5 m, new potential energy is

$$U_2 = mgb' = mg(20 - 5) = 15mg$$

\therefore Loss in potential energy,

$$\Delta U = U_1 - U_2 = 20mg - 15mg = 5mg$$

$$= \frac{20mg}{4} = \frac{E}{4} = \frac{U_1}{4}$$

i.e. $\frac{1}{4}$ th of its potential energy.

05

GENERAL PROPERTIES OF MATTER

Generally 2 to 3 questions are asked from this chapter in last years. These questions are based on the Archimede's principle, relative density, Bernoulli's theorem, surface tension and capillarity effect.

MATTER

Any substance which has mass and occupies space is called matter.

There are three states of matter

- (i) **Solid** Solids are substances in which intermolecular forces are so strong that the molecules or ions remains almost fixed at their equilibrium positions.
- (ii) **Liquid** Liquids are substances in which intermolecular forces are lesser compared to solid and their shape can be changed.
- (iii) **Gases** In gases intermolecular forces are very small and their shape and volume can be easily changed.

ELASTICITY

Elasticity is the property of body by virtue of which a body regains or tends to regain its original configuration (shape as well as size), after the removal of applied forces and body itself is called elastic body.

Some Terms Related to Elasticity

- (i) **Deforming Force** If a force applied on a body produces a change in the normal positions of the molecules of the body which results in a change in the configuration of the body either in length, volume or shape, then the force applied is called deforming force.

- (ii) **Perfect Elastic Body** If a body completely regains its original configuration on removal of external deforming forces, it is called a perfectly elastic body.
- (iii) **Plastic Body** If a body has no tendency to regain its original configuration and tends to maintain its deformed state even after the removal of the deforming force, then the body is called a plastic (or non-elastic) body.
- (iv) **Elastic Limit** The maximum deforming force upto which a body retains its property of elasticity is called elastic limit of the material of body.

STRESS

The internal restoring force acting per unit area of a deformed body is called stress, i.e.

$$\text{Stress} = \frac{\text{Restoring force}}{\text{Area}}$$

The SI unit of stress is Nm^{-2} or pascal (Pa).

There are two types of stress

- (i) **Normal stress** The normal stress is defined as the deforming force acting per unit area normal to the surface of the body.
- (ii) **Tangential stress** The tangential stress is defined as the deforming force acting per unit area tangential to the surface of the body.

STRAIN

Strain is the ratio of change in configuration produced in a body to the original configuration of the body. Being the ratio of two similar quantities, strain is a unitless and dimensionless quantity. Strain is of three types

- (i) **Longitudinal Strain** Change in length per unit original length is called longitudinal strain.

$$\text{Longitudinal strain} = \frac{\Delta L}{L}$$

- (ii) **Volume Strain** Change in volume per unit original volume is called volume strain. Volume strain = $\frac{\Delta V}{V}$

- (iii) **Shearing Strain** When there is change in shape of a body without change in its volume, then the strain produced is called shearing strain and it is defined as the angle through which a plane perpendicular to the fixed surface of the cubical body gets turned under the effect of tangential force.

Hooke's Law

According to this law within the elastic limit, the stress developed in a body is directly proportional to the strain produced in the body.

i.e. Stress \propto Strain

$$\Rightarrow \text{Stress} = E \times \text{Strain}$$

where, E is modulus of elasticity

There are three types of modulus of elasticity

- (i) **Young's modulus of elasticity (Y)** Within the elastic limit it is defined as the ratio of normal stress to the longitudinal strain.

$$\text{Thus, } Y = \frac{\text{normal stress}}{\text{longitudinal strain}} = \frac{F/A}{\Delta L/L} = \frac{F \cdot L}{\pi r^2 \Delta L} = \frac{MgL}{\pi r^2 \Delta L}$$

- (ii) **Bulk modulus of elasticity (K)** Within the elastic limit it is defined as the ratio of normal stress to the volumetric strain.

$$\text{Thus, } K = \frac{\text{normal stress}}{\text{volumetric strain}} = -\frac{F/A}{\Delta V/V} = \frac{pV}{\Delta V} \quad [\because F/A = p]$$

- **Note** The negative sign indicates the fact that with an increase in pressure, a decrease in volume occurs.

- (iii) **Modulus of rigidity or shear modulus of elasticity (η)**

Within the elastic limit it is defined as the ratio of tangential stress to the shearing strain.

$$\text{Thus, } \eta = \frac{\text{tangential stress}}{\text{shearing strain}} = \frac{F/A}{\theta} = \frac{FL}{Ax}$$

Poisson's Ratio

When a deforming force is applied at the free end of a suspended wire of length l and radius R , then its length increases by dl but its radius decrease by dR . Thus, two types of strain are produced by a single force, i.e. longitudinal strain and lateral strain.

The ratio between the lateral strain and the longitudinal strain is known as Poisson's ratio.

Poisson's ratio (σ) is given by

$$\sigma = \frac{\text{Lateral strain}}{\text{Longitudinal strain}} = -\frac{\Delta R/R}{\Delta L/L} = -\frac{\Delta R}{R} \times \frac{L}{\Delta L}$$

Here, negative sign shows that, if the length increases, then the radius of the wire decreases.

Poisson's ratio is a unitless and dimensionless quantity.

- Theoretical value of σ lies between -1 and $+\frac{1}{2}$.
- Practical value of σ lies between 0 and $+\frac{1}{2}$.

Relation between Elastic Constants Y , K , η and σ

$$(i) \frac{9}{Y} = \frac{1}{K} + \frac{3}{\eta} \qquad (ii) \eta = \frac{Y}{2(1+\sigma)}$$

$$(iii) K = \frac{4}{3(1-2\sigma)} \qquad (iv) \sigma = \frac{3K-2\eta}{2\eta+6K}$$

HYDROSTATICS

A branch of physics that deals with the characteristics of fluids at rest and especially with the pressure in a fluid or exerted by a fluid on an immersed body.

Thrust and Pressure

Thrust is the force or push acting on an object perpendicular to its surface. Effect of thrust depends on the area on which it acts. The unit of thrust is same as that of force, i.e. the SI unit of thrust is newton (N). It is a vector quantity. Pressure is the force acting perpendicularly on a unit area of the object.

$$\text{Pressure } (p) = \frac{\text{Force } (F)}{\text{Area } (A)} = \frac{\text{Thrust}}{\text{Area}}$$

The SI unit of pressure is N/m^2 , also called pascal (Pa) named after the scientist Blaise Pascal. It is a scalar quantity.
 $1 \text{ Pa} = 1 \text{ N/m}^2$

Dimensional unit of pressure is $[\text{ML}^{-1}\text{T}^{-2}]$.

From the formula of pressure, it is clear that the same force can produce different pressures depending on the area over which it acts. The same force acting on a smaller area exerts a larger pressure while a force on a larger area exerts small pressure.

Atmospheric Pressure

The pressure on the surface of the earth due to atmosphere of the earth is called atmospheric pressure.

SI unit of atmospheric pressure is Nm^{-2} or pascal and CGS unit is dyne/cm^2 .

Barometer

It is a device used to measure the atmospheric pressure. In this a glass tube open at one end and having a length of about a meter is filled with mercury remains in liquid state at room temperature.

Measured pressure, $p = \rho gh$

where, ρ is density of mercury and h is height of mercury column. Atmospheric pressure for 76 cm mercury column = $1.01 \times 10^5 \text{ Pa}$

Density

Density of a substance is defined as the mass per unit volume of the substance, i.e.

$$\text{Density } (d) = \frac{\text{Mass } (m)}{\text{Volume } (V)} = \frac{m}{V}$$

The SI unit of density is kgm^{-3}

Change in Density of a Liquid

- If equal volumes of two liquids of densities d_1 and d_2 are mixed together, then the density of the mixture is

$$d = \frac{d_1 + d_2}{2}$$

- If two liquids of masses m_1 and m_2 , densities d_1 and d_2 are mixed together, then the density of mixture is

$$d = \frac{m_1 + m_2}{\frac{m_1}{d_1} + \frac{m_2}{d_2}}$$

- Liquids are incompressible, therefore their density is same throughout.

Relative Density (Specific Gravity)

The relative density is defined as the ratio of the density of the substance to the density of water at 4°C .

$$\begin{aligned} \text{Relative density} &= \frac{\text{Density of substance}}{\text{Density of water at } 4^\circ\text{C}} \\ &= \frac{\text{Mass of any volume of substance}}{\text{Mass of equal volume of water at } 4^\circ\text{C}} \end{aligned}$$

Relative density has no unit. The density of water at 4°C is $1.0 \times 10^3 \text{ kgm}^{-3}$.

PRESSURE OF LIQUID

The normal force exerted by a liquid per unit area of the surface in contact, is called pressure of liquid or hydrostatic pressure.

Pressure exerted by a liquid column $p = h\rho g$

where, h = height of liquid column,

ρ = density of liquid

and g = acceleration due to gravity

For a point at a depth h below the surface of a liquid density ρ , the pressure p is given by

$$p = p_o + h\rho g$$

where, p_o is the atmospheric pressure. At depth h below the surface of a liquid open to the atmosphere is greater than atmospheric pressure by an amount ρgh . This excess of pressure is called a **gauge pressure**.

Laws of Liquid Pressure

- Pressure inside a liquid is same at every point on the same horizontal plane.
- The pressure exerted by the liquid is normal to any surface with which the liquid is in contact.
- The pressure at any point within the liquid is independent of shape of liquid surface as well as the area of liquid surface.
- Centre of pressure is that point of the body immersed in liquid at which the resultant liquid pressure acts.

Pascal's Law

If pressure is applied to an enclosed liquid, then it's transmitted into entire liquid without being diminished in magnitude.

Buoyant Force or Buoyancy

It is an upward force acting on the body immersed in a liquid. It is equal to the weight of liquid displaced by the immersed part of the body.

Archimedes' Principle

When a body (totally or partially) is immersed in liquid at rest, it appears lighter, this apparent loss of weight is equal to the weight of liquid displaced by the immersed part of the body.

$$\text{Apparent weight} = \text{Actual weight} - \text{Upthrust} = mg \left(1 - \frac{\rho}{d} \right)$$

where, d = density of body

and ρ = density of liquid

Weight of plastic bag full of air is same as that of empty bag, as the upthrust is equal to the air filled in the bag.

Laws of Floatation

When a body is immersed in a liquid, then two forces act on it.

- Weight of the body (w , vertically downwards)
- Upthrust (F , upwards)
 - $w > F$, i.e. weight of body is greater than upthrust of liquid, in this condition body will sink.
 - $w = F$, i.e. weight of body is equal to the upthrust of liquid, in this condition, the body floats with whole of its volume inside the liquid.
 - $w < F$, i.e. weight of body is less than upthrust of liquid, body will float with some of its part outside the liquid.

FLOW OF FLUIDS

Flow of fluids mainly are of three types

- (i) **Streamlined flow** Flow of a fluid is said to be streamlined, if each element of the fluid passing through a particular point travels along the same path, with exactly the same velocity as that of the preceding element.
- (ii) **Laminar flow** A special case of streamline flow is known as laminar flow, in which a fluid has a steady flow in the form of parallel layers and these do not mix with one another.
- (iii) **Turbulent flow** A turbulent flow is the one in which the motion of the fluid particles is disordered or irregular. In such a flow, most of the energy used up in maintaining the flow, is spent in causing eddies in the fluid and only a small part of the energy is used for the actual forward flow.

Critical Velocity

For a fluid, the critical velocity is that limiting velocity of the fluid flow upto which the flow is streamlined and beyond which the flow becomes turbulent. Value of critical velocity for the flow of liquid of density ρ and coefficient of viscosity η flowing through a horizontal tube of radius r is given by

$$v_c \propto \frac{\eta}{\rho r}$$

Reynolds' Number (N_R)

It is a unitless and dimensionless number given by

$$N_R = \frac{\rho v r}{\eta}$$

A smaller value of Reynolds' number (generally $N_R \leq 1000$) indicates a streamline flow but a higher value ($N_R \geq 1500$) indicates that the flow is turbulent and between 1000 to 1500, the flow is unstable.

Equation of Continuity

Let us consider the streamline flow of an ideal, non-viscous fluid through a tube of variable cross-section. Let at the two sections, the cross-sectional areas be A_1 and A_2 respectively and the fluid flow velocities are v_1 and v_2 , then according to the equation of continuity $A_1 v_1 \rho_1 = A_2 v_2 \rho_2$ where, ρ_1 and ρ_2 are the respective densities of the fluid. Equation of continuity is based on the conservation of mass.

If the fluid which is flowing, is incompressible, then $\rho_1 = \rho_2$. So, equation of continuity is simplified as

$$A_1 v_1 = A_2 v_2 \text{ or } Av = \text{constant}$$

This is known as equation of continuity.

Energy of a Flowing Liquid

Flowing liquid has three types of energy

- (i) **Pressure energy** If there is a pressure p on the surface area A of liquid and liquid covers a distance l due to this, then pressure energy = pAl . Pressure energy per unit volume = p .
- (ii) **Kinetic energy** If mass m and volume V of a liquid is flowing with velocity v , then kinetic energy per unit volume = $\frac{1}{2} dv^2$.

where, d = density of liquid

- (iii) **Potential energy** If mass m of liquid is at a height h above the earth's surface, then potential energy is mgh .

For unit volume of liquid $m = d$, therefore potential energy per unit volume = dgh .

Bernoulli's Theorem

According to this theorem, "if a liquid is in streamline motion, then at each point of its path, its total energy of unit volume, i.e. sum of pressure energy, kinetic energy and potential energy is constant."

$$p + \frac{1}{2} \rho v^2 + \rho gh = \text{constant}$$

Torricelli's Theorem

It states that the velocity of efflux i.e. the velocity with which the liquid flows out of an orifice (i.e. a narrow hole) in a vessel containing liquid is equal to that which a freely falling body would acquire in falling through a vertical distance equal to the depth of orifice below the free surface of liquid in vessel. Quantitatively, velocity of efflux, $v = \sqrt{2gh}$, where h is the depth of orifice below the free surface of liquid in vessel.

Viscosity

The property of liquids due to which they oppose the relative motion between their different layers is called viscosity. If viscous force F is acting between two layers of liquid of area A and having a velocity gradient $\frac{dv}{dx}$

between them, then $F = -\eta A \frac{dv}{dx}$.

where, η = coefficient of viscosity

A = area of cross-section

Here, negative sign shows viscous force is acting in opposite direction to the flow of a liquid.

Stokes' Law

When a spherical body is dropped in a liquid, then the liquid applies a retarding force, $F = 6\pi \eta r v$ where, v = velocity of the body, r = radius of the body and η = coefficient of viscosity of liquid

Terminal Velocity

If a small spherical body is dropped in a fluid, then initially it is accelerated under the action of gravity. However, with an increase in speed, the viscous force increases and soon it balances the weight of the body. Now, the body moves with a constant velocity is called the terminal velocity.

Terminal velocity v_t is given by $v_t = \frac{2}{9} \frac{r^2(\rho - \sigma)g}{\eta}$

where, r = radius of the falling body,
 ρ = density of the falling body
 and σ = density of the fluid.

Poiseuille's Formula

Poiseuille's studied the rate of flow of a liquid through a horizontal capillary tube and concluded that the volume (V) of a liquid flowing out per second through a capillary tube varies

- (i) directly as the pressure difference (p) across the two ends of the tube, i.e. $V \propto p$.
- (ii) directly as the fourth power of radius (r) of the tube, i.e. $V \propto r^4$.
- (iii) inversely as the length (l) of the tube, i.e. $V \propto \frac{1}{l}$.
- (iv) inversely as the coefficient of viscosity of the liquid, i.e. $V \propto \frac{1}{\eta}$.

On combining these factors, we get

$$V \propto \frac{pr^4}{\eta l} \text{ or } V = \frac{\pi}{8} \frac{pr^4}{\eta l}$$

where, $\frac{\pi}{8}$ is a constant of proportionality. This formula is called Poiseuille's formula and is true only for the steady flow of liquid through a horizontal capillary tube.

Intermolecular Forces

The forces between the molecules of the substances are called intermolecular forces.

There are two types of intermolecular forces

- (i) **Cohesive force** The intermolecular force of attraction acting between the molecules of same substance is called cohesive force.
 - (ii) **Adhesive force** The intermolecular force of attraction acting between the molecules of different substances is called adhesive force.
- Both cohesive and adhesive forces are attractive having range of 10^{-9} m to 1 Å.
 - The liquid for which cohesive force is larger than adhesive force, does not wet the walls of vessel, e.g. mercury does not wet the glass vessel.
 - The liquid for which adhesive force is larger than cohesive force, wets the walls of vessel, e.g. water wets the glass vessel.

SURFACE TENSION

It is property by virtue of which the free surface of liquid at rest behaves like stretched membrane tending to contract, so as to possess minimum surface area.

- Surface tension is the force acting normally on unit length of imaginary line drawn on the surface of liquid. Its unit is Nm^{-1} .

$$T = \frac{F}{l}$$

- Surface tension of a liquid is independent of area of the surface.
- A steel needle may be made to float on the surface of liquid due to surface tension.

Applications of Surface Tension (Drop, Bubble)

Spherical shape drops and bubbles can be explained on the basis of surface energy. As every system tends to have minimum potential energy, the surface of a liquid too tends to have minimum surface area. As, sphere has the minimum surface area for a given volume, drops and bubbles tend to have spherical shape.

If any other force such as gravitation, air resistance is absent, then the drops and bubbles would be perfect spheres. Another interesting consequence of surface tension is that pressure inside a spherical drop or bubble is more than the pressure outside.

Excess pressure for liquid drop $(\Delta p)_d = \frac{2S}{r}$

Excess pressure for bubble $(\Delta p)_b = \frac{4S}{r}$

where, S is the surface tension of the liquid and r is the radius of drop and bubble.

SURFACE ENERGY

The potential energy of the molecules in the surface of liquid is called the surface energy.

Surface energy = $T \times \Delta A$

where, T = surface tension of liquid

and ΔA = increase in surface area

Concept Related to Factorization to Recombination of Liquid Drop

- When a big drop of water factorized in n small drops, then energy is absorbed.

$$\text{Energy} = 4\pi R^2 T (n^{1/3} - 1)$$

where, R = radius of big drop

- When n small drops make a big drop, then energy is released.

$$\text{Energy} = 4\pi R^2 T (n^{1/3} - 1)$$

ANGLE OF CONTACT

The angle between the tangent to the liquid surface and the tangent to the solid surface at the point of contact is known as angle of contact.

Important Points Relates to Angle of Contact

- The angle of contact is always measured through the liquid.

If angle of contact $\theta = 90^\circ$, then

- liquid will wet the walls of the vessel.
- the level of liquid will be horizontal in the capillary tube.

If $\theta < 90^\circ$, then

- liquid will wet the walls of the vessel.
- liquid will rise in the capillary tube.
- level of liquid in capillary tube will be concave.

If $\theta > 90^\circ$, then

- liquid will not wet the walls of the vessel.

(b) liquid will fall in capillary tube.

(c) level of liquid in capillary will be convex.

- Angle of contact increases on increasing the temperature.
- Addition of detergent to a liquid decreases angle of contact, hence the surface tension also decreases.

CAPILLARITY

A tube with a fine and uniform bore throughout its length is called a capillary tube. The phenomenon of rise or fall of liquid in a capillary tube is called capillarity.

- If a liquid rises or falls a height h in a capillary tube and angle of contact is θ , then $h = \frac{2T \cos \theta}{rdg}$.

where, r = radius of capillary tube, d = density of liquid and T = surface tension of liquid

- Rate of flow of liquid in a capillary is $Q = \frac{\pi \rho r^4}{8\eta l}$.

> PRACTICE EXERCISE

- 1.** If a ship moves from fresh water into sea water, it will

- sink completely
- sink a little bit
- rise a little higher
- remain unaffected

- 2.** Capillary is dipped vertically in a liquid. The level in the capillary will be same as outside the capillary, if the angle of contact is

- 90°
- ∞
- 1
- acute

- 3.** In terms of K and η , Poisson's ratio σ can be expressed as

- $\sigma = \frac{2(3K + \eta)}{3K + 2\eta}$
- $\sigma = \frac{3K - 2\eta}{-2(3K + \eta)}$
- $\sigma = \frac{3K + \eta}{3K - \eta}$
- $\sigma = \frac{3K - 2\eta}{3K + \eta}$

- 4.** The energy in stretched wire is

- $\frac{1}{2} \times \text{load} \times \text{extension}$
- stress \times load
- load \times extension
- load \times strain

- 5.** Out of solid, liquid and gas which has maximum elasticity?

- Solid
- Gas
- Liquid
- Cannot be compared

- 6.** The Young's modulus for a perfectly rigid body is

- 1
- finite
- zero
- infinity

- 7.** When the temperature of a liquid increases, then the surface tension of the liquid

- increases
- decreases
- remains the same
- first increases and then decreases

- 8.** Gain in surface energy for an increase in liquid surface by A is

- $E = \frac{A}{T}$
- $E = AT^2$
- $E = TA$
- $E = A^2T$

- 9.** Two parallel glass plates dip partially in water in vertical position. The separation between the plates is d , the surface tension of water is T , density of water is ρ , the angle of contact is θ . The capillary rise of water between the plates would be

- $\frac{T \cos \theta}{\rho d}$
- $\frac{2T \cos \theta}{\rho d}$
- $\frac{2T \cos \theta}{\rho dg}$
- $\frac{T \cos \theta}{\rho dg}$

- 10.** Due to capillary action, a liquid will rise in a tube of angle of contact is

- infinity
- finite
- acute
- obtuse

- 11.** A body floats in a liquid, if the buoyant force is

- zero
- greater than its weight
- less than its weight
- equal to its weight

- 12.** The viscous force on a small sphere of radius R moving in a fluid is directly proportional to

- R
- R^3
- $\frac{1}{R}$
- $\frac{1}{R^2}$

- 13.** A capillary tube is partially immersed in a wetting liquid. In this situation, the loss in the weight of the capillary tube will be

- equal to the weight of liquid displaced
- equal to half the weight of liquid displaced
- less than the weight of liquid displaced
- more than the weight of liquid displaced

- 14.** Surface tension mainly arises due to
 (a) adhesive molecular force
 (b) gravitational force
 (c) cohesive molecular force
 (d) electrostatic force
- 15.** A water proofing agent changes the angle of contact from
 (a) $\frac{\pi}{2}$ to an obtuse
 (b) an obtuse to an acute value
 (c) acute to $\frac{\pi}{2}$
 (d) an acute to an obtuse value
- 16.** If the density of water at 0°C , 4°C and 100°C are denoted by X , Y and Z , then the correct sequence of the decreasing order of the values of density of water at the given temperature will be
 (a) X , Y and Z (b) Z , Y and X
 (c) Y , X and Z (d) Y , Z and X
- 17.** A block of wood floats in water with $\frac{4}{3}$ part under water. If it floats in another liquid with $\frac{9}{10}$ part under it, then the relative density of this liquid will be
 (a) 0.79 (b) 1 (c) 0.89 (d) 0.59
- 18.** A body floats with one-third of its volume outside water and three-fourth of its volume outside in another liquid. The specific gravity of the liquid is
 (a) $\frac{8}{3}$ (b) $\frac{4}{9}$ (c) $\frac{1}{4}$ (d) $\frac{1}{6}$
- 19.** A sample of metal weighs 210 g in air, 180 g in water and 120 g in an unknown liquid. Then, the density of metal is
 (a) four times the density of unknown liquid
 (b) 4 g cm^{-3} (c) 9 g cm^{-3}
 (d) 7 g cm^{-3}
- 20.** Two soap bubbles have radii in the ratio of 2 : 1. What is the ratio of excess pressure inside them?
 (a) 2 : 1 (b) 1 : 2
 (c) 8 : 2 (d) 2 : 8
- 21.** A capillary tube of radius R is immersed in water and water rises in it to a height H . The mass of water in capillary tube is M . If the radius of the tube is double, then mass of water that will rise in capillary will be
 (a) $3M$ (b) M (c) $2M$ (d) $\frac{M}{4}$
- 22.** A stone weighing 200 g weighs 150 g when immersed in water and 175 g when immersed in oil. The density of the oil is
 (a) 0.25 g(cc)^{-1} (b) 0.40 g(cc)^{-1}
 (c) 0.50 g(cc)^{-1} (d) 0.75 g(cc)^{-1}
- 23.** An irregular shaped body has weight of 12 kg in air and 8 kg in water. What is its density, in kg m^{-3} ?
 (a) 3000 (b) 3 (c) $\frac{3}{2}$ (d) $\frac{2}{3}$
- 24.** Two wires of the same radius and material have their lengths in the ratio 1 : 2. If these are stretched by the same force, then the strain produced in the two wires will be in the ratio
 (a) 4 : 1 (b) 1 : 2
 (c) 4 : 2 (d) 1 : 1
- 25.** The following four wires are made of the same material. Which of these will have the largest extension, when the same tension is applied?
 (a) $L = 100\text{ cm}$, $d = 2\text{ mm}$
 (b) $L = 250\text{ cm}$, $d = 2\text{ mm}$
 (c) $L = 50\text{ cm}$, $d = 0.5\text{ mm}$
 (d) $L = 300\text{ cm}$, $d = 3\text{ mm}$
- 26.** A weather forecasting meteorological balloon of volume 10 m^3 contains hydrogen of density 0.09 kg m^{-3} and its fabric mass is 6.5 kg. If it is floating in air of density 1.25 kg m^{-3} , then the mass of the equipment, it carries would be
 (a) 12.5 kg (b) 7.4 kg
 (c) 5.1 kg (d) 1 kg
- 27.** The fraction of the total volume of an iceberg of density 0.93 g cm^{-3} floating in North sea with density of 1.03 g cm^{-3} is
 (a) 1% (b) 11% (c) 21% (d) 75%
- 28.** A stone weighing 750 g appears to weighs only 500g when it is submerged in water of density 1 g(cc)^{-1} . The volume of the stone is
 (a) 250 cc (b) 500 cc
 (c) 750 cc (d) 1000 cc
- 29.** One thousand small water drops of equal size combine to form a big drop. The ratio of the final surface energy to the total initial surface energy is
 (a) 1 : 10 (b) 10 : 1
 (c) 1000 : 1 (d) 1 : 1000
- 30.** For a steel boat floating on a lake, the weight of the water displaced by the boat is \checkmark 2012 (I)
 (a) less than the weight of the boat
 (b) more than the weight of the boat
 (c) equal to the weight of the part of the boat which is below the water level of the lake
 (d) equal to the weight of the boat
- 31.** When a solid object is immersed in water, then there is a loss in its weight. This loss is \checkmark 2012 (I)
 (a) equal to the weight of the water displaced
 (b) less than the weight of the water displaced
 (c) greater than the weight of the water displaced
 (d) not related to the weight of the water displaced
- 32.** Specific gravity of silver is 11 and specific gravity of iron is 8. Which one among the following is the approximate relative density of silver with respect to iron?
 \checkmark 2012 (I)
 (a) 1.4 (b) 0.7 (c) 3.0 (d) 2.8
- 33.** Suppose, we have an iron nail and an iron ball of same mass. When submerged in water, then the iron ball may float but the nail always sinks. This is because \checkmark 2013 (II)
 (a) buoyant force on the ball is larger than that of the nail due to their shapes
 (b) viscous force on the ball is higher
 (c) viscous force on the nail is higher
 (d) gravitational force affects the ball differently from the nail
- 34.** Bernoulli's principle is based on which of among the following laws? \checkmark 2014 (I)
 (a) Conservation of mass
 (b) Conservation of momentum
 (c) Conservation of angular momentum
 (d) Conservation of energy
- 35.** Kerosene oil rises in a wick of lantern because of \checkmark 2014 (II)
 (a) buoyancy of air
 (b) diffusion of the oil through the wick
 (c) capillary action in the wick
 (d) gravitation pull of the wick
- 36.** The densities of three liquids are D , $2D$ and $3D$. What will be the density of the resulting mixture, if equal volumes of the three liquids are mixed? \checkmark 2014 (II)
 (a) $6D$ (b) $1.4D$ (c) $2D$ (d) $3D$

- 37.** A deep sea diver may hurt his ear drum during diving because of
 (a) lack of oxygen ☑ 2015 (I)
 (b) high atmospheric pressure
 (c) high water pressure
 (d) All of the above
- 38.** Which one of the following statements is not correct? ☑ 2015 (I)
 (a) In steady flow of a liquid, the velocity of liquid particles reaching at a particular point is the same at all points
 (b) Steady flow is also called streamlined flow
 (c) In steady flow, each particle may not follow the same path as taken by a previous particle passing through that point
 (d) Two streamlines cannot intersect with each other

- 39.** Which one of the following is not a result of surface tension? ☑ 2015 (I)
 (a) Nearly spherical drop of rain
 (b) Capillary rise
 (c) Removal of dirt by soap or detergent
 (d) Flow of a liquid
- 40.** A person stands on his two feet over a surface and experiences a pressure p . Now, the person stands on only one foot. He would experience a pressure of magnitude ☑ 2015 (I)
 (a) $4p$ (b) p
 (c) $\frac{1}{2}p$ (d) $2p$

- 41.** A container is first filled with water and then the entire water is replaced by mercury. Mercury has a density of $13.6 \times 10^3 \text{ kgm}^{-3}$. If X is the weight of the water and Y is the weight of the mercury, then ☑ 2016 (I)
 (a) $X = Y$
 (b) $X = 13.6Y$
 (c) $Y = 13.6X$
 (d) None of the above
- 42.** Density of water is ☑ 2016 (I)
 (a) maximum at 0°C
 (b) minimum at 0°C
 (c) maximum at 4°C
 (d) minimum at -4°C

41	c	42	c																

> Solutions

17. (b) \therefore Relative density of liquid
 $= \frac{4/3}{9/10} = \frac{40}{27} = 1.4 \approx 1$

18. (a) \therefore Specific gravity of liquid
 $= \frac{1 - \frac{1}{3}}{1 - \frac{3}{4}} = \frac{2/3}{1/4} = \frac{8}{3}$

19. (d) \therefore Density of metal
 $= \frac{\text{Weight of metal in air}}{\text{Weight of metal in air} - \text{Weight in water}}$
 $= \frac{210}{210 - 180} = \frac{210}{30} = 7 \text{ gcm}^{-3}$

22. (c) \therefore Density of oil
 $= \frac{\text{Weight in air} - \text{Weight in liquid}}{\text{Weight in air} - \text{Weight in water}}$
 $= \frac{200 - 175}{200 - 150} = \frac{25}{50} = \frac{1}{2} = 0.50 \text{ g (cc)}^{-1}$

23. (a) \therefore Relative density of body $= \frac{12}{12 - 8} = 3$
 Density of body $= 3 \times 1000 = 3000 \text{ kgm}^{-3}$

26. (c) \therefore Mass of hydrogen
 $= \text{Density} \times \text{Volume}$
 $= 0.09 \times 10 = 0.9$

Total mass = Mass of hydrogen +
 Mass of fabric
 $= 0.9 + 6.5 = 7.4$

Mass of air = $10 \times 1.25 = 12.5 \text{ kg}$
 Thus, the weight carried = $12.5 - 7.4 = 5.1 \text{ kg}$

27. (b) Given, density of ice = 0.93 gcm^{-3} ,
 density of water = 1.03 gcm^{-3}
 \therefore Immersed part of ice berg
 $= \frac{\text{Density of ice}}{\text{Density of water}} = \frac{0.93}{1.03} = \frac{93}{103}$

The volume of a piece of ice will be above water
 $= 1 - \frac{93}{103} = \frac{10}{103}$

\therefore Percentage fraction
 $= \frac{10}{103} \times 100 = \frac{10}{93} \times 100 = 11\%$

28. (a) \therefore Density of stone $= \frac{750}{750 - 500} = 3$

We know that, volume $= \frac{\text{mass}}{\text{density}}$
 $= \frac{750}{3}$
 $= 250 \text{ cc}$

29. (a) Volume remains constant.
 So, volume of big drop = volume of 1000 small drops

$$\frac{4}{3} \pi R^3 = 1000 \times \frac{4}{3} \pi r^3$$

$$R = 10r$$

\therefore $\frac{\text{Surface energy of big drop}}{\text{Surface energy of 1000 small drops}}$
 $= \frac{4 \pi R^2 T}{1000 \times 4 \pi r^2 T}$
 $= \frac{10 \times 10r}{1000r} \quad [\because R = 10r]$
 $= \frac{1}{10}$

06

HEAT AND KINETIC THEORY OF GASES

Usually 1 to 2 questions are asked from this chapter. These questions are based on the heat, temperature, boiling points, gaseous pressure and melting point.

TEMPERATURE

Temperature is the measure of degree of hotness or coldness of a body. The temperature of a body can be defined as the state/condition which would determine the direction of flow of heat when this body is placed in contact with another body.

Temperature Scales

To measure temperature, two fixed points are taken; one of them is freezing point of water, known as **icepoint** and other point is boiling point of water, known as **steam point**.

Some temperature scales are given below

- (i) **Celsius Scale ($^{\circ}\text{C}$)** In this scale of temperature, the melting point of ice is taken as 0°C and the boiling point of water as 100°C and the space between these two points is divided into 100 equal parts. This scale was designed by Anders Celsius in 1710.
- (ii) **Fahrenheit Scale ($^{\circ}\text{F}$)** In this scale, the melting point of ice is taken as 32°F and the boiling point of water as 212°F and the space between these two points is divided into 180 equal parts. This scale was designed by Gabriel Fahrenheit in 1717.

- (iii) **Kelvin Scale (K)** In this scale, the ice point and the steam point (boiling point) are taken as 273 K and 373 K, respectively and the space between these two points is divided into 100 equal parts. It was designed by Kelvin.
- (iv) **Reaumur Scale (R)** In this scale, ice point and boiling point are taken as 0°R and 80°R respectively. 1°R is equal to the 80th part of difference between two points. This scale was designed by RA Reaumur in 1730.
- (v) **Rankine Scale (Ra)** In this scale, ice point and steam point are taken as 460°Ra and 672°Ra , respectively. 1°Ra is equal to the 212th part of difference between two points.

Relations between various temperature scales

$$\begin{aligned}\frac{C}{5} &= \frac{F - 32}{9} \\ &= \frac{K - 273}{5} \\ &= \frac{R}{4} = \frac{Ra - 460}{10.6}\end{aligned}$$

Some Important Temperature on Various Scales

Temperature	Celsius (°C)	Fahrenheit (°F)	Kelvin (K)
Freezing of water	0°C	32°F	273 K
Normal temperature of the room	27°C	80.6°F	300 K
Normal temperature of the human	37°C	98.6°F	310 K
Boiling point of the water	100°C	212°F	373 K

Thermometer

The device which measures the temperature of the body, is called thermometer.

Some different types of thermometers are given below

- (i) **Constant-Volume Gas Thermometer** If p_0, p_{100}, p_{tr} and p_t are the pressures of gas at temperatures 0°C, 100°C, triple point of water and unknown temperature ($t^\circ\text{C}$) respectively keeping the volume constant, then

$$t = \left(\frac{p - p_0}{p_{100} - p_0} \times 100 \right)^\circ\text{C} \quad \text{or} \quad T = \left(273.16 \frac{p}{p_{tr}} \right)\text{K}$$

- (ii) **Platinum Resistance Thermometer** If R_0, R_{100}, R_{tr} and R_t are the resistances of a platinum wire at temperatures 0°C, 100°C, triple point of water and unknown temperature ($t^\circ\text{C}$) respectively, then

$$t = \left(\frac{R_t - R_0}{R_{100} - R_0} \times 100 \right)^\circ\text{C}$$

$$\text{or} \quad T = \left(\frac{R_t}{R_{tr}} \times T_{tr} \right)\text{K} = \left(\frac{R_t}{R_{tr}} \times 273.16 \right)\text{K}$$

- (iii) **Mercury Thermometer** In this thermometer, the length of a mercury column from some fixed point is taken as thermometric property. Thus,

$$t = \left(\frac{l_t - l_0}{l_{100} - l_0} \right) \times 100^\circ\text{C} \quad \text{or} \quad T = \left(\frac{l_t}{l_{tr}} \times 273.16 \right)\text{K}$$

Ranges of Different Thermometers

Thermometer	Lower Limit	Upper Limit
Mercury thermometer	- 30°C	300°C
Gas thermometer	- 268°C	1500°C
Platinum resistance thermometer	- 200°C	1200°C
Thermo-couple thermometer	- 200°C	1600°C
Radiation thermometer	800°C	- 6000°C

THERMAL EXPANSION

Change in temperature of a body causes change in its dimensions. Thus, increase in the dimensions (*i.e.*, length, breadth and thickness) of a body due to increase in its temperature, is called thermal expansion.

Thermal Expansion of Solids

All the solids expand on heating. This expansion of solids is called thermal expansion of solids.

Thermal expansion of solids are of three types

- (i) **Linear Expansion** When expansion of solids takes place along a line as in the case of thin rod, then the expansion is called linear expansion.

Coefficient of Linear Expansion (α)

$$= \frac{\text{Increase in length}}{\text{Initial length} \times \text{Rise in temperature}}$$

$$\Rightarrow \alpha = \frac{\Delta L}{L \times \Delta t}$$

Its unit is per °C.

- (ii) **Superficial Expansion** When expansion of solids takes place in two dimensions, as in the case of a lamina, both length and breadth increase. It is called superficial expansion.

Coefficients of Superficial Expansion (β)

$$= \frac{\text{Increase in area}}{\text{Initial area} \times \text{Rise in temperature}}$$

$$\Rightarrow \beta = \frac{\Delta A}{A \times \Delta t}$$

Its unit is per °C.

- (iii) **Volume Expansion or Cubical Expansion** When expansion of solids takes place in three dimensions, as in the case of a cube, length, breadth and height all increase. It is called volume expansion.

Coefficient of Volume Expansion (γ)

$$= \frac{\text{Increase in volume}}{\text{Initial volume} \times \text{Rise in temperature}}$$

$$\Rightarrow \gamma = \frac{\Delta V}{V \times \Delta t}$$

Its unit is per °C.

Relation between α, β and γ

$$\beta = 2\alpha, \gamma = 3\alpha, \text{ also } \alpha : \beta : \gamma = 1 : 2 : 3$$

Thermal Expansion of Liquids

Liquids have only cubical expansion because they have no shape and size. When liquids are heated, then the vessel, in which liquid is kept also heated. So, first vessel expands and then liquid.

Thermal expansion of liquids are of two types

- (i) **Apparent Expansion** The expansion of liquids neglecting expansion of vessel is called apparent expansion.

Apparent expansion coefficient,

$$\gamma_a = \frac{\text{Apparent increase in volume}}{\text{Initial volume} \times \text{Rise in temperature}} = \frac{\Delta V_a}{V \times \Delta t}$$

- (ii) **Real Expansion** It is the actual increase in volume of liquid.

Real expansion coefficient,

$$\gamma_r = \frac{\text{Real expansion in volume}}{\text{Initial volume} \times \text{Rise in temperature}}$$

$$\gamma_r = \frac{\Delta V_r}{V \times \Delta t}$$

Relation between γ_a and γ_r

$$\gamma_r = \gamma_a + \gamma_g$$

where, γ_r = real expansion of liquid.

γ_a = apparent expansion of liquid.

γ_g = volume expansion coefficient of material vessel.

Anomalous/Exceptional Behaviour of Water

As the temperature of water increases from 0 to 4°C, the density of water increases and as temperature increases beyond 4°C, the density decreases. The variation in the density in the water with temperature is shown in the figure below.

Thermal Expansion of Gases

In expansion of gases, there are two coefficients

- (i) **Volume Coefficient (γ_V)** The change in volume of gas per unit volume per unit degree celsius at constant pressure is known as coefficient of volume expansion.

- (ii) **Pressure Coefficient (γ_p)** The change in pressure of gas per unit degree celsius at constant volume is known as pressure coefficient.

- If the temperature and pressure of gas is constant, then $\frac{P_1}{P_2} = \frac{m_1}{m_2}$, where P_1 and P_2 are pressure of gas.
- If same volume jar having (P_1 and P_2) pressure and (T_1 and T_2) temperature then, $P = \frac{P_1 T_2 + P_2 T_1}{T_1 + T_2}$ (after joining both jar)

HEAT

Heat is a form of energy that flows from one body to another because of temperature difference between them.

The SI unit of heat is joule (J) and the CGS unit of heat is calorie (cal).

One calorie is defined as the heat energy required to raise the temperature of one gram of water through 1°C.

$$1 \text{ Calorie} = 4.18 \text{ J}$$

Specific Heat

The amount of heat required to raise the temperature of 1 g of a substance by 1°C is called the specific heat of gas.

It is represented by s . Its unit is cal/g°C or joule/g°C.

$$s = \frac{Q}{m \Delta t}$$

where, Q = amount of heat given to the substance

m = mass of the substance

Δt = rise in temperature

Molar Specific Heat

The amount of heat required to raise the temperature of 1 mole of a gas by 1°C is called molar specific heat.

There are two types of molar specific heat

- (i) **Molar specific heat at constant volume (C_V)** It is defined as the amount of heat required to raise the temperature of 1 mole of the gas through 1° C (or 1 K). When its volume is kept constant. It is denoted by C_V .
- (ii) **Molar specific heat at constant pressure (C_p)** It is defined as the amount of heat required to raise the temperature of 1 mole of the gas through 1° C (or 1 K), when its pressure is kept constant. It is denoted by C_p .

If specific heat at constant pressure (C_p) is greater the specific heat at constant volume (C_V), then molar specific heat, $C_p - C_V = R$

where, R = gas constant and its value is $1.99 \approx 2 \text{ cal mol}^{-1} \text{ K}^{-1}$ and this relation is called **Mayer's formula**.

Latent Heat

The amount of heat required to change the state of unit mass of a substance at constant temperature is called latent heat of the substance. If mass m of a substance undergoes a change from one state to another, then the amount of heat required for the process is

$$Q = mL$$

Where, L is the latent heat of the substance. The SI unit of latent heat is J Kg^{-1} and the CGS unit of latent heat is cal g^{-1} .

There are two types of latent heat

- (i) **Latent heat of Fusion** The amount of heat required to change the state of unit mass of a substance from solid to liquid at its melting point is called latent heat of fusion.

In case of ice the latent heat of fusion of ice is 80 cal/gm.

- (ii) **Latent heat of vaporisation** The amount of heat required to change the state of unit mass of a substance from liquid to vapour at its boiling point is called latent heat of vaporisation.

In case of water the latent heat of vaporisation is 536 cal/gm.

- **Note** Latent heat of vaporisation is more than the latent heat of fusion. This is because when a substance gets converted from liquid to vapour, there is a large increase in volume. Hence, more amount of heat is required. But when a solid gets converted to a liquid, then the increase in volume is negligible. Hence, very less amount of heat is required.

Terms Related to Change of State

There are some important terms related to change of state are given below

- (i) **Melting and Melting Point** The process of change of state from solid to liquid is called melting. The temperature at which solid starts to liquify is known as the melting point of that solid.
The melting point of a substance at atmospheric pressure is called normal melting point.
- (ii) **Fusion and Freezing Point** The process of change of state from liquid to solid is called fusion. The temperature at which liquid starts to freeze is known as the freezing point of the liquid.
- (iii) **Vaporisation and Boiling Point** The process of change of state from liquid to vapour (or gas) is called vaporisation. During the change of state (completely), the temperature remains constant which implies both liquid and vapour are at the thermal equilibrium. The temperature at which the liquid starts to evaporate is called the boiling point of the liquid.
- (iv) **Sublimation** The process of change of state directly from solid to vapour (or gas) is known as sublimation. There is no matter of liquid state of substance. The reverse process of sublimation is not possible e.g., camphor, naphthalene balls etc.

Heat Capacity or Thermal Capacity

The heat capacity of a body is defined as the amount of heat required to raise its temperature through one degree.

∴ Heat capacity = Mass × Specific heat

$$S = mc$$

The SI unit of heat capacity is JK^{-1}

Water Equivalent

The water equivalent of a body is defined as the mass of water which requires the same amount of heat as is required by the given body for the same rise of temperature.

Water equivalent = Mass × Specific heat

$$w = mc$$

The SI unit of water equivalent is kg.

Principle of Calorimetry

The branch of physics that deals with the measurement of heat is called calorimetry. The principle of calorimetry states that the heat gained by the cold body must be equal to the heat lost by hot body, provided there is no exchange of heat with the surroundings.

$$\text{Heat gained} = \text{Heat lost}$$

This principle is a consequence of the law of conservation of energy.

KINETIC THEORY OF GASES

All matter is made up of molecules. The molecules of a gas are in state of rapid and continuous motion. Their velocity depends on temperature. Using this molecular motion, various properties of a gas like temperature, pressure, energy etc can be explained. Hence, this theory is called kinetic theory of gases.

Kinetic theory of gases was developed by Clausius and Maxwell.

Assumptions of Kinetic Theory of Gases

The entire structure of the kinetic theory of gases is based on the following assumptions

- All gases consist of molecules. The molecules are rigid, elastic spheres identical in all respects for a given gas and different for different gases.
- The size of the gas molecules is very small as compared to the distance between them.
- The molecules of a gas are in a state of continuous random motion, moving in all directions with all possible velocities.
- During the random motion, the molecules collide with one another and with the walls of the vessel.
- The collisions are perfectly elastic and there are no forces of attraction or repulsion between the molecules.
- Between two collisions a molecule moves in a straight path with a uniform velocity.
- The collisions are almost instantaneous i.e., the time of collision of two molecules is negligible as compared to time interval between two successive collisions.
- In spite of the molecular collisions, the density remains uniform throughout the gas.

GAS LAWS

Mass (m), volume (V), pressure (p) and temperature (T) of a gas are the measurable properties. The laws which inter-relate these properties, are called gas laws. Let's discuss the various gas laws which give the relationship between measurable properties of gases.

- (i) **Boyle's Law** At constant temperature, the volume of the given mass of a gas is inversely proportional to its pressure.

$$p \propto \frac{1}{V} \quad [\text{at constant temperature}]$$

$$pV = \text{constant or } p_1V_1 = p_2V_2$$

- (ii) **Charles' Law** At constant pressure, the volume of given mass of the gas is directly proportional to its absolute temperature.

$$V \propto T \quad [\text{at constant pressure}]$$

$$V_t = V_0(1 + \alpha t)$$

where, α = volume coefficient (for gases, $\alpha = \frac{1}{273}$ per $^{\circ}\text{C}$)

$$\therefore V_t = V_0 \left(1 + \frac{t}{273}\right) \quad \text{or} \quad \frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Absolute zero is that temperature at which all molecular motion ceases.

- (iii) **Pressure Law or Gay Lussac's Law** At constant volume, pressure of the gas is directly proportional to its absolute temperature.

$$p \propto T \quad [\text{at constant volume}]$$

$$p_t = p_0(1 + \beta t)$$

where, β = pressure coefficient [for gases, $\beta = \frac{1}{273}$]

$$\therefore p_t = p_0 \left(1 + \frac{t}{273}\right) \quad \text{or} \quad \frac{p_1}{T_1} = \frac{p_2}{T_2}$$

The pressure exerted by gas is due to exchange of momentum of the molecules due to collision with the walls of vessel.

Ideal or Perfect Gas

An ideal or a perfect gas is that gas which strictly obeys the gas laws, (such as Boyle's law, Charles' law, Gay Lussac's law, etc.).

Following are the characteristics of the ideal gas

- (i) The size of the molecule of an ideal gas is zero, i.e., each molecule of the ideal gas is a point mass with no dimensions.
- (ii) There is no force of attraction or repulsion amongst the molecules of an ideal gas.

Equation of State or Ideal Gas Equation

The equation which relates the pressure (P), volume (V) and temperature (T) of the given state of an ideal gas is known as ideal gas equation or equation of state.

$$\text{For 1 mole of gas } \frac{PV}{T} = R \text{ (constant)} \Rightarrow PV = RT$$

Where, R = universal gas constant

Vander Waal's Gas Equations

$$\text{For 1 mole of gas } \left(P + \frac{a}{V^2}\right)(V - b) = RT$$

$$\text{For } \mu \text{ moles of gas } \left(P + \frac{a\mu^2}{V^2}\right)(V - \mu b) = \mu RT$$

Here, a and b are constant i.e. called Vander Waal's constant.

Real gases obey this equation at high pressure and low temperature.

Critical Temperature, Pressure and Volume

- (i) **Critical temperature (T_c)** The maximum temperature below which a gas can be liquefied by pressure alone is called critical temperature and it is characteristic of the gas. A gas cannot be liquefied, if its temperature is more than critical temperature. e.g. CO_2 (31.1°C), O_2 (-118°C), N_2 (-147.1°C) and H_2O (374.1°C).
- (ii) **Critical pressure (P_c)** The minimum pressure necessary to liquify a gas at critical temperature is defined as critical pressure. e.g. CO_2 (73.87 bar) and O_2 (49.7 atm).
- (iii) **Critical volume (V_c)** The volume of 1 mole of gas at critical pressure and critical temperature is defined as critical volume. e.g. CO_2 ($95 \times 10^{-6} \text{ m}^3$).

Gaseous Pressure

Molecules of gases collide with each other and also collide with the walls of the vessel. Thus, gas applies a pressure on the walls of the container, this pressure is called **gaseous pressure**.

$$p = \frac{1}{3} \frac{mn}{V} \bar{v}^2 \Rightarrow p = \frac{1}{2} \rho \bar{v}^2$$

where, m = mass of one molecule,
 n = number of molecules of the gas,
 V = volume of the vessel,
 \bar{v}^2 = root mean square velocity
 and ρ = density of gas

> PRACTICE EXERCISE

- The temperature for which the reading on Celsius and Fahrenheit scales are identical, is
(a) -40°C (b) 40°C
(c) -30°C (d) 30°C
- The equivalence of two systems in thermal equilibrium is represented by the property
(a) heat (b) temperature
(c) energy (d) specific heat
- Specific heat of a substance depends upon
(a) mass of the substance
(b) volume of the substance
(c) shape of the body
(d) nature of the substance
- When water is heated from 0°C to 20°C , how does its volume change?
(a) It shall increase
(b) It shall decrease
(c) It shall first increase and then decrease
(d) It shall first decrease and then increase
- Real expansion of a liquid is always
(a) greater than apparent expansion
(b) less than apparent expansion
(c) equal to apparent expansion
(d) None of the above
- Paraffin wax contracts on solidification. The melting point of wax will
(a) not change with pressure
(b) decrease with pressure
(c) increase with pressure
(d) None of the above
- When pressure on piece of ice is increases its melting point
(a) decreases
(b) increases
(c) remains unchanged
(d) first increases and then decreases
- SI unit of universal gas constant is
(a) $\text{Cal}/^{\circ}\text{C}$ (b) J/mol
(c) $\text{J mol}^{-1} \text{K}^{-1}$ (d) J/kg
- Molecules of a gas behaves like
(a) inelastic rigid sphere
(b) perfectly elastic non-rigid sphere
(c) perfectly elastic rigid sphere
(d) inelastic non-rigid sphere
- Which of the following statements about kinetic theory of gases is wrong
(a) The molecules of a gas are in continuous random motion.
(b) The molecules continuously undergo in elastic collisions.
(c) The molecules do not interact with each other except during collisions.
(d) The collisions amongst the molecules are of short duration.
- In the relation $n = \frac{PV}{RT}$, where $n =$
(a) number of molecules
(b) atomic number
(c) mass number
(d) number of moles
- Mean free path of a gas molecules is
(a) Inversely proportional to the number of molecules per unit volume
(b) Inversely proportional to the diameter of the molecule
(c) directly proportional to the square root of the absolute temperature
(d) Independent of temperature
- The r.m.s speed of gas molecule is given by
(a) $2.5 \sqrt{\frac{RT}{m}}$ (b) $1.73 \sqrt{\frac{RT}{M}}$
(c) $2.5 \sqrt{\frac{M}{RT}}$ (d) $1.73 \sqrt{\frac{M}{RT}}$
- A diatomic molecule has how many degrees of freedom
(a) 3 (b) 4 (c) 5 (d) 6
- For an ideal gas of diatomic molecules
(a) $C_p = \frac{5}{2}R$ (b) $C_v = \frac{3}{2}R$
(c) $C_p - C_v = 2R$ (d) $C_p = \frac{7}{2}R$
- If the pressure and volume of certain quantity of ideal gas are halved, then its temperature
(a) is doubled
(b) becomes one-fourth
(c) remains constant
(d) is halved
- A bullet of mass 10 g moving with speed of 210 m/s is stopped suddenly. If all its kinetic energy is convertes into heat, then what is the amount of heat produced in calories?
(a) 52.5×10^2 (b) 52.5×10^4
(c) 525 (d) 52.5
- From what height a block of ice must fall into a well, so that $\frac{1}{100}$ th of its mass may be melted? The temperature of the water in the well is 0°C . Latent heat of fusion of ice 80 cal/g and $J = 4.2 \times 10^7 \text{ erg / cal}$.
(a) 342 m (b) 34.2 m
(c) 3.42 m (d) 342.86 m
- 1 g of ice at 0°C is mixed with 1 g of steam at 100°C . After thermal equilibrium, the temperature of the mixture is
(a) 0°C (b) 50°C (c) 80°C (d) 10°C
- Which one of the following is the amount of that given up when 20 g of steam at 100°C is condensed and cooled to 20°C ?
(a) 10000 cal (b) 11400 cal
(c) 12400 cal (d) 13600 cal
- 1g of water at 100°C is converted to steam at the same temperature. The amount of heat required is nearest to a value of
(a) 2257 J (b) 540 J (c) zero (d) 336 J
- Two liquids of equal volume are mixed thoroughly. Their specific heats are s_1, s_2 , temperature θ_1, θ_2 and densities ρ_1 and ρ_2 , then the final temperature of the mixture is
(a) $\frac{\rho_1 s_1 \theta_1 + \rho_2 s_2 \theta_2}{\rho_1 s_1 + \rho_2 s_2}$
(b) $\frac{\rho_1 s_1 \theta_2 + \rho_2 s_2 \theta_1}{\rho_1 \theta_2 + \rho_2 \theta_1}$
(c) $\frac{\rho_1 s_1 \theta_1 + \rho_2 s_2 \theta_2}{s_1 + s_2}$
(d) $\frac{\rho_1 s_1 + \rho_2 s_2}{s_1 \theta_1 + s_2 \theta_2}$
- What is the resulting temperature t when 150 g of ice at 0°C is mixed with 300 g of water at 50°C ?
(a) 33.3°C (b) 6.6°C
(c) 25°C (d) 13.4°C
- When a gas filled in a closed vessel is heated through 1°C , its pressure increases by 0.4%, then the initial temperature of the gas was
(a) 30°C (b) 200 K
(c) 2500 K (d) 250°C

- 25.** An iron tyre is to be fitted onto a wooden wheel, 1 m in diameter. The diameter of the tyre is 6 mm smaller than that of the wheel. Find the increase in temperature of tyre, so that it fits exactly on wooden wheel.
(a) 1.666°C (b) 16.66°C
(c) 167.6°C (d) 1666°C
- 26.** A steel scale reads correctly at 0°C. Given that the coefficient of linear expansion of steel is 12×10^{-6} per K, the correction that must be applied to a length of 25 m measured by the scale at 30°C will be
(a) 0.006 m (b) 0.009 m
(c) 0.007 m (d) 0.018 m
- 27.** The quantity of heat required to convert 2.5 kg of ice at 0° to water at 20°C (assuming the latent heat of ice to be 80 cal per gram) is
(a) 200 kcal (b) 150 kcal
(c) 250 kcal (d) 225 kcal
- 28.** When a piece of metal weighing 48.3 g at 10.7°C is immersed in a current of steam at 100°C, 0.762 g of steam is condensed on it. What is the specific heat of metal?
(a) 0.95 cal/g°C (b) 9.5 cal/g°C
(c) 95 cal/g°C (d) 0.095 cal/g°C
- 29.** At constant temperature on increasing the pressure of a gas by 5% its volume will decrease by
(a) 5% (b) 5.26% (c) 4.26% (d) 4.76%
- 30.** Gas at 27°C has a volume V and pressure P on heating its pressure is doubled and volume becomes three times. The resulting temperature of the gas will be
(a) 1800°C (b) 162°C
(c) 1527°C (d) 600°C
- 31.** A gas at 27°C temperature and 30 atmospheric pressure is allowed to expand to the atmospheric pressure. If the volume becomes 10 times its initial volume, then the final temperature becomes
(a) 100°C (b) 173°C
(c) 273°C (d) -173°C
- 32.** The root mean square velocity of the molecules in a sample of helium is 5/7th that of molecules in a sample of hydrogen. If the temperature of hydrogen sample is 0°C, then the temperature of the helium sample is about
(a) 0°C (b) 0K (c) 273°C (d) 100°C

- 33.** At room temperature, the r.m.s speed of the molecules of certain diatomic gas is found to be 1930 m/s. The gas is
(a) H₂ (b) F₂ (c) O₂ (d) Cl₂
- 34.** If the ratio of vapour density for hydrogen and oxygen is $\frac{1}{16}$, then under constant pressure the ratio of their rms velocities will be
(a) $\frac{4}{1}$ (b) $\frac{1}{4}$ (c) $\frac{1}{16}$ (d) $\frac{16}{1}$
- 35.** At what temperature the molecules of nitrogen will have the same r.m.s velocity as the molecules of oxygen at 127°C
(a) 77°C (b) 350°C (c) 273°C (d) 457°C
- 36.** The temperature of an ideal gas is increased from 27°C to 127°C, then percentage increase in v_{rms} is
(a) 37% (b) 11% (c) 33% (d) 15.5%
- 37.** A cylinder of fixed capacity (of 44.8 litres) contains 2 moles of helium gas at STP. What is the amount of heat needed to raise the temperature of the gas in the cylinder by 20°C
(Take, $R = 8.31 \text{ J mol}^{-1}\text{K}^{-1}$)
(a) 996 J (b) 831 J (c) 498 J (d) 374 J
- 38.** Oxygen boils at -183°C, this temperature is
(a) -297 °F (b) -229 °F
(c) -260 °F (d) -200 °F

Directions (Q. No. 39 and 40) Read the assertion and reason carefully to mark the correct option out of the options given below

- (a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true, but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.
- 39. Assertion :** The ratio of specific heat gas at constant pressure and specific heat at constant volume for a diatomic gas is more than that for a monatomic gas.
Reason : The molecules of a monoatomic gas have more degree of freedom than those of a diatomic gas.

- 40. Assertion :** The root mean square and most probable speeds of the molecules in a gas are the same.
Reason : The Maxwell distribution for the speed of molecules in a gas symmetrical.

- 41.** Which of the following statements are true regarding heat?
I. Heat is a form of energy.
II. Heat can be reflected by a mirror.
III. Heat is an electromagnetic radiation.
IV. Heat cannot pass through vacuum.
Select the correct answer from the codes given below
(a) I, II and III
(b) I, II and IV
(c) II, III and IV
(d) I, III and IV

- 42.** Which of the following will take place when the temperature of 1 kg of water is raised from 30°C to 140°C?
I. There will be a physical change of state.
II. It goes through a chemical change.
III. The change of state requires latent heat.
IV. The boiling point of water will depend on the atmospheric pressure.

Choose the correct answer from the codes given below

- (a) Both I and II
(b) I, III and IV
(c) II, III and IV
(d) Both II and III
- 43.** Consider the following three statements
I. Heating 1 kg of water from 10°C to 50°C.
II. Melting 600 g of ice at 0°C.
III. Converting 300 g of ice at 0°C to water at 50°C.

Which one of the following shows the correct arrangement of the quantity of heat required in the above process in increasing order of magnitude?

Choose the correct answer from the codes given below

- (a) I, II and III
(b) II, I and III
(c) III, II and I
(d) III, I and II

Solutions

16. (b) According to ideal gas law

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

or $T_2 = T_1 \frac{P_2 V_2}{P_1 V_1}$

Here, $P_1 = P, V_1 = V, T_1 = T_1$
 $P_2 = \frac{P}{2}, V_2 = \frac{V}{2}, T_2 = ?$

$$\therefore T_2 = \frac{T \left(\frac{P}{2}\right) \left(\frac{V}{2}\right)}{PV}$$

$$\Rightarrow T_2 = \frac{T}{4}$$

17. (d) \therefore All kinetic energies are converted into heat.

$$\therefore Q = \frac{1}{2} m v^2$$

$$Q = \frac{1}{2} \times \frac{10}{1000} \times 210 \times 210$$

$$Q = \frac{220.5}{\text{J}} = \frac{220.5}{4.2} = 52.5 \text{ cal}$$

18. (d) $\therefore b = \frac{m}{100 m} \left(\frac{JL}{g} \right)$

$$\Rightarrow b = \frac{1}{100} \times \left(\frac{4.2 \times 80}{9.8} \right) \times 1000$$

$$b = 342.86 \text{ m}$$

19. (d) \therefore Latent heat taken by ice,
 $Q = ml = 1 \times 80 = 80^\circ\text{C}$

$$\therefore m \times s \times (100 - t) = 80 + m \times s \times (t - 0)$$

$$(100 - t) = 80 + t$$

$$\Rightarrow 20 = 2t \Rightarrow t = 10^\circ\text{C}$$

20. (c) \therefore Latent heat, $Q_1 = ml$

$$= 20 \times 540 = 10800$$

and heat, $Q_2 = m \times s \times \Delta t$

$$= 20 \times 1 \times (100 - 20) = 20 \times 80 = 1600$$

Total heat, $Q = Q_1 + Q_2$

$$= 10800 + 1600 = 12400 \text{ cal}$$

21. (a) \therefore Amount of required heat = $m \times L$

$$= 1 \times 540 = 540 \text{ cal} = 540 \times 4.18 \text{ J} = 2257 \text{ J}$$

23. (b) Latent heat taken by ice,

$$Q = mL = 150 \times 80 = 12000$$

Amount of heat given

$$= \text{Amount of heat taken}$$

$$300(50 - t) = 12000 + 150(t - 0)$$

$$300 \times 50 - 300t = 12000 + 150t$$

$$450t = 3000$$

$$t = \frac{3000}{450} = 6.6^\circ\text{C}$$

25. (c) According to question,

Given, diameter of wooden tyre
 $= 1000 - 6 = 994 \text{ mm}$

$$\text{Radius, } R = \frac{994}{2} = 497 \text{ mm}$$

Change in diameter = 6 mm

$$\Delta R = \frac{6}{2} = 3 \text{ mm}$$

$$\therefore 2\pi\Delta R = 2\pi R \times Y \times \Delta t$$

$$\Delta t = \frac{\Delta R}{RY}$$

$$= \frac{3}{497 \times 3.6 \times 10^{-5}} = 167.6^\circ\text{C}$$

29. (d) $P \propto \frac{1}{V} \Rightarrow \frac{V_2}{V_1} = \frac{P_1}{P_2} = \frac{100}{105}$

$$\Rightarrow V_2 = \frac{100}{105} V_1 = 0.953 V_1$$

$$\% \text{ Change in volume} = \frac{V_1 - V_2}{V_1} \times 100$$

$$= \frac{V_1 - 0.953 V_1}{V_1} \times 100 = 4.76\%$$

30. (c) $\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$

$$\therefore T_2 = \frac{P_2 V_2}{T_1} = \frac{2}{1} \times \frac{3}{1} \times 300 = 1800 \text{ K}$$

$$= 1527^\circ\text{C}$$

31. (d) $\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \Rightarrow T_2 = \frac{P_2 V_2}{P_1 V_1} \times T_1$

$$\Rightarrow T_2 = \frac{1}{30} \times \frac{10}{1} \times 300 = 100 \text{ K}$$

$$= -173^\circ\text{C}$$

32. (a) $v_{\text{rms}} = \sqrt{\frac{3RT}{M}} \Rightarrow v_{\text{rms}} \propto \sqrt{\frac{T}{M}}$

$$\frac{v_{\text{He}}}{v_{\text{H}_2}} = \frac{5}{7} = \sqrt{\frac{T_{\text{He}}}{M_{\text{He}}} \times \frac{M_{\text{H}_2}}{T_{\text{H}_2}}}$$

$$\Rightarrow T_{\text{He}} = \frac{25}{49} \times \frac{4}{2} \times 273 \approx 0^\circ\text{C}$$

33. (a) $v_{\text{rms}} = \sqrt{\frac{3RT}{M}} \Rightarrow M = \frac{3RT}{v_{\text{rms}}^2}$

$$\therefore M = \frac{3 \times 8.3 \times 300}{(1920)^2} = 2 \times 10^{-3} \text{ kg} = 2 \text{ g}$$

\Rightarrow Gas is hydrogen.

34. (a) $v_{\text{rms}} = \sqrt{\frac{3P}{\rho}}$

$$\Rightarrow \frac{V_1}{V_2} = \sqrt{\frac{\rho_2}{\rho_1}} \sqrt{\frac{16}{1}} = \frac{4}{1}$$

35. (a) $v_{\text{rms}} = \sqrt{\frac{3RT}{M}} \Rightarrow T \propto M$

[$\therefore v_{\text{rms}}, R \rightarrow \text{constant}$]

$$\Rightarrow \frac{T_{\text{N}_2}}{T_{\text{O}_2}} = \frac{M_{\text{N}_2}}{M_{\text{O}_2}}$$

$$\Rightarrow \frac{T_{\text{N}_2}}{(273 + 127)} = \frac{28}{32}$$

$$\Rightarrow T_{\text{N}_2} = 350 \text{ K} = 77^\circ\text{C}$$

36. (d) $V_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

% increase in

$$V_{\text{rms}} = \sqrt{\frac{3RT_2}{M}} - \sqrt{\frac{3RT_1}{M}} \times 100\%$$

$$= \frac{20 - 17.32}{17.32} \times 100 = 15.5\%$$

37. (c) Since, the volume of cylinder is fixed, the heat required is determined by C_V . It is a monoatomic gas

Therefore, its molar specific heat at constant is

$$C_V = \frac{3}{2} R$$

\therefore Heat required = number of moles \times molar specific \times rise in temperature

$$= 2 \times \frac{3}{2} R \times 20 = 60 R$$

$$= 60 \times 8.31 = 498.6 \text{ J}$$

38. (a) By using formula,

$$\frac{F - 32}{180} = \frac{C}{100} = \frac{-183}{100}$$

$$\Rightarrow F - 32 = \frac{18}{10} (-183) = -329.4$$

$$\Rightarrow F = 32 - 329.4 = -297.4 \approx -297^\circ\text{F}$$

51. (b) Given, $\Delta p = \frac{10}{100} \times p = 0.1p$

$$\text{Now, } p' = (p + \Delta p) = 1.1p \quad \dots(i)$$

For isothermal change,

$$v' p' = vp$$

$$\Rightarrow v' = \frac{vp}{p'} = \frac{vp}{1.1p} \quad [\text{from Eq. (i)}]$$

$$= \frac{10v}{11}$$

$$\Delta v \text{ (in\%)} = \left(\frac{v - v'}{v} \right) \times 100$$

$$= \left(1 - \frac{v'}{v} \right) \times 100$$

$$= \left(1 - \frac{10}{11} \right) \times 100 = 9\%$$

52. (a) \therefore Relation between Fahrenheit and Celsius scale is

$$\frac{C - 0^\circ}{100} = \frac{F - 32}{180}$$

Given that numerical value of a temperature recorded in both the scales are same.

$$^\circ\text{C} = F = x \quad [\text{say}]$$

$$\Rightarrow \frac{x}{100} = \frac{x - 32}{180}$$

$$\Rightarrow 180x = 100x - 3200$$

$$\Rightarrow 80x = -3200$$

$$\Rightarrow x = -\frac{3200}{80} \Rightarrow x = -40^\circ$$

07

THERMODYNAMICS

Generally 2 to 3 questions are asked from this chapter. These questions are based on transmission of heat, heat conductivity and thermodynamics.

THERMODYNAMICS

The branch of physics which deals with the study of heat and temperature and the relation of heat energy with different types of energy is called thermodynamics.

Thermodynamic System

A thermodynamic system is an aggregate of an extremely large number of atoms or molecules which are confined with certain boundaries. A thermodynamic system may be characterised by certain thermodynamic variables e.g. pressure, volume, temperature, mass, density etc.

Internal Energy

The net energy (i.e. the sum of molecular kinetic and potential energies) contained by the molecules of the substance is called the internal energy. It is represented by U .

Laws of Thermodynamics

There are three laws of thermodynamics, which are given below

Zeroth Law of Thermodynamics

This law was formulated by RH Fowler in 1931. The zeroth law of thermodynamics states that

If two system A and B are separately in thermal equilibrium with a third system C , then A and B are in thermal equilibrium with each other.

First Law of Thermodynamics

“The amount of heat given to a system used up in two ways, first to increase the internal energy and second to do external work.”

i.e., $dQ = dU + dW$

where, dQ = heat supplied to the system,

dW = work done by the system

and dU = change in internal energy of the system

It is the mathematical statement of 1st law of thermodynamics.

- Work done by a thermodynamical system is given by

$$W = p \Delta V$$

The work done by a gas in expansion from V_1 to V_2

$$W = \int_{V_1}^{V_2} p dV$$

- First law of thermodynamics is one form of law of conservation of energy because the heat supplied is converted into internal energy and work.
- The work done by the system depends on the path followed by it.

Thermodynamical Processes

If the thermodynamic variables of a system undergo a change with time, then the thermodynamical process is said to be occurred.

Some of the thermodynamical processes are given below

(i) **Cyclic process** When the system returns to its initial state after doing work, then the process is called cyclic process. For cyclic process, $\Delta U = 0$.

$$\therefore \text{From 1st law, } \Delta Q = \Delta W$$

(ii) **Isobaric process** If during a process in the system, pressure remains constant, then the process is called isobaric process, so heat supplied is used up partially in changing the volume and partially in changing the temperature.

$$W = p\Delta V = p(V_2 - V_1)$$

(iii) **Isochoric process** If during a process in a system, volume remains constant, then the process is called isochoric process. For this process, $\Delta W = 0$.

$$\therefore \Delta Q = \Delta U$$

Heat supplied is used to increase in internal energy.

(iv) **Isothermal process** If a physical process in a system takes place in such a way, that during the whole process temperature remains constant, then the process is called isothermal process.

For isothermal process, Boyle's law is followed, i.e.

$$pV = \text{constant} \quad [\text{from the equation, } pV = \mu RT]$$

Since, temperature remains constant, so there is no change in internal energy, i.e. $\Delta U = 0$.

$$\therefore \Delta Q = \Delta W = p\Delta V$$

Work done in isothermal process The work done in isothermal process from volume V_1 to V_2 is

$$W = 2.3026 \mu RT \log_{10} \left(\frac{V_2}{V_1} \right)$$

The workdone in isothermal process from pressure

$$p_1 \text{ to } p_2 \text{ is } W = 2.3026 \mu RT \log_{10} \left(\frac{p_1}{p_2} \right)$$

(v) **Adiabatic process** If physical process in a system takes place in such a way that there is no exchange of heat between system and the atmosphere, then process is called adiabatic process.

For adiabatic process, Poisson's law is followed, i.e.

$$pV^\gamma = \text{constant}$$

$$\text{or } TV^{\gamma-1} = \text{constant}$$

$$\text{or } \frac{T^\gamma}{p^{\gamma-1}} = \text{constant}$$

For adiabatic process, $\Delta Q = 0$

$$\therefore \text{From 1st law of thermodynamics, } \Delta U = -\Delta W$$

• During adiabatic process, specific heat is zero.

Work done in adiabatic process

$$W = \frac{(p_1V_1 - p_2V_2)}{(\gamma - 1)} = \frac{\mu R(T_1 - T_2)}{\gamma - 1}$$

where, R = principal gas constant and μ = number of moles

- During an adiabatic process, system performs the work on the basis of internal energy.
- For the adiabatic process more pressure difference is required to produce equal change in volume.

Slope of Adiabatic and Isothermal Curves

In case of expansion, the work done in an isothermal process is more than the work done in an adiabatic process.

In case of compression, the work done in an adiabatic process is more than the work done in an isothermal process.

Entropy

It is molecular disorder of system and it is thermodynamic function depending only on temperature of system.

$$\Delta S = \frac{\text{heat absorbed}}{\text{absolute temperature}} \Rightarrow \Delta S = \frac{\Delta Q}{T}$$

Entropy is the thermodynamical function which remains unchanged in an adiabatic process.

Second Law of Thermodynamics

It is impossible for a self acting device, unaided by an external agency which acts in a cycle to absorb heat from the source and convert whole amount of it into work.

Heat Engine

Heat engine is a device which converts heat into mechanical work. A heat engine essentially consists of three parts;

- source of heat at higher temperature
- working substance (steam in steam engine, fuel vapours and air in diesel engine)
- sink of heat at lower temperature

Thermal Efficiency of Heat Engine (η)

It is defined as the ratio of net work done per cycle by the engine to the total amount of heat absorbed per cycle by the working substance from the source.

$$\eta = \frac{\text{Net work done per cycle}}{\text{Total amount of heat absorbed per cycle}}$$

Efficiency of heat engine is given by,

$$\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100\%$$

where, T_1 = temperature of source,
 T_2 = temperature of sink

Carnot Cycle

Carnot cycle is the ideal cycle of operation of a heat engine, devised by Nicholas Leonard Sadi Carnot. This consists of the following four stages.

- (i) Isothermal expansion (heat absorbed)
- (ii) Adiabatic expansion (work done is positive, $W_{\text{expansion}}$)
- (iii) Isothermal compression (heat released)
- (iv) Adiabatic compression (work done is negative, $W_{\text{compression}}$)

Efficiency of Carnot engine is given by

$$\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100\%$$

where, T_2 = temperature of cold body or sink
and T_1 = temperature of hot body
or source

Also,
$$\eta = \frac{W}{Q_1} \times 100\% = \frac{Q_1 - Q_2}{Q_1} \times 100\%$$

For Carnot cycle,
$$\frac{Q_1}{Q_2} = \frac{T_1}{T_2}$$

where, Q_1 = heat absorbed and Q_2 = heat given

Carnot Theorem

No heat engine operating between two given temperatures can be more efficient than a Carnot engine.

Refrigerator

It is a device which takes heat from a cold body, work is done on it and the heat is rejected to the source.

Coefficient of performance,

$$\beta = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$$

where, Q_1 = heat absorbed and Q_2 = heat rejected

For Carnot refrigerator,

$$\beta = \frac{T_2}{T_1 - T_2} = \frac{1 - \eta}{\eta}$$

TRANSMISSION OF HEAT

As we know that heat flows from the body at higher temperature to the body at lower temperature, this flow of heat is known as transfer of heat from one place to another. There are three process by which transmission of heat takes place.

- (i) **Conduction** Conduction is that process of transmission of heat in which heat goes from one particle to another particle of substance, but no particle leaves its position. In solids, transmission of heat takes place by conduction process. All metals are good conductor of heat. Good absorbers are always also good radiators. Cooking utensils are provided with wooden or ebonite handles, since wood or ebonite is a bad conductor of heat. Silver is the best conductor of heat.
- (ii) **Convection** Convection is that process of transmission of heat in which particles of substance goes to another place after taking heat from the source and other particles come to their place. In liquids and gases, transmission of heat takes place by convection process. Land and sea breezes are due to convection. The chimney used in a kitchen or in a factory is based on the convection. In rooms, ventilators are provided to escape the hot air by convection.
- (iii) **Radiation** Radiation is that process of transmission of heat in which there is no need of medium for transfer of heat. It is the quickest way of transmission of heat. Heat from the sun comes to the earth by radiation.

Important Definitions Related to Transmission of Heat

Stable State The state of material in which material cannot absorb or emit the heat, known as stable state of material.

Isothermal Surface The conductor which have some temperature at all the points, known as isothermal surface.

Temperature Gradient The rate of change in temperature with the distance known as temperature gradient. Its unit is $^{\circ}\text{C}/\text{meter}$.

Temperature gradient =
$$\frac{Q_1 - Q_2}{r}$$
 where $Q_2 > Q_1$

Thermal Conductivity

The ability of material to conduct the heat through it, is known as thermal conductivity. Thus, heat conduction is defined as the time rate of heat flow in a material for a given temperature difference.

Consider a metal rod of length l and area of cross-section A . Let the ends of the rod are at the temperatures T_1 and T_2 .

Then, the rate of flow of heat (H) conducted through any section (in steady state) of the rod is directly proportional to the temperature difference ΔT , time t for which the heat flows and the area of cross section A and is inversely proportional to the length L of the rod. Thus, the rate of heat transfer is given by

$$\text{Rate of heat transfer} = \frac{\Delta Q}{\Delta t} = \frac{KA(T_1 - T_2)}{L} \Rightarrow H = KA \frac{\Delta T}{L}$$

$$\text{Also, } H = \frac{Q}{t}$$

$$\therefore \text{Heat transfer, } Q = KA \frac{\Delta T}{L} \cdot t$$

Here, K is known as coefficient of thermal conductivity of material of rod. The greater value of K implies that material will conduct the heat more rapidly. The SI unit of K is $\text{Js}^{-1}\text{m}^{-1}\text{K}^{-1}$ or $\text{Wm}^{-1}\text{K}^{-1}$. The value of thermal conductivity vary slightly with temperature, but it can be considered to be constant over normal temperature range.

If $A = 1$, $T_1 - T_2 = \Delta T = 1$, $L = 1$ and $t = 1$, then $Q = K$

Hence, the coefficient of thermal conductivity of a material may be defined as the quantity of heat that flows per unit time through a unit cube of the material, when its opposite faces are kept at a temperature difference of one degree.

Thermal Current and Thermal Resistance

The rate of flow of heat is known as heat current. It is denoted by H .

$$\text{Thus, } H = \frac{\Delta Q}{\Delta t} = KA \frac{(T_1 - T_2)}{L} = \frac{T_1 - T_2}{\left(\frac{L}{KA}\right)}$$

$$\text{Thermal resistance, } R = \frac{\Delta T}{H} = \frac{T_1 - T_2}{H} = \frac{L}{KA}$$

$$\therefore \text{Thermal resistance, } R = \frac{L}{KA}$$

$$\text{It is just resemble to current, } i = \frac{V_1 - V_2}{R}$$

where, $V_1 - V_2 =$ voltage difference and $R =$ resistance.

So, the terms $\frac{T_1 - T_2}{(L/KA)}$ and $\frac{L}{KA}$ can be treated as thermal current (heat flow) and thermal resistance, respectively.

Formulae of Combination of Metal Rods

Types of combination	Series combination	Parallel Combination
Rate of Heat transfer	$H = \frac{k_1 A (\theta_1 - \theta_2)}{l_1} = \frac{K_2 A (\theta_1 - \theta_2)}{l_2}$	$K = (K_1 A_1 + K_2 A_2) \frac{\Delta \theta}{l}$
Contact surface temperature	$Q = \frac{K_1 \theta_1 l_1 + K_2 \theta_2 l_1}{k_1 l_2 + k_2 l_1}$	—
Equivalent heat conductivity	$K = \frac{l_1 + l_2}{l_1 / k_1 + l_2 / k_2}$	$K = \frac{K_1 A_1 + K_2 A_2}{A_1 + A_2}$
Equivalent heat resistance	$R = R_1 + R_2$	$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$

where, l_1 and $l_2 =$ Length of rods.

k_1 and $k_2 =$ Thermal conductivity factor of rods.

θ_1 and $\theta_2 =$ Temperature of free surfaces.

A_1 and $A_2 =$ Cross sectional area.

Definitions Related to Radiation

Emissive Power (e) It is defined as the amount of heat radiated by unit area of the surface in one second at a given temperature and for given wavelengths. Its unit is $\text{J/m}^2\text{s}$.

Emissivity (ϵ) at a given temperature The ratio of total emissive power of the body to the total emissive power of a perfectly black body at that temperature is called emissivity, represented as $\epsilon = \frac{e}{E}$.

Absorptive Power (a) It is defined as the ratio of absorbed radiation and total incident radiation. It has no unit.

$$a = \frac{\text{Energy absorbed}}{\text{Energy incident}}$$

Spectral Emissive Power (e_λ) Spectral emissive power (e_λ) is the amount of heat radiated by unit area of body in one second in unit spectral region at particular wavelength λ . Its unit is $\text{J/m}^2 \text{second } \text{\AA}$.

Spectral Absorptive Power It is defined as the ratio of radiations absorbed by the surface in unit spectral region at wavelength λ , to the total amount of radiations incident on it.

Perfectly Black Body

A perfectly black body is one which absorbs completely all the radiations of whatever wavelength incident upon it. Since, it neither reflect nor transmit any radiation, it appears black whatever the colour of the incident radiation may be.

Kirchhoff's Law

At any temperature and for a particular wavelength, the ratio of emissive power to the absorptive power of all substances is same and it is equal to the emissive power of a perfectly black body.

$$\text{i.e. } \frac{e_\lambda}{a_\lambda} = E_\lambda$$

Stefan's Law

According to this law, the amount of heat radiated by unit area of surface in one second, is directly proportional to the fourth power of absolute temperature of the body.

$$E \propto T^4 \text{ or } E = \sigma T^4$$

where, σ is Stefan's constant. The unit of σ is $\text{Jm}^{-2}\text{s}^{-1}\text{K}^{-4}$ or $\text{Wm}^{-2}\text{K}^{-4}$ and its value is $5.67 \times 10^{-8} \text{ Wm}^{-2}\text{K}^{-4}$.

Newton's Law of Cooling

According to this law, the rate of cooling of a body is directly proportional to the temperature difference of body and its surroundings.

e.g. Hot water takes much less time in cooling from 100°C to 95°C than from 20°C to 15°C .

If hot water and fresh tap-water are kept in a refrigerator, the rate of cooling of hot water will be faster than the tap-water.

Wien's Displacement Law

According to this law, at a particular temperature of perfectly black body, the product of maximum wavelength (λ_m) and absolute temperature T is constant.

$$\text{i.e. } \lambda_m T = \text{constant or } \lambda_m T = b$$

where, the value of b is $2.9 \times 10^{-3} \text{ mK}$.

This is called Wien's displacement law.

It is used to compute the temperature of the Sun or of the Stars.

> PRACTICE EXERCISE

- The blackboard seems black because it
 - reflects every colour
 - does not reflect any colour
 - absorbs black colour
 - reflects black colour
- The mode of propagation of heat from the sun to the earth is
 - conduction alone
 - convection alone
 - radiation alone
 - Both convection and radiation
- The internal energy of a gram molecule of an ideal gas depends on
 - only volume
 - only temperature
 - only pressure
 - Both pressure as well as temperature
- If γ denotes the ratio of the two specific heat of a gas, then the ratio of the slopes of adiabatic and isothermal p - V curves at their point of intersection is
 - $\frac{1}{\gamma + 1}$
 - $\frac{1}{\gamma}$
 - $\gamma - 1$
 - γ
- The internal energy U is unique function of any state because change in U
 - depends upon path
 - does not depend upon path
 - corresponds to an isothermal process
 - corresponds to an adiabatic process
- In a Carnot engine, when heat is taken by a perfect gas from the source, then the temperature of the source
 - decreases
 - increases
 - remains constant
 - None of these
- The source and sink temperatures of a Carnot engine are 400 K and 300 K , its efficiency is
 - 50%
 - 25%
 - 30%
 - 100%
- A Carnot engine works between 100°C and 20°C . Its efficiency is
 - 1944.7%
 - 0.21447%
 - 200%
 - 21.4%
- An ideal heat engine absorbs heat at a temperature 150°C and its exhaust temperature is 50°C . The efficiency of heat engine is
 - 23.64%
 - 50%
 - 20%
 - 25%
- 1 L of air at 76 cm of Hg is compressed to a pressure of 120 cm of Hg under isothermal condition. The new volume is
 - 633.3 cm^3
 - 6.33 cm^3
 - 76 cm^3
 - 19 cm^3
- A number of small drops of Hg adiabatically coalesce to form a single drop. The temperature of the drop will
 - decrease
 - remain same
 - increase
 - depend on size
- A gas filled cylinder fitted with a piston is immersed in ice at 0°C . The piston is rapidly pushed down to compress the gas which is therefore heated. It is then left for sometime, so that the gas is once again reaches at 0°C . The piston is now slowly raised upto the initial position. 100 g of ice is melted during this process, the work done on the gas is
 - 60 cal
 - 80 cal
 - 800 cal
 - 8000 cal
- Four hot metallic articles which are coloured as blue, red, black and white but have the same temperature and then they are allowed to cool. Which will have the fastest cooling rate?
 - White
 - Red
 - Blue
 - Black
- Air is blown over a hot body to cool it. This would increase the rate of heat loss by
 - conduction
 - radiation and convection
 - convection
 - Both conduction and convection

- 15.** On increasing the temperature of a substance gradually, one notice the colour
(a) blue (b) green (c) red (d) yellow
- 16.** If the temperature of sun becomes twice its present temperatures, then
(a) radiated energy would be predominantly in ultraviolet region
(b) radiated energy would be predominantly in infrared region
(c) radiated energy would be predominantly in X-ray region
(d) radiated energy would become twice the present radiated energy
- 17.** An iron mass falls from a height of 1 km on the ground. If all the energy is converted into heat, then the rise of temperature of the mass will be
(a) 2.33°C (b) 0.233°C
(c) 23.3°C (d) 233°C
- 18.** Four rods of length l and radius r of the same material are kept at the same temperature. Which of the rods conduct most heat?
(a) $l = 2$ m, $r = 10$ cm
(b) $l = 2$ m, $r = 5$ cm
(c) $l = 1$ m, $r = 5$ cm
(d) $l = 1$ m, $r = 10$ cm
- 19.** Two bodies A and B are placed in an evacuated vessel maintained at a temperature of 27°C. The temperature of A is 327°C and that of B is 227°C. The ratio of heat loss from A and B is about
(a) 1 : 2 (b) 2 : 8
(c) 8 : 2 (d) 2 : 1
- 20.** A fan produces a feeling of comfort during hot weather because
(a) our body radiates more heat in air
(b) fan supplies cool air
(c) conductivity of air increase
(d) our perspiration evaporates rapidly
- 21.** Which one of the following is the mode of heat transfer in which warm material is transported, so as to displace a cooler material?
(a) Conduction only
(b) Convection only
(c) Radiation
(d) Both conduction and convection
- 22.** The temperature of the stars can be estimated by
(a) Wien's displacement law
(b) Rayleigh-Jeans law
(c) Faraday's law
(d) Maxwell-Boltzmann law
- 23.** Luminosity of rigel star in orion constellation is 17000 times that of our sun. If the surface temperature of sun is 6000 K, then the temperature of the star is about
(a) 18000 K (b) 68500 K
(c) 7000 K (d) 8000 K
- 24.** Resistance of a conductor varies with temperature in a manner
(a) $R_t = R_0 (1 + \alpha^2 t)$
(b) $R_t = R_0 (1 + \alpha t)$
(c) $R_t = R_0 (1 + \alpha t)^2$
(d) $R_t = R_0 (1 - \alpha t)$
- 25.** If a gas is heated at constant pressure, then its isothermal compressibility
(a) increases with temperature
(b) remains constant
(c) decreases with temperature
(d) decreases inversely with temperature
- 26.** The pressure and density of a diatomic gas changes adiabatically from (p, ρ) to (p', ρ') . If p'/p is equal to 32, then ρ'/ρ should be
(a) 128 (b) 28 (c) 1/128 (d) 32
- 27.** Consider the following statements about a thermos flask.
I. It is a practical device in which the heat flowing into or out of the system by conduction, convection or radiation is reduced as much as possible.
II. It consists of a doublewalled glass vessel.
III. In a thermos flask, the heat transfers by convection is minimised by silvering the surfaces and that by radiation is minimised by evacuating the space between the walls.
Of these statements
(a) Both II and III (b) Both I and II
(c) Both I and III (d) I, II and III
- 28.** Which of the following are factors upon which the amount of heat radiated from a body depends?
I. Excess temperature of the body over surroundings.
II. Density of the body.
III. Exposed area of the body.
IV. Nature of the surface of the body
Choose the correct answer from the codes given below
(a) I, II and III (b) I, II and IV
(c) I, III and IV (d) II, III and IV
- 29.** Consider the following types of surfaces
A surface that is
I. coated with lamp black
II. polished
III. painted white
The correct sequence of the decreasing order of the emissive powers of the given surfaces will be
(a) I, III, II (b) III, II, I
(c) II, I, III (d) II, III, I
- > Previous Years' Questions**
- 30.** **Statement I** A thermoflask is made of double-walled glass bottles.
Statement II Metals are good conductors while gas and air are poor conductors of heat. **☑ 2012 (I)**
(a) Both the statements are individually true and Statement II is the correct explanation of Statement I
(b) Both the statements are individually true but Statement II is not the correct explanation of Statement I
(c) Statement I is true but Statement II is false
(d) Statement I is false but Statement II is true
- 31.** The thermal conductivity of copper is 4 times that of brass. Two rods of copper and brass having same length and cross-section are joined end to end. The free end of copper is at 0°C and the free end of brass is at 100 °C. The temperature of the junction is **☑ 2012 (I)**
(a) 20°C (b) 40°C (c) 60°C (d) 10°C
- 32.** The earth's surface receives maximum energy at 12 noon but the maximum temperature never occurs at 12 noon. State which of the following reasons are correct? **☑ 2012 (I)**
I. Transformation of solar energy into heat requires sometime.
II The loss of energy through long wave radiations from the earth's surface exceeds the energy received from the sun at 4:00 pm.
III. Energy received by the earth from solar radiations continues to exceed the energy lost by outgoing long wave radiations from the earth's surface upto 4:00 pm.
Select the correct answer using the codes given below
(a) Both I and II (b) Both II and III
(c) Both I and III (d) I, II and III

- 33.** Body *A* of mass 2 kg and another body *B* of mass 4 kg of same material are kept in the same sunshine for sometime interval. If the rise in temperature is equal for both the bodies, then which one among the following in this regard is correct? **☑ 2012(I)**
- (a) Heat absorbed by *B* is double because its mass is double
 (b) Heat absorbed by *A* is double because its mass is equal
 (c) Heat absorbed by both *A* and *B* is equal because the quantity of heat absorbed does not depend upon mass
 (d) Heat absorbed by *B* is four times than the heat absorbed by *A* because the quantity of heat absorbed is proportional to square of the mass
- 34.** A hot object loses heat to its surroundings in the form of heat radiation. The rate of loss of heat depends on the **☑ 2012 (II)**
- (a) temperature of the object
 (b) temperature of the surroundings
 (c) temperature difference between the object and its surroundings
 (d) average temperature of the object and its surroundings
- 35.** Which one among the following statements about thermal conductivity is correct? **☑ 2012 (II)**
- (a) Steel > wood > water
 (b) Steel > water > wood
 (c) Water > steel > wood
 (d) Water > wood > steel
- 36.** A bucket full of water is kept in a room and it cools from 75°C to 70°C in time T_1 minutes, from 70°C to 65°C in time T_2 minutes, and from 65°C to 60°C in time T_3 minutes, then **☑ 2012 (II)**
- (a) $T_1 = T_2 = T_3$ (b) $T_1 < T_2 < T_3$
 (c) $T_1 > T_2 > T_3$ (d) $T_1 < T_3 < T_2$
- 37.** Which one of the following is the SI unit of the thermal conductivity of a material? **☑ 2015 (I)**
- (a) $\text{Wm}^{-1}\text{K}^{-1}$ (b) Wm/K
 (c) $\text{Wm}^{-1}/\text{K}^{-1}$ (d) $\text{Js}^{-1}\text{m}^{-1}\text{K}$
- 38.** Thermal conductivity of aluminium, copper and stainless steel increases in the order **☑ 2015 (I)**
- (a) Copper < Aluminium < Stainless steel
 (b) Stainless steel < Aluminium < Copper
 (c) Aluminium < Copper < Stainless steel
 (d) Copper < Stainless steel < Aluminium
- 39.** The silvering in thermo flask is done to avoid heat transfer by **☑ 2015 (II)**
- (a) convection (b) conduction
 (c) radiation (d) Both (a) and (b)
- 40.** Which one of the following statements is not correct? **☑ 2016 (I)**
- (a) Conduction can occur easily in solids, less easily in liquids but hardly at all in gases
 (b) Heat energy is carried by moving particles in a convection current
 (c) Heat energy is carried by electromagnetic waves in radiation
 (d) The temperature at which a solid changes into a liquid is called the boiling point
- 41.** The brightness of a star depends on its **☑ 2016 (I)**
- (a) size and temperature
 (b) size and distance from the earth
 (c) size, temperature and mass
 (d) size, temperature and distance from the earth
- 42.** Matter around us can exist in three different states namely, solid, liquid and gas. Correct order of their compressibility is **☑ 2016 (I)**
- (a) Liquid < Gas < Solid
 (b) Solid < Liquid < Gas
 (c) Gas < Liquid < Solid
 (d) Solid < Gas < Liquid

> Solutions

- 7.** (b) We know that, efficiency of Carnot engine,

$$\eta = 1 - \frac{T_2}{T_1} \Rightarrow \eta = 1 - \frac{300}{400}$$

$$\left[\text{given, } T_2 = 300 \text{ K, } T_1 = 400 \text{ K} \right]$$

$$= \frac{400 - 300}{400} = \frac{100}{400} = \frac{1}{4} = 25\%$$

- 8.** (d) Given,

$$T_1 = 100^\circ\text{C} = 100 + 273 = 373\text{K}$$

$$T_2 = 20^\circ\text{C} = 20 + 273 = 293\text{K}$$

Efficiency of carnot engine is given by

$$\eta = \left(1 - \frac{T_2}{T_1} \right) = \left(1 - \frac{293}{373} \right) = \left(\frac{373 - 293}{373} \right)$$

$$= 0.214 = 21.47\%$$

- 9.** (a) Given,

$$T_1 = 150^\circ\text{C} = 150 + 273 = 423\text{K}$$

$$T_2 = 50^\circ\text{C} = 50 + 273 = 323\text{K}$$

Efficiency of heat engine is given by

$$\eta = \left(1 - \frac{T_2}{T_1} \right) = \left(1 - \frac{323}{423} \right) = \left(\frac{423 - 323}{423} \right)$$

$$= 0.236 = 23.6\%$$

- 10.** (a) $\therefore 1 \text{ L} = 10^3 \text{ cm}^3$

In isothermal condition, $p_1V_1 = p_2V_2$

$$V_2 = \frac{p_1V_1}{p_2} = \frac{76 \times 10^3}{120} = 633.3 \text{ cm}^3$$

- 36.** (b) Average temperature of water in first case is

$$Q_1 = \frac{75^\circ + 70^\circ}{2} = \frac{145^\circ}{2} = 72.5^\circ \text{ C}$$

Let room temperature is Q_0

$$\therefore \Delta Q_1 = Q_1 - Q_0 = 72.5^\circ - Q_0$$

Similarly,

$$\Delta Q_2 = \frac{70^\circ + 65^\circ}{2} - Q_0 = 67.5^\circ - Q_0$$

$$\Delta Q_3 = \frac{65^\circ + 60^\circ}{2} - Q_0 = 62.5^\circ - Q_0$$

Time for cooling $\propto \frac{1}{\Delta Q}$

$$\therefore T_1 \propto \frac{1}{\Delta Q_1}, T_2 \propto \frac{1}{\Delta Q_2} \text{ and } T_3 \propto \frac{1}{\Delta Q_3}$$

$$\text{As, } \Delta Q_1 > \Delta Q_2 > \Delta Q_3$$

$$\Rightarrow T_1 < T_2 < T_3$$

08

OPTICS

As an average 4 to 5 questions are asked from this chapter. These questions are based on reflection of light, refraction of light, scattering of light, uses of mirrors, refractive index, human eye, eye defects and optical instruments.

Optics is the branch of physics which deals with the study of behaviour, effect and properties of light.

LIGHT

Light is a form of energy which produces visual sensation in our eyes. Light is an electromagnetic waves which is transverse in nature. The speed of light in vacuum is 3×10^8 m/s.

➔ **Note Ray of light** A straight line path along which the transfer of light energy takes place is called a ray of light.

Reflection of Light

The phenomenon of bouncing back of light rays in the same medium on striking a smooth surface is called reflection of light.

There are two types of reflection

(i) **Regular reflection** If the reflecting surface is perfectly smooth surface, then the reflection is called regular reflection.

(ii) **Irregular reflection** If the reflecting surface is rough, then the reflection is called irregular reflection.

Laws of Reflection

There are two laws of reflection

(i) Angle of incidence is always equal to the angle of reflection.

$$\angle i = \angle r$$

(ii) The incident ray, the reflected ray and the normal at the point of incidence, all lie in the same plane.

Mirror

Mirror is a polished surface of glass from which all the light is reflected. If the reflecting surface is plane, then mirror is called **plane mirror** and if reflecting surface is spherical, then it is called **spherical mirror**.

Image

If light rays coming from a point on object meets at another point after reflection or appear to come from other point, then this second point is called the image of first point. There are two types of image

(i) **Real image** If the light rays coming from a point, meets at another point actually after reflection, then the image formed is called real image.

(ii) **Virtual image** If the light rays coming from a point, does not meet actually after reflection or appear to come from another point, then the image formed is called virtual image.

Reflection from Plane Mirror

In the plane mirror, the size of image is always equal to the size of the object and it is of virtual nature. The image in a plane mirror appears as far behind the mirror as the object is in front of it.

Important points related to simple mirror are given below

- If the object is displaced by a distance a towards or away from the mirror, then its image will be displaced by a distance a towards or away from the mirror.
 - The minimum size of the mirror required to see the full image of an observer is half the height of the observer.
 - If the plane mirror is rotated in the plane of incidence by an angle θ , then the reflected ray rotates by an angle 2θ .
 - Focal length of plane mirror is infinity, i.e. power is zero. Linear magnification produced by plane mirror is 1. When two plane mirrors are kept facing each other at an angle θ and an object is placed between them, then number of images, $n = \frac{360^\circ}{\theta} - 1$, if $\frac{360^\circ}{\theta}$ is even or the object lies symmetrically. Number of images, $n = \left(\frac{360^\circ}{\theta}\right)$, if $\frac{360^\circ}{\theta}$ is odd or the object lies asymmetrically.
 - When two plane mirrors is parallel to each other, then the number of images are infinity.
- **Note** The plane mirror is utilised in the form of kaleidoscope, periscope and looking glass, etc.

Spherical Mirror

If the reflecting surface of the mirror is curved inwards or outwards, then the mirror is called a spherical mirror.

Spherical mirrors are of two types

- (i) **Concave mirror** The spherical mirror with inward curved reflecting surface is called concave mirror. A beam of light generally converges after reflection from its surface, hence it is also called **convergent mirror**.

e.g. The inner curved surface of a shining spoon can be considered as a concave mirror.

- (ii) **Convex mirror** The spherical mirror with outward curved reflecting surface is called convex mirror. A beam of light generally diverges after reflection from its surface, hence it is also called **divergent mirror**.

e.g. The outer curved surface of a shining spoon can be treated or considered as a convex mirror.

Some Definitions Related to Spherical Mirrors

- Centre of curvature** Centre of curvature of a spherical mirror is the centre of the sphere of which the mirror is apart. In the above figures, it is marked by C.
- Radius of curvature** Radius of curvature of a spherical mirror is the radius of sphere of which the mirror is apart. In the above figure, it is shown by R.
- Pole** The pole of the spherical mirror is mid-point of its reflecting surface. In the figure, it is shown by P.
- Principal axis** The principal axis of a spherical mirror is the line joining the pole and centre of curvature. In the figure, PC is principal axis.
- Aperture of mirror** The part of the reflecting surface of a mirror which can be exposed to the incident light is called its aperture. In the figure, M_1M_2 is the aperture of mirror.
- Principal focus or focus** It is a point on the principal axis of the mirror at which the light rays coming parallel to principal axis, after reflection actually meet or appear to be coming from. It is represented by F. For a concave mirror, the focus is in front of the mirror, while for a convex mirror, the focus is behind the mirror. The focus of a concave mirror is real, while the focus of a convex mirror is virtual.
- Focal length** The distance between pole and focus of a spherical mirror is called its focal length. It is represented by f .
 - Focal length of plane mirror is infinity.
 - Radius of curvature of plane mirror is infinity.

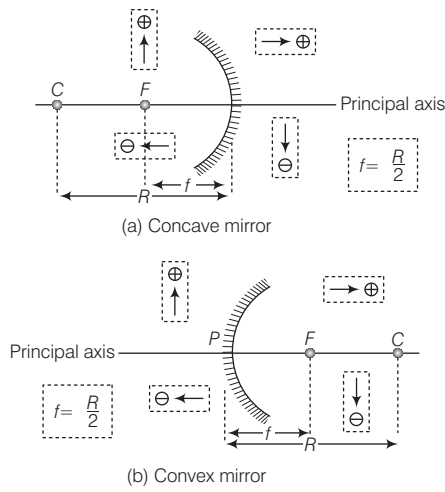

Relation between Focal Length and Radius of Curvature of Spherical Mirror

If the aperture of the mirror is small, then the following relation is given below between focal length (f) and radius of curvature (R).

i.e.
$$f = \frac{R}{2}$$

Sign Convention for Reflection by Spherical Mirrors

While dealing with the reflection of light by spherical mirrors, we shall follow a set of sign convention called the new cartesian sign convention based on cartesian coordinates. In this convention, the pole (P) of the mirror is taken as the origin. The principal axis of the mirror is taken as X -axis of the coordinate system.

The conventions are as follows

- The object is always placed to the left of the mirror.
- All distances parallel to principal axis (X -axis) are measured from the pole of the mirror.
- Distances to the left of pole ($-ve$ X -axis) are **negative**. Distances to the right of pole ($+ve$ X -axis) are **positive**.
- Distances measured perpendicularly above the principal axis (along $+Y$ -axis) are taken as **positive**.
- Distances measured perpendicularly below the principal axis (along $-Y$ -axis) are taken as **negative**.

Image Formation by Spherical Mirrors

Image formation by spherical mirrors are of two types

(i) Image Formation by a Concave Mirror

The table given below illustrates the ray diagram along with the position and nature of image, formed by a concave mirror for various positions of the object.

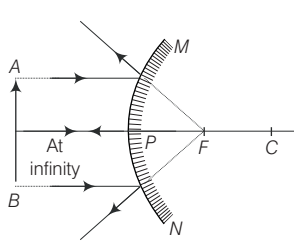

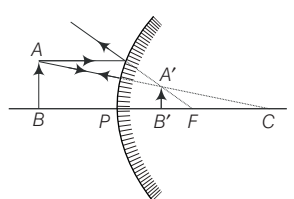

Formation of Image by Concave Mirror for Different Positions of Object

Position of object	Ray Diagram	Position of image	Nature and size of image
At infinity		At focus or in the focal plane	Real, inverted, extremely diminished point size
Beyond the centre of curvature but at finite distance		Between focus and the centre of curvature	Real, inverted and diminished
At the centre of curvature		At the centre of curvature	Real, inverted and equal to the object
Between focus and centre of curvature		Beyond the centre of curvature	Real, inverted and bigger than object
At the focus		At infinity	Real, inverted and extremely magnified
Between the pole and focus		Behind the mirror	Virtual, erect and magnified

(ii) Image Formation by a Convex Mirror

For studying the image formed by a convex mirror, there are two positions of the object which are considered. Firstly, when the object is at infinity and the second position is, when the object is at a finite distance from the mirror. The table given below illustrates the ray diagrams along with the position and nature of image, formed by convex mirror for the above two positions of the object.

Formation of Image by Convex Mirror for Different Positions of Object

Position of object	Ray diagram	Position of image	Nature and size of image
At infinity		At the focus, behind the mirror	Virtual, erect and extremely diminished
Between infinity and the pole of the mirror (i.e. at finite distance)		Between the focus and the pole, behind the mirror	Virtual, erect and diminished

Mirror Formula

In spherical mirror, the distance of the object from its pole is called the object distance (u). The distance of the image from pole of the mirror is called the image distance (v). The relation between quantities (u, v and f), i.e. mirror formula,

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

where u, v and f are to be used according to their new cartesian sign convention.

Linear Magnification

The ratio of height of image to the height of object is called linear magnification (m).

i.e.
$$m = \frac{\text{height of image (I)}}{\text{height of object (O)}}$$

Or

The ratio of image distance to the object distance is called linear magnification.

i.e.
$$m = \frac{\text{image distance (v)}}{\text{object distance (u)}} = \frac{-v}{u}$$

Linear magnification produced by plane mirror is 1.

Identification of Mirrors

By the observation of the image produced by the mirror at different positions of object, nature of the mirror can be identified.

- (i) If the image formed by the mirror is of same size as that of object for different positions of object, then the mirror is plane mirror.
- (ii) If the image formed by the mirror is diminished for all positions of object, then the mirror is convex mirror.
- (iii) If the image formed behind the mirror is longer than the object, then the mirror is concave mirror.

Uses of Mirrors

- (i) **Plane mirror** As looking glass.
- (ii) **Concave mirror** As shaving mirrors, used by doctors, shades of table lamp, for search lights.
- (iii) **Convex mirror** As back view mirrors in vehicles, in street lamps, etc.
- (iv) **Cylindrical mirror** The mirrors whose reflecting surface from the part of a cylinder are called cylindrical mirrors.

REFRACTION OF LIGHT

Change in path of a light ray as it passes from one medium to another medium is called refraction of light.

When light travels from a rarer medium to a denser one, it bends towards the normal ($i > r$) and when travels from a denser medium to a rarer one, it bends away from the normal ($i < r$).

where, i = angle of incidence
and r = angle of refraction

► **Note** A medium in which the speed of light is more, is known as **optically rarer medium** and the medium in which speed of light is lesser is known as **optically denser medium**.

When a ray of light suffers refraction, then its velocity and wavelength changes but frequency remain same

i.e.
$$n_1 = n_2 \quad \text{or} \quad \frac{v_1}{\lambda_1} = \frac{v_2}{\lambda_2}$$

Laws of Refraction

Laws of refraction is governed by following laws

- (i) The incident ray, the normal to surface of separation at the point of incidence and refracted ray all lie in the same plane.
- (ii) For the light ray of same colour, for two medium, the ratio of sine of angle of incidence and sine of angle of refraction is constant, i.e.

$$\frac{\sin i}{\sin r} = {}_1\mu_2 = \frac{\mu_2}{\mu_1} \quad [\text{constant}]$$

where, ${}_1\mu_2$ is called **refractive index** of second medium with respect to first medium.

This law is also called **Snell's law**.

Refractive Index

Refractive index of a medium,

$$\mu = \frac{c}{v} = \frac{\lambda_{\text{air}}}{\lambda_{\text{medium}}} = \frac{\text{speed of light in vacuum}}{\text{speed of light in the medium}}$$

where, c = speed of light in vacuum = 3×10^8 m/s

- Value of refractive index depends on the nature of the two mediums, colour of light ray and temperature of the two mediums.
- On increasing the temperature of medium, its refractive index decreases.
- Refractive index is the optical property of the medium.
- Refractive indices of all mediums are measured with respect to air.
- Refractive index is maximum for diamonds.
- If light ray travels from vacuum to a medium, then refractive index is known as the absolute refractive index of that medium,

$${}_1\mu_2 = \frac{\text{velocity of light in first medium}}{\text{velocity of light in second medium}}$$

$${}_1\mu_2 = \frac{\text{wavelength } (\lambda) \text{ in first medium}}{\text{wavelength } (\lambda) \text{ in second medium}}$$

➔ **Note** For glass/water pair, ${}_w\mu_g = \frac{{}_a\mu_g}{{}_a\mu_w}$.

Refraction through a Rectangular Glass Slab

When a light ray enters in a glass slab, then the emergent ray is parallel to the incident ray but it is shifted sideward slightly. In this case, refraction takes place twice, first when ray enters glass slab from air and second when exits from glass slab to air.

The perpendicular distance between incident ray and

$$\text{emergent ray, } d = t \left[1 - \frac{\cos i}{\sqrt{\mu^2 - \sin^2 i}} \right] \sin i$$

This value is equal to lateral shift of ray.

where, i = angle of incidence, r = angle of refraction and e = angle of emergence

Critical Angle

When a light ray goes to rarer medium from denser medium, then as we increase the angle of incidence, angle of refraction also increases, so the angle of incidence for which the angle of refraction becomes 90° is called critical angle.

$$\sin C = \frac{\mu_R}{\mu_D} \Rightarrow C = \sin^{-1} \left(\frac{\mu_R}{\mu_D} \right) = \sin^{-1} \left(\frac{1}{{}_d\mu_r} \right)$$

TOTAL INTERNAL REFLECTION

If the angle of incidence in denser medium is greater than critical angle (C), then the ray is reflected back into the first rarer medium, this phenomenon is called total internal reflection.

For total internal reflection, it is necessary that

- (i) Light ray should go to rarer medium from denser medium.
- (ii) Angle of incidence in denser medium should be greater than critical angle.

Some Phenomena Based on Total Internal Reflection (TIR)

- (i) Brilliance of diamond is due to total internal reflection.
- (ii) A fish inside the water cannot see the entire surface, it sees only a circular path of radius r of light.

$$r = \frac{b}{\sqrt{\mu^2 - 1}}$$

- (iii) In desert the phenomena of mirage occurs due to total internal reflection.
- (iv) The air bubbles in glass paper weight appear silvery white due to total internal reflection.
- (v) When a test tube blackened from outsider dipped in water from outside appears silvery white due to total internal reflection.
- (vi) Critical angle increases on increasing the temperature.

REFRACTION FROM SPHERICAL SURFACES

Refraction at spherical surface are of two types

- (i) Convex
- (ii) Concave

For both surfaces refraction formula is given by

$$\frac{{}_1\mu_2}{v} - \frac{1}{u} = \frac{{}_1\mu_2 - 1}{R}$$

${}_1\mu_2$ is refractive index of second medium with respect to first. If μ_1 and μ_2 are refractive indices of first and second medium with respect to air, then

$$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R}$$

Lens

A lens is a uniform refracting medium bounded by two spherical surfaces or one spherical and one plane surfaces. Lens are mainly of two types

(i) Convex or Convergent Lens

The transparent medium bound by two bulging surfaces is called convex lens. Convex lens are of three types (as shown below)

(a) Double convex lens

(b) Plano-convex lens

(c) Concavo-convex lens

If the plane surface of a plano-convex lens is polished, then it behaves like a concave mirror of focal length half of the initial value.

(ii) Concave or Divergent Lens

The transparent medium bounded by two hollow surfaces is called concave lens.

(a) Double concave lens

(b) Plano-concave lens

(c) Convexo-concave lens

Some Definitions Related to Lenses

- (i) **Optical centre** The centre point of a lens is known as its optical centre. It is represented by O . The optical centre is a point within or outside the lens, directed to which incident rays refract without any deviation in the path.

- (ii) **Principal focus** Lens has two principal foci

- (a) **First principal focus** It is a point on the principal axis of lens, the rays starting from or directed to which become parallel to principal axis after refraction.

- (b) **Second principal focus** It is the point on the principal axis at which the rays coming parallel to the principal axis, converge on the other side of lens (convex) or appear to meet on the same side of lens (concave), after refraction from the lens.

Both the foci of convex lens are real while that of concave lens are virtual.

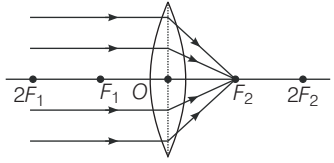

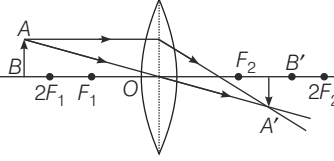

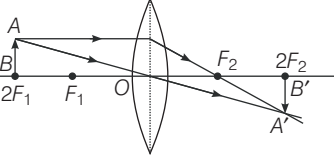

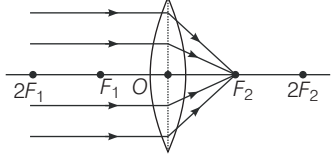

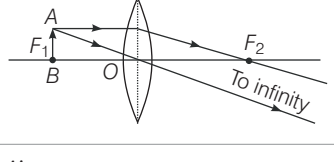

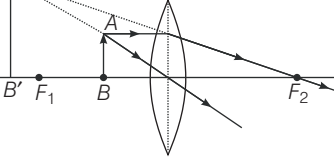

- (iii) **Centres of curvature** The centres of the two imaginary spheres of which the lens is a part are called centres of curvature of the lens. A lens has two centres of curvature with respect to its two curved surfaces.
- (iv) **Radii of curvature** The radii of the two imaginary spheres of which the lens is a part are called radii of curvature of the lens. It is represented by C . A lens has two radii of curvature. These may or may not be equal.

Image Formation by Lenses

Formation of Image by a Convex Lens

The table given below illustrates the ray diagrams along with the position and nature of image, formed by convex lens for various positions of the object.

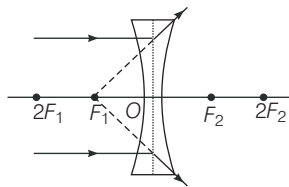

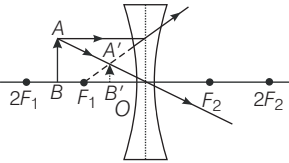

Formation of Image by Convex Lens for Different Positions of Object

Position of object	Position of image	Size of image	Nature	Ray diagram
At infinity	At F_2	Extremely diminished	Real and inverted	
Beyond $2F_1$ (at finite distance)	Between F_2 and $2F_2$	Diminished	Real and inverted	
At $2F_1$	At $2F_2$	Same size	Real and inverted	
Between F_1 and $2F_1$	Beyond $2F_2$	Magnified	Real and inverted	
At F_1	At infinity	Highly magnified	Real and inverted	
Between lens and F_1	On same side of the lens as an object	Magnified	Virtual and erect	

Formation of Image by a Concave Lens

For studying the image formation by concave lens, there are two positions of object. Firstly, when the object is at infinity and the second position is when the object is at finite distance from the lens. The table given below illustrates the ray diagrams along with the position and nature of image, formed by concave lens for the above two positions of the object.

Formation of Image by Concave Lens for Different Positions of Object

Position of object	Position of image	Size of image	Nature of image	Ray diagram
At infinity	At focus on same side of lens as an object	Highly diminished	Virtual and erect	
At finite distance	Between focus and optical centre on the same side of lens as an object	Diminished	Virtual and erect	

Important Formula Related to Lens

(i) **Lens formula** The formula connecting the object and image distance, for both convex and concave lens is

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

where, f = focal length of lens,

u = object distance and v = image distance

(ii) **Power of lens** The ability of lens to converge or diverge the light ray is called power of lens. It is measured as the reciprocal of focal length.

$$\text{Power, } P = \frac{1}{f \text{ (in metre)}} \Rightarrow P = \frac{100}{f \text{ (in cm)}}$$

Its unit is diopter (D).

Power of a plane mirror is zero.

(iii) **Newton's formula for lenses** Newton's formula for lens is given by

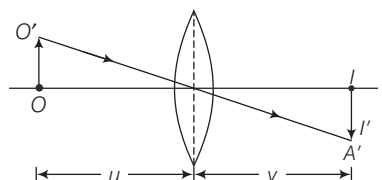

$$f^2 = a_1 a_2 \quad \Rightarrow \quad f = \sqrt{a_1 a_2}$$

where, a_1 = distance of object from first focus

and a_2 = distance of object from second focus

Magnification Produced by Lens

(i) **Linear magnification of lens** Linear magnification (m) is given by

$$m = \frac{\text{size of image (I)}}{\text{size of object (O)}} = \frac{\text{distance of image}}{\text{distance of object}} \Rightarrow m = \frac{v}{u}$$

(ii) **Areal magnification of lens** Areal magnification (m_s) is given by

$$m_s = \frac{\text{area of image}}{\text{area of object}} = \frac{A_i}{A_o} = m^2 = \left(\frac{f}{f + u} \right)^2$$

► **Note** Relation between speed of object and image

$$v_i = \left(\frac{f}{f + u} \right) v_o$$

Some Phenomenon Related to Lens

1. **Lens immersed in a liquid** If ${}_a\mu_g$ is the refractive index of lens and ${}_a\mu_l$ refractive index of liquid, then the total length of lens is

$$\frac{1}{f} = ({}_a\mu_g - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

2. **Cutting of a lens**

(i) If a symmetrical convex lens of focal length f is cut into two parts along its optical axis, then focal length of each part (a plano-convex lens) is $2f$. However, if the two parts are joined as shown in figure, then the focal length of combination is again f .

- (ii) If a symmetrical convex lens of focal length f is cut into two parts along the principal axis, then focal length of each part remains unchanged at f . If these two parts are joined with curved ends on one side focal length of the combination is $\frac{f}{2}$. But on joining two parts in opposite sense the net focal length becomes infinite (or net power = 0).

Combination of Thin Lenses

1. If two or more lenses are placed in contact, then equivalent focal length of the combination,

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} + \dots = \sum_{i=1}^n \frac{1}{f_i}$$

Power of combination,

$$P = P_1 + P_2 + \dots = \sum_{i=1}^n P_i$$

2. If two lenses of focal lengths f_1 and f_2 are separated by a distance x , then its equivalent focal length,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{x}{f_1 f_2}$$

Power of combination,

$$P = P_1 + P_2 - x P_1 P_2$$

PRISM

Prism is a uniform transparent refracting medium bounded by two plane surfaces inclined at an angle.

Angle of Deviation

The angle subtended between the directions of incident ray (i) and emergent ray (e) is called angle of deviation (δ).

Dispersion of Light

When white light is incident on a glass prism, then it splits into its seven colour components in the sequence of VIBGYOR. This phenomenon is called dispersion of white light.

The refractive index of glass is maximum for violet colour and minimum for red colour of light. Therefore, violet colour of white light (sunlight) deviated maximum and red colour of light deviated least.

RAINBOW

When the sun shines just after a shower of rain, a rainbow is seen in the sky opposite to the sun. It is in the form of circular arcs of seven colours. Rainbow is formed due to dispersion of sunlight by water droplets suspended in air. In each drop, dispersion of sunlight and then total internal reflection take place. There are two kinds of rainbow such as primary rainbow and secondary rainbow.

Angular Dispersion

It is the angular separation between the two extreme rays.

$$\text{Angular dispersion, } \theta = \delta_V - \delta_R = (\mu_V - \mu_R)A$$

Dispersive Power

The dispersive power of a prism material is measured by the ratio of angular dispersion to the mean deviation suffered by light beam.

\therefore Dispersive power,

$$\omega = \frac{\delta_V - \delta_R}{\delta} = \frac{\mu_V - \mu_R}{\mu - 1}$$

where, μ is the mean value of refractive index of prism

- The dispersive power of a prism depends only on its material and is independent of angle of prism, angle of incidence or size of the prism.
- Dispersive power is a unitless and dimensionless term.
- Dispersive power of a flint glass prism is more than that of a crown glass.

Dispersion without Deviation

(Direct Vision Prism)

1. To produce dispersion without mean deviation, we use a combination of two prisms of different materials such that

$$A' = \left(\frac{\mu - 1}{\mu' - 1} \right) A$$

2. Net dispersion caused

$$= (\mu_V - \mu_R) A + (\mu'_V - \mu'_R) A'$$

$$= (\mu - 1) A (\omega - \omega') = \delta (\omega - \omega')$$

Deviation without Dispersion

(Achromatic Prism)

1. To produce deviation without dispersion, we use a combination of two prisms of different materials such that

$$A' = \frac{[\mu_V - \mu_R]}{[\mu'_V - \mu'_R]} A$$

2. Resultant deviation produced = $\delta \left[1 - \frac{\omega}{\omega'} \right]$

Scattering of Light

When light passes through a medium in which particles are suspended whose sizes are of the order of wavelength of light, then light on striking these particles, deviated in different directions. This phenomenon is called scattering of light. Therefore, red colour of light is scattered least (wavelength is highest) and violet colour of light is scattered most (wavelength is least).

- **Danger signals** are of red colours because red colour of light scatters least and therefore these signals can be seen from far away.
- **The sky appears blue** because in sunlight, the blue colour of light is scattered maximum and this scattered blue light enters our eyes and therefore sky appears blue.

- **Clouds appear white** because clouds are consists of large size of droplets of water and dust particles which scatter all colours of light equally. The mixture of all seven colours of sunlight is white.
- **Sky appears black to astronauts from space** because there is no atmosphere in space and therefore no scattering of light takes place.

HUMAN EYE

Human eye is one of the most valuable and sensitive sense organs in the human body. It enables us to see the wonderful world and colour around us. It consists of a **lens** which is made up of living tissues.

A human eye has the following main parts

Cornea It is the transparent spherical membrane covering the front of the eye. Light enters the eye through this membrane.

Crystalline lens The eye lens is a convex lens made of a transparent, soft and flexible material like a jelly made of proteins.

Iris It is a dark muscular diaphragm between the **cornea** and the **lens**. It controls the size of the **pupil**.

Pupil It is a small hole between the **iris** through which light enters the eye.

Ciliary muscles They hold the lens in position and help in modifying the curvature of the lens.

Retina It is the light sensitive surface of eye on which the image is formed. It contains light sensitive cells **rods** and **cones**.

Optic nerve It transmits visual information from the **retina** to the **brain**.

Sclera It is an opaque, fibrous, protective, outer layer of an eye containing **collagen** and **elastic fibre**. It is also known as **white of the eye**.

Blind spot It is the point at which the optic nerve leaves the eye. It contains no rods and cones, so an image formed at this point is not sent to the brain.

Aqueous humour Behind the cornea, we have a space filled with a transparent liquid called the aqueous humour.

Vitreous humour The space between eye lens and retina is filled with another liquid called vitreous humour.

Accommodation of eye It is the ability of eye lens, to change its focal length to form sharp images of objects at different positions from the eye on the retina of the eye.

Range of vision It is the distance between near point and the far point of an eye. For normal eye, the range of vision is 25 cm to infinity.

Near point It is the nearest position of an object from human eye, so that its sharp images is formed on the retina.

Defects of Vision

- **Myopia or short sightedness** It is a defect of eye due to which a person can see nearby objects clearly but cannot see far away objects clearly.
- In this defect, the far point of eye shifts from infinity to a nearer distance. The defect can be removed by using a **concave lens** of appropriate power.
- **Hypermetropia or long sightedness** It is a defect of eye due to which a person can see far away objects clearly but cannot see nearby objects clearly.
- **Presbyopia** It is found in old age people. In this defect, one cannot read comfortably and clearly. This defect can be corrected by using bifocal lenses. In this defect, the near point of eye shifts away from the eye. The defect can be removed by using a **convex lens** of appropriate power.
- **Astigmatism** In this defect, a person cannot focus on horizontal and vertical lines at the same distance at the same time. This defect can be removed by using suitable **cylindrical lenses**.
- **Colour Blindness** In this defect, a person is unable to distinguish among few colours. The reason of this defect is the absence of cone cells sensitive for few colours. This defect cannot be removed.
- **Cataract** In this defect, an opaque, white membrane is developed on cornea due to which a person loses power of vision partially or completely. This defect can be removed by removing this membrane through surgery.
With the application of generalised rules of optics, optical instruments are developed and used.

Optical Instruments

Optical instrument is a device which is made from proper combination of mirrors, prisms and lenses. The principle of working of optical instruments depends on laws of reflection and refraction of light.

Microscope

It is an optical instrument which forms a magnified image of a small nearby object and thus increases the visual angle subtended by the image at the eye, so that the object is seen to be bigger and distinct.

Simple Microscope

A simple microscope is a convex lens of short focal length which is fixed in a frame provided with handle.

Simple microscope

Magnification of simple microscope

(i) When final image is formed at least distance of distinct vision,

$$M = 1 + \frac{D}{f}$$

(ii) For relaxed eye, $M = \frac{D}{f}$

where, D = least distance of distinct vision

Compound Microscope

It consists of two converging lenses arranged coaxially. The one facing the object is called **objective** and the one close to eye is called **eye piece**. The objective has a smaller aperture and smaller focal length than those of the eyepiece.

Compound microscope

Magnification of compound microscope

(i) For relaxed eye, $M_{\infty} = -\frac{v_o}{u_o} \left(\frac{D}{f_e} \right)$

In this position, length of microscope,

$$L_{\infty} = v_o + f_e$$

(ii) When final image is formed at least distance of distinct vision,

$$M_D = -\frac{v_o}{u_o} \left(1 + \frac{D}{f_e} \right)$$

Length of microscope,

$$L_D = v_o + u_e$$

where,

v_o = distance of first image from object lens,

u_o = distance of object from objective lens

and f_e = focal length of eyepiece

Telescope

Telescope is an optical instrument which increases, the visual angle at the eye by forming the image of a distant object at the least distance of distinct vision, so that the object is seen distinct and bigger.

Astronomical Telescope

It consists of two converging lenses placed coaxially. The one facing the distant object is called the objective and has a large aperture and large focal length.

The other is called the eyepiece, as the eye is placed close to it. The eyepiece tube can slide within the objective tube, so that the separation between the objective and the eye-piece may be varied.

Magnification of astronomical telescope

(i) For relaxed eye, $M_\infty = -\frac{f_o}{f_e}$

In this position, length of telescope, $L_\infty = f_o + f_e$

(ii) When final image is formed at least distance of distinct vision,

$$M_D = -\frac{f_o}{f_e} \left(1 + \frac{f_e}{D} \right)$$

Length of telescope,

$$L_D = f_o + f_e$$

where, f_o = focal length of objective lens and

f_e = focal length of eyepiece

It is used for observing distinct images of heavenly bodies like stars, planets, etc.

➤ **Note** A refracting telescope consists of two convex lenses of unequal focal length.

> PRACTICE EXERCISE

- The principle of working of periscope is based on
 - Only reflection
 - Only refraction
 - Both reflection and refraction
 - Both reflection and interference
- If a concave mirror of focal length 10 cm is immersed in water, its focal length will
 - be reduced
 - be increased
 - remain unchanged
 - change sign
- The sun is visible to us a little before the actual sunrise and a little after the actual sunset. This is because of
 - refraction
 - scattering
 - reflection
 - diffraction
- The boundaries of a block of transparent material are found to be completely invisible when placed in a liquid of refractive index μ . This is possible only, if

the refractive index of the material of the block is

- greater than μ
 - equal to μ
 - less than μ
 - equal to unity
- The blue colour of the sky can be attributed to
 - differential scattering of sunlight by the atmosphere
 - total internal reflection of the sunlight by the atmosphere
 - absorption of sunlight
 - refraction of sunlight by the atmosphere
 - If a man approaches a plane mirror at the rate of 2 km/h, then his image would approach him at the rate of
 - 1 km/h
 - 2 km/h
 - 4 km/h
 - 8 km/h
 - Which one of the following diagrams correctly illustrates the refraction of a normally incident ray of light through a glass slab?

- Which one of the following is the correct arrangement in the decreasing order of the refractive indices of glass, diamond and water?
 - Glass, water, diamond
 - Water, diamond, glass
 - Diamond, water, glass
 - Diamond, glass, water
- When light passes from air into glass, it experiences change of
 - frequency and wavelength
 - frequency and speed
 - wavelength and speed
 - frequency, wavelength and speed

- 10.** The correct sequence of the decreasing order of velocity of light in glass, diamond and water is
 (a) diamond, glass, water
 (b) glass, diamond, water
 (c) diamond, water, glass
 (d) water, glass, diamond
- 11.** If the refractive indices of water and that of glass with respect to air are $\frac{4}{3}$ and $\frac{3}{2}$ respectively, then the refractive index of glass with respect to water is
 (a) 2.66 (b) 2 (c) 1.125 (d) 0.88
- 12.** When a ray of light is reflected under multiple reflections by a set of plane parallel mirrors, then the intensity of the ray diminishes due to
 (a) absorption as well as scattering of light from the mirrors
 (b) scattering of light by the atmosphere
 (c) absorption of light by the atmosphere
 (d) None of the above
- 13.** If half of the body of a lens is converted with black paper, then the image produced by the lens will
 (a) have its size reduced to half
 (b) disappear
 (c) have its intensity reduced to half
 (d) None of the above
- 14.** A beam of monochromatic is passing from one medium to another. Which one of the following quantities does not change?
 (a) Amplitude (b) Velocity
 (c) Wavelength (d) Frequency
- 15.** An astronaut in an the earth satellite will observe sky as
 (a) blue (b) red (c) white (d) black
- 16.** Rays of light get refracted while passing from air to glass because
 (a) density of glass is higher than that of air
 (b) they cannot be reflected from a glass surface
 (c) glass absorbs energy from the light rays
 (d) speed of light in glass is less than the speed of light in air
- 17.** The stars twinkle at night because
 (a) they emit energy (b) of diffraction
 (c) of refraction (d) of reflection
- 18.** Which one of the following colours has longest wavelength?
 (a) Green (b) Yellow
 (c) Blue (d) Red
- 19.** The wavelength of the light of violet colour is
 (a) 4 micron (b) 0.4 micron
 (c) 0.04 micron (d) 0.004 micron
- 20.** The order of colour in a secondary rainbow is
 (a) no regular pattern is observed
 (b) red on the inner edge and violet on the outer edge
 (c) red on the outer edge and violet on the inner edge
 (d) None of the above
- 21.** A stereoscopic camera produces an image, which is
 (a) magnified
 (b) three-dimensional
 (c) three-dimensional in appearance
 (d) coloured
- 22.** The inability of rays of different colours to converge at a single point after refraction through a convex lens is called
 (a) coma
 (b) spherical aberration
 (c) chromatic aberration
 (d) distortion
- 23.** For a thin lens, the nodal points coincide with
 (a) nodal planes (b) principal foci
 (c) optical centre (d) optional axis
- 24.** A convex lens is immersed in a liquid denser than glass. It will behave as a
 (a) diverging lens (b) plane glass
 (c) convergent lens (d) optical axis
- 25.** An air bubble inside water behaves as a
 (a) concave lens
 (b) concave convex lens
 (c) plano-convex lens
 (d) convex lens
- 26.** The magnifying power of a telescope can be increased by
 (a) increasing the diameter of the objective
 (b) reducing the focal length of eyepiece
 (c) reducing focal length of the objective
 (d) increase the diameter of eyepiece
- 27.** In Rayleigh scattering, the degree of scattering is proportional to fourth power of wavelength but the size of the scattering particles of the medium should be
 (a) less than the wavelength used
 (b) equal to the wavelength used
 (c) atleast four times the wavelength used
 (d) three times the wavelength used
- 28.** Which one of the following optical instruments produce a virtual image?
 (a) A simple magnifier
 (b) Movie projector
 (c) An ordinary single lens reflex camera
 (d) None of the above
- 29.** Focal length of the eye lens which enables us to see the object at varying distances, is controlled and changed by
 (a) retina (b) ciliary muscles
 (c) choroid (d) vitreous humour
- 30.** Which one of the following is correct? Large aperture telescopes are used for
 (a) greater resolution
 (b) greater magnification
 (c) reducing lens aberration
 (d) ease of manufacture
- 31.** In a healthy human eye, the focussing is done by
 (a) the change in the convexity of the lens through ciliary muscles
 (b) changing in the refractive index of the eye fluid
 (c) changing curvature of retina
 (d) to and from movement of the eye lens
- 32.** The human eye has essentially a lens and a retina used as a screen. Which one of the following statements is true about this combination of lens and retina?
 (a) It is a convex lens with variable focal length and at a fixed distance between the retina and the lens
 (b) It is a convex lens with variable focal length and its distance from the retina
 (c) It is a convex lens of constant focal length at a fixed distance from the retina
 (d) It is a concave lens of adjustable focal length at a fixed distance from the retina
- 33.** The region of retina in which the vision is most acute is
 (a) conjunctiva (b) ciliary body
 (c) fovea centralis (d) vitreous humour
- 34.** Defect of colour blindness can be remedied by the use of
 (a) cylindrical lens (b) bifocal lens
 (c) contact lens (d) None of these
- 35.** Which one of the following is used to remove astigmatism for a human eye?
 (a) Concave lens (b) Convex lens
 (c) Cylindrical lens (d) Prismatic lens
- 36.** Two plane mirrors are inclined at an angle of 60° to each other. If an object is placed between them, then the number of images produced will be
 (a) 5 (b) 6 (c) 10 (d) 4

37. A plane mirror lies face up, making an angle of 15° with the horizontal. A ray of light coming down vertically on the mirror. The angle of incidence, the angle between the reflected ray and the horizontal are respectively

- (a) $10^\circ, 20^\circ$ (b) $15^\circ, 15^\circ$
(c) $15^\circ, 30^\circ$ (d) $15^\circ, 60^\circ$

38. In a motor car, spherical mirrors are utilised at two different places, (i) the head light and (ii) rear view mirror. What type of mirrors are used?

- (a) concave for case (i) and convex for case (ii)
(b) convex for case (i) and concave for case (ii)
(c) concave for both cases
(d) convex for both cases

39. Suppose that a light wave propagates from a point *A* to another point *B* and we introduce into its path a glass plate ($\mu_g = 1.33$) of thickness $t = 1$ mm. If $\lambda_0 = 500$ nm is at *A*, then the change in wavelength of the wave at *B* is

- (a) 1000 wavelength (b) 1500 wavelength
(c) 2500 wavelength (d) 3000 wavelength

40. Two convex lenses of focal lengths f_1 and f_2 are separated by a distance d . The combination will work as a glass slab, if

- (a) $d = f_1 + f_2$ (b) $d < f_1 + f_2$
(c) $d > f_1 + f_2$ (d) $d \geq f_1 + f_2$

41. Which one of the following can be used to focus sun light?

- (a) Plane mirror (b) Concave lens
(c) Concave mirror (d) Convex mirror

42. Consider the following statements

- I. In a periscope, prisms are used to turn the incoming light through 90° .
II. In a periscope, plane mirrors can also be used instead of prisms.
III. The loss of intensity of light is more in the case of reflections by a mirror.

Which of the statements given above are correct?

- (a) Both II and III (b) Both I and II
(c) All of these (d) Both I and III

43. Which of the following are true regarding image formation with the help of mirrors?

- I. A concave mirror can give a diminished virtual image.
II. A concave mirror can give a real image.

- III. A convex mirror can give a virtual image.
IV. A convex mirror cannot give a real image.

Select the correct answer from the codes given below

- (a) Both I and III (b) Both I and IV
(c) I, III and IV (d) II, III and IV

44. Which of the following pairs are correctly matched?

- I. Power of lens : diopter
II. Two waves of same frequency: diffraction and amplitude having constant phase difference optical fibre

III. Total internal reflection : optical fibre

IV. Change of focal length of a lens with colour : spherical aberration

- (a) Both II and IV (b) I, II and III
(c) II, III and IV (d) Both I and III

45. Consider the following statement(s)

- I. Compound microscope has an objective lens with a very short focal length.
II. Simple microscope is of a strong converging lens system.
III. Television camera converts the optical image into electrical video signals.
IV. Hypermetropia is corrected by using a diverging lens.

Which of the statement(s) given above is/are correct?

- (a) Only IV (b) I, II and III
(c) All of these (d) Both II and III

46. Match List I (Defect in vision) with List II (Correcting lens) and select the correct answer using the codes given below the lists.

List I (Defect in vision)	List II (Correcting lens)
A. Short sight or myopia	1. Cylindrical lens
B. Long sight or hypermetropia	2. Bifocal lens
C. Presbyopia	3. Convex lens
D. Astigmatism	4. Concave lens

Codes

- A B C D A B C D
(a) 4 3 2 1 (b) 3 4 2 1
(c) 4 2 3 1 (d) 3 2 1 4

47. Consider the following statement(s)

- I. The focal length of the objective of a microscope is less than the focal length of the eyepiece.

II. The minimum distance between an object and its real image formed by a convex lens of focal length f is equal to $4f$.

Which of the statement(s) given above is/are correct?

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

> Previous Years' Questions

48. If the focal length of the biconvex lens is 25 cm, then the power of the lens will be **☑ 2012 (I)**

- (a) + 4 D (b) - 4 D
(c) + 0.04 D (d) + 0.04 D

49. Two thin convex lenses of focal lengths 4 cm and 8 cm are separated by a distance of 4 cm in air. The combination will have the focal length **☑ 2012 (I)**

- (a) 4 cm (b) 8 cm (c) 12 cm (d) 32 cm

50. Statement I Convex mirror is used as a driver mirror.

Statement II Images formed by convex mirror are diminished in size. **☑ 2012 (I)**

Codes

- (a) Both the statements are individually true and Statement II is the correct explanation of Statement I
(b) Both the statements are individually true but Statement II is not the correct explanation of Statement I
(c) Statement I is true but Statement II is false
(d) Statement I is false but Statement II is true

51. To obtain the powerful parallel beams of light from a vehicle's headlight, one must use

☑ 2012 (II)

- (a) front surface silvered plane mirror
(b) back surface silvered plane mirror
(c) concave mirror
(d) convex mirror

52. A refracting telescope consists of

☑ 2012 (II)

- (a) one concave mirror and one convex lens
(b) two convex lenses of equal focal length
(c) two concave mirrors of different focal lengths
(d) two convex lenses of unequal focal lengths

53. The mirror used for the head light of a car is **☑ 2012 (II)**

- (a) spherical concave
(b) plane
(c) cylindrical
(d) parabolic concave

- 54.** Yellow colour light is used as fog light because yellow colour
☑ 2012 (II)
- light is most scattered by fog
 - has the longest wavelength among all colours
 - has the longest wavelength among all colours except red and orange, but the red colour is already used for brake light and stop light, whereas orange colour is avoided due to its similarity with red
 - has the shortest wavelength among all colours not already reserved for other purpose
- 55.** The human eye is like a camera and hence it contains a system of lens. The eye lens forms
☑ 2013 (I)
- a straight or upright, real image of the object on the retina
 - an inverted, virtual image of the object on the retina
 - an inverted, real image of the object on the retina
 - a straight or upright, real image of the object on the iris
- 56.** An object is placed at the focus of a concave mirror. The image will be
☑ 2013 (I)
- real, inverted, same size at the focus
 - real, upright, same size at the focus
 - virtual, inverted, highly enlarged at infinity
 - real, inverted, highly enlarged at infinity
- 57.** An optician prescribes a power = -0.5 D. The corresponding lens must be a
☑ 2013 (I)
- convex lens of focal length 2 m
 - convex lens of focal length 50 cm
 - concave lens of focal length 2 m
 - concave lens of focal length 50 cm
- 58.** The spread in colours in a rainbow on sky is primarily due to
☑ 2013 (I)
- dispersion of sunlight
 - reflection of sunlight
 - refraction of sunlight
 - total internal reflection of sunlight
- 59.** A beautiful rainbow on the sky is due to the
☑ 2013 (II)
- dispersion of sunlight from a water droplet only
 - reflection of sunlight from a water droplet only
 - reflection and refraction of sunlight from a water droplet only
 - refraction, dispersion and reflection of sunlight from a water droplet only
- 60.** During sunrise and sunset, sun appears reddish- orange because
☑ 2013 (II)
- during that time sun emits only reddish-orange light
 - all other colours are absorbed by the atmosphere
 - reddish-orange light is least scattered by the atmosphere
 - all other colours apart from reddish-orange are reflected back by the atmosphere
- 61.** Rays of light get refracted while passing from air to glass because
☑ 2013 (II)
- density of glass is higher than that of air
 - they cannot be reflected from a glass surface
 - glass absorbs energy from the light rays
 - speed of light in glass is less than the speed of light in air
- 62.** White light while passing through a glass prism breaks up into light of different colours because
☑ 2013 (II)
- refractive index of glass for different colours of light is different
 - glass prism absorbs white light and emits lights of several colours in different directions
 - of total internal reflection of white light on surfaces of the prism
 - of the interference of different colours inside the prism
- 63.** Consider the following statement(s) A real image
☑ 2014 (I)
- can be formed on a screen
 - is always magnified and inverted
- Which of the statements given above is/are correct?
- Only I
 - Only II
 - Both I and II
 - Neither I nor II
- 64.** In optical instruments, the lenses are used to form image by the phenomenon of
☑ 2014 (I)
- reflection
 - refraction
 - scattering
 - diffusion
- 65.** If speed of light in air is 3×10^8 m/s, then the speed of light in glass (with refractive index 1.5) would be
☑ 2014 (I)
- 2×10^8 m/s
 - 4.5×10^8 m/s
 - 3×10^8 m/s
 - 1.5×10^8 m/s
- 66.** While looking at an image formed by a convex lens (one-half of the lens is covered with a black paper), which one of the following will happen to the image?
☑ 2014 (I)
- Half of the image will be visible
 - Intensity of the image will be diminished
 - Image will be inverted now
 - One can see an image of smaller size
- 67.** Which one of the following processes explains the splitting of a beam of white light into its constituent colours?
☑ 2014 (II)
- Dispersion
 - Reflection
 - Diffraction
 - Polarisation
- 68.** Optical glass used in the construction of spectacles is made by
☑ 2014 (II)
- flint glass
 - crookes glass
 - quartz glass
 - hard glass
- 69.** A ray of light travels from a medium of refractive index n_1 to a medium of refractive index n_2 . If angle of incidence is i and angle of refraction is r , then $\frac{\sin i}{\sin r}$ is equal to
☑ 2014 (II)
- n_1
 - n_2
 - $\frac{n_2}{n_1}$
 - $\frac{n_1}{n_2}$
- 70.** Light waves projected on oil surface show seven colours due to the phenomenon of
☑ 2014 (II)
- polarisation
 - refraction
 - reflection
 - interference
- 71.** Light waves are
☑ 2014 (II)
- electromechanical waves
 - electromagnetic waves
 - electrooptical waves
 - magnetooptical waves
- 72.** Optical glass used in the construction of spectacles is made by
☑ 2014 (II)
- flint glass
 - crookes glass
 - quartz glass
 - hard glass
- 73.** A ray of light when refracted suffers change in velocity. In this context, which one among the following statements is correct?
☑ 2015 (I)
- Velocity increases as the ray passes from a rarer to a denser medium
 - Velocity decreases as the ray passes from a denser to a rarer medium
 - Velocity decreases as the ray passes from a rarer to a denser medium
 - Change of velocity does not depend on the nature of medium

Solutions

$$\begin{aligned} \therefore v_{IO} &= v_I - v_O = -v - v = -2v \\ &= -2 \times 2 = 4 \text{ km/h} \end{aligned}$$

[given, $v = 2 \text{ km/h}$]

Hence, image will approach with 4 km/h.

11. (c) Given, ${}_a\mu_g = 3/2$, ${}_a\mu_w = 4/3$,

$$\begin{aligned} {}_w\mu_g &=? \\ \text{We know that,} \\ {}_w\mu_g &= \frac{{}_a\mu_g}{{}_a\mu_w} = \frac{3/2}{4/3} = \frac{9}{8} = 1.125 \end{aligned}$$

36. (a) Given, $\theta = 60^\circ$

$$\therefore n = \frac{360^\circ}{\theta} = \frac{360}{60} = 6 = \text{even}$$

$$\Rightarrow \text{Number of images} = 6 - 1 = 5$$

48. (a) Given, $f = 25 \text{ cm} = 25 \times 10^{-2} \text{ m}$

We know that,

$$P = \frac{1}{f(\text{metre})} = \frac{1}{25 \times 10^{-2}} = 4 \text{ D}$$

49. (a) We know that, $\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{x}{f_1 f_2}$

where, $f_1 = 4 \text{ cm}$, $f_2 = 8 \text{ cm}$, $x = 4 \text{ cm}$

$$\therefore \frac{1}{f} = \frac{1}{4} + \frac{1}{8} - \frac{4}{4 \times 8}$$

$$\frac{1}{f} = \frac{3}{8} - \frac{1}{8} = \frac{1}{4}$$

Focal length, $f = 4 \text{ cm}$

56. (d) The object is placed at the focus of a concave mirror. Now, using mirror formula, $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

$$\Rightarrow \frac{1}{v} + \frac{1}{(-f)} = \frac{1}{-f} \Rightarrow v = \infty$$

Also, magnification, $m = \frac{-v}{u} = \infty$

Therefore, the image will be real, inverted and highly enlarged at infinity.

57. (c) It is given that, $P = -0.5 \text{ D}$

$$\therefore f = \frac{1}{P} = \frac{1}{-0.5} = -2 \text{ m}$$

Negative sign shows concave lens. It means it is a concave lens of focal length 2 m.

59. (d) The formation of a rainbow involves a series of physical phenomena, refraction, dispersion and total internal reflection.

65. (a) Given, $c = 3 \times 10^8 \text{ m/s}$, $\mu = 1.5$

$$\therefore v_g = \frac{c}{\mu} = \frac{3 \times 10^8}{1.5} = 2 \times 10^8 \text{ m/s}$$

67. (a) The phenomenon of splitting of white light (sunlight) into its constituent colours is called dispersion.

Dispersion of white light when it passes through a prism is shown as below.

69. (c) According to Snell's law,

$$n_1 \times \sin i = n_2 \times \sin r$$

$$\Rightarrow \frac{\sin i}{\sin r} = \frac{n_2}{n_1}$$

Patches of light due to the interference.

73. (c) When light goes from one medium to another, it is called refraction.

Velocity of light in any medium,

$$v = \frac{\text{Velocity of light in vacuum } (c)}{\text{Refractive index of the medium } (\mu)}$$

For denser medium $\mu_d > \mu_r$ (rarer medium).

$$\therefore v_d < v_r$$

Therefore, velocity decreases as the ray passes from a rarer to a denser medium.

74. (b) Given, $f = +15 \text{ cm}$, $u = -10 \text{ cm}$

\therefore Lens formula,

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{v} = \frac{1}{f} + \frac{1}{u}$$

$$\Rightarrow \frac{1}{v} = \frac{1}{15} - \frac{1}{10} \text{ or } \frac{1}{v} = \frac{2-3}{30}$$

$$\text{or } \frac{1}{v} = \frac{-1}{30} \Rightarrow v = -30 \text{ cm}$$

Now, we can write

\therefore Magnification

$$m = \frac{\text{Height of image } (h_i)}{\text{Height of object } (h_o)} = \frac{v}{u}$$

$$\Rightarrow m = \frac{-30}{-10} = 3$$

$$\therefore m > 0 \text{ and } m > 1$$

\therefore Image is virtual and magnified.

82. (c) Initial distance of the lady from the mirror is

$$x_1 = 1 \text{ m} = 100 \text{ cm}$$

After moving 60 cm towards the mirror, new distance is

$$x_2 = 100 - 60 = 40 \text{ cm}$$

\therefore Distance of her image from herself is

$$d = x_2 + x_2 = 2x_2 = 80 \text{ cm}$$

83. (a) Given, focal length of the concave mirror, $f = -16 \text{ cm}$

\therefore Magnitude of radius of curvature of the mirror,

$$|R| = 2f = 32 \text{ cm}$$

When object is shifted towards the focus, new distance of the object

$$u = -(32 - 8) \text{ cm} = -24 \text{ cm}$$

Applying mirror formula, we get

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f} \Rightarrow \frac{1}{v} - \frac{1}{24} = \frac{1}{-16}$$

$$\Rightarrow \frac{1}{v} = \frac{1}{24} - \frac{1}{16} = \frac{16 - 24}{24 \times 16} = \frac{-8}{24 \times 16}$$

$$\Rightarrow v = -48 \text{ cm}$$

\therefore Magnification,

$$m = -\frac{v}{u} = \frac{-(-48)}{-24} = -2$$

As magnification is negative and having magnitude more than one, image will be real and magnified.

84. (c) It is given that,

focal length of the convex lens,

$$f = 15 \text{ cm}$$

Distance of pencil from the pole,

$$u = -10 \text{ cm}$$

Applying mirror formula, we get

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

$$\Rightarrow \frac{1}{v} - \frac{1}{10} = \frac{1}{15}$$

$$\Rightarrow \frac{1}{v} = \frac{1}{10} + \frac{1}{15} = \frac{25}{150}$$

$$\Rightarrow v = 6 \text{ cm}$$

\therefore Magnification,

$$m = -\frac{v}{u} = \frac{-6}{-10} = 0.6$$

As magnification is positive and less than one image will be vertical, erect and diminished.

09

OSCILLATION AND WAVES

In last years 2 to 3 questions are asked from this chapter, which are based on the simple harmonic motion, simple pendulum, sound waves and reflection of sound waves.

PERIODIC MOTION

A motion which repeats itself over and again after a regular interval is called a periodic motion.

e.g.

- The revolution of earth around the Sun is a periodic motion.
- The motion of hands of a clock is a periodic motion.

Periodic Function

A function which repeats its value after a fix interval of time is called a periodic function.

$$y(t) = y(t + T)$$

where, T is the period of the function.

Trigonometric function $\sin\theta$ and $\cos\theta$ are simplest periodic functions having period of 2π .

OSCILLATORY MOTION

A periodic to and fro motion of a body about a fixed point, is called an oscillatory or vibratory motion.

e.g.,

- The motion of the pendulum of a wall clock.
- The motion of a loaded spring.
- The motion of a bar magnet suspended in the earth's magnetic field.
- Simple pendulum, spring pendulum, etc.

➤ **Note** Every oscillatory motion is periodic but every periodic motion is not an oscillatory motion.

Types of Oscillatory Motion

There are two types of oscillatory motion

- Harmonic Oscillation** When a body repeats its motion about a fixed point after a regular time interval is known as the harmonic oscillation. e.g., sine or cosine function is called harmonic function.
- Non-harmonic Oscillation** A non-harmonic oscillation is the combination of two or more than two harmonic oscillations.

Simple Harmonic Motion (SHM)

Simple harmonic motion is a simplest form of vibratory or oscillatory motion in which a particle moves to and fro repeatedly about a mean position.

Some Important Terms Related to SHM

Some important terms related to SHM are as follow

- Restoring Force** The force acting on the particle (executing SHM) which tends to bring it towards its mean position is called restoring force. Restoring force is always directed towards mean position or acts in the direction opposite to that of displacement.

$$\text{Restoring force, } F = -kx$$

where, k is a constant and x is displacement about mean position.

- Amplitude** The maximum displacement of the particle from mean position, is called the amplitude of the oscillation. It is denoted by a .

- (iii) **Phase** The physical quantity which expresses the position and direction of the motion of an oscillating particle is called phase. It is denoted by ϕ .
- (iv) **Time Period** The time after which the particle keeps on repeating its motion is called time period. It is denoted by T .
- (v) **Frequency** The number of oscillations made by the particle is called frequency.

$$\text{Frequency, } n = \frac{1}{\text{Time Period } (T)}$$

Its unit is per second or Hertz

- (vi) **Angular Frequency** The rate of change of a phase angle of particle (executing SHM) with respect to time is called angular frequency. Its unit is radian/second.

$$\begin{aligned} \text{Angular frequency, } \omega &= \frac{2\pi}{\text{Time Period } (T)} \\ &= 2\pi \times \text{Frequency } (n) \end{aligned}$$

Types of SHM

There are two types of SHM

- (i) **Linear SHM** When a particle moves to and fro about a fixed point along a straight line, then its motion is called linear simple harmonic motion. e.g. Motion of a mass connected to a spring.
- (ii) **Angular SHM** Instead of straight line motion, if particle or centre of mass of body is oscillating on a small arc of circular motion, then its motion is called angular simple harmonic motion. e.g. Motion of a bob of simple pendulum.

Kinematics of Simple Harmonic Motion

Simple harmonic motion can be defined as the straight line motion of the foot of perpendicular drawn from the particle on the diameter of the circle.

- (i) **Displacement** The displacement of a particle executing SHM at any instant is given by

$$y = a \sin \omega t = a \sin \frac{2\pi}{T} t = a \sin 2\pi n t \quad \dots(i)$$

$$y = a \cos \omega t = a \cos \frac{2\pi}{T} t = a \cos 2\pi n t \quad \dots(ii)$$

$$y = a \sin(\omega t \pm \phi) \quad \dots(iii)$$

First relation is valid when time is noted from the instant when the vibrating particle is at mean position.

Second relation is valid when the time is noted from the instant when the vibrating particle is at extreme position.

- (ii) **Velocity** The velocity of the particle executing SHM at any instant, is defined as the time rate of change of its displacement at that instant.

$$\text{Velocity, } v = \omega \sqrt{a^2 - y^2}$$

- (a) When the particle is at mean position i.e. $y = 0$, then its velocity is maximum

$$\therefore v_{\max} = \omega a$$

- (b) When the particle is at extreme position, i.e. $y = \pm a$, then its velocity is zero.

$$\therefore v = \omega \sqrt{a^2 - a^2} = 0$$

- (iii) **Acceleration** The acceleration of the particle executing SHM at any instant, is defined as the rate of change of its velocity at that instant.

$$A = \frac{dv}{dt} = \frac{d}{dt}(a\omega \cos \omega t)$$

$$= -\omega^2 a \sin \omega t = -\omega^2 y \quad \{\text{As, } y = a \sin \omega t\}$$

- (a) When the particle is at the mean position i.e. $y = 0$, then acceleration is zero.

$$\therefore a_{\text{mean position}} = 0$$

- (b) When the particle is at the extra position i.e. $x = a$, then acceleration is maximum.

$$\therefore a_{\text{extreme position}} = -\omega^2 a$$

ENERGY IN SHM

A particle executing SHM possesses two types of energy.

- (i) **Potential Energy** When a body is displaced from its equilibrium position by doing work upon it, acquires potential energy.

$$\text{Potential energy } (U) = \frac{1}{2} m \omega^2 y^2$$

Potential energy is maximum at extreme position i.e., at

$$y = \pm a$$

$$U_{\max} = \frac{1}{2} m \omega^2 a^2$$

Potential energy is minimum (zero) at mean position i.e., at

$$y = 0$$

$$U_{\max} = 0$$

- (ii) **Kinetic Energy** When a body is released, it begins to move back with a velocity, thus acquiring kinetic energy,

$$\text{Kinetic energy } (K) = \frac{1}{2} m\omega^2(a^2 - y^2)$$

K.E is maximum at mean position i.e $y = 0$

$$\therefore K_{\max} = \frac{1}{2} m\omega^2 a^2$$

Kinetic energy is minimum (zero) at extreme position i.e.,

$$\begin{aligned} & y = a \\ \therefore \text{ At } & y = \pm a \\ & K = 0 \end{aligned}$$

(iii) **Total Energy** Total energy can be obtained by adding potential and kinetic energies. Therefore,

$$E = K + U = \frac{1}{2} m\omega^2(a^2 - y^2) + \frac{1}{2} m\omega^2 y^2 = \frac{1}{2} m\omega^2 a^2$$

Comparison between linear and angular simple harmonic motion

S. No.	Linear Simple Harmonic Motion	Angular Simple Harmonic Motion
1.	Restoring force, $f \propto -x$ $\Rightarrow f = -kx$ where, k = restoring force constant	Restoring torque $\tau \propto -\theta$ $\tau = -C\theta$ where, C = restoring torque
2.	Acceleration, $a = -\frac{k}{m}x$ $\Rightarrow \frac{d^2x}{dt^2} + \frac{k}{m}x = 0$ It is the differential equation of linear simple harmonic motion	Acceleration, $\alpha = -\frac{C}{I}\theta$ $\Rightarrow \frac{d^2\theta}{dt^2} + \frac{C}{I}\theta = 0$ It is the differential equation of angular simple harmonic motion
3.	Displacement $y = a \sin \omega t$	Angular displacement $\theta = \theta_0 \sin \omega t$
4.	Acceleration, $A = -\omega^2 y$ So, $\omega = \sqrt{\frac{k}{m}} = \frac{2\pi}{T} = 2\pi n$ where, T = time period and n = frequency	Acceleration $\alpha = -\omega^2 \theta$ $\omega = \sqrt{\frac{C}{I}} = \frac{2\pi}{T} = 2\pi n$ where, T = time period n = frequency
5.	Time period $T = 2\pi \sqrt{\frac{m}{k}}, n = \frac{1}{2\pi} \sqrt{\frac{k}{m}}$	Time period $T = 2\pi \sqrt{\frac{I}{C}}, n = \frac{1}{2\pi} \sqrt{\frac{C}{I}}$

SIMPLE PENDULUM

If a heavy point mass is suspended by a weightless, inextensible and perfectly flexible string from a rigid support, then this arrangement is called a simple pendulum.

The time period of the simple pendulum is given by

$$T = 2\pi \sqrt{\frac{l}{g}}$$

where, l = effective length (length of string) of the pendulum and g = acceleration due to gravity

Oscillation of a Simple Pendulum in a Lift

If the pendulum is suspended from the ceiling of the lift.

(i) If the lift is at rest or moving upward with constant velocity.

$$T = 2\pi \sqrt{\frac{l}{g}} \quad \text{and} \quad n = \frac{1}{2\pi} \sqrt{\frac{g}{l}}$$

(ii) If the lift is moving upward with constant acceleration a

$$T = 2\pi \sqrt{\frac{l}{g+a}} \quad \text{and} \quad n = \frac{1}{2\pi} \sqrt{\frac{g+a}{l}}$$

Time period decreases and frequency increases

(iii) If the lift is moving downward with constant acceleration a

$$T = 2\pi \sqrt{\frac{l}{g-a}} \quad \text{and} \quad n = \frac{1}{2\pi} \sqrt{\frac{g-a}{l}}$$

Time period increases and frequency decreases.

(iv) If the lift is moving downward with acceleration $a = g$

$$T = 2\pi \sqrt{\frac{l}{g-g}} = \infty \quad \text{and} \quad n = \frac{1}{2\pi} \sqrt{\frac{g-g}{l}} = 0$$

It means there will be no oscillation in a pendulum.

Types of Simple Pendulum

There are five types of simple pendulum

- (i) **Second's Pendulum** A simple pendulum having time period of 2 s, is called second's pendulum. The effective length of second's pendulum is 99.992 cm i.e., approximately 1 m on the earth.
- (ii) **Conical Pendulum** If a simple pendulum is fixed at one end and the bob is rotating in a horizontal circle, then it is called conical pendulum.
- (iii) **Compound Pendulum** Any rigid body mounted, so that it is capable of swinging in a vertical plane about some axis passing through it is called a compound pendulum.
- (iv) **Physical Pendulum** When a rigid body of any shape is capable of oscillating about an axis, is called a physical pendulum.
- (v) **Spring Pendulum** A point mass suspended from a massless (or light) spring constitutes a spring pendulum. If the mass is once pulled downwards, so as to stretch the spring and then released, the system oscillates up and down about its mean position simple harmonically.

OSCILLATIONS OF A SPRING

A spring pendulum consists of a point (small sized) mass m either suspended from a massless (or light) spring or placed on a smooth horizontal plane attached with a spring.

If the mass is once pulled so as to stretch the spring and is then released, then a restoring force acts on it which continuously tries to restore its mean position, restoring force $F = -kl$, where k is force constant and l is the change in length of the spring under the restoring force. The spring pendulum oscillates simple harmonically having time period and frequency given by

$$T = 2\pi\sqrt{\frac{m}{k}} \text{ and } n = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$$

where, k is the force constant of the spring and it is numerically equal to the force required to increase the length of the spring by unity. If the spring is not light but has a mass m_s , then

$$T = 2\pi\sqrt{\frac{(m + 1/3)m_s}{k}}$$

If two masses m_1 and m_2 , connected by a spring, are made to oscillate on a horizontal surface, then its period will be

$$T = 2\pi\sqrt{\frac{\mu}{k}}$$

where, $\mu = \frac{m_1 m_2}{m_1 + m_2}$ = reduced mass of the system.

Oscillation of a Spring Combination

There are two types of spring combination

1. Series Combination of Springs

If two springs of spring constants k_1 and k_2 are joined in series (horizontally and vertically), then their equivalent spring constant k_s is given by

$$\frac{1}{k_s} = \frac{1}{k_1} + \frac{1}{k_2} \Rightarrow k_s = \frac{k_1 k_2}{k_1 + k_2}$$

$$\therefore T = 2\pi\sqrt{\frac{m}{k_s}} = 2\pi\sqrt{\frac{m(k_1 + k_2)}{k_1 k_2}}$$

2. Parallel Combination of Springs

If the two springs of spring constants k_1 and k_2 are joined in parallel as shown in fig., then their equivalent spring constant $k_p = k_1 + k_2$ hence,

$$T = 2\pi\sqrt{\frac{m}{k_p}} = 2\pi\sqrt{\frac{m}{k_1 + k_2}}$$

WAVE

A wave is a vibratory disturbance in a medium which carries energy from one point to another point without any actual movement of the medium.

There are mainly three types of waves

- (i) **Mechanical Waves** The waves which can be propagated or produced only in a material medium, are called mechanical waves.
- (ii) **Electromagnetic Waves** The waves which require no medium for their propagation or production, are called electromagnetic waves.
- (iii) **Matter Waves** The waves associated with moving particles like electrons, protons, etc, are called matter waves.

Types of Mechanical Waves

Mechanical waves are of two types

1. Longitudinal Waves

A wave in which the particles of the medium vibrate in the same direction of propagation of wave is called longitudinal wave. Longitudinal waves can be produced in all the three media such as solids, liquids and gases. The waves which are produced in air are always longitudinal. e.g., those waves which travel along a spring when it is pushed and pulled at one end, are longitudinal waves.

When coils are closer to each other than normal, **compressions** are observed in the spring. When coils are farther apart than normal, **rarefactions** are observed. A long feasible spring which can be compressed or extended easily, is called **slinky**.

➔ **Note** When a longitudinal wave passes through air, the density of air changes continuously and the pressure and energy are being transferred.

2. Transverse Waves

A wave in which the particles of the medium vibrate perpendicular to the direction of propagation of wave, is called transverse wave.

Transverse waves can be produced only in solids and liquids

e.g.,

- Light is a transverse wave but it is not a mechanical wave.
- The waves produced by moving one end of long spring or rope up and down rapidly and whose other end is fixed, are transverse waves.

- The water waves (or ripples) formed on the surface of water in a pond (when a stone is dropped in the pond of water), are transverse waves.

A transverse wave travels horizontally in a medium and the particles of the medium vibrate up and down in the vertical direction. In transverse waves, crest and trough are formed.

A **crest** is that part of the transverse wave which is above the line of zero disturbance of the medium. A **trough** is that part of the transverse wave which is below the line of zero disturbance.

A transverse wave has been represented by a displacement-distance graph as shown below

A Transverse Wave by a Displacement-Distance Graph

WAVE MOTION

When a large number of particles vibrates simultaneously in a medium, then disturbance propagates in the medium. The motion of disturbance is called wave motion. Energy of momentum is transferred to the neighbouring particles of the medium as wave proceeds.

Some definitions related to wave motion

- (i) **Amplitude** It is the maximum displacement suffered by the particles of the medium about their mean positions. It is denoted by A .
- (ii) **Time Period** The time period of a wave is the time in which a particle of medium completes one vibration to and fro about its mean position. It is denoted by T .
- (iii) **Frequency** The frequency of a wave is the number of waves produced per unit time in the given medium. It is equal to the reciprocal of the time period T of the particle and is denoted by n . Thus

$$n = \frac{1}{T}$$

S.I unit of n is S^{-1} or hertz (Hz)

- (iv) **Angular Frequency** The rate of change of phase with time is called angular frequency of the wave. It is denoted by ω . Thus

$$\omega = \frac{2\pi}{T} = 2\pi n$$

SI unit of ω is $\text{rad } S^{-1}$

- (v) **Wavelength** The distance between two nearest particles of the medium which are vibrating in the same phase. It is denoted by λ .
- (vi) **Wave Number** The number of waves present in a unit distance of the medium is called wave number. It is equal to the reciprocal of wavelength λ . Thus

$$\text{Wave number, } \bar{\nu} = \frac{1}{\lambda}$$

SI unit of wave number is m^{-1} .

- (vii) **Angular wave number of propagation constant** The quantity $\frac{2\pi}{\lambda}$ is called angular wave number or propagation constant of a wave. It represents phase change per unit path difference. It is denoted by K . Thus

$$K = \frac{2\pi}{\lambda}$$

The SI unit of K is radian per metre or $\text{rad } m^{-1}$.

- (viii) **Wave velocity or phase velocity** The distance covered by a wave per unit time in its directions of propagation is called its wave velocity or phase velocity. It is denoted by v .

Relation between Wave Velocity, Frequency and Wavelength

$$\text{Wave velocity} = \frac{\text{Distance}}{\text{Time}}$$

$$v = \frac{\lambda}{T} \text{ or } v = n\lambda \quad \left\{ \because n = \frac{1}{\lambda} \right\}$$

i.e, Wave velocity = Frequency \times Wavelength

SOUND

Sound is a form of energy, which produces the sensation of hearing. These are longitudinal mechanical waves. Sound waves have low frequency and high wavelength. Sound waves cannot travel in vacuum.

The rebounding back of sound, when it strikes a hard surface is called **reflection of sound**. The repetition of sound due to reflection of sound wave is called an **echo**.

According to their frequency range, waves are divided into the following categories

1. **Audible or Sound Waves** The longitudinal mechanical waves, which lie in the frequency range 20 Hz to 20000 Hz are called audible or sound waves. These waves are sensitive to human ear.
2. **Infrasonic Waves** The longitudinal mechanical waves having frequencies less than 20 Hz are called infrasonic waves. These waves are produced by sources of bigger size such as earthquakes, volcanic eruptions, ocean waves, elephants and whales.
3. **Ultrasonic Waves** The longitudinal mechanical waves having frequencies greater than 20000 Hz are called ultrasonic waves. Human ear cannot detect these waves. But certain creatures like dog, cat, bat, mosquito etc., can detect these waves.

➔ **Note** Bat not only detect but also produce ultrasonic waves.

Characteristics of Sound

Intensity or Loudness

Intensity of sound at any point in space is defined as the amount of energy passing normally per unit area held around that point per unit time. Its SI unit is watt/metre. Loudness depends on intensity of sound.

Unit of loudness is **bel** and $\frac{1}{10}$ th of bel is **decibel** (dB).

Source of Sound	Noise level (dB)
Whisper	20
Ordinary conversation	65
Traffic on a busy road	70
Amplified rock music	120
Jet aeroplane, 30 m away	140

Quality or Timbre of Sound

Quality is that characteristic of sound, which enables us to distinguish between sound produced by two sources having the same intensity and pitch. It depends on harmonics and their relative order and intensity.

Pitch or Frequency

The pitch of a sound is the characteristic which distinguishes between a shrillness or graveness of sound. Pitch depends upon frequency. A still and sharp sound has higher pitch and grave and dull sound has lower pitch.

SONAR

The acronym SONAR stands for **Sound Navigation And Ranging**. The SONAR is a device, that uses the ultrasonic waves to measure the distances, directions and speed of objects under water. The ultrasonic sound pulse to travel from the ship to the bottom of the sea and back to the ship. In other words, the SONAR measures the time taken by the echo to return to the ship.

Half of this time gives the time taken by the ultrasonic sound to travel from the ship to the bottom of the sea.

Some applications of SONAR are given

- Target location for torpedoes.
- Resources location for mines.
- Submarine navigation.
- In aircraft.
- Remotely operated vehicles.
- Detecting the vehicle location.

Shock Waves

A body moving with supersonic speed in air leaves behind it, a conical region of disturbance, which spreads continuously. Such a disturbance is called **shock wave**. These waves carry huge energy and may even make cracks in window panes or even damage a building. Earthquakes have shock waves.

SPEED OF SOUND

The speed of sound basically depends upon elasticity and density of medium. Speed of sound in air is 332 m/s, in water is 1483 m/s and in iron is 5130 m/s. When sound enters from one medium to another medium, its speed and wavelength changes but frequency remains unchanged.

Resonance column method is a method for determination of speed of sound in air. **Kundt's tube** method is a method for determination of speed of sound in gas.

➔ **Note** Liquids and solids generally have higher speeds of sound than in gases.

Effect of Physical Parameters on Speed of Sound

Effect of Temperature The speed of sound in a gas is directly proportional to the square root of absolute temperature of the gas, i.e. $v \propto \sqrt{T}$. So, velocity of sound in air increases due to rise in temperature.

Effect of Pressure If temperature remains constant, then there is no effect of change in pressure on the velocity of sound.

Effect of Humidity In humid air, velocity of sound increases as compared to the dry air.

Effect of Frequency There is no effect of frequency on the velocity of sound.

Effect of Wind If wind is blowing, then the speed of sound changes. The speed of sound is increased, if wind is blowing in the direction of propagation of sound wave.

Refraction of Sound Waves

When a sound wave moves from one mechanical medium to another mechanical medium, then the waves are refracted or transmitted. This phenomenon is called refraction of sound.

The refracted waves deviated from the original path of the incident waves. The main reason for occurrence of refraction in sound is different speeds of sound, in different media at different temperatures.

Speed of Longitudinal Waves (or Sound) in Gases : Newton Formula

Newton gave a relation to calculate the velocity of sound in a gas. According to Newton, the velocity of sound

$$v = \sqrt{\frac{B}{d}}$$

where, B is volume coefficient of elasticity (also called bulk modulus of elasticity) of the gas and d is density.

Newton assumed that the changes in pressure and volume of a gas when sound waves are propagated through it, are isothermal. Hence, in the above formula, B is isothermal bulk modulus of the gas whose value is equal to the initial pressure (p) of the gas. Therefore, according to Newton, the speed of sound in a gas $v = \sqrt{\frac{p}{d}}$.

Laplace's Correction

Laplace pointed out that Newton's assumption was wrong. According to Laplace, the changes in pressure and volume of a gas when a gas propagates through the air, are not isothermal but should be adiabatic. Because when sound waves are propagated through air, these are accompanied by the change of temperature of gas. Hence, changes are adiabatic and not isothermal.

Hence, in Newton's formula, B should represent the adiabatic bulk modulus of the gas whose value is equal to γp i.e., $B = \gamma p$

where, $\gamma = \frac{C_p}{C_v}$ = ratio of two principal specific heat of gas

Thus, Laplace's formula for the speed of sound in a gas is

$$v = \sqrt{\frac{\gamma p}{d}}$$

ECHO

When a person shouts in a big empty hall, we first hear his original sound, after that we hear the reflected sound of that shout. This reflected sound is known as echo. An echo is nothing but just the reflected sound. So, the repetition of sound caused by reflection of sound waves is called an echo.

SUPERPOSITION OF WAVES

When a number of waves meet simultaneously at a point in a medium, this is called superposition of waves.

Principle of Superposition of Waves

The principle of superposition of waves states that when a number of waves travel through a medium simultaneously, the resultant displacement of any particle of the medium at any given time is equal to the algebraic sum of the displacement due to the individual waves.

If $y_1, y_2, y_3, \dots, y_n$ are the displacements due to waves acting separately, then according to the principle of superposition the resultant displacement, when all the waves act together is given by the algebraic sum

$$y = y_1 + y_2 + y_3 + \dots + y_n$$

Standing or Stationary Waves

When two identical waves of same amplitude and frequency travelling in opposite directions with the same speed along the same path superpose each other, the resultant wave does not travel in the either direction and is called stationary or standing wave.

On the path of stationary wave, there are some points where the amplitude is zero. These points are known as **nodes**.

On the other hand, there are some points where the amplitude is maximum. These points are known as **antinodes**.

There are two types of stationary waves

- 1. Longitudinal Stationary Waves** Longitudinal stationary waves are formed as a result of superimposition of two identical longitudinal waves travelling in opposite directions.
e.g., Stationary waves produced in organ pipes and in air column of resonance tube apparatus are longitudinal stationary waves.
- 2. Transverse Stationary Waves** Transverse stationary waves are formed as a result of superimposition of two identical transverse waves travelling in opposite directions.
e.g., Stationary waves produced on the vibrating string of a Sonometer are transverse stationary waves.

Standing Waves in String

When a wave is set up on a string of length L fixed at two ends, then this wave gets reflected from the two fixed ends of the string continuously and as a result of superimposition of these waves, transverse standing waves are formed on the string.

Consider a string of length L and mass m per unit length stretched with tension T . The fundamental modes of vibration setup in a string fixed at both ends are shown below.

- Fundamental frequency or frequency in first normal mode of vibration

$$n_1 = \frac{v}{2L} \quad \text{or} \quad \frac{1}{2L} \sqrt{\frac{T}{m}}$$

where, v = speed of wave in string

This is called normal or fundamental mode of vibration. The sound or note so produced, is called **fundamental note or first harmonic**.

- Frequency in second normal mode of vibration

$$n_2 = \frac{v}{L} = \frac{2v}{2L}$$

$$n_2 = 2n_1$$

Frequency of vibrating string becomes twice the fundamental frequency. The note or sound so produced, is called **second harmonic or first overtone**.

- Frequency in third normal mode of vibration

$$n_3 = 3 \left(\frac{v}{2L} \right) = 3n_1$$

Frequency of vibration of string becomes three times the fundamental frequency. The note or sound so produced, is called **third harmonic or second overtone**.

Standing Waves in Organ Pipes

Organ pipes are musical instruments which are used for producing musical sound by blowing air into the pipe.

There are two types of organ pipes

(i) Vibration in Closed Organ Pipe

Closed organ pipe is closed at one end and open at the other end. Sound wave is sent by a source vibrating near the open end. The wave is reflected from the fixed end. This inverted wave is again reflected at the open end. After two reflections, it moves towards the fixed end and interferes with the new wave sent by the source in that direction.

In an organ pipe, the closed end is essentially a node point of minimum amplitude of vibration and the open end is antinode point of maximum amplitude of vibration.

The fundamental modes of vibration are shown below, when there is a node at the closed end and an antinode at the open end.

- Fundamental frequency or frequency in first normal mode of vibration

$$n_1 = \frac{v}{4L}$$

This is the lowest frequency of vibration and is called the fundamental frequency. The note or sound so produced, is called **fundamental note or first harmonic**.

- Frequency in second normal mode of vibration

$$n_2 = \frac{3v}{4L} = 3n_1$$

Thus, the frequency of vibration in 2nd normal mode is thrice the fundamental frequency. The note so produced, is called **third harmonic or first overtone**.

- Frequency in third normal mode of vibration

$$n_3 = 5 \frac{v}{4L} = 5n_1$$

The frequency of vibration in 3rd normal mode is five times the fundamental frequency. The note or sound so produced, is called **fifth harmonic or second overtone**.

$$\therefore n_1 : n_2 : n_3 : \dots = 1 : 3 : 5 : \dots$$

(ii) Vibration in Open Organ Pipe

An open organ pipe is a cylindrical tube of which both ends are open. A source of sound near one of the ends sends the wave in the pipe. The wave is reflected by the other open end and travels towards the source. It suffers second reflection at the open end near the source and then interferes with the new wave sent by the source.

The fundamental modes of vibration are shown below, when there are antinodes at both ends.

- Fundamental frequency or frequency in first normal mode of vibration

This is the lowest frequency of vibration and is called fundamental frequency. The note or sound so produced, is called **fundamental note or first harmonic**.

- Frequency in second normal mode of vibration

Frequency in vibration in second normal mode is twice the fundamental frequency. The note so produced, is called **second harmonic or first overtone**.

- Frequency in third normal mode of vibration

Frequency of vibration in third normal mode is thrice the fundamental frequency. The note so produced, is called **third harmonic or second overtone**.

$\therefore n_1 : n_2 : n_3 : \dots = 1 : 2 : 3 : \dots$

Therefore, even and odd harmonics are produced by an open organ pipe.

BEATS

When two sound waves of equal amplitudes and nearly equal frequencies are produced simultaneously, then the intensity of resultant sound wave increases and

decreases with time. This change in the intensity of sound, is called phenomenon of beats. Resultant frequency is equal to the difference in frequencies of two sound sources.

Doppler's Effect in Sound

When there is a relative motion between source and observer of the sound, a variation in the frequency (pitch) of sound is observed by the observer. This phenomenon is called Doppler's effect. Here, change in frequency is called **Doppler's shift**.

The variation in frequency (pitch) of sound depends on the three different relative motions between source and observer.

Special Cases

1. If only source *S* is in motion towards the observer, then $v_o = 0$ and v_s is +ve.

Hence,
$$n = n_0 \left[\frac{v}{v - v_s} \right]$$

But if source *S* is in motion away from the observer, then v_s is -ve and hence,

$$n = n_0 \left[\frac{v}{v + v_s} \right]$$

2. If only observer *O* is in the motion towards the source, then $v_s = 0$ and v_o is -ve.

Hence,
$$n = n_0 \left[\frac{v - (-v_o)}{v} \right] = n_0 \left[\frac{v + v_o}{v} \right]$$

But if observer *O* is the motion away from the source, then v_o is +ve,

Hence,
$$n = n_0 \left[\frac{v - v_o}{v} \right]$$

3. If both source *S* and observe *O* are in motion and approaching each other, then v_s is +ve, but v_o is -ve.

Hence,
$$n = n_0 \left[\frac{v + v_o}{v + v_s} \right]$$

4. If both source *S* and observe *O* are in motion such that they are receding from each other, then v_s is -ve but v_o is +ve.

Hence,
$$n = n_0 \left[\frac{v - v_o}{v + v_s} \right]$$

Conditions of Doppler Effect

There will be no change in observed frequency due to Doppler's effect when

- (i) The source *S* and observer *O* are at rest or moving in such a way that distance between them remains constant.
- (ii) Source and observer are moving in mutually perpendicular directions.
- (iii) The velocity of source *S* and of observer *O* is equal to or greater than the velocity of sound in the given medium.

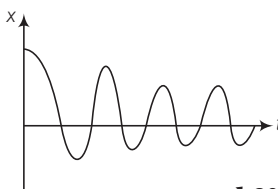

> PRACTICE EXERCISE

- The total energy of a particle executing simple harmonic motion is proportional to the
 - amplitude of the motion
 - square of the amplitude of the motion
 - cube of the amplitude of the motion
 - square of the acceleration of the body
- The approximate intensity level of the sound which can cause damage to the ear drum is
 - 20 dB
 - 60 dB
 - 100 dB
 - 160 dB
- Which among the following is the necessary condition for simple harmonic motion?
 - Constant period
 - Constant acceleration
 - Displacement and acceleration are proportional
 - Displacement and torque are proportional
- A slow-running pendulum clock can be speeded up by
 - increasing the length of the rod
 - increasing the weight of the bob
 - reducing the length of the rod
 - reducing the weight of the bob
- Sound travels in gases in the form of
 - longitudinal waves only
 - transverse waves only
 - longitudinal as well as transverse waves
 - stationary waves only
- To produce sound it is necessary that
 - the source should execute longitudinal vibrations
 - the source should execute transverse vibrations
 - the source may execute any type of vibration
 - the vibrations of source are not necessary
- The pitch of sound depends upon
 - frequency and amplitude
 - frequency alone
 - amplitude alone
 - the difference in frequencies from two sources
- When a wire of a sitar is plucked, then the waves produced in air will be
 - stationary waves
 - transverse waves
 - longitudinal waves
 - a combination of transverse and stationary wave
- A source of sound is moving away from the stationary observer with a velocity v_s . Velocity of sound is v . If n is the frequency of the source of sound, then the apparent frequency of sound heard by the observer is
 - $\frac{v}{v + v_s} n$
 - $\frac{v}{v - v_s} n$
 - $\frac{v}{v + v_s} n$
 - $\frac{v + v_s}{v} n$
- A body executing simple harmonic motion while passing through its mean position will have
 - kinetic energy only
 - potential energy only
 - Both kinetic and potential energies
 - minimum acceleration
- The ratio of the fundamental frequency of an open and closed organ pipe of same length is
 - 2 : 4
 - 2 : 1
 - 3 : 1
 - 1 : 1
- For a particle executing SHM, the equilibrium position is at $x = 0$ and the amplitude at $x = A$, the KE of the particle will be equal to the potential energy
 - at $x = 0$
 - at $x = A$
 - at $x = A/2$
 - when x is greater than $A/2$ but less than A
- Two simple pendulums have the same period of oscillation. The necessary condition for this is
 - their lengths are equal and the suspended particles have the same mass
 - their lengths are equal but the suspended particles need not have the same mass
 - their lengths are different but the suspended particles have the same mass
 - the masses of the suspended particle must be in the inverse ratio of the lengths of the pendulums
- An elastic spring has a force constant k . It is cut into three equal parts. The force constant of each part is
 - $k/3$
 - $3k$
 - k^3
 - k
- A sound wave having wavelength λ forms stationary wave after reflection from surface. The distance between two consecutive nodes is
 - $\frac{\lambda}{2}$
 - $\frac{\lambda}{8}$
 - $\frac{\lambda}{4}$
 - λ
- There are two strings of equal length and diameter but the densities are in the ratio 1 : 2, they are stretched by a tension T . The ratio of frequencies will be
 - 2 : 1
 - 1 : 2
 - $1 : \sqrt{2}$
 - $\sqrt{2} : 1$
- Consider the following statements. In a stationary wave
 - all the particles perform simple harmonic motion with a frequency which is four times that of the two component waves.
 - particles on the opposite sides of a node vibrate with a phase difference of π .
 - the amplitude of vibration of a particle at an antinode is equal to that of either component wave.
 - all the particles between two adjacent nodes vibrate in phase.
 Of these statements
 - Both I and II are correct
 - I, III and IV are correct
 - Both II and IV are correct
 - I, II, III and IV are correct
- The apparent frequency noted by a moving listener away from the stationary source is 10% less than the real frequency. If the velocity of sound is 330 m/s, then the velocity of the listener is
 - 8.5 m/s
 - 40 m/s
 - 50 m/s
 - 16.5 m/s
- The wavelength of light received from a galaxy is 4% greater than that received from an identical source on the earth. The velocity of the galaxy relative to the earth is
 - 12×10^6 m/s
 - 8×10^5 m/s
 - 1.2×10^6 m/s
 - 7.5×10^6 m/s

- 20.** The earth is moving towards a stationary star with a velocity of 100 km/s. If the wavelength of the light emitted by the star is 5000 Å, then the change in wavelength apparent to an observer will be
(a) 167 Å (b) zero (c) 16.7 Å (d) 1.67 Å
- 21.** If the frequency of a note emitted by a source changes by 20% as it approaches an observer and then recedes away from him, the speed of the source is nearly
(a) 22 m/s (b) 11 m/s
(c) 33 m/s (d) 44 m/s
- 22.** The ratio of the frequencies of the fundamental notes between one organ pipe open at both ends and another organ pipe of same length closed at one end is
(a) 3 (b) 4 (c) 2 (d) 1
- 23.** A given tube is open at both the ends. The shortest length of a column of air that would vibrate at 331 Hz in such a tube is (the velocity of sound is 331 m/s)
(a) 0.25 m (b) 0.5 m (c) 1 m (d) 2 m
- 24.** The fork *A* of frequency 100 is sounded with another tuning fork *B*. The number of beats produced is 2. On putting some wax on the prongs of *B*, the number of beats reduces to 1. The frequency of the fork *B* is
(a) 102 (b) 107 (c) 98 (d) 94
- 25.** If the length of second's pendulum is increased by 2%, how many seconds will it lose per day?
(a) 3600 s (b) 3456 s
(c) 1728 s (d) 864 s
- 26.** Two sound waves passing through air have their wavelengths in the ratio 4 : 5. Their frequencies are in the ratio
(a) 4 : 5 (b) 3 : 4
(c) 5 : 4 (d) 1 : 1
- 27.** The periodic time of simple pendulum is 2 s in a lab at rest. If it is suspended from the roof of a lift accelerating upwards with an acceleration 2 m/s², then its periodic time will be (Take, $g = 10 \text{ m/s}^2$)
(a) $\sqrt{\left(\frac{40}{12}\right)}$ s (b) $\sqrt{\left(\frac{8}{40}\right)}$ s
(c) $\sqrt{\left(\frac{12}{40}\right)}$ s (d) $\sqrt{\left(\frac{40}{8}\right)}$ s

- 28.** 56 tuning forks are so arranged in series that each fork gives 4 beats/s with the previous one. The frequency of the last fork is 3 times that of the first. The frequency of the first fork is
(a) 50 (b) 70
(c) 110 (d) 40
- 29.** A sonometer string and a tuning fork are sounded together, they produce 6 beats/s. When the length of string is either 95 cm or 100 cm, then the frequency of the tuning fork is
(a) 120 c/s (b) 100 c/s
(c) 190 c/s (d) 234 c/s
- 30.** A fork *A* has frequency 2% more than frequency of standard fork and *B* has a frequency 3% less than the frequency of the same standard fork. The forks *A* and *B* produce 6 beats/s. The frequency of the fork *A* is
(a) 140 Hz (b) 122.4 Hz
(c) 110 Hz (d) 250 Hz

> Previous Years' Questions

- 31.** Which one among the following is not produced by sound waves in air? **☑ 2012(I)**
(a) Polarisation (b) Diffraction
(c) Reflection (d) Refraction
- 32.** A swinging pendulum has its maximum acceleration at
(a) the bottom of the swing **☑ 2012(II)**
(b) the two extremities of the swing
(c) every point on the swing
(d) no particular portion of the pendulum
- 33.** For a simple pendulum, the graph between T^2 and L (where, T is the time period and L is the length) is **☑ 2012(II)**
(a) straight line passing through origin
(b) parabolic (c) circle
(d) None of the above
- 34.** SONAR is mostly used by **☑ 2012(II)**
(a) doctors (b) engineers
(c) astronauts (d) navigators
- 35.** The ceilings of a concert hall are generally curved **☑ 2012(II)**
(a) because they reflect the sound to the audience
(b) because they can absorb noise
(c) to have better aeration in the hall
(d) as any sound from outside can not pass through a curved ceiling

Solutions

18. (d) \therefore Change in apparent frequency

$$n'' - n' = \frac{2nv_0}{v}$$

$$\frac{10}{100}n = \frac{2nv_0}{v} \Rightarrow \frac{10 \times v}{2 \times 100} = \frac{10 \times 330}{2 \times 100}$$

[\therefore given, $v = 330$ m/s]

$$= 16.5 \text{ m/s}$$

19. (a) $\therefore \frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow v = \frac{c}{\lambda} \Delta\lambda = \frac{c}{\lambda} (\lambda' - \lambda)$

$$= \frac{3 \times 10^8 \times 4}{100} = 12 \times 10^6 \text{ m/s}$$

20. (d) Given, $\lambda = 5000 \text{ \AA}$, $v = 100 \text{ km/s}$,

$$c = 3 \times 10^8 \text{ m/s}, \Delta\lambda = ?$$

$$\therefore \Delta\lambda = \lambda \frac{v}{c} = 5000 \times \frac{100 \times 1000}{3 \times 10^8} \times 10^{-10}$$

$$= 1.67 \times 10^{-10} \text{ m} = 1.67 \text{ \AA}$$

21. (c) Change in apparent frequency

$$n'' - n' = \frac{2nv_s}{v}$$

$$\frac{20}{100}n = \frac{2nv_s}{v}$$

$$v_s = \frac{20 \times v}{2 \times 100} = \frac{20 \times 330}{2 \times 100}$$

[given, $v = 330$ m/s]

$$v_s = 33 \text{ m/s}$$

22. (c) According to question, $\frac{v/2L}{v/4L} = 2$

23. (b) Given, $v = 331 \text{ m/s}$, $n = 331 \text{ Hz}$, $l = ?$

\therefore Fundamental frequency, $n = \frac{v}{2l}$

$$331 = \frac{331}{2l} \Rightarrow l = 0.5 \text{ m}$$

25. (d) $\therefore T' = T \sqrt{\frac{l + 2l/100}{l}}$

$$= T \left(1 + \frac{2}{100}\right)^{1/2} = 2 \left(1 + \frac{1}{100}\right)$$

$$\therefore T' - T = \frac{2}{100} = \frac{1}{50} \text{ s}$$

Therefore, loss in second's per day

$$= \frac{1/50}{2} \times 24 \times 60 \times 60 = 864 \text{ s}$$

26. (c) $\therefore \frac{v_1}{v_2} = \frac{v_1}{v_2} = \frac{n_1 \lambda_1}{n_2 \lambda_2} \Rightarrow n_1 \lambda_1 = n_2 \lambda_2$

$$\Rightarrow \frac{n_1}{n_2} = \frac{\lambda_2}{\lambda_1} = \frac{5}{4} = 5:4$$

28. (c) Given, $n_i = 3n$, $n_f = n$, $N = 56$,

$$x = 4 \text{ beats/s}$$

$$\therefore n_i = n_f + (N - 1)x$$

where, x is the number of beats

$$3n = n + (56 - 1)4$$

$$2n = 55 \times 4 \Rightarrow n = \frac{55 \times 4}{2} \Rightarrow n = 110$$

29. (d) The frequency of tuning fork is $n + 6$ or $n - 6$

Frequency of sonometer wire, $n \propto \frac{1}{l}$

$$\therefore \frac{n + 6}{n - 6} = \frac{100}{95}$$

$$95(n + 6) = 100(n - 6)$$

$$95n + 95 \times 6 = 100n - 600$$

$$600 + 570 = 5n$$

$$n = \frac{1170}{5} \Rightarrow n = 234 \text{ c/s}$$

43. (a) Given, $f = 2 \text{ kHz} = 2 \times 10^3 \text{ Hz}$,

$$\lambda = 35 \text{ cm} = 35 \times 10^{-2} \text{ m}$$

$$d = 1.4 \text{ km} = 1.4 \times 10^3 \text{ m}$$

$$\therefore v = f\lambda = 2 \times 10^3 \times 35 \times 10^{-2} = 700 \text{ m/s}$$

$$\therefore t = \frac{d}{v} = \frac{1.4 \times 10^3}{700} = 2 \text{ s}$$

45. (d) Given, $v = 300 \text{ m/s}$,

$$n = 3 \times 10^5 \text{ Hz}, \lambda = ?$$

\therefore The velocity of sound, $v = n\lambda$

$$\text{or } \lambda = \frac{v}{n} = \frac{300}{3 \times 10^5} = 100 \times 10^{-5} = 10^{-3} \text{ m}$$

$$= 10^{-3} \times 100 \text{ cm}$$

10

ELECTROSTATICS

Only one question has been asked from this chapter based on the Coulomb's law, but there is always a possibility that questions may be asked from this chapter in future.

The branch of physics, which deals with the study of charges at rest (i.e. static charges), the forces between the static charges, fields and potentials due to these charges is called **electrostatics**.

ELECTRIC CHARGE

Electric charge is the property associated with matter due to which it produces and experiences electrical and magnetic effects. It is a scalar quantity. Its SI unit is coulomb (C). The proton possesses positive charge (+ e) and electron possesses an equal negative charge ($-e$), where, $e = 1.6 \times 10^{-19}$ coulomb (C).

Properties of Electric Charge

- Two like charges repel each other, while two unlike charges attract each other.
- Electrification by friction can be explained on the basis of transfer of electron (i.e. negative charged particles of an atom) from one object to other, when these are rubbed to each other. Charges are invariant and always distributed on the surface of the conductor.
- A charged body attracts lighter neutral body.
- During any process, the net electric charge of an isolated system remains constant.
- Charge is conserved i.e., it can neither be created nor be destroyed.

Coulomb's Law

The force of interaction (attraction or repulsion) between two stationary point charges in vacuum is directly proportional to the product of the charges and inversely proportional to the square of distance between them. Mathematically, electrostatic force between two stationary charges is given by

$$F = \frac{k|q_1 q_2|}{r^2}$$

where, k is a proportionality constant

In SI unit, k is given by

$$k = \frac{1}{4\pi\epsilon_0} = 9 \times 10^9 \text{ Nm}^2\text{C}^{-2}$$

where, $\epsilon_0 = 8.85 \times 10^{-12} \text{ C}^2\text{N}^{-1}\text{m}^{-2}$ and is called the **permittivity of free space**.

i.e.
$$F = 9 \times 10^9 \frac{|q_1 q_2|}{r^2}$$

The coulomb force acts along the straight line connecting the points of location of the charges. It is central and spherically symmetric.

If $q_1 = q_2 = 1 \text{ C}$ and $r = 1 \text{ m}$

Then,
$$F = 9 \times 10^9 \frac{1 \times 1}{1^2}$$

$$F = 9 \times 10^9 \text{ N}$$

i.e. One coulomb is the charge that when placed at distance of 1m from another charge of same magnitude in vacuum, experiences an electric force of repulsion of magnitude $9 \times 10^9 \text{ N}$. Coulomb is a big unit, in practice we use smaller units like mC or μC .

Superposition Principle

According to the superposition principle, forces on any charge due to number of other charges is the vector sum of all the forces on that charge due to other charges, taken one at a time. The individual forces are unaffected due to the presence of other charges. Consider a system of n point charges $q_1, q_2, q_3, \dots, q_n$ be distributed in space in a discrete manner. The charges are interacting with each other. Let the charges be q_2, q_3, \dots, q_n exert forces $F_{12}, F_{13}, \dots, F_{1n}$ respectively on charge q_1 .

Then, according to the principle of superposition, the total force on charge q_1 is given by

$$F_1 = F_{12} + F_{13} + \dots + F_{1n} \quad \dots(i)$$

If the distance between the charges q_1 and q_2 is denoted as r_{12} and \hat{e}_{21} is unit vector from charge q_2 to q_1 , then

$$F_{12} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{r_{12}^2} \hat{e}_{21}$$

Similarly, the force on charge q_1 due to other charges is given by

$$F_{13} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_3}{r_{13}^2} \hat{e}_{31}$$

$$F_{1n} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_n}{r_{1n}^2} \hat{e}_{n1}$$

Substituting these values in Eq.(i), we get

$$F_1 = \frac{1}{4\pi\epsilon_0} \left(\frac{q_1 q_2}{r_{12}^2} \hat{e}_{21} + \frac{q_1 q_3}{r_{13}^2} \hat{e}_{31} + \dots + \frac{q_1 q_n}{r_{1n}^2} \hat{e}_{n1} \right)$$

$$F_{1i} = \frac{q_1}{4\pi\epsilon_0} \sum_{i=2}^n \frac{q_i}{r_{i1}^2} \hat{e}_{i1}$$

⇒ The interaction must be on the charge which is to be studied due to other charges.

ELECTRIC FIELD

Electric field due to a given charge is the space around the charge in which electrostatic force of attraction or repulsion due to the charge can be experienced by any other charge.

Electric Field Intensity

The electric field intensity at any point is the strength of electric field at that point. It is defined as the force experienced by unit positive charge placed at that point. If F is the force acting on a small test charge $+q_0$ at any point r , then electric field intensity at that point is given by

$$E(r) = \frac{F(r)}{q_0}$$

The SI unit of electric field intensity is newton per coulomb (N/C).

Electric Field Lines

An electric field line in general is a curve drawn in such a way that the tangent to it at each point is in the direction of the electric field at that point.

A field line is a space curve, i.e. a curve in three-dimensions.

Properties of Electric Field Lines

Electric field lines follow some important properties which are discussed below

- (i) Electric field lines start from positive charges and end at negative charges. In the case of a single charge, they may start or end at infinity.
- (ii) Tangent to any point on electric field lines shows the direction of electric field at that point.
- (iii) Two field lines can never intersect each other because, if they intersect, then two tangents drawn at that point will represent two-directions of field at that point, which is not possible.
- (iv) In a charge free region, electric field lines can be taken to be continuous curves without any breaks.
- (v) Electric field lines do not form closed loops (because of conservative nature of electric field).
- (vi) Electric field lines are perpendicular to the surface of a charged conductor.
- (vii) Electric field lines contract lengthwise to represent attraction between two unlike charges.
- (viii) Electric field lines exert sideways pressure to represent repulsion between two like charges.
- (ix) The number ΔN of lines per unit cross-sectional area perpendicular to the field lines (i.e. density of lines of force) is directly proportional to the magnitude of the intensity of electric field in that region.

$$\frac{\Delta N}{\Delta A} \propto E$$

ELECTRIC POTENTIAL

Electric potential at a point in an electric field is defined as the amount of work done in bringing a unit positive charge, without any acceleration, from infinity to that point, along any arbitrary path.

If W work is to be done to bring a test charge q_0 from infinity to a point, then the potential of that point, is

$$V = \frac{W}{q_0}$$

SI unit of potential is volt, where

$$1V = \frac{1J}{1C}$$

Potential Difference

Potential difference between two points in an electric field is equal to the work done per unit charge in carrying a positive test charge from one point to the other point.

Potential difference between two points A and B is given as, $\Delta V = V_B - V_A = \frac{W}{q_0}$. Its

SI unit is volt. It can also be joule/coulomb.

Potential difference is that physical quantity, which decides the direction of flow of charge between two points in the electric field. Positive charge always tends to move from higher potential towards lower potential.

Equipotential Surface

The surface drawn in an electric field, at which each point has same potential, is called equipotential surface.

- Equipotential surfaces are always normal to lines of force.
- The work done in moving a charge on equipotential surface is zero because potential difference is zero.
- Two equipotential surfaces never intersect each other.

Electric field (E) and electric potential (V) are related as

$$dV = -E \cdot dr$$

where, dr is small displacement.

- If θ is the angle between dr and E , then

$$dV = -E dr \cos\theta$$

Some Formulae for Electric Field Intensity and Electric Potential

Charge distribution	Point of observation	Electric intensity	Electric potential
Point charge (q)	• Anywhere at distance r	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r^2}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$
Charged conducting sphere of radius R	• Point at infinity ($r = \infty$)	$E = 0$	$V = 0$
	• Point at centre of sphere ($r = 0$)	$E = 0$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$
	• Point on the surface of sphere ($r = R$)	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R^2}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$
	• Point outside the sphere ($r > R$)	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r^2}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$
	• Point inside the sphere ($r < R$)	$E = 0$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$
Uniformly charged non-conducting sphere of radius R	• Point at infinity	$E = 0$	$V = 0$
	• Point at centre of sphere ($r = 0$)	$E = 0$	$V = \frac{3}{2} \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$
	• Point on the surface of sphere ($r = R$)	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R^2}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$
	• Point outside the sphere ($r > R$)	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r^2}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$
	• Point inside the sphere ($r < R$)	$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{qr}{R^3}$	$V = \frac{1}{4\pi\epsilon_0} \cdot \frac{(3R^2 - r^2)}{2R^3}$
Charged circular ring of radius R	• Point on the axis at distance r from the centre	$E = \frac{qr}{4\pi\epsilon_0(R^2 + r^2)^{3/2}}$	$V = \frac{q}{4\pi\epsilon_0\sqrt{R^2 + r^2}}$
	• At the centre of the ring	$E = 0$	$V = \text{constant} = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{R}$

Electric Potential Energy

Electric potential energy is a potential energy that results from conservative coulomb forces and is associated with the configuration of particular set of point charge within a defined system.

$$\text{Electric potential energy } (U) = \frac{q_1 q_2}{4\pi\epsilon_0 r}$$

Unit of electric potential energy is Joule.

Energy Density

Energy density is the amount of energy stored in a given system or region of space per unit volume or mass, through the latter is more accurately

termed specific energy $V_e = \frac{1}{2} \epsilon_0 E^2$

ELECTRIC DIPOLE

An electric dipole consists of a pair of equal and opposite point charges separated by some small distance.

Dipole Moment of an Electric Dipole

The strength of an electric dipole is measured by a vector quantity known as electric dipole moment (p) which is the product of the charge (q) and separation between the charges ($2l$).

i.e. $p = q \times 2l$ or $|\mathbf{p}| = q(2l)$

It is a vector quantity and its direction is always from negative charge to positive charge. The SI unit of dipole moment is coulomb-metre (C-m).

If charge q gets larger and the distance $2l$ gets smaller and smaller, keeping the product $|\mathbf{p}| = q \times 2l = \text{constant}$, we get what is called an ideal dipole or point dipole. Thus, an ideal dipole is the smallest dipole having almost no size.

Electric Field Intensity due to an Electric Dipole

Electric field of an electric dipole is the space around the dipole in which the electric effect of the dipole can be experienced. An electric dipole consists of two charges $+q$ and $-q$, therefore according to the superposition principle, the electric field due to an electric dipole at a point will be equal to the vector sum of the electric field due to the two individual charges.

(i) At a Point on the Axial Line

Electric field intensity (E) at a point P on the axial line of the dipole is given by

$$E_P = \frac{1}{4\pi\epsilon_0} \frac{2px}{(x^2 - l^2)^2}$$

Electric Field on Axial Line of an Electric Dipole

In vector form, $\mathbf{E}_P = \frac{1}{4\pi\epsilon_0} \frac{2p\mathbf{x}}{(x^2 - l^2)^2}$

If dipole is short, $2l \ll x$, then

$$E_P = \frac{2p}{4\pi\epsilon_0 x^3}$$

(ii) At a Point on the Equatorial Line

Resultant electric field intensity at point θ is

$$\mathbf{E}_\theta = \mathbf{E}_A + \mathbf{E}_B$$

Electric field on equatorial line of an electric dipole

where, $\mathbf{E}_A = \frac{1}{4\pi\epsilon_0} \frac{q}{(x^2 + l^2)}$, $\mathbf{E}_B = \frac{1}{4\pi\epsilon_0} \frac{q}{(x^2 + l^2)}$

On resolving \mathbf{E}_A and \mathbf{E}_B into two rectangular components, the vectors $E_A \sin \theta$ and $E_B \sin \theta$ are equal in magnitude and opposite to each other and hence cancel out.

The vectors $E_A \cos \theta$ and $E_B \cos \theta$ are acting along the same direction and hence add up.

$$\begin{aligned} \therefore E_\theta &= E_A \cos \theta + E_B \cos \theta = 2E_A \cos \theta \quad \{\because E_A = E_B\} \\ &= \frac{1}{4\pi\epsilon_0} \frac{2ql}{(x^2 + l^2)^{3/2}} \end{aligned}$$

But $q \times 2l = |\mathbf{p}|$, the dipole moment.

$$\therefore E_\theta = \frac{1}{4\pi\epsilon_0} \frac{|\mathbf{p}|}{(x^2 + l^2)^{3/2}}$$

If the dipole is short, $2l \ll x$.

$$\therefore E_\theta = \frac{1}{4\pi\epsilon_0} \frac{|\mathbf{p}|}{x^3}$$

ELECTRIC FLUX

Electric flux over an area is equal to the total number of electric field lines crossing through that area. Its SI unit is $\text{Nm}^2 \text{C}^{-1}$.

Electric field intensity and electric flux

Electric flux $\Delta\phi_E$ crossing through a small area element ΔS is given by

$$\Delta\phi_E = E\Delta S \cos \theta$$

where, E = electric field intensity and ΔS = area vector

Special Cases

- (i) For $0^\circ < \theta < 90^\circ$, $\Delta\phi_E$ is positive.
- (ii) For $\theta = 90^\circ$, $\Delta\phi_E$ is zero.
- (iii) For $90^\circ < \theta < 180^\circ$, $\Delta\phi_E$ is negative.

Gauss's Theorem

The electric flux over any closed surface is $\frac{1}{\epsilon_0}$ times the total charge enclosed by that surface.

i.e. $\phi_E = \frac{\Sigma q}{\epsilon_0}$

where, Σq = total charge enclosed (i.e. sum of all the charges inside a closed surface). If total enclosed surface is zero, then total electric flux is zero.

Conductors

Conductors are the materials through which electric charge can flow easily. Most of the metals are conductors of electric charge. Silver is the best conductor of electric charge.

Insulators

Insulators are the materials through which electric charge cannot flow, glass, rubber, wood etc. Insulators are also called dielectrics, when an electric field is applied, induced charges appear on the surface of the dielectric. Hence, it can be said that dielectric are the insulating materials which transit electric effect without conducting.

Dielectrics

In a dielectric under the effect of an external field, a net dipole moment is induced in the dielectric. Due to molecular dipole moments, a net charge appears on the surface of the dielectric.

These induced charges produce a field opposing the external field. Induced field is lesser in magnitude than the external field. So, field inside the dielectric gets reduced.

$$E = |E_0| - |E_{in}|$$

where, E = resultant electric field in the dielectric

E_0 = external electric field between two plates

and E_{in} = electric field inside the dielectric

A net dipole moment is developed by an external field in either case, whether a polar or non-polar dielectric.

Dielectric Constant (K)

The ratio of the strength of the applied electric field to the strength of the reduced value of the electric field on placing the dielectric between the plates of a capacitor is called the dielectric constant of the dielectric medium.

It is also known as **relative permittivity** or **specific inductive capacity** and is denoted by K (or ϵ_r).

Therefore, dielectric constant of a dielectric medium is given by

$$K = \frac{E_0}{E}$$

➤ **Note** The value of K is always greater than 1.

Polarisation (P)

The induced dipole moment developed per unit volume in a dielectric slab on placing it in an electric field is called polarisation. It is denoted by P .

If p is induced dipole moment acquired by an atom of the dielectric and N is the number of atoms per unit volume, then polarisation is given by $P = Np$

ELECTRICAL CAPACITANCE

Capacitance of a conductor is the amount of charge needed in order to raise the potential of the conductor by unity.

Mathematically, capacitance, $C = \frac{Q}{V}$

Electrical capacitance is a scalar. SI unit of capacitance is 1 farad (1F).

where, $1F = \frac{1C}{1V}$

Capacitance of an isolated spherical conductor (solid or hollow) is given by

$$C = 4\pi\epsilon_0 R = \frac{R}{9 \times 10^9}$$

Capacitor

A capacitor is a device which stores electrostatic energy. Net charge on a capacitor is zero. However, ordinarily we talk in terms of charge on either plate of a capacitor and that is finite.

Capacitance of Capacitor

Capacitance of capacitor is the ratio of charge (q) and applied potential (V) i.e. $C = \frac{q}{V}$

Spherical Capacitor Capacitance

(i) When external sphere is connected to earth then,

$$C = 4\pi\epsilon_0 \left(\frac{ab}{b-a} \right) \quad [\text{In air}]$$

$$C = \frac{4\pi\epsilon_0 K ab}{(b-a)} \quad [\text{In medium}]$$

(ii) When internal sphere is connected to earth, then,

$$C = \frac{4\pi\epsilon_0 b^2}{(b-a)} \quad [\text{In air}]$$

$$C = \frac{4\pi\epsilon_0 K ab}{(b-a)} \quad [\text{In medium}]$$

Factors Affecting Capacitance of a Capacitor

- (i) Capacitance of capacitor is directly prepositional to area (A)
i.e. $C \propto A$
- (ii) Capacitance of capacitor is inversely prepositional to distance (d) between the plates
i.e. $C \propto \frac{1}{d}$
- (iii) Capacitance of capacitor is directly prepositional to dielectric of medium (K)
i.e. $C \propto K$

Combination of Capacitors

There are two common methods of grouping of capacitors

1. Series Grouping

In a series arrangement, the charge on each plate of each capacitor has the same magnitude, equal to the charge supplied by the battery.

The potential difference is distributed inversely in the ratio of capacitors,

i.e. $V = V_1 + V_2 + V_3 + \dots$

and $V_1 : V_2 : V_3, \dots = \frac{1}{C_1} : \frac{1}{C_2} : \frac{1}{C_3} : \dots$

The equivalent capacitance C_S is given by

$$\frac{1}{C_S} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3} + \dots$$

$$= \sum_{i=1}^{i=n} \frac{1}{C_i}$$

2. Parallel Grouping

In a parallel arrangement, the potential across each of the capacitor is, exactly same.

Charges on different capacitors are different. In fact, the charge is distributed in the ratio of capacitance,

i.e. $Q = Q_1 + Q_2 + Q_3 + \dots$

and $Q_1 : Q_2 : Q_3, \dots = C_1 : C_2 : C_3, \dots$

The equivalent capacitance is given by

$$C_P = C_1 + C_2 + C_3 + \dots = \sum_{i=1}^{i=n} C_i$$

Energy Stored in a Capacitor

The energy of a charged capacitor is measured by the total work done in charging the capacitor to a given potential. Let us assume that initially both the plates are uncharged. Now, we have to repeatedly move small positive charges from one plate and transfer them to the other plate. Now, when an additional small charge (dq) is transferred from one plate to another plate, then the small work done is given by

$$dW = V'dq = \frac{q'}{C}dq$$

[\because charge on plate when dq charge is transferred be q']

The total work done in transferring charge Q is given by

$$W = \int_0^Q \frac{q'}{C} dq = \frac{1}{C} \int_0^Q q' dq = \frac{1}{C} \left[\frac{(q')^2}{2} \right]_0^Q = \frac{Q^2}{2C}$$

This work is stored as electrostatic potential energy U in the capacitor.

$$U = \frac{Q^2}{2C} = \frac{(CV)^2}{2C} = \frac{1}{2} CV^2 \quad [\because Q = CV]$$

The energy stored per unit volume of space in a capacitor is called **energy density**.

Energy density, $U = \frac{1}{2} \epsilon_0 E^2$

Total energy stored in series combination or parallel combination of capacitors is equal to the sum of energies stored in individual capacitors.

i.e. $U = U_1 + U_2 + U_3 + \dots$

PRACTICE EXERCISE

- Consider a static point charge. If this charge is negative, then the electric lines of forces are
 - straight lines converging towards the charge
 - concentric circle with charge at the centre
 - straight lines radiating away from the charge
 - parallel straight lines
- Three different capacitors are connected in series. On them there will be
 - equal charges
 - equal potential
 - equal charge and equal potential
 - equal charge and unequal potential
- When air in a capacitor is replaced by a medium of dielectric constant K , then capacitance
 - remains constant
 - increases k^2 times
 - decreases k times
 - increases k times
- When charge on a capacitor increases keeping geometry same
 - capacity increases
 - capacity decreases
 - capacity remains same
 - None of the above
- n equal capacitors are first connected in series and then in parallel. The ratio of maximum to minimum capacitance is
 - $\frac{1}{n^2}$
 - n
 - $\frac{1}{n}$
 - n^2
- Three capacitors each of capacitance $1 \mu\text{F}$ are connected in series and parallel. The equivalent capacitance will be respectively
 - $\frac{1}{6} \mu\text{F}, 3 \mu\text{F}$
 - $\frac{1}{3} \mu\text{F}, 3 \mu\text{F}$
 - $\frac{1}{2} \mu\text{F}, 1 \mu\text{F}$
 - None of these
- Two point charges Q and $-2Q$ are placed at some distance apart. If the electric field at the location of Q is E , then the electric field at the location of $-2Q$ will be
 - $\frac{E}{2}$ in direction of E
 - $\frac{E}{4}$ in opposite direction of E
 - $2E$ in same direction of E
 - None of the above

- A hollow sphere of copper is charged with positive charge. The electric field inside the sphere will be
 - zero
 - equal to the electric field on the surface of the sphere
 - less than the electric field on the surface of the sphere
 - greater than the electric field on the surface of the sphere
- The radius of a metallic sphere, if its capacitance is $(1/9) \mu\text{F}$, will be
 - 10^3m
 - 10^4m
 - 10^9m
 - 10^2m
- Four charges, Q each are located at the four vertices of a regular tetrahedron of side l . The potential energy of the system will be
 - $\frac{6Q^2}{4\pi\epsilon_0 l}$
 - $\frac{4Q^2}{\pi\epsilon_0 l^2}$
 - $\frac{8Q^2}{4\epsilon_0 \pi l}$
 - $\frac{Q^2}{4\pi\epsilon_0 l}$
- When the distance between the two charges as well as their magnitudes is decreased to half, then the force between them
 - remains same
 - reduces to half
 - becomes double
 - becomes four times
- The heat generated when condenser of $100 \mu\text{F}$ capacity is charged to 200V and discharged through a 2Ω resistance
 - 2J
 - 4J
 - 8J
 - 16J
- The equivalent capacitance of the combination of three capacitors each of capacitance C between points A and B as shown in figure is

The diagram shows a circuit with two terminals, A and B. Between A and B, there are two parallel branches. The upper branch contains two capacitors connected in series, each labeled with the letter 'C'. The lower branch contains a single capacitor labeled 'C'. The equivalent capacitance between A and B is to be determined.

 - $3C$
 - $\frac{C}{2}$
 - $2C$
 - C
- The radius of earth is 6400km , the capacitance of earth is
 - $711 \mu\text{F}$
 - $611 \mu\text{F}$
 - $811 \mu\text{F}$
 - $511 \mu\text{F}$

- 125 water drops of equal radius and equal capacitance C coalesce to form a single drop of capacitance C' . The relation between C and C' is
 - $C' = \frac{C}{125}$
 - $C' = 5C$
 - $C' = 125C$
 - $C' = C$
- A capacitor of capacitance $10 \mu\text{F}$ has been charged to 100V . It is now connected in parallel to another uncharged capacitor C . The common potential becomes 40V . The capacitance of the other capacitor C is
 - $5 \mu\text{F}$
 - $10 \mu\text{F}$
 - $15 \mu\text{F}$
 - $20 \mu\text{F}$
- A point charge of $5 \mu\text{C}$ is placed at the centre of a sphere of radius 9.2m . If $\epsilon_0 = 8.854 \times 10^{-12} \text{C}^2 \text{N}^{-1} \text{m}^{-2}$, then the electric flux through the surface of the sphere will be
 - $4.35 \times 10^5 \text{N} \cdot \text{m}^2 \text{C}^{-1}$
 - $5.05 \times 10^5 \text{N} \cdot \text{m}^2 \text{C}^{-1}$
 - $5.65 \times 10^5 \text{N} \cdot \text{m}^2 \text{C}^{-1}$
 - $5.95 \times 10^5 \text{N} \cdot \text{m}^2 \text{C}^{-1}$
- The capacitance of a parallel plate capacitor $10 \mu\text{F}$. If now the overlapping area of plates are doubled and separation of the plates is halved, then the new capacitance will be
 - $60 \mu\text{F}$
 - $80 \mu\text{F}$
 - $20 \mu\text{F}$
 - $40 \mu\text{F}$
- The diameter of each plate of an air capacitor is 4cm . To make the capacity of this parallel plate capacitor equal to that of the sphere of diameter 20cm , the distance between the plates will be
 - $1 \times 10^{-3} \text{cm}$
 - 1cm
 - $1 \times 10^{-3} \text{cm}$
 - $4 \times 10^{-3} \text{cm}$
- A conductor bears a charge of 2mC at potential 10^3V . The capacitance of capacitor is
 - $2 \mu\text{F}$
 - $4 \mu\text{F}$
 - $1 \mu\text{F}$
 - $8 \mu\text{F}$
- The energy density (energy per unit volume) in an electric field caused by a point charge falls off with the distance from the point charge as
 - $\frac{1}{r^4}$
 - $\frac{1}{r^3}$
 - $\frac{1}{r^2}$
 - $\frac{1}{r}$

- 22.** A battery used for charging an air capacitor is removed after the capacitor is fully charged. Some mica sheets (dielectric constant K) are inserted between the two plates. If E is the energy of the air capacitor, then the energy stored in the mica capacitor will be
(a) KE (b) $\frac{E}{K}$ (c) K^2E (d) E
- 23.** When a soap bubble is charged
(a) its radius increases
(b) its radius decreases
(c) its radius remain unchanged
(d) it collapses
- 24.** A parallel plate air condenser is charged by connecting it to a battery. The battery is disconnected and then a sheet of glass of dielectric constant 8 is inserted between the plates. In this context, which of the following would be true?
I. Potential difference between the plates is reduced by a factor of eight.
II. Potential difference between the plates is increased by a factor of eight.

- III. Electric field between the plates is reduced by a factor of eight.
Select the correct answer from the codes given below
(a) Only III (b) Only II
(c) I and III (d) II and III
- 25.** Two electrons are separated by distance of 1\AA . The coulomb force between them will be
(a) $2.3 \times 10^{-8}\text{ N}$ (b) $4.6 \times 10^{-8}\text{ N}$
(c) $3.6 \times 10^{-8}\text{ N}$ (d) $1.6 \times 10^{-9}\text{ N}$
- 26.** Two electric charges $+q$ and $-q$ are situated at a distance apart from each other. The electric field E and the potential V at the mid-point between the charges will be characterised
(a) $E = 0, V = 0$
(b) $E \neq 0, V = 0$
(c) $E \neq 0, V \neq 0$
(d) $E = 0, V \neq 0$
- 27.** Two charges in air experience a coulomb force of 20 N . If the space between them is filled with a medium of dielectric constant $K = 4$, then what is the new force?
(a) 2.5 N (b) 10 N
(c) 10 N (d) 5 N

- 28.** An electron of mass $9 \times 10^{-31}\text{ kg}$ and charge $1.6 \times 10^{-19}\text{ C}$ is placed in an electric field of strength $9 \times 10^6\text{ N/C}$, the force on electron will be
(a) $0.72 \times 10^{-12}\text{ N}$ (b) $1.44 \times 10^{-12}\text{ N}$
(c) $2.88 \times 10^{-12}\text{ N}$ (d) $4.44 \times 10^{-12}\text{ N}$
- 29.** A spherical capacitor is having potential of 200 V and capacity is Co , what is the energy stored?
(a) $(2 \times 10^4)\text{ Co}$ (b) $(2 \times 10^3)\text{ Co}$
(c) $(4 \times 10^4)\text{ Co}$ (d) $(8 \times 10^4)\text{ Co}$
- 30.** A capacitor of $20\text{ }\mu\text{F}$ and charged to 500 V is connected in parallel to another capacitor of $10\text{ }\mu\text{F}$ charged to 200 V . The common potential will be
(a) 200 V (b) 400 V
(c) 800 V (d) 1600 V

> Previous Years' Question

- 31.** Two similarly charged bodies are kept 5 cm apart in air. If the second body is shifted away from the first by another 5 cm , their force of repulsion will be
☑ 2012 (I)
(a) doubled (b) halved
(c) quadrupled
(d) reduced to one-fourth

> ANSWERS

> Solutions

- 6.** (b) $C_{(\text{series})} = \frac{C}{n} = \frac{1}{3}\text{ }\mu\text{F}$
 $C_{(\text{Parallel})} = nC = 3C = 3\text{ }\mu\text{F}$
- 10.** (a) Potential energy,
$$U = \frac{1}{4\pi\epsilon_0} \left[\frac{q_1q_2}{r} + \frac{q_2q_3}{r} + \frac{q_3q_4}{r} + \frac{q_4q_1}{r} + \frac{q_2q_4}{r} + \frac{q_1q_3}{r} \right]$$

$$U = \frac{1}{4\pi\epsilon_0} \frac{6Q^2}{l}$$

where, $q_1 = q_2 = Q$ and $r = l$
- 12.** (a) Given, $C = 100\text{ }\mu\text{F}$, $V = 200\text{ V}$, $U = ?$
 $\therefore U = \frac{1}{2} CV^2 = \frac{1}{2} \times 100 \times 40000 = 2\text{ J}$
- 15.** (b) Radius of single drop $R = n^{1/3} r$
 $R = (125)^{1/3} r \Rightarrow R = 5r = R_2$
 $\frac{C_1}{C_2} = \frac{R_1}{R_2} \Rightarrow \frac{C}{C'} = \frac{r}{5r} \therefore C' = 5C$
- 16.** (c) Given, $C = 10\text{ }\mu\text{F}$
 $V = 100\text{ V}$
 \therefore Common potential,
 $V' = \frac{10 \times 100 + C \times 0}{10 + C}$
 $40 = \frac{1000}{10 + C} \Rightarrow 40C = 1000 - 400$
 $C = \frac{600}{40} \Rightarrow C = 15\text{ }\mu\text{F}$
- 17.** (c) Given, $q = 5\text{ }\mu\text{C} = 5 \times 10^{-6}\text{ C}$,
 $r = 9.2\text{ m}$
and $\epsilon_0 = 8.854 \times 10^{-12}\text{ C}^2\text{ Nm}^{-2}$
 \therefore Electric flux,
$$\phi_E = \frac{q}{\epsilon_0} = \frac{5 \times 10^{-6}}{8.854 \times 10^{-12}}$$

 $= 5.65 \times 10^5\text{ Nm}^2\text{ C}^{-1}$
- 31.** (d) Electrostatic force of repulsion F , between two charges separated by a distance r is
$$F \propto \frac{1}{r^2}$$

$$\therefore \frac{F_1}{F_2} = \left(\frac{r_2}{r_1} \right)^2 = \left(\frac{10\text{ cm}}{5\text{ cm}} \right)^2 = 4 \Rightarrow F_2 = \frac{F_1}{4}$$

CURRENT ELECTRICITY

In last year 4 to 5 questions were asked from this chapter based on the topics : Ohm's law, combination of resistor, Kirchoff's law and specific uses of conductors respectively. This chapter is important from examination point of view.

ELECTRIC CURRENT

Rate of flow of charge is called the electric current (i) i.e.,

$$i = \frac{q}{t}$$

Current is a scalar quantity. Unit of electric current is ampere. The direction of flow of current is opposite to the direction of flow of electrons.

According to its magnitude and direction, electric current is of two types

- (i) **Direct Current (DC)** An electric current whose magnitude and direction do not change with time, is called direct current. e.g., a cell, battery or DC dynamo are the sources of direct current.
- (ii) **Alternating Current (AC)** An electric current whose magnitude changes continuously and direction changes periodically, is called alternating current.
e.g., AC dynamo is the source of alternating current.

Current Density (J)

The current flowing normally through the unit of cross-section is called current density. If current i is distributed uniformly over area A , then current density

$$J = \frac{i}{A}$$

The direction of current density is in the direction of motion of positive charge.

Drift Velocity

When an electric field is applied across the conductor, then the electric field gives a constant velocity to the free electrons along the length of the wire, this velocity is called drift velocity (v_d). It is of the order of 10^{-4} m/s.

Current flowing in a wire is

$$i = neAv_d$$

where, n = number of free electrons in unit volume of wire and A = area of cross-section of the wire.

Electric Potential

The electric potential at a point in an electric field is defined as the amount of work done in bringing a unit positive charge from infinity to that point.

► **Note** Variable DC potential is represented by the following symbol

Potential Difference

The potential difference between two points in an electric field is defined as the amount of work done in moving a unit positive charge from one point to the other point.

Ohm's Law

If there is no change in the physical state of a conductor, then the ratio of potential difference across its ends and the current flowing through it is constant

$$\frac{V}{i} = R \quad \text{[constant]}$$

Constant R is called electric resistance of the circuit.

Unit of electric resistance R is ohm (Ω).

Inverse of electric resistance is called the **electric conductance**. Its unit is ohm^{-1} or mho.

Ohmic Conductor The conductor which obey the Ohm's law is known as ohmic conductor. e.g. Metallic wire.

Non-ohmic Conductor The conductor which not obey the Ohm's law is known as non-ohmic conductor. e.g. Diode valve, triode valve.

Electrical Resistance

Electrical resistance is defined as the ratio in the potential difference (V) across the ends of the conductor to the current (i) flowing through it,

$$\text{i.e.} \quad R = \frac{V}{i}$$

The SI unit of electrical resistance is Ω (ohm) and its dimension is $[\text{ML}^2\text{T}^{-3}\text{A}^{-2}]$.

Effect of Temperature on the Resistance

- On increasing the temperature of the metal, its resistance increases.
- On increasing the temperature of semiconductor its resistance decreases.
- On increasing the temperature of alloy, their resistance increase but it is small compared to the pure metals.
- On increasing the temperature of electrolytes, their resistance decreases.

Specific Resistance

Ratio of electric field and the current density at a point in the conductor is called the current density at a point in the conductor is called the specific resistance or resistivity. It is a constant for the material.

$$\rho = \frac{E}{J} \quad \text{or} \quad \rho = \frac{RA}{l}$$

Its unit is ohm-metre.

Some factors affecting specific resistance are given below

- Resistivity increases with increases of temperature.
- Resistivity increases on mixing of impurity and increase of mechanical stress.
- The resistance of super conductor is zero.

Conductivity

Inverse of specific resistance is called conductivity (σ).

Unit of conductivity is mho/metre.

Conductance

Inverse of resistance is called conductance. Unit of conductance is ohm^{-1} or siemen or mho.

Different electrical conducting materials of specific uses

- The filament of bulb is made of tungsten. The resistivity and melting point of tungsten both are high.
- In heating equipments (heater, gysar and electric press), the coils are made of nichrome because the resistivity and melting of nichrome is very high.
- In resistance box, the standard resistances are made of manganin or constantan. Their resistivity do not depend upon temperature, therefore the value of standard resistance does not vary.
- Fuse wire is made of mixed conductor (63% tin and 37% lead). The value of melting point is low but resistivity is very high. The fuse wire is placed in the series to protect the main line.

Combination of Resistance

- Series combination** In this combination, resistances are joined end to end.

Combination of resistance in series

In series combination, equivalent resistance is equal to sum of individual resistance.

$$R = R_1 + R_2 + R_3$$

- In series combination, current through each resistance is same.

$$i = i_1 = i_2 = i_3$$

- In series combination potential difference across each resistance is different.

$$V = V_1 + V_2 + V_3$$

Such that $V_1 : V_2 : V_3 = R_1 : R_2 : R_3$

- Parallel combination** In this combination, first ends of all the resistances is connected to one point and second ends of all the resistances is connected to other point.

Combination of resistance in parallel

In parallel combination, equivalent resistance is given by

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

- In parallel combination, potential difference across each resistance is same. $V = V_1 = V_2 = V_3$
- In parallel combination current in each resistance is different.

$$i = i_1 + i_2 + i_3 \text{ such that } i_1 : i_2 : i_3 = \frac{1}{R_1} : \frac{1}{R_2} : \frac{1}{R_3}$$

ELECTRIC CELL

An electric cell a device which maintains a continuous flow of charge (or electric current) in a circuit by a chemical reaction. In an electric cell there are two rods of different metals called electrodes.

There are three basic types of electric cell

- Electrochemical cell** In this type of cell, chemical energy is converted into electric energy. It is also two types
 - Primary cell** A cell is called primary, if it used only for discharge. The current leaves the cell at the positive (+) terminal goes through the external circuit and enters the cell at the negative (-) terminal. e.g. Daniell cell, leclanche cell.
 - Secondary cell** In a secondary cell, the current pass in both directions. When current leaves the cell at the positive terminal and enters the cell at the negative terminal, then the cell is discharge. This is called normal working of the cell. The most commonly used secondary cell is a lead accumulator.
- Photo cell** In this type of cell, radiant energy is converted into electric energy.
- Thermocouple cell** In this type of cell, thermal energy is converted into electrical energy.

Electromotive Force

The energy given by the cell in the flow of unit charge in the whole circuit is called the emf of the cell.

Or

The potential difference across the terminals of the cell, when no current is being taken from the cell is called emf of a cell.

$$E = \frac{W}{q}$$

Its unit is volt. Emf E is characteristic of each cell and it is a constant for the cell.

Internal Resistance of a Cell

The resistance offered by the electrolyte of cell, inside called the internal resistance of cell. It is represented by r .

- If current i is being taken from the cell and potential difference across the cell is V , then internal resistance,

$$r = \frac{E - V}{i} \text{ or } r = R \left(\frac{E}{V} - 1 \right)$$

where, R is resistance of external circuit

- If the distance between the plates of cell increases, then internal resistance increases.
- On increasing the area of the electrodes of the cell, internal resistance decreases.
- On increasing the concentration of the electrolyte of the cell its internal resistance increases.

Terminal Voltage

The voltage across the terminals of a cell is called the terminal voltage or terminal potential difference. The terminal voltage of a cell is not constant, it depends on the current you draw from the cell. The larger the current you draw, the smaller the terminal voltage.

Relation between Electromotive Force, Terminal Voltage and Internal Resistance of Cell

The relation between electromotive fore (E), internal resistance (r) and external resistance (R) of circuit is $E = V + ir$.

Combination of Cells

- In series** In this combination of cells negative end of each cell is connected to the positive end of the next cell.

Combination of cells in series

Let n cells each of internal resistance r and emf E are connected in series.

So, total emf = nE and total internal resistance = nr .

Current taken from the combination

$$i = \frac{nE}{nr + R}$$

If $nr < R$, i.e. total internal resistance of cell is less than the external resistance, then the current taken from the combination is n times the current taken from one cell.

- If $nr \gg R$, i.e. total internal resistance of cells is greater than the external resistance, then the current taken from the combination is same as that from one cell. So, there is no benefit, joining the cells of high internal resistance in series order.

- In parallel** In this combination positive terminals of all the cells are connected to one point and negative terminals to the other point.

- Let n cells each of internal resistance r and of emf E are connected in parallel. Then, emf of combination = E and total internal resistance = $\frac{r}{n}$.

Current taken from the combination

$$i = \frac{nE}{r + nR}$$

Combination of cells in parallel

- If $\frac{r}{n} \gg R$ i.e. total internal resistance of cells is greater than external resistance, then current taken from the combination is n times that from one cell.
- If $\frac{r}{n} \ll R$ i.e. total internal resistance of cells is less than external resistance, then current taken from the combination is equal to that from one cell. So, there is no benefit of connecting cells of low internal resistance in parallel.

(iii) **Mixed grouping** In this combination, a certain number of cells are connected in various series and all such series are then connected in parallel.

Number of cells = mn

emf of combination = nE

Total internal resistance = $\frac{nr}{m}$

Current taken in external resistance, $i = \frac{mnE}{nr + mR}$

Combination of cells in mixed group

For maximum current in the circuit $mR = nr$.

If two cells oppose each other, then current taken

from them $I = \frac{E_1 - E_2}{r_1 + r_2 + R}$

Similarly, if cells support each other, then $I = \frac{E_1 + E_2}{r_1 + r_2 + R}$

Charging current of a cell is given by

$$i = \frac{\text{emf of charger} - \text{emf of cell}}{\text{total resistance of the circuit}}$$

In a battery of N cells each of emf E , if n cells are wrongly connected, then net emf,

$$E' = NE - 2nE$$

RHEOSTAT

It is a variable resistor which is used to control current in the circuit. They are able to vary the resistance in a circuit without interruption. The construction is very similar to the construction of a potentiometers.

Symbol of rheostat

Kirchhoff's Laws

Sometimes complex electric circuits cannot be reduced to simple series parallel combination, for analysing such circuits Kirchhoff's gave two laws. Which are as follows

(i) **Junction law** The algebraic sum of the current flowing into any junction is zero.

$$\text{Thus, } \sum I_{\text{junction}} = 0$$

(ii) **Loop law** The algebraic sum of the potential difference is any closed loop is equal to zero.

$$\text{Thus, } \sum_{\text{closed loop}} \Delta V = 0 \Rightarrow \sum E + RI = 0$$

$$\Delta E = - \sum RI$$

Wheat Stone's Bridge

It is an arrangement of four resistances making a closed circuit. The resistance of given conductor can be determined with its help. When there is no deflection in the galvanometer, then

$$\frac{P}{Q} = \frac{R}{S}$$

In this case $V_B = V_D$ and the bridge will be balanced.

Wheat stone's bridge

DIFFERENT MEASURING DEVICES

- **Ammeter** Ammeter is a device which is used to measure the electric current in a circuit. Ammeter is always connected in series with the current source. It has very low resistance.
- **Voltmeter** Voltmeter is a device which is used to measure the potential difference across the ends of a conductor. Voltmeter is always connected in parallel. It has very high resistance.
- **Galvanometer** Galvanometer is a device used to detect the presence of the electric current in a circuit.

To convert galvanometer into ammeter a low resistance wire called shunt is connected in parallel with the galvanometer.

$$\text{Resistance of shunt, } S = \frac{i_g G}{i - i_g}$$

where, G = resistance of galvanometer,
 i = range of ammeter

and i_g = safe current for galvanometer coil

To convert galvanometer into voltmeter a high resistance (R) is connected in series with the

$$\text{galvanometer, } R = \frac{V}{i_g} - G$$

where, V = range of voltmeter

HEATING EFFECT OF ELECTRIC CURRENT

Whenever the electric current is passing through a conductor, then it becomes hot after some times. This indicates that electric energy is being converted into heat energy. This effect is known as heating effect of current or Joule heating effect.

$$H = \frac{W}{4.2} = \frac{VIt}{4.2} = \frac{V^2 t}{4.2R} = \frac{I^2 Rt}{4.2}$$

Electrical Power

The rate at which work is done by the source of emf in maintaining the effect of current in a circuit is called electric power of the circuit.

$$P = VI = \frac{V^2}{R} = I^2 R$$

SI unit of power is watt.

Electrical Energy

The total work done by the source of emf is maintaining the electric current in the circuit for a given time is called electrical energy consumed in the circuit. SI unit of electric energy is joule but another unit is watt-hour.

Kilowatt-hour (kWh)

It is bigger unit of electric energy. It is known as Board of Trade Unit (BTO).

$$1 \text{ kWh} = P(\text{in kW}) \times t(\text{in hour})$$

$$1 \text{ kWh} = 1000 \times 3600$$

$$1 \text{ kWh} = 3.6 \times 10^6 \text{ Joule}$$

The electric energy consumed in kWh is given by

$$W = \frac{V(\text{in volt}) \times I(\text{in amp}) \times t(\text{in hour})}{1000}$$

THERMOELECTRIC EFFECT

The phenomenon of production of electricity with the help of heat is called thermoelectricity and this effect is called thermoelectric effect.

Seebeck Effect

When a temperature difference is produced across the junctions of two different materials, then a current starts flowing in the couple of wires, without the presence of any external battery.

The emf causing this flow is called thermo emf and this effect is known as thermoelectric effect or Seebeck effect.

Peltier Effect

The absorption or evolution of heat at a junction of two dissimilar metals, when current is passed through is known as Peltier effect.

$$\text{Peltier coefficient, } \pi = T \frac{dE}{d\theta}$$

Thomson Effect

The absorption or evolution of heat along the length of a wire when current is passed through a wire whose ends are kept at different temperatures is known as Thomson effect.

$$\text{Thomson coefficient, } \sigma = -T \frac{dS}{d\theta}$$

CHEMICAL EFFECT OF ELECTRICITY

The most common chemical effect of current electricity is electrolysis just like solids, some liquid also conduct electricity. Such liquid are called electrolytes. When electric current passes through an electrolyte it decomposes into its constituents.

Faraday's Laws of Electrolysis

- (i) **First law** The amount of substance deposited or liberated in electrolysis is directly proportional to the charge flowing through the electrolyte.

Amount deposited or liberated, $m = zq$ or $m = zit$

where, z = electrochemical equivalent of the substance

- (ii) **Second law** If same amount of current is passed through different electrolytes for same time, then the ratio of masses of the substance liberated at respective electrodes is equal to the ratio of their chemical equivalents.

$$\frac{m_1}{m_2} = \frac{E_1}{E_2}$$

where, E_1 and E_2 = chemical equivalents of the first and second substances.

$$\text{or } \frac{z_1}{z_2} = \frac{E_1}{E_2}$$

Faraday Constant (F)

The quantity of charge required to liberate one gram equivalent of a substance is called Faraday constant (F).

$$F = \frac{E}{A} \Rightarrow F = 96500 \text{ coulomb or } F = Ne$$

where, N = Avogadro's number and e = electronic charge

> PRACTICE EXERCISE

- When a particular current flows through a resistance wire,
 - the heat produced will be more, if the current is drawn from an AC source
 - the heat produced will be more, if the current is drawn from DC source
 - no heat will be produced
 - heat will be independent of source and current
- There are two wires of the same material and lengths. The cross-sections of the wires are different. If the diameter of the first wire is double that of the second wire, then the specific resistance of the first wire will be
 - four times that of the second wire
 - double that of the second wire
 - half that of the second wire
 - same as that of the second wire
- Which one of the following sets of properties are relevant for an electrical fuse wire needed for normal applications?
 - Thick wire, high melting point alloy, short length
 - Thick wire low melting point alloy, large length
 - Short length, low melting point alloy, thin wire
 - Large length, low melting point alloy, thin wire
- The utility of a safety fuse in an electric circuit depends on its low
 - melting point
 - strength
 - resistivity
 - conductivity
- Fuse wire is made of
 - 63% tin and 37% lead
 - 63% lead and 37% tin
 - 73% tin and 37% aluminium
 - 63% lead and 37% aluminium
- When the distance between the two charges as well as their magnitudes is decreased to half, the force between them
 - remains same
 - reduces to half
 - becomes double
 - becomes four times

- If a voltage V is applied to a copper conductor and a current I flows through it. Which one of the following gives the relation between V and I ?

- The materials of negative electrode, positive electrode, electrolyte and depolariser of dry cell are respectively
 - zinc, carbon, ammonium chloride and manganese dioxide
 - carbon, zinc, manganese dioxide and ammonium chloride
 - carbon, zinc, manganese dioxide and ammonium chloride
 - zinc, carbon, manganese dioxide and ammonium chloride
- Which one of the following is the reason for using fuses in house hold electrical circuits?
 - To reduce the voltage and prevent shocks
 - To reduce the rate of consumption of electrical energy
 - To break the circuit, if the current is too high
 - To link different parallel circuits together
- The heater element in an electric iron is made of
 - constantan
 - tungsten
 - iron
 - nichrome
- What is immaterial for electric fuse?
 - Its length
 - Its radius
 - Its specific resistance
 - Current flowing through it
- Watt hour meter measures
 - current
 - electric energy
 - voltage
 - power

- The relation between Seebeck coefficient, thermoelectric power S and Peltier coefficient π is given by
 - $S = \frac{\pi}{T^2}$
 - $S = \frac{\pi^2}{T}$
 - $S = \frac{\pi}{T}$
 - $S = \pi T$
- The five resistors each having resistances of 5Ω are connected in parallel. If a voltage of 10 V is applied to the circuit, then the current through the circuit is
 - 10 A
 - 2 A
 - 5 A
 - 1 A
- All the bulbs shown in the given figure marked 1, 2, 3, 4 and 5 are identical.

- Both 1 and 5
 - Both 3 and 4
 - Only 2
 - Only 1
- Three equal resistances, connected in series across a source of emf together dissipate 10 W of power. What will be the power dissipated, if the same resistances are connected in parallel across the same source?
 - 90 W
 - 30 W
 - 3 W
 - 10 W
 - In the circuit shown in the figure, the currents i_1 and i_2 are passing through resistances R_1 and R_2 respectively, V_1 and V_2 are the respective voltage drops. If current i is passing from E to F and the voltage drop across EF is V , then these quantities are related as

- (a) $i = i_1 + i_2, V = V_1 = V_2$
- (b) $i = i_1 = i_2, V = V_1 + V_2$
- (c) $i = i_1 + i_2, V = V_1 + V_2$
- (d) $i = i_1 = i_2, V = V_1 = V_2$

- 18.** Three bulbs with power rating of 40 W, 60 W and 100 W at 220 V are connected in series to a 220 V mains. Energy consumption will be
- (a) the same for all the bulbs
 - (b) the highest for 100 W bulb
 - (c) the highest for 60 W bulb
 - (d) the highest for 40 W bulb

- 19.** Internal resistance of a 12 V car battery is 0.02Ω . What is the theoretical maximum power which it can deliver?
- (a) 3600 W
 - (b) 2400 W
 - (c) 100 W
 - (d) 1200 W

- 20.** For the network shown in figure, the resistance between points A and B will be

- (a) 65Ω
- (b) 40Ω
- (c) 25Ω
- (d) 15Ω

- 21.** Two equal small metal balls are given charges 30 and -60 units respectively. They are then allowed to touch each other and are again separated to the same distance as before. The electrostatic forces between the two balls before and after they touch each other will be in the ratio of
- (a) $-8 : 1$
 - (b) $4 : 1$
 - (c) $2 : 1$
 - (d) $1 : 8$

- 22.** What is the potential difference between the points A and B?

- (a) Zero
- (b) $\frac{3E}{2}$
- (c) $3E$
- (d) $6E$

- 23.** One unit of electricity costs 50 paise. In 10 h one heater of 2000 W rating would consume electricity costing
- (a) ₹ 10.00
 - (b) ₹ 5.00
 - (c) ₹ 2.50
 - (d) ₹ 1.00

- 24.** In the circuit shown in the given figure, the heat produced in the 5Ω resistor due to a current flowing in it is 10 cal/s. The heat produced in the 4Ω resistor is

- (a) 1 cal/s
- (b) 2 cal/s
- (c) 3 cal/s
- (d) 4 cal/s

- 25.** A secondary cell of emf 2.5 V and internal resistance of 0.05Ω is being charged with a current of 10 A. The potential difference between the two terminals of the secondary cell will be
- (a) 2.0
 - (b) 2.2
 - (c) 2.5
 - (d) 3.0

- 26.** How many 100 W bulbs may be safely used on a 220 V supply with 5 A fuse?

- (a) 5
- (b) 8
- (c) 11
- (d) 20

- 27.** Two resistances R_1 and R_2 are joined as shown in the figure, to two batteries of emf E_1 and E_2 . If E_2 is short-circuited the current through R_1 is

- (a) E_1/R_1
- (b) E_2/R_1
- (c) E_2/R_2
- (d) $E_1/(R_2 + R_1)$

- 28.** An electric bulb, rated at 100 W, 230 V, is connected to source of 230 V AC mains. The bulb is lighted for 100 days at the rate of 10 h/day. What is the cost of light consumed by the bulb, if 1 unit of electricity costs 50 paise?

- (a) ₹ 100
- (b) ₹ 10
- (c) ₹ 50
- (d) ₹ 23

- 29.** Two electric bulbs whose resistance area in the ratio 1 : 2 are connected in parallel to a constant voltage source. The power dissipated in them will have the ratio
- (a) 1 : 4
 - (b) 1 : 1
 - (c) 2 : 1
 - (d) 1 : 2

- 30.** In the electrical circuit shown below, what is the effective resistance between points P and Q?

- (a) 15Ω
- (b) $\frac{15}{8} \Omega$
- (c) $\frac{8}{15} \Omega$
- (d) $\frac{3}{2} \Omega$

- 31.** If in an electric circuit, 30 C of charge flow in 5s, then the current through it is

- (a) 5 A
- (b) 6 A
- (c) 10 A
- (d) 180 A

- 32.** A factory gets its electrical power from a generator 2 km away. The two wires connecting the generator to the factory terminals have a resistance of 0.04 ohm/km. When the generator supplies 50 A to the factory, the terminal voltage at the generator is 220 V. A voltmeter connected to the factory terminal should then read
- (a) 100 V
 - (b) 200 V
 - (c) 232 V
 - (d) 212 V

- 33.** The resistance of certain length of wire having a diameter of 6 mm is 5Ω . The wire is drawn such that the diameter becomes 3 mm. The new resistance will be
- (a) 5Ω
 - (b) 30Ω
 - (c) 60Ω
 - (d) 80Ω

- 34.** A current of 5 A is passing through a metallic wire of cross-section are $4 \times 10^{-6} \text{ m}^2$. If the density of the change carriers in the wire is $5 \times 10^{26} / \text{m}^3$, the drift velocity of the electron is
- (a) $\frac{1}{64} \text{ m/s}$
 - (b) $\frac{1}{32} \text{ m/s}$
 - (c) $\frac{1}{16} \text{ m/s}$
 - (d) $\frac{1}{128} \text{ m/s}$

- 35.** A copper wire is stretched to make 0.1% longer, the percentage change in its resistance is
- (a) 0.2%
 - (b) 0.1%
 - (c) 0.5%
 - (d) 0.4%

- 36.** A current of 3A flows through a wire shown in figure. The potential difference between points A and B is

- (a) 26.5 V
- (b) 14.5 V
- (c) 58 V
- (d) 25 V

- 37.** Five resistances of $10 \Omega, 20 \Omega, 20 \Omega, 40 \Omega,$ and 50Ω are connected as shown in figure. The equivalent resistance between points A and B is

- (a) 40Ω
- (b) 60Ω
- (c) 20Ω
- (d) 30Ω

38. The equivalent resistance between points x and y will be

- (a) 7.5Ω (b) 8.5Ω
(c) 9Ω (d) 3.5Ω
39. Four cells each of emf 1.5 V and internal resistance 2Ω are connected in parallel. This combination sends a current to an external resistance of 2Ω . The value of current in external resistance is
(a) 0.9 A (b) 0.6 A (c) 1.5 A (d) 1.2 A
40. A uniform wire of length l and radius r has resistance 100Ω . It is recast into a thin wire of (i) length $2l$ (ii) radius $r/2$. The resistance of new wire in each case will be respectively
(a) $400 \Omega, 1600 \Omega$ (b) $200 \Omega, 400 \Omega$
(c) $100 \Omega, 800 \Omega$ (d) None of these
41. Three resistances $2 \Omega, 3 \Omega$ and 5Ω are connected in parallel and potential difference of 20 V is applied across the terminals of combination. The potential difference across 3Ω resistance will be
(a) 20 V (b) 9 V (c) 6 V (d) 3 V
42. A fuse wire of radius 0.2 mm blows when current flowing is 5 A . For what value of current another fuse wire of same material but of radius 0.3 mm will blow
(a) 9.2 A (b) 4.5 A
(c) 18.4 A (d) 6.2 A
43. The time of flow of current 1 A through AgNO_3 solution to produce a deposit of 11.18 g of silver.
ECE of silver is 0.001118 g/C
(a) $2 \text{ h } 46 \text{ min } 40 \text{ s}$ (b) $3 \text{ h } 40 \text{ min } 40 \text{ s}$
(c) $4 \text{ h } 56 \text{ min } 40 \text{ s}$ (d) None of these
44. A 100 W heating unit is designed to operate on 120 V line. The line voltages drops to 110 V . The percentage heat output is
(a) 30% (b) 27% (c) 16% (d) 2%

45. How many electrons flow per second through an electric bulb rated $220 \text{ V}, 100 \text{ W}$?

- (a) 3.84×10^{18} electrons/s
(b) 2.84×10^{18} electrons/s
(c) 5.84×10^{18} electrons/s
(d) 1.84×10^{18} electrons/s
46. A 60 W bulb carries current of 0.5 A . The total charge passing through it in 1 h is
(a) 1800 C (b) 3600 C
(c) 3000 C (d) 2400 C
47. How many calories of heat will approximately be developed in a 210 W electric bulbs in 5 min ?
(a) 80000 (b) 63000
(c) 1050 (d) 15000
48. A tap supplies water at 22°C . A man takes 1 litre of water per min at 37°C from the geyser. The power of geyser is
(a) 1575 W (b) 1050 W
(c) 525 W (d) 2100 W
49. For a certain thermocouple, the emf $e = at + bt^2$ where t in $^\circ\text{C}$ is the temperature of hot junction. The cold junction being at 0°C . If $a = 10 \mu\text{V}/^\circ\text{C}$ and $b = -0.02 \mu\text{V}/^\circ\text{C}^2$, then the temperature of inversion (in $^\circ\text{C}$) will be
(a) 500°C (b) 600°C
(c) 700°C (d) 800°C
50. A wire has a resistance of 32Ω . It is melted and drawn into a wire of half of its original length. What is the resistance of the new wire?
(a) 32Ω (b) 16Ω (c) 8Ω (d) 4Ω
51. If the current is flowing through a 10Ω resistor, then in which one of the following cases maximum heat will be generated?
(a) 5 A in 12 min
(b) 4 A in 3 min
(c) 3 A in 6 min
(d) 2 A in 12 min
52. The rating of an electric lamp is 110 V . To use it on 220 V , one will have to use which one of the following?
(a) Transistor (b) Resistor
(c) Transformer (d) Generator
- 53.

The figure shows current in a part of electrical network. What is the value of current I ?

- (a) 0.2 A (b) 0.1 A (c) 0.3 A (d) 0.5 A

54. Consider the following statements

- Ohm's law is applicable to all conductors.
- The resistance of a pure metallic wire increases with increasing temperature.
- The equivalent resistance of a set of resistors joined in parallel is less than the value of smallest resistor in the set.

Which of the following statement is/are correct?

- (a) 1 and 2 (b) 1 and 3
(c) 1, 2 and 3 (d) 2 and 3

55. A parallel plate air condenser is charged by connecting it to a battery. The battery is disconnected and then a sheet of glass of dielectric constant 8 is inserted between the plates. In this context, which of the following would be true?

- Potential difference between the plates is reduced by a factor of eight.
- Potential difference between the plates is increased by a factor of eight.
- Electric field between the plates is reduced by a factor of eight.

Select the correct answer from the code given below

- (a) Only 3 (b) Only 2
(c) 1 and 3 (d) 2 and 3

> Previous Years' Questions:

56. The main power supply in India is at 220 V , whereas that in the US is at 110 V . Which one among the following statements in this regard is correct? **☑ 2012 (I)**
(a) 110 V is safer but more expensive to maintain.
(b) 110 V is safer and cheaper to maintain.
(c) 110 V leads to lower power loss.
(d) 110 V works better at higher latitudes.
57. The resistance of a wire is 10Ω . If it is stretched ten times, the resistance will read **☑ 2012 (I)**
(a) 1Ω (b) 10Ω
(c) 100Ω (d) 1000Ω

58. Two metallic wires *A* and *B* are of same material and have equal length. If the cross-sectional area of *B* is double that of *A*, then which one among the following is the electrical resistance of *B*? **2012 (I)**

- (a) Twice that of *A* (b) 4 times that of *A*
 (c) $\frac{1}{4}$ that of *A* (d) $\frac{1}{2}$ that of *A*

59. In India, distribution of electricity for domestic purpose is done in the form of **2012 (II)**

- (a) 220 V, 50 Hz
 (b) 110 V, 60 Hz
 (c) 220 V, 60 Hz
 (d) 110 V, 50 Hz

60. Which one among the following is the correct order of power consumption for light of equal intensity? **2012 (II)**

- (a) CFL Tube < Fluorescent Tube < Incandescent Bulb < Light Emitting Diode
 (b) Light Emitting Diode < CFL Tube < Fluorescent Tube < Incandescent Bulb
 (c) CFL Tube < Fluorescent Tube < Light Emitting Diode < Incandescent Bulb
 (d) Incandescent Bulb < Light Emitting Diode < Fluorescent Tube < CFL Tube

61. When an electrical safety fuse is rated (marked) as 16 A, it means it **2012 (II)**

- (a) will not work, if current is less than 16 A
 (b) has a resistance of 16 Ω
 (c) will work if the temperature is more than 16°C
 (d) will be blown (break) if current exceeds 16 A

62. Which one among the following is the true representation of (i) variable DC potential (ii) rheostat and (iii) AC ammeter respectively? **2012 (II)**

- (a) (i)  (b) (i) 
 (ii)  (ii) 
 (iii)  (iii) 
 (c) (i)  (d) (i) 
 (ii)  (ii) 
 (iii)  (iii) 

63. Consider the following circuit, The current flowing through each of the resistors connected in the above circuit is **2012 (II)**

- (a) 2 A (b) 1 A (c) 9 A (d) 4 A

64. Ohm's law defines **2013 (I)**

- (a) a resistance
 (b) current only
 (c) voltage only
 (d) Both current and voltage

65. A current *I* flows through a potential difference *V* in an electrical circuit containing a resistance *R*. The product of *V* and *I*, i.e. *VI* may be understood as **2013 (II)**

- (a) resistance *R*
 (b) heat generated by the circuit
 (c) thermal power radiated by the circuit
 (d) rate of change of resistance

66. A current of 0.5 A is drawn by a filament of an electric bulb for 20 min. The amount of electric charge that flows through the circuit is **2013 (II)**

- (a) 1C (b) 10 C (c) 600 C (d) 300 C

67. Ohm's law can also be taken as a statement for **2013 (II)**

- (a) conservation of energy
 (b) conservation of electric charge
 (c) conservation of angular momentum
 (d) non-conservation of momentum of the flowing charges

68. **2013 (II)**

What should be the reading of the voltmeter *V* in the circuit given above? (All the resistances are equal to 1 Ω and the battery is of 1.5 V)
 (a) 1.5 V (b) 0.66 V (c) 1 V (d) 2 V

69. An electric heater is rated 1500 W, electric power costs ₹ 2 per kW-h, then the cost of power for 10 h running the heater is **2013 (II)**

- (a) ₹ 30 (b) ₹ 15
 (c) ₹ 150 (d) ₹ 25

70. During short-circuiting, the current flowing in the electrical circuit **2014 (I)**

- (a) reduces substantially
 (b) does not change
 (c) increases instantaneously
 (d) varies continuously

71. **2014 (I)**

The current (*I*)- Voltage (*V*) plot of a certain

- (a) a semiconductor
 (b) a conductor which obeys Ohm's law
 (c) a superconductor
 (d) an insulator

72. Two conducting wires *A* and *B* are made of same material. If the length of *B* is twice that of *A* and the radius of circular cross-section of *A* is twice that of *B*, then their resistances *R_A* and *R_B* are in the ratio **2014 (I)**

- (a) 2 : 1 (b) 1 : 2
 (c) 1 : 8 (d) 1 : 4

73. When you walk on a woolen carpet and bring your finger near the metallic handle of a door, an electric shock is produced. This is because **2015 (I)**

- (a) charge is transferred from your body to the handle
 (b) a chemical reaction occurs when you touch the handle
 (c) the temperature of the human body is higher than that of the handle
 (d) the human body and the handle arrive at thermal equilibrium by the process

74. The product of conductivity and resistivity of a conductor **2015 (I)**

- (a) depends on pressure applied
 (b) depends on current flowing through conductor
 (c) is the same for all conductors
 (d) varies from conductor-to-conductor

75. Three equal resistances when combined in series are equivalent to 90 Ω . Their equivalent resistance when combined in parallel will be **2015 (II)**

- (a) 10 Ω (b) 30 Ω
 (c) 270 Ω (d) 810 Ω

76. The resistance of a wire of length l and area of cross-section a is x ohm. If the wire is stretched to double its length, its resistance would become **☑ 2015 (II)**

- (a) $2x$ ohm
- (b) $0.5x$ ohm
- (c) $4x$ ohm
- (d) $6x$ ohm

77. Consider the following circuit.

☑ 2016 (I)

The equivalent resistance of the circuit will be

- (a) 12Ω
- (b) $8\frac{11}{12} \Omega$
- (c) $9\frac{1}{11} \Omega$
- (d) $\frac{24}{25} \Omega$

78. A given conductor carrying a current of I ampere. It produces an amount of heat equal to 2000 J. The current through the conductor is doubled the amount of heat produced will be **☑ 2016 (I)**

- (a) 2000 J
- (b) 4000 J
- (c) 8000 J
- (d) 1000 J

79. A simple circuit contains a 12 V battery and bulb having 24 ohm resistance. When turn on the switch, the ammeter connected to the circuit would read **☑ 2016 (I)**

- (a) 0.5 A
- (b) 2 A
- (c) 4 A
- (d) 5 A

80. Three resistors with magnitudes 2Ω , 4Ω , and 8Ω are connected in parallel, equivalent resistance of the system would be **☑ 2016 (I)**

- (a) less than 2Ω
- (b) more than 2Ω but less than 4Ω
- (c) 4Ω
- (d) 14Ω

ANSWERS

1	b	2	a	3	c	4	a	5	a	6	a	7	b	8	a	9	c	10	d
11	a	12	b	13	c	14	a	15	a	16	a	17	a	18	b	19	a	20	d
21	a	22	c	23	a	24	b	25	a	26	c	27	a	28	c	29	c	30	c
31	b	32	d	33	d	34	a	35	a	36	d	37	c	38	a	39	b	40	a
41	a	42	a	43	a	44	c	45	b	46	a	47	d	48	b	49	a	50	c

61	a	62	c	63	a	64	d	65	c	66	c	67	a	68	c	69	a	70	a
71	b	72	c	73	a	74	c	75	a	76	c	77	c	78	c	79	a	80	a

Solutions

14. (a) Resistances are connected in parallel

$$\frac{1}{R} = \frac{1}{5} + \frac{1}{5} + \frac{1}{5} + \frac{1}{5} + \frac{1}{5} \Rightarrow R = 1 \Omega$$

Voltage = 10 V

$$\text{Current, } i = \frac{V}{R} = \frac{10}{1} = 10 \text{ A}$$

18. (b) $\therefore P \propto \frac{1}{R}$ [V is same]

$$\therefore R_{40} > R_{60} > R_{100}$$

Electric energy, $E = Pt$ or $E \propto P$

Therefore, energy consumption will be the highest for 100 W bulb.

23. (a) Unit = $\frac{\text{Power} \times \text{hours}}{1000}$
 $= \frac{2000 \times 10}{1000} = 20 \text{ kWh}$

\therefore Cost of one unit = ₹ 0.50

\therefore Cost of 20 units
 $= 0.50 \times 20 = ₹ 10.00$

24. (b) 4Ω and 6Ω are in series

\therefore Resistance, $R_2 = 4 + 6 = 10 \Omega$

$$\frac{i_1}{i_2} = \frac{R_2}{R_1} = \frac{10}{5} = \frac{2}{1}$$

$$\text{Heat } \frac{H}{t} = P = i^2 R \therefore \frac{P_5}{P_4} = \left(\frac{i_1}{i_2}\right)^2 \times \frac{5}{4}$$

$$\frac{P_5}{P_4} = \left(\frac{2}{1}\right)^2 \times \frac{5}{4} = \frac{5}{1}$$

$$\frac{10}{P_4} = \frac{5}{1}$$

$$\Rightarrow P_4 = \frac{10}{5} = 2 \text{ cal/s}$$

25. (a) Potential difference,

$$V = E - IR = 2.5 - 10 \times 0.05 = 2 \text{ V}$$

26. (c) $nP = VI$

where, n is the number of bulbs

$$\therefore n \times 100 = 220 \times 5$$

$$n = \frac{220 \times 5}{100} = 11 \text{ bulbs}$$

28. (c) Unit = $\frac{P \times t}{1000}$
 $= \frac{100 \times 100 \times 10}{1000} = 100 \text{ kWh}$

\therefore Cost of one unit = ₹ 50

\therefore Cost of 100 units = $0.50 \times 100 = ₹ 50$

29. (c) We know that $P \propto \frac{1}{R}$
 $\therefore \frac{P_1}{P_2} = \frac{R_2}{R_1} = \frac{2}{1}$

30. (c) In given figure resistances are said to be in parallel. So,

$$\frac{1}{R} = \frac{1}{1} + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} = \frac{8 + 4 + 2 + 1}{8}$$

$$\frac{1}{R} = \frac{15}{8} \Rightarrow R = \frac{8}{15} \Omega$$

34. (a) Given, $i = 5 \text{ A}$, $A = 4 \times 10^{-6} \text{ m}^2$

and $n = 5 \times 10^{26} / \text{m}^3$

Drift velocity of the electron

$$v_d = \frac{i}{neA}$$

$$= \frac{5}{5 \times 10^{26} \times 1.6 \times 10^{-19} \times 4 \times 10^{-6}}$$

$$= \frac{1}{64} \text{ m/s}$$

36. (d) From Kirchoff's law,

$$V_A - 18 + 8 - 9 - 6 - V_B = 0$$

$$V_A - V_B = 25 \text{ V}$$

39. (b) Current, $i = \frac{E}{R + \frac{r}{n}}$

$$i = \frac{1.5}{2 + \frac{2}{4}} = \frac{1.5}{2 + 0.5}$$

$$= \frac{1.5}{2.5} = 0.6 \text{ A}$$

42. (a) The relation between current in blowing fuse wire and its radius

$$i \propto r^{3/2}$$

$$\therefore \frac{i_1}{i_2} = \left(\frac{r_1}{r_2}\right)^{3/2}$$

$$\Rightarrow \frac{5}{i_2} = \left(\frac{0.2}{0.3}\right)^{3/2}$$

$$i_2 = 9.18 = 9.2 \text{ A}$$

43. (a) $m = Zit$

$$t = \frac{m}{Zi} = \frac{11.18}{0.001118 \times 1} = 10000 \text{ s}$$

$$= 2 \text{ h } 46 \text{ min } 40 \text{ s}$$

44. (c) Power, $P = \frac{V^2}{R}$

$$100 = \frac{120 \times 120}{R}$$

$$R = \frac{120 \times 120}{100} = 144 \Omega$$

$$P' = \frac{110 \times 110}{R} = \frac{110 \times 110}{144} = 84 \text{ W}$$

$$\text{Output power} = 100 - 84 = 16$$

$$\% \text{ Heat} = \frac{16 \times 100}{100} = 16\%$$

48. (b) $W = JH = P \times t = J \times m \times s \times \Delta Q$

$$\therefore Pt = J \times m \times s \times \Delta Q$$

$$P = \frac{J \times m \times s \times \Delta Q}{t}$$

$$= \frac{4.2 \times 1 \times 1000 \times (37 - 22)}{60}$$

$$= 1050 \text{ W}$$

58. (d) Electrical resistance of a wire is

$$R = \frac{\rho l}{A}$$

where, ρ = resistivity of the material of wire

l = length of the wire

A = area of cross-section of the wire.

For wire A, $R_A = \frac{\rho l_A}{A_b}$

Similarly, $R_B = \frac{\rho l_B}{A_b}$

$$\therefore \frac{R_A}{R_B} = \frac{l_A}{l_B} \times \frac{A_b}{A_a} = (1) \times (2)$$

$$[\because l_A = l_B \text{ and } A_b = 2A_a]$$

$$\Rightarrow R_B = \frac{R_A}{2}$$

63. (a) Given circuit is as shown below. Let current in the circuit is I .

$$\therefore \text{Current } I = \frac{6 \text{ V}}{R_{eq}} = \frac{6}{\frac{3 \times 3}{3 + 3}} = \frac{6}{\frac{3}{2}}$$

$$= \frac{6 \times 2}{3} = 4 \text{ A}$$

$$\therefore \text{Current through each resistor is } I' = \frac{I}{2}$$

$$= \frac{4}{2} = 2 \text{ A}$$

66. (c) It is given that

Current (I) = 0.5 A

Time (t) = 20 min = 1200 s

We know that, Charge (Q) = $I \times t$

$$= 0.5 \times 1200 = 600 \text{ C}$$

68. (c) Equivalent resistance of the circuit

$$= 1 + \frac{1 \times 1}{1 + 1} = 1 + \frac{1}{2} = \frac{3}{2} \Omega$$

Total voltage (V) = 1.5 V

$$\text{Current } (I) = \frac{V}{R_{eq}}$$

$$= \frac{1.5}{\frac{3}{2}} = 1 \text{ A}$$

Reading of voltmeter (V) = $I \times 1$

$$= 1 \times 1 = 1 \text{ V}$$

72. (c) Given that, $l_B = 2l_A$ and $r_A = 2r_B$

Now, from $R = \rho \frac{l}{A}$

$$\frac{R_A}{R_B} = \frac{l_A}{l_B} \times \frac{r_B^2}{r_A^2} = \frac{l_A}{2l_A} \times \frac{r_B^2}{4r_B^2} = 1:8$$

75. (a) Let each resistance be R .

According to the question,

$$R + R + R = 90 \Omega$$

$$3R = 90 \Omega$$

$$\Rightarrow R = 30 \Omega$$

where these resistors are combined in parallel, then equivalent resistance is

$$R_{eq} = \frac{R}{3} = \frac{30}{3} = 10 \Omega$$

76. (c) According to question, resistance of wire is given by

$$x = \frac{\rho l}{a}$$

[ρ = resistivity, l = length, a = area]

If length is doubled, its area of cross-section decreases but volume remains constant.

i.e. $l \times a = 2l \times A'$ [A' = New area]

$$\Rightarrow A' = \frac{a}{2}$$

Now, new resistance

$$R = \frac{\rho 2l}{a/2} = \frac{4\rho l}{a}$$

as $\frac{\rho l}{a} = x$ ohm so, $R = 4x$ ohm

77. (c) Consider the given circuit

This circuit consists of two sections, I and II. In first section, three resistors are in parallel connection, therefore equivalent resistance is

$$\frac{1}{R_1} = \frac{1}{2} + \frac{1}{4} + \frac{1}{6} = \frac{6 + 3 + 2}{12}$$

$$\Rightarrow R_1 = \frac{12}{11} \Omega$$

This resistance is in series with the resistance 8 Ω of section II.

\therefore Equivalent resistance of the circuit

$$R_{eq} = R_1 + 8$$

$$= \frac{12}{11} + 8 = \frac{100}{11} = 9 \frac{1}{11}$$

78. (c) Let resistance of the coil is R and measuring heat produced for time t seconds.

$$\therefore H = I^2 RT = (1)^2 (R)(t) \Rightarrow 2000 \text{ J} = Rt$$

Similarly, when current is doubled, the amount of heat produced is $H' = (I')^2 RT = (2^2)(Rt) = 4Rt$

$$= 4 \times 2000 \text{ J} = 8000 \text{ J} [\because Rt = 2000 \text{ J}]$$

79. (a) It is given that emf of the battery, $E = 12 \text{ V}$

Resistance of the bulb, $R = 24 \Omega$

where switch is turned on, current through the bulb is

$$I = \frac{E}{R} = \frac{12}{24} = 0.5 \text{ A}$$

Hence, reading of ammeter is 0.5 A.

80. (a) Equivalent resistance of three resistors of resistances 2 Ω , 4 Ω and 8 Ω is

$$\frac{1}{R_{eq}} = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} = \frac{4 + 2 + 1}{8} = \frac{7}{8}$$

$$\therefore R_{eq} = \frac{8}{7} \Omega = 1.142 \Omega$$

Therefore, equivalent resistance is less than 2 Ω .

12

MAGNETIC EFFECTS OF ELECTRIC CURRENT AND MAGNETISM

In last year 3 to 4 questions were asked from this chapter based on the topics types of magnet, electromagnetic induction, magnetic force, and magnetic field and various laws to determine the direction of field and force. So, this chapter is important.

ELECTROMAGNETICS

The branch of physics in which we studied the effect of magnetic field produced due to current or moving charge, is known as magnetic effects of electric current.

Magnetic Field

It is a region or space around a magnet or current carrying conductor or a moving charge in which its magnetic effect can be felt. Its SI unit is tesla (T).

Biot-Savart Law

According to this law, “the magnetic field $d\mathbf{B}$ at the point P due to the small current element of length $d\mathbf{l}$ is given by

$$dB = \frac{\mu_0}{4\pi} \frac{i dl \sin\theta}{r^2} \text{ Wb/m}^2 \text{ or tesla}$$

$$= \frac{\mu_0}{4\pi} \frac{id\mathbf{l} \times \mathbf{r}}{r^3}$$

where, μ_0 is a constant and it is called permeability of free space

$$\mu_0 = 4\pi \times 10^{-7} \text{ Wb/A-m}$$

Rules to Find the Direction of Magnetic Field

- (i) **Right hand palm rule** If we spread our right hand in such a way that thumb is towards the direction of current and fingers are towards that point, where we have to find the direction of field, then the direction of field will be perpendicular to the palm.
- (ii) **Maxwell's right handed screw rule** If a right handed cork screw is rotated, so that its tip moves in the direction of flow of current through the conductor, then the rotation of the head of the screw gives the direction of magnetic lines of force.

Applications of Biot-Savart's Law

S.No	Current Carrying Geometrical Shape	Diagram	Mathematical form
1.	Finite length current carrying conductor		$B = \frac{\mu_0}{4\pi} \frac{l}{d} (\sin \theta_1 + \sin \theta_2)$
2.	Infinite length current carrying conductor		$\theta_1 + \theta_2 = \frac{\pi}{2}$ $B = \frac{\mu_0}{2\pi} \frac{l}{d}$
3.	At the terminal of infinite length current carrying conductor		$\theta_1 = 0^\circ, \theta_2 = \frac{\pi}{2}, B = \frac{\mu_0}{4\pi} \frac{l}{d}$
4.	If P point lie outside area of wire		$B_p = \frac{\mu_0 l}{4\pi d}$ $[\sin(90^\circ - \alpha_1) - \sin(90^\circ - \alpha_2)]$ $= \frac{\mu_0 l}{4\pi d} (\cos \alpha_1 - \cos \alpha_2)$
5.	On the axis of current carrying coil		$B = \frac{\mu_0 N I R^2}{2(R^2 + x^2)^{3/2}}$
6.	On the center of current carrying loop coil		$x = 0$ $B = \frac{\mu_0 N I}{2R}$
7.	On the center of current carrying loop		$N = 1$ $B = \frac{\mu_0 I}{2R}$
8.	On the center of segment of current carrying circle		$B = \frac{\mu_0}{4\pi} \cdot \frac{l}{R} \times \theta$
9.	On the axis of current carrying solenoid		$B = \frac{\mu_0 n I}{2} (\cos \theta_1 - \cos \theta_2)$ where, n = Number of turns in per unit length $L \gg R$
10.	On the center of long solenoid		$\theta_1 = 180^\circ, \theta_2 = 0^\circ, B_e = \mu_0 N I$
11.	On the terminal of solenoid		$\theta_1 = 90^\circ, \theta_2 = 0^\circ, B_e = \frac{\mu_0 N I}{2}$

Ampere's Circuital Law

It states that the line integral of magnetic field around any closed path in vacuum is equal to μ_0 times the total current enclosed by the loop.

$$\oint \mathbf{B} \cdot d\mathbf{l} = \mu_0 I_{\text{net}}$$

The simplified form of it is

$$B l = \mu_0 I_{\text{net}}$$

This equation is used in following conditions

- (i) At every point of the closed circuit $B \parallel dl$
- (ii) The magnetic field at every point of the closed circuit remains uniform.

Application of Ampere's Circuital Law

The main applications of Ampere's circuital law are as follow

- (i) The magnetic field due to straight wire of infinite length

$$B = \frac{\mu_0}{2\pi} \cdot \frac{I}{r}$$

- (ii) The magnetic field due to conducting rod of radius R at a point at distance r from the rod.

(a) $r < R, B = \left(\frac{\mu_0 I}{2\pi R^2}\right) \cdot r$

or $B \propto r$

- (b) When $r = R$ (i.e., on the surface of the conducting rod)

$$B = \frac{\mu_0 I}{2\pi R}$$

- (c) $r > R$

$$B = \frac{\mu_0}{2\pi} \cdot \frac{I}{r}$$

- (iii) The magnetic field due to hollow cylindrical pipe of radius R at a point at distance r from the current carrying hollow pipe.

- (a) When $r < R$, then $B = 0$

- (b) When $r \geq R$, then $B = \frac{\mu_0}{2\pi} \cdot \frac{I}{r}$

Force between two Parallel Current Carrying Conductor

Two linear parallel conductor carrying currents in the same direction attract each other while in opposite direction they repel each other. Therefore, force between two current carrying parallel conductor per unit length is

$$F = \frac{\mu_0}{4\pi} \cdot \frac{2I_1 I_2}{r^2}$$

Magnetic Field of a Moving Point Charge

The magnetic field due to a charge q , moving with speed v at a point P at distance r from the charge is given by the following formula.

$$\vec{B} = \frac{\mu_0}{4\pi} \cdot \frac{q}{r^2} (\vec{v} \times \vec{r})$$

Force on a Moving Charge in Magnetic Field

Force on a moving charge in the magnetic field is given by

$$F_m = qvB \sin\theta = q(\mathbf{v} \times \mathbf{B})$$

where, q = magnitude of charge,
 v = velocity of charge,
 B = intensity of magnetic field

and θ = angle between direction of velocity and direction of magnetic field

It is also called **Lorentz force**.

- Electromagnetic and gravitational forces act on neutral and large bodies.
- If the moving charge is moving perpendicular to the magnetic field, then its kinetic energy remains constant.
- The force acting in the presence of electric and magnetic field simultaneously

$$F = q(E + v \times B)$$

Rules to Find the Direction of Force

- Right hand palm rule** If a linear conductor is grasped in the palm of the right hand with thumb pointing along the direction of the current, then the finger tips will point in the direction of lines of force.
- Fleming's left hand rule** If we spread the forefinger, central finger and thumb of our left hand in such a way that these three are perpendicular to each other, then first forefinger is in the direction of magnetic field, second central finger is in the direction of current and thumb will represent the direction of force.

Motion of Charged Particle in a Magnetic Field

When a charged particle enters in a magnetic field perpendicularly, then it moves on a circular path.

$$\text{Radius of circular path, } r = \frac{mv}{Bq} = \frac{\sqrt{2mE_K}}{qB}$$

$$\text{Time period of particle, } T = \frac{2\pi m}{Bq}$$

$$\text{Frequency of particle, } n = \frac{Bq}{2\pi m}$$

where, symbols have their usual meanings.

- If a charged particle is moving in the direction of magnetic field, then it experiences no force.
- The velocity of proton moving in a magnetic field changes continuously.

Force on a Current Carrying Conductor in Magnetic Field

When a current carrying conductor is placed in magnetic field, then it experiences a force on it, this force is given by

$$F_m = Bil \sin\theta = i\mathbf{l} \times \mathbf{B}$$

where, B = intensity of magnetic field,

i = current in the conductor,

l = length of the conductor

and θ = angle between the length of the conductor and direction of magnetic field

When, $\theta = 90^\circ$ or $\sin\theta = 1$, then $F = ilB$ (Maximum)

When, $\theta = 0$ or $\sin\theta = 0$

$$F = ilB \times 0 = 0$$

When the current carrying conductor is placed parallel to the field, the acting force will be zero.

Application of Current Carrying Conductor

- Magnetic force acting on a current carrying conductor is not central force because $F = BIl \sin\theta$ expression does not depends upon r .
- The force dF is always perpendicular to B and idL .

MAGNET

A naturally occurring black coloured substance called lodestone can attract pieces of iron kept nearby. In early days, the Greeks observed this property of lodestone an oxide called magnetite (Fe_3O_4). This type of substance is called magnet.

Magnet is of two types

- Natural Magnet** Natural magnet is a substance found in nature, which has the property of attracting small pieces of iron, this property is called magnetism.
- Artificial Magnets** The magnet which is made by artificially that is known as artificial magnet. It's shape and size is fixed.
 e.g. Horseshoe magnet

Important Facts Related to Magnet

- (i) Artificial magnet have short life and natural magnet have long life.
- (ii) Magnetism of earth have for infinite time.
- (iii) Unstable magnet is an induced magnet.
- (iv) Magnet are use in electric bell, fan, washing machine etc.

Pole Strength

The ability of magnetic pole to attract magnetic material is known as pole strength. It is denoted by m . The pole strength of North and South pole is represented by $+m$ and $-m$.

$$\text{Pole strength } (m) = \frac{\text{Magnetic force}}{\text{Magnetic induction}} = \frac{F}{m}$$

Unit of pole strength is Ampere-meter or Newton/Tesla.

Magnetic Axis

The line joining north pole and the south pole of a magnet is called the magnetic axis.

Effective Length of Magnet

The distance between the north pole and the south pole of the magnet is called the effective length of the magnet.

Magnetic Dipole

Two equal and opposite pole separated by a distance $2l$ are said to constitute a dipole.

Magnetic Moment

The magnetic moment of a bar magnet is given by the product of its length and pole strength. It is represented by M .

$$M = (2l) \times m$$

Unit of magnetic moment is ampere-meter².

MAGNETIC FIELD

The area surrounding the magnet in which, another magnet experience a force on it is called magnetic field.

Magnetic Field Lines

The imaginary lines which represents the direction of magnetic field is known as magnetic field lines.

Some properties of magnetic field lines are given below

- Magnetic line of force always from closed curves.
- They leave the north pole and enter the south pole externally.
- They move from the south pole to the north pole with in the magnet.

- They tend to contract laterally.
- The magnetic field lines never intersect each other.

Some Properties of Magnet

- (i) **Intensity of magnetisation** The intensity of magnetisation is defined as magnetic moment per unit volume.

i.e.
$$I = \frac{M}{V}$$

where, M = magnetic dipole moment,
and V = volume of material

- (ii) **Magnetic permeability** The magnetic permeability of a material is the measure of degree to which the magnetic field can penetrate or permeate a medium. It is denoted by μ is

$$\mu = \frac{B}{H}$$

where, B = magnetic induction
and H = magnetising field

- (iii) **Magnetic susceptibility** The intensity of magnetisation per unit magnetising field is known as magnetic susceptibility

i.e.
$$\phi = \frac{I}{H}$$

where, I = intensity of magnetisation
and H = magnetising field

- (iv) **Relation between magnetic susceptibility and permeability** The relative magnetic permeability,

$$\mu_r = 1 + \phi$$

where, $\mu_r = \frac{\mu}{\mu_0}$ [μ_0 = absolute permeability]

$$\therefore \frac{\mu}{\mu_0} = 1 + \phi \quad \text{or} \quad \mu = \mu_0(1 + \phi)$$

Torque on Bar Magnet in Magnetic Field

In figure, a uniform magnetic field B is represented by equi distant parallel line. NS is a bar magnet of length $2l$ and strength of each pole is m . The magnet is held at angle θ with the direction of B

Torque

$$(\tau) = mBl \sin \theta + mBl \sin \theta$$

$$\tau = 2mBl \sin \theta = MB \sin \theta$$

In vector, $\tau = \vec{M} \times \vec{B}$

Torque on Bar Magnet in Magnetic Field

Work Done in Rotating a Dipole in a Magnetic Field

The total work done in deflecting the dipole through an angle θ from 0° is

$$W = MB(1 - \cos\theta)$$

- If $\theta = 0^\circ$, then $W = MB[1 - 1] = 0$
- If $\theta = 90^\circ$, then $W = MB$
- If $\theta = 180^\circ$, then $W = 2MB$

where, M is magnetic dipole moment

Field due to Small Bar Magnet (Magnetic Dipole)

- (i) In end on position (on axial point)

$$B = \frac{\mu_0}{4\pi} \frac{2M}{r^3}$$

where, r is distance of the required point from the centre of dipole

- (ii) In broad side on position (on perpendicular bisector)

$$B = \frac{\mu_0}{4\pi} \frac{M}{r^3}$$

- (iii) At any general point (r, θ) relative to centre of dipole

$$B = \frac{\mu_0}{4\pi} \frac{M}{r^3} \sqrt{1 + 3\cos^2\theta}$$

EARTH'S MAGNETISM

The earth is a natural source of magnetic field. One magnetic field present everywhere near the surface of the earth. A freely suspended magnet always points in the north-south direction even in the absence of any other magnet.

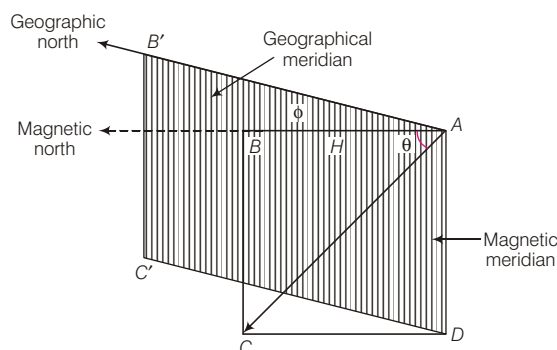

This suggests that the earth itself behaves as a magnet which causes a freely suspended magnet (or magnetic needle) to point always in a particular direction i.e. north and south. The shape of earth's magnetic field resembles that of a bar magnet of length one-fifth of earth's diameter buried at its centre.

The south pole of a earth's magnet is towards the earth's north pole (geographical north), while the north pole of earth's magnet is towards the earth's south pole (geographical south). Thus, there is a magnetic S-pole near the geographical north and a magnetic N-pole near the geographical south. The positions of the earth's magnetic poles are not well defined on the globe, they are spread over an area.

Magnetic Elements

To have a complete knowledge of the earth's magnetism at a place, the following three elements must be known

- Angle of declination** The angle between the magnetic meridian and geographical meridian at a place is called the angle of declination (or simply the declination) at that place.
- Angle of dip or inclination** The angle which the axis of needle makes with the horizontal, is called angle of dip (θ).
- Horizontal component of the earth's field** The direction of the earth's field at the magnetic poles is normal to the earth's surface (i.e., in vertical direction) and at magnetic equator it is parallel to the earth's surface, (i.e., in horizontal direction). Thus, the resultant earth's field can be resolved in two components.

Horizontal Component of the Earth's Magnetic Field

The horizontal component B_H along AB

$$B_H = B_e \cos\theta \quad \dots(i)$$

The vertical component B_V along AD

$$B_V = B_e \sin\theta \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\therefore \frac{B_V}{B_H} = \frac{B_e \sin\theta}{B_e \cos\theta} = \tan\theta$$

$$\text{or} \quad B_V = B_H \tan\theta$$

Again from Eqs. (i) and (ii), we get

$$B_H^2 + B_V^2 = B_e^2 (\cos^2\theta + \sin^2\theta)$$

$$\text{or} \quad B_e = \sqrt{B_H^2 + B_V^2}$$

IMPORTANT POINTS

At any place, angle of dip is θ and magnetic meridian is α , then

$$\tan\theta = 2 \tan\alpha$$

Intensity of Earth magnetic field

$$I = I_0 \sqrt{1 + 3 \sin^2\alpha}$$

$$\text{where,} \quad I_0 = \frac{M}{R^2}$$

R = radius of Earth

At magnetic equator line $\lambda = 0$ and at poles $\lambda = 90^\circ$, then

$$I_{\text{pole}} = 2I_{\text{equator}}$$

Classification of Magnetic Substances

On the basis of magnetic properties, different materials have been classified into three categories

- (i) **Diamagnetic substance** These substances when placed in an external magnetic field, then acquire feeble magnetism opposite to the direction of the magnetic field. e.g. Bi, Zn, Au, NaCl, H₂O, etc.
- (ii) **Paramagnetic substance** These substances when placed in an external magnetic field, then acquire feeble magnetism in the direction of the magnetic field.
e.g. Al, Na, Pt, Mn, CuCl₂, O₂, etc.
- (iii) **Ferromagnetic substance** These substances when placed in an external magnetic field are strongly magnetised in the direction of the field.
e.g. Fe, Ni, Co, Fe₂O₃, etc.

Curie's Law

According to Curie's Law, the magnetic susceptibility of paramagnetic substance is inversely proportional to the absolute temperature. i.e.

$$\chi \propto \frac{1}{T}$$

Curie Temperature

Above a certain temperature the substance loses its ferromagnetic character and begins to behave as a paramagnetic substance. This particular temperature is called the Curie temperature of the substance.

Magnetic Flux

It is defined as the total number of magnetic lines of force passing normally through any surface.

If surface of area A is placed perpendicular to uniform magnetic field B . Then, magnetic flux $\phi = BA$.

Its unit is Wb (weber) or kg-m²/s²A.

If a plane is parallel to the magnetic field, then no flux link will pass through it and magnetic flux link with coil will be zero. If the coil is rotated through 90° in the magnetic field, then magnetic flux linked with the coil is zero.

ELECTROMAGNETIC INDUCTION

"Whenever the magnetic flux linked with a closed circuit changes an induced emf produced in the circuit, due to this current is induced in the circuit. This emf lasts only, so long as the change in flux lasts." This phenomena is called electromagnetic induction.

Faraday's Laws of Electromagnetic Induction

- (i) **First Law** Whenever the magnetic flux linked with a coil changes, an induced emf induced in the circuit.
- (ii) **Second Law** Induced emf is equal to the negative rate of change of magnetic flux

$$e = - \frac{\Delta \phi}{\Delta t}$$

If circuit has a coil of N turns, then

$$e = - \frac{\Delta (N \phi)}{\Delta t}$$

Induced Current and Induced Charge

If a circuit have a resistance (R), then

- (i) Induced current, $i = \frac{N \Delta \phi}{R \Delta t}$.
- (ii) Induced charge, $q = \frac{N}{R} \Delta \phi$.

where, R = resistance of the circuit

Lenz's Law

"The direction of the induced emf is such as to oppose the change that causes it."

Lenz law is one form of law of conservation of energy. If North pole of a bar magnet approaches towards a coil, then the direction of induced current in coil will be anti-clockwise, to form North pole, so that it may oppose the approaching of North pole.

Similarly, if North pole is going away from a coil, then direction of induced current will be clockwise to form South pole, so that it may oppose the receding of North pole.

Induced emf in a Conducting Rod in Different Situations

- (i) If a conductor of length l is moving perpendicularly in a magnetic field, then induced potential difference across the ends of conductor

$$e = Bvl$$

- (ii) If direction of velocity makes an angle θ with direction of magnetic field, then

$$e = Bv l \sin \theta$$

- (iii) emf induced in rod of length l rotating about an end in a uniform magnetic field is

$$e = \frac{B\omega l^2}{2}$$

where, ω is the angular speed.

Types of Electromagnetic Induction

Electromagnetic induction is of two types

- (i) **Self-induction** When the current flowing through a coil changes, then induced current produces in the same coil, it is called self-induction.

- (a) Coefficient of self-inductance of a coil is

$$L = \frac{N \phi}{i}$$

or
$$L = - \frac{e}{\Delta i / \Delta t}$$

- (b) Coefficient of self-inductance of a solenoid

$$L = \frac{\mu_0 N^2 A}{l}$$

where, L is length of the solenoid, A is area, N is number of turns and i is current flowing through the coil. Unit of coefficient of self-inductance is 'Henry' or volt/amp/second.

Symbol is 

- (ii) **Mutual induction** When two coils are placed near each other, then if there is a change in current in one coil, then emf is induced in the another coil, this phenomena is called mutual induction.

- (a) Coefficient of mutual inductance is given by

$$M = \frac{N_2 \phi_2}{i_1} \quad \text{or} \quad M = \frac{-e_2}{\Delta i_1 / \Delta t}$$

- (b) Mutual inductance between two plane coils is

$$M = \frac{\mu_0 N_1 N_2 \pi R_2^2}{2R_1}$$

where, R_1 and R_2 are radius of the coils

- (c) In case of a solenoid having primary coil N_1 and secondary coil N_2 turns, then

$$M = \frac{\mu_0 \mu_r N_1 N_2 A}{l}$$

where, l is length of solenoid and A is area.

Coefficient of Coupling of the Two Circuits

Let us now calculate mutual inductance between two circuits in terms of the self-inductance of each circuit alone.

Let us first consider a case when the total flux associated with one coil links with the other, i.e., a case of maximum flux linkage. Consider two coils placed adjacent to each other,

$$M_{12} = \frac{N_2 \phi_{B_2}}{i_1} \quad \text{and} \quad M_{21} = \frac{N_1 \phi_{B_1}}{i_2}$$

Similarly,
$$L_1 = \frac{N_1 \phi_{B_1}}{i_1} \quad \text{and} \quad L_2 = \frac{N_2 \phi_{B_2}}{i_2}$$

If all the flux of coil 2 links with coil 1 and *vice-versa* then,

$$\phi_{B_2} = \phi_{B_1}$$

Since, $M_{12} = M_{21} = M$, hence, we have

$$M_{12} M_{21} = M^2 = \frac{N_1 N_2 \phi_{B_1} \phi_{B_2}}{i_1 i_2} = L_1 L_2$$

$$\therefore M_{\max} = \sqrt{L_1 L_2}$$

This is the maximum possible value of M as the total flux associated with one coil links with the other. In general only a fraction $K_2 (< 1)$ of ϕ_{B_2} passes through the coil 1. Similarly a fraction $K_1 (< 1)$ of ϕ_{B_1} passes through coil 2.

Hence, $\phi_{B_1} = K_2 \phi_{B_2}$

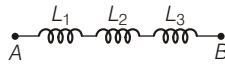

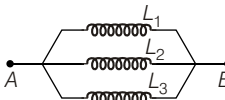

and $\phi_{B_2} = K_1 \phi_{B_1}$

$$\therefore M_{21} M_{12} = M^2 = \frac{N_1 N_2 K_1 K_2 \phi_{B_1} \phi_{B_2}}{i_1 i_2} = K_1 K_2 L_1 L_2$$

or
$$M = K \sqrt{L_1 L_2} \quad (K \leq 1)$$

Here, $K = \sqrt{K_1 K_2}$ is a number, depending on the geometry of the coils and their relative closeness having value between 0 and 1.

Combination of Inductor

S.No	Combination of inductor	Combination diagram	Equivalent Inductance
1.	Series Combination		$L = L_1 + L_2 + L_3$
2.	Parallel Combination		$\frac{1}{L} = \frac{1}{L_1} + \frac{1}{L_2} + \frac{1}{L_3}$

Magnetic Resonance Image

It is produce due to the presence of hydrogen atoms in tissues. The nucleus of the hydrogen atoms produce magnetic resonance. It is known as nuclear magnetic resonance. This resonance is absorbed by special coil and send it to computer. This technique is used to analyse the various activities of brain.

Transformer

It is a static electrical device used to step-up a low voltage to a high voltage or to step down a high voltage into a low voltage and is used on AC circuits. Transformer works on the principle of electromagnetic induction.

Step-up Transformer

A step-up transformer steps the primary voltage up to a higher value. If the numbers of turns of secondary coil is more than the number of turns of primary coil, then it is called step-up transformers.

Step-down Transformer

A step-down transformer steps the primary voltage down a lower value. If the number of turns of the secondary coil is less than that of the primary coil, it is called a step down transformer.

$$\text{For transformer } \frac{I_S}{I_P} = \frac{V_P}{V_S} = \frac{N_P}{N_S} = k$$

where, I_P and I_S = current in primary and secondary coil.

V_P and V_S = potential in primary and secondary coil.

N_P and N_S = Number of turns in primary and secondary.

Alternating Current

The current whose magnitude and direction changes with time and after a fixed period of time, it repeats the same magnitude and direction, called alternating current. Equation of alternating current is

$$I = I_0 \sin \omega t$$

where, I_0 = peak value of AC
and ω = angular frequency of AC

Alternating Voltage

The voltage whose magnitude and direction changes with time and after a fixed period of time, it repeats the same magnitude and direction, called alternating voltage. Equation of alternating voltage is

$$V = V_0 \sin \omega t$$

Mean Value of AC

Mean value for half-cycle of AC is given by

$$I_m = \frac{2 I_0}{\pi}$$

$$\text{or } I_m = 0.637 I_0$$

For complete cycle, mean value of AC is zero.

Root Mean Square Value of AC

For a complete cycle of AC, the root mean square value of current is called root mean square value.

$$I_{\text{rms}} = \frac{I_0}{\sqrt{2}} = 0.707 I_0$$

In India distribution of electricity for domestic purpose is done in the form of 220V and at 50 Hz.

Power in Alternating Circuit

(i) If a circuit have only resistor then average power

$$P_{\text{av}} = V_{\text{rms}} \times I_{\text{rms}}$$

(ii) If a circuit have resistor and inductor, then

$$P_{\text{av}} = V_{\text{rms}} \times I_{\text{rms}} \cos \phi$$

$$\text{where, } \cos \phi = \frac{R}{\sqrt{R^2 + \omega^2 L^2}}$$

(iii) If a circuit have only inductor or capacitor, then $P_{\text{av}} = 0$.

Choke Coil

Choke coil is a device used to control the AC circuit. In choke coil power loss is negligible.

➤ PRACTICE EXERCISE

- Which one of the following statements about electric or magnetic fields is not true?
 - All electric charges, whether static or in motion with respect to an observer, give rise to electric fields
 - All electric charges, whether static or in motion with respect to an observer, give rise to magnetic fields
 - Electric fields exert forces on all charges
 - Magnetic fields exert forces on charges only when the charges are in motion with respect to an observer
- The direction of the induced emf during electromagnetic induction is determined by
 - Ampere's law
 - Lenz's law
 - Faraday's law
 - Maxwell's law
- The electromagnetically induced current always flows in such a direction that the action of the magnetic field set-up by it tends to oppose the cause producing it. This is known as
 - Lenz's law
 - Faraday's law
 - Biot-Savart's law
 - Ampere's law
- An artificial satellite with metal surface is moving around the earth in a circular orbit. An induced current flows in the satellite. Which of the following statements is correct?
 - The plane of the orbit is inclined to the equatorial plane
 - The plane of the orbit is equatorial plane
 - Irrespective of the plane of the orbit the satellite speed must be more than 8km/s
 - The plane of the orbit coincides with the equatorial plane and the speed of the satellite is more than 6 km/s
- The North pole of a magnet is brought near a metallic ring as shown in the figure. The direction of induced current in the ring will be

- clockwise
 - anti-clockwise
 - first clockwise and then anti-clockwise
 - first anti-clockwise and then clockwise
- A freely suspended magnetic needle at the magnetic North pole of the earth
 - remains vertical
 - remains horizontal
 - makes an angle 23° with vertical
 - makes an angle 67° with vertical
 - When a coil of wire is rotated in a uniform magnetic field, a/an
 - alternating emf of varying frequency is generated
 - direct current of varying emf is generated
 - direct current of constant emf is generated
 - alternating emf of constant amplitude is generated
 - In combined field of a magnet and earth two null points are located on its axis. The magnet is placed with its axis
 - perpendicular to meridian, N-pole facing North
 - perpendicular to meridian, S-pole facing North
 - in the magnetic meridian, N-pole facing North
 - in the magnetic meridian, S-pole facing North
 - The soft iron (used as core material) has
 - high malleability
 - low malleability
 - high retentivity
 - low retentivity
 - The value of intensity of horizontal component of certain magnetic field is approximately
 - 3.4 g
 - 0.34 g
 - 0.034 g
 - 0.0034 g
 - A current is flowing in a circular conductor in clockwise direction. The coil is in the plane of the paper. The direction of the magnetic field is
 - perpendicular to the plane of paper in the upward direction
 - perpendicular to the plane of the paper in the downward direction
 - along the plane of the paper
 - None of the above

- An electric motor is used to convert
 - electrical energy into mechanical energy
 - mechanical energy into kinetic energy
 - mechanical energy into electrical energy
 - higher voltage to lower voltage
- Heating a magnet will
 - weaken it
 - strengthen it
 - reverse its polarity
 - have no effect
- In the process of magnetisation of a bar
 - only the outer layers of the bar get magnetised
 - only the surface of the bar gets magnetised
 - only the ends of the bar get magnetised
 - the entire bulk of the bar gets magnetised
- Two conducting parallel wires carry current in opposite directions. They will
 - attract each other
 - repel each other
 - get rotated to be perpendicular to one another
 - experience no force between them
- The temperature at and above which a ferromagnetic material become paramagnetic is called
 - inversion temperature
 - curie temperature
 - debye temperature
 - critical temperature
- In the given figure, the earth's magnetism is imagined to be as due to a magnet placed at a small angle to its axis of rotation, with the South pole in the northern hemisphere. A dip-needle will then set horizontally

- along the earth's magnetic equator
- along the earth's magnetic poles
- anywhere on the earth
- along a direction which makes an angle of 45° with the earth's magnetic equator

18. Frequency of the AC main in India is

- (a) 50 cps (b) 60 cps
(c) 100 cps (d) 120 cps

19. The output of a dynamo using a split ring commutator is

- (a) fluctuating DC
(b) AC
(c) DC
(d) half-wave rectified voltage

20. A choke coil

- (a) reduces current in DC
(b) increases current in DC
(c) reduces current in AC
(d) increases current in AC

21. Two electric bulbs, each designed to operate with a power of 500 W in 220 V lines are put in series in a 110 V. What will be the power generated by each bulb?

- (a) 25 W (b) 10 W
(c) 31.25 W (d) 3.125 W

22. An L - C circuit has frequency f , now if a resistance $R < 2\sqrt{L/C}$ introduced in the circuit, then the frequency will become/remains

- (a) f (b) more than f
(c) less than f (d) zero

23. When power is drawn from the secondary circuit of a transformer, then the dynamic resistance

- (a) decreases
(b) increases
(c) remains unchanged
(d) changes erratically

24. The core used in transformers and other electromagnetic device is laminated to

- (a) increases the magnetic field
(b) reduce the residual magnetism in the core
(c) increase the level of the magnetic saturation of the core
(d) reduce eddy current losses in the core

25. In a step-down transformer, the input voltage is 22 kV and the output voltage is 550V. The ratio of number of turns in the secondary to primary is

- (a) 1 : 40 (b) 40 : 1
(c) 20 : 1 (d) 1 : 20

26. A step-up transformer is used on a 120 V line to provide a potential difference of 2400 V at 2 A current. If the primary has

100 turns, then the number of turns in the secondary coil is

- (a) 1000 (b) 150
(c) 600 (d) 2000

27. A transformer has an efficiency of 80%. It works at 4 kW and 100 V. If the secondary voltage is 240 V, then the current in the primary coils is

- (a) 5 A (b) 7 A
(c) 15 A (d) 40 A

28. In a step-down transformer, the input voltage is 200 V and the output voltage is 5V. The turn ratio of the transformer is

- (a) 40 : 1 (b) 30 : 2 (c) 20 : 1 (d) 1 : 30

29. A straight line conductor of length 0.4 m is moved with a speed of 7 m/s to a magnetic field of intensity 0.9 Wb/m^2 . The induced emf across the conductor is

- (a) 1.25 V (b) 250 V
(c) 2.52 V (d) 5 V

30. An emf of 5 V is produced by a self inductance when the current changes at a steady rate from 3 to 2 A in 1 ms. The value of self inductance is

- (a) 500 H (b) 250 H
(c) 5 mH (d) zero

31. Two pure inductors, each of self inductance L , are connected in parallel but are well separated from each other, then the total inductance is

- (a) $L/3$ (b) $L/2$
(c) $3L$ (d) $L/5$

32. A conductor carrying current when placed in an external magnetic field, experiences a mechanical force. The device whose working is based on this principle is

- (a) electric motor
(b) dynamo
(c) electric bell
(d) None of the above

33. A jet aeroplane has total wing span of 60 m and moving with a speed of 400 m/s. If the earth's magnetic field is 0.3 gauss, then the potential difference between the wing tips of a jet aeroplane is

- (a) 0.4 V (b) 0.5 V
(c) 0.7 V (d) 0.72 V

34. A coil is wound on a frame of rectangular cross-section. If the linear dimensions of the frame are increased by a factor of 2 and the number of turns per unit length of the coil remain the same, then the self inductance increases by a factor of

- (a) 5 (b) 3 (c) 15 (d) 8

35. A coil of area 500 cm^2 having 1000 turns is put perpendicular to a magnetic field of intensity $4 \times 10^{-5} \text{ Wb/m}^2$. It is rotated by 180° in 0.1 s, the induced emf produced is

- (a) 60 mV (b) 40 mV (c) 50 mV (d) 70 mV

36. A jet aircraft is flying due to South at 300 m/s at a place, where the vertical component of the earth's magnetic field is $80 \mu\text{T}$. The potential difference between wing tips, if they are 25 m apart is

- (a) 0.5 V (b) 0.3 V (c) 0.6 V (d) 0.2 V

37. A coil of $10 \text{ cm} \times 20 \text{ cm}$ having 40 turns is making 18 rev/min in a magnetic field of intensity 0.5 Wb/m^2 . The peak value of the induced emf is about

- (a) 225 V (b) 425 V (c) 113 V (d) 330 V

38. A magnetic needle lying parallel to magnetic field requires W units of work to turn it through 60° . The torque needed to maintain the needle in this position will be

- (a) W (b) $\sqrt{3}W$ (c) $\frac{\sqrt{3}W}{2}$ (d) $2W$

39. Points A and B are situated along the extended axis of 2 cm long have magnet at a distance x and $2x$ cm respectively, from the pole nearer to the points. The ratio of magnetic fields at A and B will be

- (a) 4 : 1 approximately
(b) 4 : 1 exactly
(c) 8 : 1 approximately
(d) 8 : 1 exactly

40. Consider the following statements

As one moves from one place to another, the magnetic field of the earth will vary

- I. in magnitude
II. in direction
III. linearly with height
IV. linearly with the temperature of the place

Of the above statements

- (a) Both I and II (b) Only III
(c) I, II, III and IV (d) Both III and IV

41. Which of the following statements are not correct?

- I. Magnetic monopoles do not exist.
- II. Two iron bars which are magnetised always attract.
- III. A wire freely suspended in a magnetised field orients itself parallel to the field.
- IV. Copper is diamagnetic and aluminium is paramagnetic.

Choose the answer from the following codes

- (a) I, III and IV (b) Both II and IV
(c) Both II and III (d) II, III and IV

42. Which of the following statements are correct regarding ferromagnetic materials?

- I. They contain iron
- II. They exhibit hysteresis
- III. They are characterised by atoms with permanent dipole moments

Choose the answer from the codes given below

- (a) I, II and III (b) Both I and II
(c) Both II and III (d) Both I and III

► Previous Years' Questions

43. For which among the following house appliances, magnet is an essential part? **☑ 2012 (I)**

- (a) Calling bell (b) Fan
(c) Washing machine (d) All of these

44. The torque on a rectangular coil placed in a uniform magnetic field is large when the **☑ 2012 (II)**

- (a) number of turns is large
(b) number of turns is less
(c) plane of the coil is perpendicular to the magnetic field
(d) area of the coil is small

45. Consider the following statements **☑ 2012 (II)**

- I. If a piece of bar magnet is broken into two equally long pieces, then the pieces will not lose the magnetic properties.
- II. Magnetic properties of a substance lie in the atomic level.

Which of the statement (s) given above is/are correct?

- (a) Only I (b) Only II
(c) Both I and II (d) Neither I nor II

46. The polarity of an unmarked horse-shoe magnet can be determined by using **☑ 2012 (II)**

- (a) a charged glass rod
(b) a magnetic compass
(c) an electroscope
(d) another unmarked bar magnet

47. The earth's magnetic field is approximately **☑ 2012 (II)**

- (a) 1 T (b) 2 G (c) 10^4 T (d) 1 G

48. Match the following **☑ 2012 (II)**

List I	List II
A. Artificial magnet	1. Long lived
B. Permanent magnet	2. Last for infinitely long period
C. Temporary magnet	3. Short lived
D. Earth as a magnet	4. Induced magnet

Codes

- | | |
|-------------|-------------|
| A B C D | A B C D |
| (a) 3 1 4 2 | (b) 3 4 1 2 |
| (c) 2 1 4 3 | (d) 2 4 1 3 |

49. A positively charged particle projected towards West is deflected towards North by a magnetic field. The direction of the magnetic field is **☑ 2013 (I)**

- (a) towards South
(b) towards East
(c) in downward direction
(d) in upward direction

50. A current-carrying wire is known to produce magnetic lines of force around the conducting straight wire. The direction of the lines of force may be described by **☑ 2013 (I)**

- (a) left-hand thumb rule for up current and right-hand thumb rule for down current
(b) right-hand thumb rule for up current and left-hand thumb rule for down current
(c) right-hand thumb rule for both up and down currents
(d) left-hand thumb rule for both up and down currents

51. Gravitational force shares a common feature with electromagnetic force. In both cases, the force is **☑ 2013 (I)**

- (a) between massive and neutral objects
(b) between charged objects
(c) a short range
(d) a long range

52. **☑ 2013 (I)**

The motion of an electron in presence of a magnetic field is depicted in the figure given above. The force acting on the electron will be directed

- (a) into the page
(b) out of the page
(c) opposite to the motion of the electron
(d) along the motion of the electron

53. Imagine a current carrying wire with the direction of current downward or into the page. The direction of magnetic field lines is **☑ 2013 (I)**

- (a) clockwise (b) anti-clockwise
(c) into the page (d) out of the page

54. A positively charged particle projected towards West is deflected towards North by a magnetic field. The direction of the magnetic field is **☑ 2013 (I)**

- (a) towards South
(b) towards East
(c) in downward direction
(d) in upward direction

55. Which one among the following properties of a proton may change, while it moves freely in a magnetic field? **☑ 2013 (II)**

- (a) Speed (b) Charge
(c) Mass (d) Velocity

56. Van de Graaff generator is used for

- (a) accelerating charged particles
(b) generating large currents
(c) generating electric field
(d) generating high frequency voltage

57. The phenomenon of electromagnetic induction implies a production of induced **☑ 2014 (I)**

- (a) resistance in a coil when the magnetic field changes with time
(b) current in a coil when an electric field changes with time
(c) current in a coil when a magnetic field changes with time
(d) voltage in a coil when an electric field changes with time

58. A force \mathbf{F} , acting on an electric charge q , in presence of an electromagnetic field, moves the charge parallel to the magnetic field with velocity \mathbf{v} . Then, \mathbf{F} is equal to (where, \mathbf{E} and \mathbf{B} are electric field and magnetic field, respectively) **☑ 2014 (I)**

- (a) $q\mathbf{E}$ (b) $q(\mathbf{v} \times \mathbf{B})$
(c) $q(\mathbf{v} \times \mathbf{E})$ (d) $q\mathbf{B}$

59. Statement I It is not necessary that every bar magnet has one North pole and one South pole.

Statement II Magnetic poles occur in pair. **2014 (II)**

Codes

- (a) Both the statements are individually true and Statement II is the correct explanation of Statement I
- (b) Both the statements are individually true but Statement II is not the correct explanation of Statement I
- (c) Statement I is true but Statement II is false
- (d) Statement I is false but Statement II is true

60. If a charged particle (+*q*) is projected with certain velocity parallel to the magnetic field, then it will **2015 (I)**

- (a) trace helical path
- (b) trace circular path
- (c) continue its motion without any change
- (d) come to rest instantly

61. Two long wires each carrying a DC current in the same direction are placed close to each other. Which one of the following statements is correct? **2015(II)**

- (a) The wires will attract with each other
- (b) The wires will repel with each other
- (c) There will be no force between the wires
- (d) There will be a force between the wires only at the moment when the current is switched on or off

62. Magnetic meridian is an imaginary **2015 (II)**

- (a) line along North-South
- (b) point
- (c) vertical plane
- (d) horizontal plane

> Solutions

26. (d) Given, $V_p = 120\text{V}$, $V_s = 2400\text{V}$,

$$\frac{N_p}{V_s} = \frac{N_s}{V_p}$$

$$\therefore \frac{N_s}{V_p} = \frac{N_p}{V_s}$$

$$\Rightarrow \frac{N_s}{120} = \frac{2400}{120} = 20$$

$$\Rightarrow N_s = 2000$$

27. (d) ∴ Efficiency of transformer,

$$\eta = \frac{\text{Output power}}{\text{Input power}} = \frac{V_s i_s}{V_p i_p}$$

But $P = Vi$

$$\Rightarrow 4 \times 1000 = 100 \times i$$

$$i = 40\text{ A}$$

The current in the primary coil is 40 A.

28. (a) Given, $V_s = 5\text{ V}$, $V_p = 200\text{V}$, $N_p : N_s = ?$

For transformer,

$$\frac{N_s}{N_p} = \frac{V_s}{V_p} = \frac{5}{200} = \frac{1}{40}$$

$$N_p : N_s = 40 : 1$$

30. (c) ∴ Self inductance, $L = \frac{e}{\Delta i / \Delta t}$

$$= \frac{5}{\frac{1}{1 \times 10^{-3}}} = 5 \times 10^{-3} = 5\text{ mH}$$

31. (b) Two pure inductors are connected in parallel.

$$\therefore \text{Total inductance, } \frac{1}{L'} = \frac{1}{L} + \frac{1}{L}$$

$$\Rightarrow L' = \frac{L}{2}$$

33. (d) Given, $l = 60\text{ m}$, $v = 400\text{ m/s}$, $B = 0.3$, $\text{emf} = ?$

$$\text{emf} = Bvl = 0.3 \times 400 \times 60 \times 10^{-4}$$

$$= 0.72\text{ V}$$

34. (d) We know that, inductance,

$$L = \mu_0 n^2 V$$

$$\therefore \frac{L_2}{L_1} = \frac{V_2}{V_1} = \frac{(2 \times K)^3}{(K)^3} = 8$$

$$\Rightarrow L_2 = 8 L_1$$

35. (b) Given, $A = 500\text{ cm}^2$, $N = 1000\text{ turns}$

$$B = 4 \times 10^{-5}\text{ Wb/m}^2, \theta = 180^\circ$$

and $t = 0.1\text{ s}$, $e = ?$

$$\therefore e = \frac{-NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$$

$$= \frac{-1000 \times 4 \times 10^{-5} \times 500}{0.1}$$

$$= \frac{(\cos 180^\circ - \cos 0^\circ) \times 10^{-4}}{0.1}$$

$$= 4 \times 10^{-2}\text{ V} = 40\text{ mV}$$

36. (c) ∴ Given, $B = 80\text{ }\mu\text{T} = 80 \times 10^{-6}\text{ T}$,

$$v = 300\text{ m/s},$$

$$l = 25\text{ m},$$

$$e = ?$$

$$e = Bvl$$

$$= 80 \times 10^{-6} \times 300 \times 25$$

$$= 0.6\text{ V}$$

38. (b) $W = MB(\cos\theta_1 - \cos\theta_2)$

$$= MB(\cos 0^\circ - \cos 60^\circ)$$

$$= MB\left(1 - \frac{1}{2}\right) = \frac{MB}{2}$$

and $\tau = MB \sin\theta$

$$= MB \sin 60^\circ = MB \frac{\sqrt{3}}{2}$$

$$\tau = \sqrt{3} W$$

61. (a) When two wires carry current I_1 and I_2 in the same direction and separated by a distance d .

The force of attraction between the wires is

$$F = \frac{\mu_0}{2\pi d} I_1 I_2 L$$

where, L is the length of the wire.

13

NUCLEUS AND RADIOACTIVITY

In last year 2 questions were asked based on the topics structure of nucleus and nucleus energy. So, study these topics carefully.

NUCLEAR STRUCTURE

The entire positive charge and nearly the entire mass of atom is concentrated in a very small space called the nucleus of an atom. The radius of nucleus is of the order of nearly 10^{-15} m to 10^{-14} m. The nucleus consists of protons and neutrons. They are called nucleons

Number of protons = Atomic number (Z)

Number of neutrons

$$= \text{Mass number } (A) - \text{Atomic number } (Z)$$

Thus, the nucleus of an atom represented as ${}_Z X^A$

Neutron

Basic particle of nucleus is Neutron. It is discovered by James Chadwick.

Properties of Neutron

Properties of neutron are given below

- Mass of neutron is 1.6750×10^{-27} kg.
- Spin angular momentum of neutron is $\frac{1}{2} \times \left(\frac{h}{2\pi}\right)$.
- Magnetic torque of neutron is 9.57×10^{-27} Joule/Tesla.
- Half life of neutron is 12 min.

Properties of Nucleus

Properties of nucleus are given below

- Size of the nucleus is of the order of fermi. (1 fermi = 10^{-15} m)
- The radius of the nucleus is given by $R = R_0 A^{1/3}$ where, $R_0 = 1.3$ fermi and A is the mass number.
- The size of the atom is of the order of 10^{-10} m.
- The volume of nucleus is

$$V = \frac{4}{3} \pi R^3 = \frac{4}{3} \pi (R_0 A^{1/3})^3$$

- Density = $\frac{\text{Mass of nucleus}}{\text{Volume of the nucleus}}$

$$= \frac{Am_p}{\frac{4}{3} \pi (R_0 A^{1/3})^3} = \frac{m_p}{\frac{4}{3} \pi R_0^3}$$

where, $m_p = 1.6 \times 10^{-27}$ kg = mass of proton

and $R_0 = 1.3$ fermi.

- Density of nuclear matter is of the order of 10^{17} kg/m³
- Density of nuclear matter is independent of the mass number.

Atomic Mass Unit

Atomic mass unit or amu is the unit in which atomic masses are expressed. 1 amu is defined as 1/16th the mass of an atom of ${}_8 \text{O}^{16}$ which is the most abundant isotope of oxygen.

$$1 \text{ amu} = 1.66 \times 10^{-27} \text{ kg}$$

Different Atomic Species

Atomic species are of three types

- (i) **Isotopes** The atoms of same element which have same atomic number but different mass number are called isotopes. e.g., ${}_{17}\text{Cl}^{35}$, ${}_{17}\text{Cl}^{33}$, ${}_{1}\text{H}^1$, ${}_{1}\text{H}^2$, ${}_{1}\text{H}^3$

The chemical properties of isotopes are same.

- (ii) **Isobars** The atoms of different elements which has same mass number but different atomic number are called isobars. e.g., ${}_{18}\text{Ar}^{40}$, ${}_{20}\text{Ca}^{40}$

Isotope used for treatment of blood cancer is Ag^{191} .

- (iii) **Isotones or Isoneutronic** The atoms of different elements of which the nuclei have the same number of neutrons but different number of protons are called the isotones. e.g. (${}_{11}\text{Na}^{23}$ and ${}_{12}\text{Mg}^{24}$) and (${}_{19}\text{K}^{39}$ and ${}_{20}\text{Ar}^{40}$) are the isotones.

Mirror Nuclei

The nuclei, having the same mass number A but with the proton and neutron number interchanged, are called mirror nuclei.

Nuclear Force

Nuclear force are the strong forces of attraction which hold together the nucleons in the tiny nucleus of an atom, inspite of strong electrostatic force of repulsion between proton. The nuclear forces arise due to exchange of sub-nuclear particles, hence very complex in nature.

Some properties of nuclear force are given below

- Nuclear force is short range force. It cannot work beyond 10^{-15} meter.
- It is the strongest force in nature.
- It gives the stability to Nuclei.
- This force does not depend on charge.
- It is not a central force.

Einstein Mass-Energy Equivalence Principle

Einstein made the suggestion that energy mass are equivalent. He predicted that if the energy of a body changes by an amount E , then it's mass changes by an amount given by the equation.

$$E = mc^2$$

where, c is the speed of light.

Pair Production

When an energetic γ -ray photon falls on a heavy substance, it is absorbed by some nucleus of the substance and an electron and a positron are produced.

This phenomenon is called 'pair production' and may be represented by the equation

Pair Annihilation

The converse phenomenon of pair production is called pair annihilation. When an electron and a positron come very close to each other, they annihilate each other by combining together and two γ -photons are produced. This phenomenon can be represented by the following equation.

Mass Defect

It is found that mass of the nucleus is less than the total mass of protons and neutrons, this mass difference is called mass defect. If mass defect is Δm , then

$$\Delta m = Zm_p + (A - Z)m_n - M$$

where, Z = atomic number,

m_p = mass of proton,

m_n = mass of neutron

and M = mass of nucleus

Nuclear Binding Energy

The minimum energy required to separate the nucleons up to an infinite distance from the nucleus, is called nuclear binding energy.

It is expressed as

$$\Delta E = \Delta mc^2 = \Delta m \times 931.5 \text{ MeV}$$

where, c is speed of light = 3×10^8 m/s

Nuclear binding energy per nucleon

$$= \frac{\text{Nuclear binding energy } (\Delta E)}{\text{Total number of nucleons } (A)}$$

Packing fraction was introduced by Aston and is expressed

by packing fraction, $f = \frac{\Delta m}{A} \times 10^4$

Nuclear Energy

It is the loss of mass, which appears in the form of energy. The two main sources of nuclear energy are as given below

1. Nuclear Fission

The process of splitting of a heavy nucleus into two nuclei of nearly comparable masses with the liberation of energy is called **nuclear fission**. When U^{235} is bombarded with fast moving neutrons, it splits

The reason for liberation of energy is that total mass of resultant nuclei is less than the mass of initial nucleus, this mass defect changes into energy. Nuclear fission was discovered by Otto han and Strassman.

- Thermal neutrons have energy approx 0.25 eV.
- The number of neutrons produced is proportional to r^3 (r = size of fissionable material).

Nuclear Chain Reaction

If the particle starting the nuclear fission reaction is produced as a product and further takes part in the nuclear fission reaction, then a chain of fission reaction started, which is called nuclear chain reaction. Nuclear chain reactions are of two types

- (i) **Controlled Chain Reaction** A fission chain reaction which proceeds slowly and in balanced manner without any explosion and in which the energy released can be controlled.
- (ii) **Uncontrolled Chain Reaction** A nuclear chain reaction in which fission neutrons keep on increasing until the whole of the fissible substance is consumed. Atom bomb works on the principle of uncontrolled chain reaction.

Critical Size

The minimum size of piece of a radioactive element to continue the chain reaction is called critical size. The critical mass of uranium is 10 kg.

Nuclear Reactor

It is a device that can initiate a self-sustaining controlled chain reaction of a fissionable material. They are used at nuclear power plants for generating electricity and in propulsion of ships. It is based upon controlled nuclear chain reaction.

- **Nuclear Fuel** Fissionable material are used like U^{235} , U^{233} , Pu^{239} etc.
- **Moderator** Used to slow down the fast moving neutrons produced during the fission. e.g. Heavy water graphite, deuterium, etc.
- **Control Rods** They have the ability to capture the slow neutrons.
- **Coolant** Used to remove the heat produced. e.g. Liquid sodium.

2. Nuclear Fusion

When two light nuclei combine together to form a single nucleus, then this phenomena is called **nuclear fusion**.

- Fusion is possible only when there is an abundance of lighter element.
- Fusion takes place at high temperature 10^7 or 10^8 C.
- Fusion reaction is also called **thermonuclear reaction** and energy released is called **thermonuclear energy**.
- The fusion of nuclei is an uncontrolled process. Till now there is no method available for controlling the release of fusion energy. Therefore, fusion cannot be used for the service of mankind.

Solar Energy

The secret of sun energy is nuclear fusion. In sun due to very high temperature, fusion of hydrogen nuclei takes place to form helium nuclei. The energy produced in this process, is given up by the sun.

Hydrogen Bomb

It is based on the concept of nuclear fusion. The process is initiated by nuclear fission of uranium, which there after used for fusion of light elements like hydrogen. When hydrogen bomb explodes, it generates the huge amount of energy and produces very high temperature.

RADIOACTIVITY

The spontaneous emission of some types of invisible rays from some substances is called **radioactivity** and these substances are called radioactive substances. The emitted rays are called radioactive rays.

For radioactive elements ratio of number of neutrons to number of protons is greater than 1.

These are of three types

1. α -rays

Rays of relatively low penetrating power emitted by radium and other radioactive substances are known as α -rays. α -rays consists of α -particles $2He^4$. α -particles have two unit positive charge and has a mass of four times that of a proton.

Some properties of α -rays are given below

- α -particles are deflected in electric and magnetic fields.
- Velocity of α -particles is of the order $\frac{1}{10}$ th to that of light.
- α -particles ionise the gases through which they pass.
- α -particles have very less penetrating power. These are stopped by aluminium foil of thickness of a 0.1 mm.
- α -particles produce fluorescence in substances like zinc sulphide.
- α -particles get scattered while passing through metal foils.
- On being stopped α -particles produce heating effect.
- α -particles can produce artificial radioactivity in certain elements.
- The energies of α -particles emitted from a radioactive substance is not the same.

2. β -rays

A form of ionising radiation, emitted by radioactive substances, which consists of negatively charged electrons. β -rays are very fast moving electrons. β -particles carry 1 unit negative charge.

Some properties of β -rays are given below

- β -particles are deflected in electric and magnetic fields.

- β -particles have velocity approximately equal to the speed of light.
- β -particles can ionise the gas through which they pass but their ionising power is $\frac{1}{100}$ th to that of α -particles.
- Penetrating power of β -particles is 100 times to that of α -particles.
- β -particles produce fluorescence in substance like zinc sulphide.
- β -particles can affect a photographic plate.
- β -particles can produce artificial radioactivity.

3. γ -rays

Penetrating electromagnetic radiation of a kind arising from the radioactive decay of atomic nuclei. γ -rays have no charge and no mass.

Some properties of γ -rays are given below

- γ -rays have no metallic properties, these are electromagnetic rays.
- γ -rays are not deflected in electric and magnetic fields.
- γ -rays have no charge and no mass.
- Ionising power of γ -rays is very less than α and β -rays.
- Velocity of γ -rays is equal to that of light.
- γ -rays have very high penetrating power, these rays pass through 30 cm thick iron sheet.
- They can affect the photographic plate.
- They knock out the electrons from the surface on which they fall.
- γ -rays can produce fluorescence in substance.
- They produce heating effect on the surface exposed to them.
- Wavelength of γ -rays is of the order of 10^{-12} m.

Law of Radioactive Decay

Activity of a radioactive substance will be directly proportional to the nucleus present in the sample N at any instant t .

$$-\frac{dN}{dt} \propto N \Rightarrow \frac{dN}{dt} = -\lambda N \Rightarrow N = N_0 e^{-\lambda t}$$

where, N_0 = original amount and λ = decay constant

Unit of decay constant is sec^{-1} .

Time required to decay from N_0 to N

$$t = \frac{2.303}{\lambda} \log_{10} \left(\frac{N_0}{N} \right)$$

The value of decay constant is independent of temperature, pressure and force etc.

Half-Life of a Radioactive Element

The time interval in which mass of a radioactive substance or the number of atoms reduced to half its initial value is called **half-life** ($T_{1/2}$).

- Half-life time is constant for a radioactive element.
- Half-life of a radioactive material cannot be changed by physical or chemical changes.

Remaining amount after n half-lives.

$$N = N_0 \left(\frac{1}{2} \right)^n$$

where, N_0 = initial amount, $n = \frac{\text{total time } (T)}{\text{half-life period}}$

$$\therefore \text{Half-life, } T_{1/2} = \frac{0.6931}{\text{constant } (\lambda)}$$

${}^6\text{C}^{14}$ is used to predict the age of archaeological findings.

Mean Life of Radioactive Substance

The sum of life times of all atoms of the element divided by the number of all atoms present initially in the sample of the element is called the mean life of a radioactive substance.

$$\therefore \text{Mean life } \tau = \frac{\text{Sum of life time of all the atoms}}{\text{Total number of atoms}} = \frac{1}{\lambda}$$

- Mean life is greater than half-life.
- The percentage of atoms left one mean life time is equal to 37%.

$$1 \text{ curie (1 Ci)} = 3.7 \times 10^{10} \text{ decay/second}$$

$$1 \text{ amu} = 931.5 \text{ MeV.}$$

Activity of a Radioactive Isotope

The activity A of a radioactive substance (or radio isotope) means that the rate of decay per second or the number of nuclei N disintegrating per second.

$$A = \frac{dN}{dt}$$

Its SI unit is becquerel (Bq).

$$1 \text{ (Bq)} = 1 \text{ disintegration/second}$$

Soddy-Fazan's Displacement Rule

- (i) When a radioactive atom emits one α -particle, then atomic number of resultant atom decreases by 2 unit and mass number decreases by 4 unit.

- (ii) When a radioactive atom emits one β -particle, then atomic number of resultant atom increases by 1 unit and mass number remains same. ${}_Z X^A \xrightarrow{-\beta} {}_{Z+1} Y^A + {}_{-1} e^0 + \bar{\nu} + \text{Energy}$

- (iii) When a radioactive atom emits γ -rays, then mass number and atomic number remain unchanged.

PRACTICE EXERCISE

- Law of radioactive decay is associated with
(a) Planck (b) Compton
(c) Madam curie (d) Einstein
- Which one of the following is the correct sequence in terms of increasing mass?
(a) Proton, electron, α -particle, hydrogen atom
(b) Electron, proton, hydrogen atom, α -particle
(c) Hydrogen atom, proton, electron, α -particle
(d) α -particle, proton, hydrogen atom, electron
- α -particles are
(a) protons
(b) ionised helium atoms
(c) negatively charged particles
(d) electromagnetic waves
- When an α -particle captures an electron it becomes
(a) a helium ion
(b) a β -particle
(c) a helium atom
(d) any hydrogen atom
- In the reaction represented by equation

$${}_Z X^A \longrightarrow {}_{Z-2} Y^{A-4}$$

$$\longrightarrow {}_{Z-2} Y^{A-4} \longrightarrow {}_{Z-1} K^{A-4}$$
 which of the following will give the correct sequence radiations?
(a) α, γ, β (b) α, β, γ
(c) γ, α, β (d) β, α, γ
- If the nuclear forces between two protons, two neutrons and between proton and neutron is denoted F_{pp} , F_{nn} and F_{pn} respectively, then
(a) $F_{pp} = F_{nn} = F_{pn}$ (b) $F_{pp} = F_{pn} \neq F_{nn}$
(c) $F_{pp} = F_{nn} \neq F_{pn}$ (d) $F_{pp} \neq F_{pn} \neq F_{nn}$
- Wilson cloud chamber detects
(a) α -particle only
(b) γ -particle only
(c) β -particle only
(d) α and β -particle both
- The 1994 Nobel Prize in physics was awarded for the work in the field of
(a) Top quarks
(b) Infrared astronomy
(c) Neutron physics
(d) High T_c superconductivity
- A neutron, an electron, a proton and an alpha particle are moving with equal kinetic energy. The correct sequence of the increasing order of the velocities of these particles will be
(a) alpha particle, neutron, proton, electron
(b) alpha particle, proton, neutron, electron
(c) electron, neutron, proton, alpha particle
(d) proton, neutron, alpha particle, electron
- When a beta particle is emitted from the nucleus of an atom, then the effect is to
(a) decrease the atomic number by one
(b) decrease the mass number by one
(c) increase the mass number by one
(d) increase the atomic number by one
- The anti-particle of electron is
(a) β -particle (b) proton
(c) positron (d) α -particle
- The mass of positron is same as
(a) electron (b) neutron
(c) α -particle (d) proton
- In a nuclear reaction,

$${}_{92}\text{U}^{238} \longrightarrow {}_Z\text{Th}^A + {}_2\text{He}^4$$
 the value of A and Z are
(a) $A = 234, Z = 90$ (b) $A = 234, Z = 94$
(c) $A = 238, Z = 94$ (d) None of these
- In ${}_{88}\text{Ra}^{226}$ nucleus, there are
(a) 138 protons and 88 neutrons
(b) 138 neutrons and 88 protons
(c) 226 protons and 88 electrons
(d) 226 neutrons and 138 electrons
- The mass of a neutron is same as that of
(a) a proton (b) a meson
(c) an electron (d) None of these
- In a ${}_{92}\text{U}^{235}$ atom, there are
(a) 143 protons, 92 neutrons and 143 electrons
(b) 143 protons, 92 neutrons and 92 electrons
(c) 92 protons, 143 neutrons and 92 electrons
(d) 92 protons, 143 neutrons and 143 electrons
- Nuclear forces are stronger than
(a) magnetic force
(b) gravitational force
(c) electrostatic force
(d) All of the above
- When M is atomic mass, A is a mass number, then $(M - A)/A$ is called
(a) fermi energy (b) binding energy
(c) packing fraction (d) None of these
- The density of nucleus is of the order of
(a) 10^{24} kg/m³ (b) 10^{17} kg/m³
(c) 10^{12} kg/m³ (d) 10^3 kg/m³
- An isobar is produced in
(a) deuteron emission
(b) proton emission
(c) α -emission
(d) β -emission
- The isotope generally used for the treatment of blood cancer is
(a) Ag¹⁹¹ (b) O¹⁵ (c) Hg¹⁰⁷ (d) I¹³¹
- Thermal neutrons have energy equal to
(a) 2.5 eV (b) 0.25 eV
(c) 0.025 eV (d) 0.0025 eV
- Enormous energy generation in the sun and the stars is due to
(a) radioactive decay
(b) thermonuclear reaction
(c) thermoionic emission
(d) nuclear fission
- The main source of solar energy is
(a) nuclear fusion
(b) nuclear fission
(c) gravitational contraction
(d) chemical reactions
- When the mass equal to amu is converted completely into energy, then the energy produced will be
(a) 1.5×10^{-10} J (b) 1.5×10^{-12} J
(c) 1.5×10^{-18} J (d) 1.5×10^{-14} J
- In nuclear chain reactions
(a) a U²³⁵ nucleus is bombarded with a fast moving α -particle
(b) a U²³⁵ nucleus is bombarded with a fast moving neutron
(c) a U²³⁵ nucleus is bombarded with a slow moving neutron
(d) a U²³⁵ nucleus is bombarded with a slow moving α -particle
- Recent tests conducted in Pokhran were only based on
(a) nuclear fusion devices
(b) nuclear fission devices
(c) nuclear fusion as well as nuclear fission devices
(d) clear nuclear devices which no nuclear waste

28. Match List I with List II and select the correct answer using codes gives below the lists

List I	List II
A. Solar energy	1. Nuclear energy
B. Light energy	2. Nuclear fusion
C. Sound energy	3. Mechanical vibration
D. Energy released by a atom bomb	4. Incandescent solid

Codes

A B C D

- (a) 1 4 3 2
 (b) 2 3 4 1
 (c) 2 4 1 3
 (d) 1 3 4 2

29. If each fission of ${}_{92}\text{U}^{235}$ releases 200 MeV, how many fissions must occur per second to produce a power of 1 kW?
 (a) 3.125×10^{16}
 (b) 3.125×10^{15}
 (c) 3.125×10^{14}
 (d) 3.125×10^{13}
30. Fusion reaction takes place at the temperature about

- (a) 3×10^6 K (b) 3×10^4 K
 (c) 3×10^2 K (d) 3×10^3 K

31. The process by which a heavy nucleus splits into lighter nucleus is known as

- (a) chain reaction (b) α -decay
 (c) fusion (d) fission

32. How much energy will approximately be released, if all the atoms of 1 kg of deuterium could undergo fusion? Assume in the fusion of deuterium, 0.1% mass is converted into energy

- (a) 8×10^{23} MeV (b) 6×10^{27} eV
 (c) 9×10^{13} J (d) 2×10^7 kWh

33. Molecular weight of heavy water used as a moderator in nuclear reactor is

- (a) 10 (b) 18 (c) 22 (d) 16

34. A nuclear reactor is a device to produce nuclear energy with the help of

- (a) nuclear fusion
 (b) uncontrolled chain reaction
 (c) controlled chain reaction
 (d) graphite as fuel

35. The main source of energy of the sun is

- (a) fusion of heavy nuclei
 (b) fusion of light nuclei
 (c) fission of light nuclei
 (d) Both fusion and fission

36. Which one of the following isotopes is used to predict the age of archaeological findings?

- (a) ${}_{55}\text{Rb}^{238}$
 (b) ${}_{7}\text{N}^{14}$
 (c) ${}_{16}\text{P}^{30}$
 (d) ${}_{6}\text{C}^{14}$

> Previous Years' Questions

37. An atom of carbon has 6 protons. Its mass number is 12. How many neutrons are present in an atom of carbon? ☑ 2016 (I)

- (a) 12 (b) 6
 (c) 10 (d) 14

38. Which one of the following is not a form of stored energy? ☑ 2016 (I)

- (a) Nuclear energy
 (b) Potential energy
 (c) Electrical energy
 (d) Chemical energy

> ANSWERS

1	c	2	b	3	b	4	b	5	a	6	a	7	d	8	c	9	a	10	d
11	c	12	a	13	a	14	b	15	a	16	c	17	d	18	b	19	b	20	d
21	a	22	b	23	b	24	a	25	a	26	c	27	c	28	c	29	d	30	a

> Solutions

5. (a) ${}_Z X^A \xrightarrow{\alpha} {}_{Z-2} Y^{A-4}$
 $\xrightarrow{\gamma^0} {}_{Z-2} Y^{A-4} \xrightarrow{-1\beta^0} {}_{Z-1} K^{A-4}$
 So, we can see that α , γ and β will be the correct sequence.
25. (a) $\therefore 1 \text{ amu} = 931 \text{ MeV}$
 $= 931 \times 10^6 \times 1.6 \times 10^{-19}$
 $= 1.4896 \times 10^{-10}$
 $= 1.5 \times 10^{-10} \text{ J}$

29. (d) Given,
 Power, $P = 1 \text{ kW} = 10^3 \text{ J/s}$
 \therefore Rate of nuclear fission
 $= \frac{10^3}{200 \times 1.6 \times 10^{-3}} = 3.125 \times 10^{13}$
32. (c) \therefore Mass, $m = 1 \times \frac{0.1}{100} = 10^{-3} \text{ kg}$
 We know that,
 Energy, $E = mc^2 = 10^{-3} \times (3 \times 10^8)^2$
 $[\because c = 3 \times 10^8 \text{ m/s}^2]$

- $= 10^{-3} \times 9 \times 10^{16}$
 $= 9 \times 10^{13} \text{ J}$
37. (b) We know that,
 Mass number (A)
 $=$ Number of proton (p)
 $+ \text{Number of neutron } (n)$
 $12 = 6 + n \Rightarrow n = 6$
 Mass number determines the atomic mass of atoms.

14

MODERN PHYSICS

From this chapter 1 to 2 questions have been asked, based on the topics hydrogen spectrum and X-rays.

Modern physics refers to the post-Newtonian conception of physics. Modern physics deals with the underlying structure of the smallest particles in nature (quantum mechanics), as well as a rigorous understanding of the “fundamental interaction” of particles, understood as forces.

CATHODE RAYS

Cathode rays are the stream of high speed negatively charged particles moving from cathode to anode in a discharge tube.

Properties of Cathode Rays

Some properties of cathode rays are given below

- (i) Cathode rays travel in straight lines.
- (ii) Cathode rays heat up the material on which they fall.
- (iii) Cathode rays can produce physical and chemical change and also can exert mechanical pressure.
- (iv) Cathode rays can ionise the gases and can produce X-rays.
- (v) Cathode rays can produce fluorescence.
- (vi) Cathode rays can penetrate through thin metal foils.
- (vii) Cathode rays are deflected in electric and magnetic field.
- (viii) Cathode rays carry negative charge.

Motion of Cathode Rays (Electrons) Parallel in Electric Field

An electron have mass (m) and charge (e). It moves in electric field (E). Then,

- (i) force on electron, $F = eE$
- (ii) when electron is projected in the direction of electric field or opposite direction, then its path is linear line.
- (iii) electric field intensity,

$$E = \frac{V}{d} = \frac{\text{potential between plates}}{\text{distance between plates}}$$

- (iv) applied acceleration on electron,

$$a = \frac{F}{m} = \frac{eE}{m}$$

Motion of Cathode Rays (Electron) Perpendicular to Electric Field

An electron have mass (m) and charge (e). It enters into electric field perpendicularly. Then,

- (i) force on electron, $F = eE$.
- (ii) with velocity v_x , the time required to pass length of electric field, $t = \frac{l}{v_x}$.
- (iii) Acceleration produced in perpendicular direction of motion,

$$a = \frac{F}{m} = \frac{eE}{m}$$

(iv) After covering the length (l), deviation of electron,

$$y = \frac{1}{2} at^2 = \frac{1}{2} \left(\frac{eE}{m} \right) \left(\frac{l}{v_x} \right)^2$$

So, the path of electron is parabolic.

(v) If the vertical component of electron velocity v_y , then

$$v_y = at = \left(\frac{eE}{m} \right) t = \left(\frac{V}{d} \right) \left(\frac{e}{m} \right) \left(\frac{l}{v_x} \right)$$

(vi) Resultant velocity, $v = \sqrt{v_x^2 + v_y^2}$ and $\theta = \tan^{-1} \left(\frac{v_y}{v_x} \right)$

Uses of Cathode Rays

- (i) In cathode ray oscilloscope.
- (ii) In production of X-rays.

POSITIVE RAYS

Positive rays are moving positive ions of the gas filled in the discharge tube. The mass of these particles is nearly equal to the mass of the atoms of gas.

Positive rays were discovered by Goldstein.

Properties of Positive Rays

Some properties of positive rays are given below

- (i) These consist of fast moving positively charged particles.
- (ii) These rays are deflected in magnetic field.
- (iii) These rays are deflected in electric field.
- (iv) These rays travel in straight line.
- (v) The speed of positive rays is less than that of cathode rays.
- (vi) These rays can affect the photographic plate.
- (vii) These rays penetrate through the thin aluminium foil.
- (viii) These rays can produce fluorescence and phosphorescence.

MATTER WAVE

In case of light some phenomenon like diffraction and interference can be explained on the basis of its wave character. However, the certain other phenomenon such as black body radiation and photoelectric effect can be explained only on the basis of its particle nature.

Thus, light is said to have a dual character. Such studies on light wave were made by Einstein in 1905. Louis-de-Broglie, in 1924 extended the idea of photons to material particles such as electron and he proposed that matter also has a dual character as wave and as particle.

de-Broglie Relation

According to de-Broglie, a wave is associated with energy moving particle. These waves are called **de-Broglie waves** or **matter waves**.

According to quantum theory, energy of photon,

$$E = h\nu \quad \dots(i)$$

If mass of the photon is taken as m , then as per Einstein's equation,

$$E = mc^2 \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$h\nu = mc^2$$

$$h \frac{c}{\lambda} = mc^2 \quad [\because \nu = c/\lambda]$$

where, λ = wavelength of photon

$$\lambda = \frac{h}{mc}$$

de-Broglie asserted that the above equation is completely a general function and applies to photon as well as all other moving particles.

$$\text{So, } \lambda = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$$

where, m is mass of particle and v is its velocity

Properties of Matter Wave

Some properties of matter waves are given below

- (i) de-Broglie wavelength, $\lambda \propto \frac{1}{v}$. If the particle moves faster, then the wavelength will be smaller and *vice-versa*.
- (ii) If the particle is at rest ($v = 0$), then the de-Broglie wavelength is infinite ($\lambda = \infty$). Such a wave cannot be visualised.
- (iii) de-Broglie waves cannot be electromagnetic in nature because electromagnetic waves are produced by motion of charged particles.
- (iv) The wavelength of a wave associated with moving particle defines a region of uncertainty, within which the whereabouts of the particles are unknown.

PHOTOELECTRIC EFFECT

The phenomena of emission of electrons from metal surface by the action of light rays is called the photoelectric effect, the emitted electrons are called photoelectron and the current produced due to these electrons is called **photoelectric current**.

- Photoelectric effect is based on the law of conservation of energy.
- In photoelectric effect, the photons completely disappear and all of its energy is given to the photoelectrons. Emission of one electron takes place corresponding to the absorption of one photon.
- Ratio of number of electrons emitted to the number of photons incident is less than unity because the photons can be involved in many other ways.

Laws of Photoelectric Effect

- (i) There is no time lag between emission of electrons and incidence of light.
- (ii) The number of emitted electrons is directly proportional to the intensity of incident light.
- (iii) The kinetic energy of emitted electrons does not depend upon the intensity of incident light.
- (iv) The kinetic energy of emitted electrons is directly proportional to the frequency of incident light.
- (v) The number of emitted electrons does not depend on the frequency of incident light.
- (vi) If the frequency of incident light is less than threshold frequency, then no electron will be ejected.
- (vii) The photoelectric emission is an instantaneous process. The time lag between the incidence of radiations and emission of photoelectrons is very small or less than even 10^{-9} second.

Threshold Frequency

The minimum frequency of light necessary to eject the electrons from metallic surface is called threshold frequency or cut-off frequency (ν_0). For a frequency lower than cut-off frequency, no photoelectric emission is possible even, if the intensity is large.

Work Function

The minimum energy required to eject the electrons from metal is called the work function of metal (W).

$$W = h\nu_0 \quad \left[\begin{array}{l} \text{where, } h = \text{Planck's constant} \\ \text{and } \nu_0 = \text{threshold frequency} \end{array} \right]$$

Einstein's Equation of Photoelectric Effect

\therefore Kinetic energy, $E_K = h(\nu - \nu_0)$

$$\Rightarrow \frac{1}{2} m v_{\max}^2 = h(\nu - \nu_0)$$

$$\text{or } \frac{1}{2} m v_{\max}^2 = h\nu - h\nu_0 \quad [:: W = h\nu_0]$$

$$\text{or } \frac{1}{2} m v_{\max}^2 = h\nu - W$$

where, E_K = maximum kinetic energy of photoelectron,

ν = frequency of incident light,

ν_0 = threshold frequency,

h = Planck's constant

and W = work function

Relation between Stopping Potential and Threshold Frequency

If electron is retarded through a potential difference of V_0 , then all kinetic energy will be converted to potential energy.

$$\Rightarrow eV_0 = K_{\max} = \frac{1}{2} m v_{\max}^2 = h\nu - h\nu_0 = h\nu - W \quad [:: W = h\nu_0]$$

where, V_0 is called **stopping potential**

Photoelectric Cell

It is a device based on phenomena of photoelectric effect which converts light energy directly into electric energy.

These are of three types

- (i) Photoemissive cell
- (ii) Photovoltaic cell
- (iii) Photoconductive cell

► **Note** Saturation current in the photocell varies with distance as

$$i \propto \frac{1}{d^2}$$

Applications of Photoelectric Cells

- In reproduction of sound in cinema, television and phototelegraphy.
- In measuring the temperature of celestial bodies.
- To control the temperature in furnace and in chemical process.
- In automatic doors.
- In photoelectric counters.
- In automatic switches for street lights.
- In photoelectric sorters.
- In space for obtaining electrical energy from sunlight during space travel, $\nu \geq \nu_0$ or $\lambda \leq \lambda_0$.

X-RAYS

When fast moving cathode rays strike on a metal piece of high melting point and of high mass number, then some invisible rays produced. These rays are called X-rays.

These rays were discovered by Roentgen. These rays are electromagnetic in nature. The device used to produce X-rays is called **coolidge tube**.

Properties of X-rays

Some properties of X-rays are given below

- (i) These are electromagnetic in nature.
- (ii) X-rays travel in straight line with speed of light.
- (iii) These show reflection, refraction, interference, diffraction and polarisation.
- (iv) Wavelength of X-rays is the order of 1 \AA .
- (v) These are not deflected by electric and magnetic fields.

- (vi) These produce illumination on falling on fluorescent substances.
- (vii) X-rays ionise the gas in which they pass.
- (viii) X-rays penetrate through different depth into different substances.
- (ix) X-rays show photoelectric effect.

Applications of X-rays

- In surgery
- In trading
- In searching
- In radiotherapy
- In laboratory

Moseley's Law

The frequency of a particular spectrum line of X-rays is proportional to the atomic number of elements

$$\nu \propto (Z - b)^2 \text{ or } \nu = a(Z - b)^2$$

where, a and b are constants and Z is replaced by $(Z - b)$ due to the screening atomic number effect of orbital electrons

$$a = \frac{me^4}{8\epsilon_0^2 h^3} \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

Bragg's Law

This law states that, when the X-ray is incident onto a crystal surface its angle of incidence θ , will reflect back with a same angle of scattering θ . And when the path difference d is equal to a whole number n , of wavelength λ . A constructive interference will occur.

Consider the diagram in which beam of an X-rays incident at an angle θ get diffracted as shown in figure.

Clearly, path difference between ray 1 and ray 2 is $2d \sin \theta$.

For maxima of X-rays diffracted from the crystal.

$$2d \sin \theta = n\lambda$$

where, $n = 1, 2, 3, \dots$, d is interatomic gap of the crystal

Compton Shift

When X-rays are scattered by loosely bound electrons in a target some of the scattered X-rays have a long wavelength, then the incident X-rays. This is called Compton shift in wavelength. The phenomenon in which the wavelength of the incident X-rays increases and hence the energy decreases due to scattering from an atom is known as Compton effect.

Expressions for Compton Shift

(i) This Compton shift in wavelength is given by

$$\Delta\lambda = \frac{h}{m_0 c} (1 - \cos \phi)$$

where, h = Planck's constant,
 m_0 = rest mass of electron,
 ϕ = angle of scattering and c = speed of light

(ii) Kinetic energy of recoil electron,

$$E_K = \frac{hc}{\lambda} - \frac{hc}{\lambda'}$$

(iii) Direction of recoil electron,

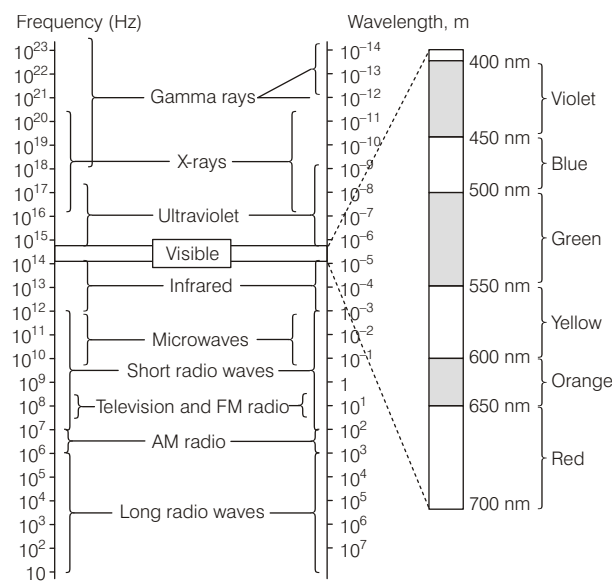

$$\tan \theta = \frac{\lambda \sin \phi}{\lambda' - \lambda \cos \phi}$$

(iv) Compton wavelength of electron

$$= \frac{h}{m_0 c} = 0.024 \text{ \AA}$$

Electromagnetic Spectrum

The orderly arrangement of EM wave in increasing or decreasing order of wavelength (λ) or frequency (ν) is called electromagnetic spectrum. The range varies from 10^{-12} m to 10^4 m, i.e. from γ -rays to radiowaves.

Electromagnetic Spectrum

Bohr's Model of Hydrogen Like Atoms

Bohr combined classical and early quantum concepts and gave his theory in the form of three postulates as given below

First postulate An electron in an atom could revolve in certain stable orbit without the emission of radiant energy, contrary to the predictions of electromagnetic theory.

Second postulate The electron revolves around the nucleus only in those orbits for which the angular momentum is some integral multiple of $h/2\pi$, where h is the Planck's constant.

The angular momentum, $L = \frac{n \cdot h}{2\pi}$
 $mvr = \frac{nh}{2\pi}$ [$\because L = mvr$]

where, $n = 1, 2, 3, \dots$

Third postulate An electron might make a transition from one of its specified non-radiating orbit to another of lower energy. When it does, so a photon is emitted having energy equal to the energy difference between the initial and final states.

$$h\nu = E_i - E_f$$

where, E_i and E_f are the energies of the initial and final states and $E_i > E_f$

Condition of Circular Orbit

The atoms consist of central nucleus, containing the entire positive charge and almost all the mass of the atom. The necessary centripetal force for circular orbits is provided by coulomb attraction between the electron and nucleus.

$$\frac{mv^2}{r} = \frac{1}{4\pi\epsilon_0} \frac{Ze^2}{r^2}$$

- Condition for quantisation, $mvr = \frac{nh}{2\pi}$.
- Radius of n th orbit (from above two equations)

$$r_n = \frac{\epsilon_0 h^2 n^2}{\pi m Z e^2} = 0.53 \frac{n^2}{Z} \text{ \AA} = \frac{n^2}{Z} r_0$$

where, $r_0 = 0.53 \text{ \AA}$

- Size of an atom is approx 1 \AA.
- Speed of electron in n th orbit,

$$v_n = \frac{e^2}{2\epsilon_0 h} \frac{Z}{n} = \frac{c}{137} \frac{Z}{n} \quad [\text{where, } c = \text{speed of light}]$$

- KE is $E_K = \frac{1}{4\pi\epsilon_0} \cdot \frac{Ze^2}{2r}$
- PE is $U = -\frac{1}{4\pi\epsilon_0} \cdot \frac{Ze^2}{r}$
- Total energy = $-\frac{1}{4\pi\epsilon_0} \cdot \frac{Ze^2}{2r}$
- Condition of transition, $h\nu = E_1 - E_2$

Frequency of emitted radiation is

$$\nu = \frac{E_1 - E_2}{h} = Z^2 R c \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

- Wave number, $\bar{\nu} = \frac{1}{\lambda} = R Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$

Series

The atomic hydrogen emits spectrum consisting of various series. The frequency of a line in a series can be expressed as a difference of two terms

(i) **Lyman series** $\frac{1}{\lambda} = R \left(\frac{1}{1^2} - \frac{1}{n^2} \right)$, where $n = 2, 3, 4, 5, \dots$
[ultraviolet region]

(ii) **Balmer series** $\frac{1}{\lambda} = R \left(\frac{1}{2^2} - \frac{1}{n^2} \right)$, where $n = 3, 4, 5, 6, \dots$

[visible region]

(iii) **Paschen series** $\frac{1}{\lambda} = R \left(\frac{1}{3^2} - \frac{1}{n^2} \right)$, where $n = 4, 5, 6, 7, \dots$
[infrared region]

(iv) **Brackett series** $\frac{1}{\lambda} = R \left(\frac{1}{4^2} - \frac{1}{n^2} \right)$, where $n = 5, 6, 7, 8, \dots$
[infrared region]

(v) **Pfund series** $\frac{1}{\lambda} = R \left(\frac{1}{5^2} - \frac{1}{n^2} \right)$, where $n = 6, 7, 8, 9, \dots$
[infrared region]

> PRACTICE EXERCISE

- The neutron, proton, electron and alpha particles are moving with equal kinetic energies. How can the particles be arranged in the increasing order of their velocities?
 (a) Alpha particle-neutron-proton-electron
 (b) Proton-electron-neutron-alpha particle
 (c) Electron-proton-neutron-alpha particle
 (d) Neutron-proton-electron-alpha particle

- Cathode rays were discovered by
 (a) Millikan (b) Rutherford
 (c) W. Crookes (d) J.J. Thomson
- Cathode rays are deflected by
 (a) Neither electric field nor magnetic field
 (b) Both electric field and magnetic field
 (c) Only electric field
 (d) Only magnetic field
- Cathode rays are
 (a) electromagnetic wave
 (b) positively charged
 (c) negatively charged
 (d) neutral

- Which one of the following will be deflected by electric field?
 (a) Ultraviolet rays (b) X-rays
 (c) γ -rays (d) Cathode rays
- Cathode rays have velocity
 (a) either less or greater than velocity of light c
 (b) less than velocity of light c
 (c) equal to velocity of light c
 (d) greater than velocity of light c
- Positive rays were discovered by
 (a) Bragg's
 (b) Aston
 (c) Goldstein
 (d) Thomson

8. The phenomenon of photoelectric effect was explained by
 (a) Bohr (b) Einstein
 (c) Maxwell (d) Planck
9. Photoelectrons are emitted when
 (a) a zinc plate is irradiated with light
 (b) a zinc plate is subjected to high pressure
 (c) a zinc plate is hammered
 (d) a zinc plate is heated
10. The work function for photoelectric effect
 (a) is different for different metals
 (b) is same for all metals
 (c) depends upon the frequency of light
 (d) None of the above
11. Einstein was awarded noble prize for his
 (a) explanation of photoelectric effect
 (b) unified field of theory
 (c) general theory of relativity
 (d) special theory of relativity
12. The photoelectric effect is based on the law of conservation of
 (a) angular momentum
 (b) linear momentum
 (c) linear mass (d) energy
13. The momentum of a photon of wavelength λ is given by
 (a) $\frac{1}{h\lambda}$ (b) $\frac{\lambda}{h}$ (c) $\frac{h}{\lambda}$ (d) $h\lambda$
14. The rest mass of a photon of wavelength λ is
 (a) hc/λ (b) h/λ (c) $h/c\lambda$ (d) zero
15. Conversion of light energy into electrical energy is achieved in a
 (a) cloud chamber (b) thermocouple
 (c) photocell (d) coolidge tube
16. Of the following properties, the photon does not possess
 (a) frequency (b) momentum
 (c) energy (d) rest mass
17. Electrons in the atom are held due to
 (a) van der Waals' forces
 (b) gravitational forces
 (c) nuclear forces
 (d) coulomb forces
18. According to Bohr's atomic model, the electron revolve around the nucleus in
 (a) stationary elliptical orbit
 (b) radiating circular orbit
 (c) stationary circular orbit
 (d) arbitrary circular orbit
19. Molecular weight of heavy water used as a moderator in nuclear reactor is
 (a) 10 (b) 18 (c) 22 (d) 16
20. The wave nature of matter was first discovered by
 (a) C.V. Raman
 (b) Davison and Germer
 (c) de-Broglie (d) J. J. Thomson
21. The speed of electron in the orbit of hydrogen atom in ground state is
 (a) c (b) $c/2$ (c) $c/10$ (d) $c/137$
22. Compton effect is associated with
 (a) positive rays (b) β -rays
 (c) X-rays (d) visible rays
23. A cathode ray tube is operated at 2500 V. The speed of electron will be
 (a) 3×10^7 m/s (b) 1.5×10^7 m/s
 (c) 3.6×10^6 m/s (d) 6×10^7 m/s
24. The specific charge on an electron is
 (a) 1.759×10^{11} C / kg
 (b) 1.672×10^{-27} C / kg
 (c) 1.62×10^{10} C / kg
 (d) 9.11×10^{-21} C / kg
25. The value of retarding potential needed to stop the photoelectrons ejected from a metal surface of work function 1.2 eV with light of energy 2 eV is
 (a) 3.8 V (b) 1.8 V
 (c) 2.8 V (d) 0.8 V
26. Light of wavelength 4000 Å is incident on a metal plate whose work function is 2 eV. What is the maximum KE of emitted photoelectron?
 (a) 0.5 eV (b) 1.1 eV
 (c) 1.5 eV (d) 2.0 eV
27. The threshold frequency of potassium is 3×10^{14} Hz. The work function is
 (a) 0.5×10^{-19} J (b) 4×10^{-19} J
 (c) 2×10^{-19} J (d) 1.0×10^{-19} J
28. The energy of incident photon is 12.375 eV while the energy of scattered photon is 9.375 eV. Then, KE of recoil photon is
 (a) 21.75 eV (b) more than 3 eV
 (c) less than 3 eV (d) 3 eV
29. The energy of photon corresponding to the visible light of maximum wavelength is nearly
 (a) 7 eV (b) 3.2 eV
 (c) 1.6 eV (d) 1 eV
30. For light of wavelength 5000 Å, the photon energy is nearly 2.5 eV. For X-ray of wavelength 1 Å, the photon energy will be close to
 (a) $\left(\frac{2.5}{5000}\right)$ eV (b) $\left[\frac{2.5}{(5000)^2}\right]$ eV
 (c) $2.5 \times (5000)^2$ eV (d) $[2.5 \times 5000]$ eV
31. The radius of first Bohr's orbit of electron in hydrogen atom is ($e = 1.6 \times 10^{-19}$ C, $m = 9.1 \times 10^{-31}$ kg, $h = 6.6 \times 10^{-34}$ J-s)
 (a) 0.53 mm (b) 53 Å
 (c) 0.53 Å (d) 5.3 Å
32. The difference in angular momentum associated with the electron in the two successive orbits of hydrogen atom is
 (a) $\frac{h}{2\pi}$ (b) $\frac{2nh}{\pi}$
 (c) $\frac{h}{2}$ (d) $(n-1) \frac{h}{2\pi}$
33. The speed of electron in the ground state of hydrogen atom is
 (a) 2×10^6 m/s (b) 2×10^5 m/s
 (c) speed of sound (d) zero
34. The recoil speed of a hydrogen atom after it emits a photon in going from $n = 5$ state to $n = 1$ state is (Rydberg's constant $R = 1.097 \times 10^7$ /m)
 (a) 4.18 m/s (b) 5.18 m/s
 (c) 6.18 m/s (d) 3.18 m/s
35. Ratio of energy of orbital electron in 4th orbit and 5th orbit of hydrogen atom is
 (a) 4 : 5 (b) 5 : 4
 (c) 25 : 16 (d) 16 : 25
36. First spectral line of sodium atom is 5890 Å, the first excitation potential is
 (a) 10.2 eV (b) 4.1 eV
 (c) 3.7 eV (d) 2.1 eV
37. The frequency of first line of Balmer series in hydrogen atoms is ν_0 jumps, then the frequency ν of the line emitted by doubly ionised lithium atom (Li^{2+}) is
 (a) $\nu_0/9$ (b) $9\nu_0$ (c) $4\nu_0$ (d) $2\nu_0$
38. If the distance of 100 W bulb is increased from a photocell, then the saturation current in the photocell varies with distance d as
 (a) $i \propto \frac{1}{d^2}$ (b) $i \propto d^2$
 (c) $i \propto d$ (d) $i \propto \frac{1}{d}$
39. A potential difference of 42000 V is used in an X-ray tube to accelerate electrons. The maximum frequency of X-rays produced is ($e = 1.6 \times 10^{-19}$ C and $h = 6.63 \times 10^{-34}$ J-s)
 (a) 10^{20} (b) 10^{16} (c) 10^{18} (d) 10^{19}

40. The largest distance between the interatomic planes of a crystal is 10 \AA . What is the upper limit for wavelength of X-rays, which can be usefully studied with this crystal?
(a) 20 \AA (b) 40 \AA (c) 30 \AA (d) 10 \AA
41. If K_α radiation of $M_0 (Z = 42)$ has a wavelength of 0.71 \AA . Calculate the wavelength of the corresponding radiation of Cu ($Z = 29$)
(a) 1.52 \AA (b) 2.0 \AA (c) 3.52 \AA (d) 2.52 \AA
42. Consider the following statements
- Gamma rays are not constituents of nuclei but they are emitted when a nucleus in an excited state returns to its normal state.
 - The neutron to proton ratio for stable nuclei is always less than one.
 - Beta rays consists of ordinary electrons which are of nuclear origin but do not revolve in orbits.
 - Both X-rays and γ -rays are electromagnetic radiations. Of the above statements

- (a) 1, 2 and 3 (b) 2, 3 and 4
(c) 1, 3 and 4 (d) 1, 2 and 4

> Previous Years' Questions

43. The penetrating power of X-rays can be increased by \checkmark 2012 (I)
- increasing the current in the filament
 - decreasing the potential difference between the cathode and the anode
 - decreasing the current in the filament
 - increasing the potential difference between the anode
44. Which one among the following transitions of hydrogen atom emits radiation of the shortest wavelength? \checkmark 2012 (I)
- $n = 2$ to $n = 1$
 - $n = 3$ to $n = 2$
 - $n = 4$ to $n = 3$
 - $n = 5$ to $n = 4$
45. Which one among the following transitions is associated with the largest change in energy in hydrogen atom? \checkmark 2012 (II)
- $n = 5$ to $n = 3$
 - $n = 2$ to $n = 1$
 - $n = 3$ to $n = 2$
 - $n = 4$ to $n = 2$
46. Light waves are \checkmark 2014 (II)
- electromechanical waves
 - electromagnetic waves
 - electrooptical waves
 - magneto-optical waves
47. The working of a microwave oven involves \checkmark 2014 (II)
- absorption of microwaves by matter
 - reception of microwaves by optical fibre
 - microwave amplification by stimulated emission of radiation
 - transmission of microwaves through a metal
48. Which one of the following statements is not correct? \checkmark 2015 (II)
- The Kelvin scale of temperature is called the absolute scale
 - Visible light radiation has wavelength range of $400\text{-}700 \text{ nm}$
 - The capacity to do work is called power
 - The wavelength of Gamma rays is less than that of X-rays
49. X-rays are electromagnetic radiation whose wavelengths are of the order of \checkmark 2015 (II)
- 1 m
 - 10^{-1} m
 - 10^{-5} m
 - 10^{-10} m

> Solutions

25. (d) \therefore Retarding potential,
 $eV_0 = h\nu - h\nu_0 = 2 - 1.2 = 0.8 \text{ eV}$
 $\Rightarrow V_0 = 0.8 \text{ V}$

26. (b) Given, wavelength, $\lambda = 4000 \text{ \AA}$,
work function, $W_0 = 2 \text{ eV}$
 $\therefore K_{\max} = \left(\frac{hc}{\lambda} - W_0 \right)$
 $= \left(\frac{6.6 \times 10^{-34} \times 3 \times 10^8}{4000 \times 10^{-10}} - 2 \times 1.6 \times 10^{-19} \right)$
 $= (4.95 \times 10^{-19} \text{ J} - 2 \text{ eV})$
 $= (3.09 \text{ eV} - 2 \text{ eV}) = 1.1 \text{ eV}$

27. (c) $\therefore W = h\nu_0 = 6.626 \times 10^{-34} \times 3 \times 10^{14}$
[$\therefore \nu_0 = 3 \times 10^{14}$]

$$= 19.878 \times 10^{-20} \text{ J} = 1.98 \times 10^{-19} \text{ J}$$

$$= 2 \times 10^{-19} \text{ J}$$

28. (d) The KE for recoil photon = KE
incident + KE scattered
 $= 12.375 \text{ eV} - 9.375 \text{ eV} = 3 \text{ eV}$

30. (d) Given, $\lambda_1 = 5000 \text{ \AA}$, $\lambda_2 = 1 \text{ \AA}$
 $\therefore E \propto \frac{1}{\lambda} \Rightarrow \frac{E_2}{E_1} = \frac{\lambda_1}{\lambda_2} = \frac{5000}{1}$
 $E_2 = (5000)E_1 = (2.5 \times 5000) \text{ eV}$

39. (d) Given, $V = 42000 \text{ V}$
 $\therefore eV = h\nu_{\max}$
 $\nu_{\max} = \frac{eV}{h} = \frac{1.6 \times 10^{-19} \times 42000}{6.63 \times 10^{-34}} = 10^{19}$

40. (a) By Bragg's law, $2d \sin \theta = n\lambda$
 $\Rightarrow \lambda = \frac{2d \sin \theta}{n}$

$$\lambda_{\max} = 2d = 2 \times 10 \text{ \AA} = 20 \text{ \AA}$$

41. (a) $\therefore \lambda \propto \frac{1}{(Z-1)^2} \Rightarrow \frac{\lambda_1}{\lambda_2} = \frac{(Z_2-1)^2}{(Z_1-1)^2}$
 $\frac{0.71}{\lambda_2} = \frac{(29-1)^2}{(42-1)^2} = \frac{(28)^2}{(41)^2}$
 $\Rightarrow \lambda_2 = 1.52 \text{ \AA}$

49. (d) Mostly X-ray have a wavelength ranging from 0.01 nm to 10 nm .

$$\therefore 1 \text{ nm} = 10^{-9} \text{ m}$$

$$\therefore 0.1 \text{ nm} = 10^{-10} \text{ m}$$

PHYSICAL AND CHEMICAL CHANGES

Generally 1-2 questions are asked from this chapter. Questions from this chapter are mostly based upon the facts about physical and chemical changes.

There are some changes during which no new substances are formed whereas during some other changes new substances are formed. Therefore on this basis we can classify all the changes into two groups- physical changes and chemical changes.

1. Physical Changes

A physical change is a change in which the composition of a substance is not affected, i.e. no new substance is formed. e.g. Interconversion of states is a physical change because these changes occur without a change in composition and no change in the chemical nature of the substance.

When an ordinary piece of iron is magnetised in the presence of a strong magnetic field. Here the colour, density, mass and the composition remains the same. Hence, magnetisation is a physical change. The physical changes are reversible. Magnetisation can be reversed by heating the piece of iron.

Evaporation, distillation, sublimation, condensation and crystallisation are examples of physical changes.

The blue colour of copper sulphate crystal disappears when it is heated strongly because on heating water of crystallisation of crystal is lost. It regains its blue colour when moistened with a drop of water.

It is an example of a physical change.

Some facts about the physical changes are

- (i) Physical changes are temporary and reversible.
- (ii) Composition of the constituent of matter remains same during physical change i.e. constituent particles of matter does not change.
- (iii) Physical changes are due to the change in physical properties like density, volume, state temporarily.

► Note

- Amount of space that a substance or object occupies is called volume of that substance.
- Density is the degree of compactness of a substance. It is defined as mass per unit volume.

$$\text{i.e. Density} = \frac{\text{Mass}}{\text{Volume}}$$

2. Chemical Changes

These changes result in the formation of new substances. In a chemical change, the composition and molecular structure of the substance undergoing changes are considered.

e.g. When a piece of iron or nail is left in moist air for a long time, it rusts and gives a reddish brown look. During rusting process iron combines with oxygen to give a new product.

Here rusting, is a chemical change which cannot be reversed back by any physical process. As we eat food, the digestion of food starts from the mouth and during this process many chemical changes take place in the stomach.

The complex food material gets converted into simple molecules of glucose which is oxidised in the body cells to release energy.

Similarly, burning of any substance is a chemical change. Burning is always accompanied by the production of heat. Explosion of a fire work is also a chemical change (heat, light, sound and unpleasant gases are produced in explosion).

Blue copper sulphate crystals on heating loses its all water molecules giving white anhydrous salt which decomposes into black cupric oxide and sulphur trioxide on strong heating.

► Note

- Burning of a candle is an example of both physical and chemical changes.
- Ozone is decomposed to oxygen in the presence of ultraviolet rays. It is an example of chemical change.

Some facts about the chemical changes are

- (i) During chemical changes, the composition of the substance changes due to change in constituent particles of substance.
- (ii) Identity of the substance is lost during a chemical change.
- (iii) Energy is absorbed or released during a chemical change.
- (iv) Chemical change is permanent and irreversible.

► PRACTICE EXERCISE

- Which of the following is a true statement about the physical change?
 - Physical changes are temporary changes and can be reversed
 - During physical changes the composition of constituents molecule changes.
 - Energy is absorbed or released during a physical change
 - Identity of the substance is lost after the physical change
- Which of the following is not a chemical change?
 - Combustion of fuel
 - Electrolysis of acidified water
 - Oxidation reaction of cells at anode
 - Glowing of a platinum wire
- Which of the following is a physical change?
 - Oxidation
 - Reduction
 - Both (a) and (b)
 - None of these
- Which of the following is a physical change?
 - Formation of curd
 - Burning of candle
 - Rusting of iron rod
 - Heating of copper wire by electricity
- Which of the following is a chemical change?
 - Heating of iron to red hot
 - Magnetisation of iron piece
 - Rusting of iron
 - All of the above
- Which of the following is a chemical change?
 - Evaporation
 - Dissolution
 - Sublimation
 - Precipitation
- Which of the following is always accompanied during a chemical change?
 - Evolution of light
 - Evolution or absorption of heat
 - Evolution of heat only
 - Absorption of heat only
- Which of the following substances undergo chemical changes on heating?
 - Sodium chloride
 - Silica
 - Lead nitrate
 - Platinum wire
- Which one among the following is a chemical process?
 - Distillation of sea (salty) water
 - Crystallisation of impure salt (NaCl)
 - Production of iodine (I₂) from seaweeds
 - Sublimation of iodine (I₂)
- Which among the following is a chemical change?
 - A wet towel dries in the sun
 - Lemon juice added to tea causing its colour to change
 - Hot air rises over a radiator
 - Coffee is brewed by passing steam through ground coffee
- Any change in matter that results in the disappearance of one or more substances and the appearance of one or more substances, each having its own set of intensive properties is known as
 - extrinsic change
 - intrinsic change
 - physical change
 - chemical change
- Heating of a substance results in
 - a physical change
 - a chemical change
 - a physical or a chemical change
 - None of the above
- An endothermic reaction is accompanied by
 - evolution of light and water
 - evolution of heat
 - absorption of heat
 - None of the above
- Combustion of a candle is a/an
 - physical change
 - reduction reaction
 - endothermic reaction
 - exothermic reaction
- Which of the following represent a physical change?
 - Cutting of carrot into pieces.
 - Separation of iron and sulphur from their mixture
 - Formation of salt from sea-water

Codes

 - I and II
 - II and III
 - I and III
 - All of these
- Which of the following represent both physical and chemical change?
 - Burning of candle
 - Burning of methane
 - Decomposition of salt

Codes

 - I and II
 - II and III
 - I and III
 - Only I

Directions (Q. Nos. 17-19)

Following questions consist of two statements, I and II. Examine these two statements and select the correct choice according to the codes given below.

- (a) Both the statements are true and Statement II is the correct explanation of Statement I
 (b) Both the statements are true but Statement II is not the correct explanation of Statement I
 (c) Statement I is true, but Statement II is false
 (d) Statement I is false, but Statement II is true

17. Statement I Sublimation of NH_4Cl is a chemical change.

Statement II Sublimation is a phenomenon in which a solid on heating directly changes into gas without changing to liquid.

18. Statement I Emission of light from stars is a chemical change.

Statement II Source of light from stars is nuclear fission reactions.

19. Statement I Making of soda water by dissolving carbon dioxide in water is a chemical change.

Statement II A change in which chemical composition remains same is called physical change.

20. Which of the following processes related to physical change?

- I. Salt dissolved in water.
 II. Dissociation of salt in water
 III. Decomposition of salt by electrolysis

Codes

- (a) I and II (b) II and III
 (c) I and III (d) All of these

21. Which of the following represent a chemical change?

- I. Magnetisation of iron
 II. Condensation of liquid
 III. Burning of fuel
 IV. Rusting of iron

Codes

- (a) I and II (b) II and III
 (c) III and IV (d) I and IV

22. Which of the following processes related to chemical change?

- I. Movement of free electrons in copper wire.
 II. Electric current passes through copper wire.

III. Electric current passes through NaCl aqueous solution.

Codes

- (a) I and II
 (b) II and III
 (c) I and III
 (d) III only

23. Which of the following processes responsible for chemical change?

- I. Electrolysis II. Sublimation
 III. Corrosion IV. Decomposition

Codes

- (a) I and II
 (b) II and III
 (c) III and IV
 (d) I, III and IV

24. Which of the following changes are chemical changes?

- I. Burning of candle
 II. Breaking of chalk
 III. Melting of wax
 IV. Formation of water from hydrogen and oxygen.

Codes

- (a) I and II (b) II and III
 (c) III and IV (d) I and IV

25. Match the following

List I	List II
A. Formation of cloud	1. Dissolution of salt
B. Formation of acid rain	2. Rusting
C. Corrosion of iron	3. Chemical change
D. Physical process	4. Physical change

Codes

- A B C D A B C D
 (a) 4 3 2 1 (b) 1 2 3 4
 (c) 1 3 4 2 (d) 4 2 3 1

> Previous Years' Questions

Directions (Q. Nos. 26-27) Following questions consist of two statements, I and II. Examine these two statements and select the correct choice according to the codes given below.

- (a) Both the statements are true and Statement II is the correct explanation of Statement I.
 (b) Both the statements are true but Statement II is not the correct explanation of Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.

26. Statement I Conversion of blue copper sulphate to black cupric oxide on heating is a physical change.

Statement II A change in which chemical composition does not change is called physical change.

☑ 2012 (I)

27. Statement I The blue colour of copper sulphate crystal disappears when it is heated strongly.

Statement II Due to heating water of crystallisation of crystal is lost.

☑ 2012 (I)

28. Which one among the following is not a chemical change? ☑ 2013 (I)

- (a) Curdling of milk (b) Ripening of fruits
 (c) Evaporation of water
 (d) Burning of coal

29. A sample of carbon dioxide that undergoes a transformation from solid to liquid and then to gas would undergo ☑ 2014 (II)

- (a) a change in mass
 (b) a change in density
 (c) a change in composition
 (d) no change in physical properties

30. Which one of the following is not a chemical change? ☑ 2016 (I)

- (a) Ripening of fruits
 (b) Curdling of milk
 (c) Freezing of water
 (d) Digestion of food

02

ELEMENTS, MIXTURES AND COMPOUNDS

Usually 2-3 questions are asked from this chapter. Questions are mostly based upon the states of matter and also on the basic knowledge of element, compound and mixture.

MATTER

Anything that occupies space and possesses mass is termed as **matter**.

Matter is made up of small particles. There are intermolecular spaces between the constituent particles of matter. The matter may be classified as follows:

- (i) **Physical classification** *Matter may be classified into five states:* Solids, liquids, gases, plasma and Bose-Einstein condensate. Plasma and Bose-Einstein condensate states can be seen in specific conditions.
- (ii) **Chemical classification** *Matter may be classified into*
 - (a) pure substances (elements and compounds)
 - (b) mixtures

States of Matter

Almost all substances exist in three states under appropriate conditions of temperature and pressure.

1. Solids

Characteristics of solids are as follows:

- (i) Solids have a definite shape and a definite volume.
- (ii) Intermolecular forces operating between the molecules are very strong due to which their positions are fixed. Molecules can only vibrate to and fro about their mean position.

- (iii) Molecules are closely packed and associated with minimum energy.

→ Note

- The melting point of a solid is an indication of strength of intermolecular forces of attraction.
- Melting point of a solid \propto strength of intermolecular forces.

Solids can be of the following two types:

- (i) **Amorphous solids** Constituent particles do not possess the orderly arrangement over the long range. e.g. glass, rubber and plastic etc. Glass is a supercooled liquid.
- (ii) **Crystalline solids** Constituent particles are arranged in an orderly arrangement over the long range. e.g. graphite, diamond, NaCl etc.

Crystalline solids can be further classified as:

- (a) **Ionic solids** Constituent particles are ions and interparticle forces are strong electrostatic forces of attraction, e.g. NaCl, BaCl₂, ZnS.
- (b) **Metallic solids** Constituent particles are positively charged kernels and free electrons. Interparticle forces are metallic bonds. e.g. Fe, Cu, Al etc.
- (c) **Covalent solids** Constituent particles are atoms and interparticle forces are strong covalent bonds. e.g., diamond, quartz, SiO₂.
- (d) **Molecular solids** Constituent particles are molecules and interparticle forces are hydrogen bonds or van der Waals' forces. e.g. solid CO₂, I₂ etc.

2. Liquids

Characteristics of liquids are as follows:

- (i) Liquids have no definite shape but have a definite volume.
- (ii) Intermolecular forces operating between the molecules are weak due to which they can slide over one another but cannot escape the boundary in normal conditions.
- (iii) Molecules are closely packed and associated with intermediate energy due to motion.

3. Gases

Characteristics of gases are as follows:

- (i) Gases have neither definite shape nor volume.
- (ii) Intermolecular forces operating between the molecules are very weak due to which their positions are not fixed and thus, they can move freely.
- (iii) Molecules are wide apart and are associated with maximum energy.
- (iv) Gases exert pressure on the walls of the container due to collision of molecules with the walls of the container.

➤ **Note** Compressibility depends upon the intermolecular spaces between the particles of matter. $\text{Compressibility} \propto \text{intermolecular spaces}$
Solid < liquid < gas

CHANGE IN STATE AND LATENT HEAT

The conversion of a substance from one state to another state at a definite temperature is known as change in state. The state of substance can be changed by changing temperature or pressure.

e.g. Solid state $\xrightleftharpoons[\text{cool}]{\text{heat}}$ Liquid state $\xrightleftharpoons[\text{cool}]{\text{heat}}$ Gaseous state

During the change in state the temperature of the substance does not change but internal potential energy of molecules change. (kinetic energy of molecules remain same).

The amount of heat energy required by a substance from one state to another state at atmospheric pressure is called latent heat of that substance.

Terms Related to Change of State

Melting point The temperature at which a solid melts to become a liquid at the atmospheric pressure is called its melting point. When a solid melts, its temperature remains the same. Melting point of those substances which contract upon melting reduces on increasing pressure. On the other hand melting point of those substances which expand upon melting increases with increasing pressure.

Freezing point The temperature at which a liquid becomes solid at the atmospheric pressure is called its freezing point.

Boiling point The temperature at which a liquid starts boiling at the atmospheric pressure is called its boiling point. Boiling is a bulk phenomenon. Boiling point of water increases in presence of impurities in the water. Boiling point increases on increasing pressure upon liquid that's why food cooks comparatively faster in pressure cooker.

PURE SUBSTANCES

These substances have fixed composition and non-variable properties.

These can not be separated into simple substances by physical methods. Elements and compounds are pure substances.

1. Elements

An element is a substance which cannot be split up into two or more simpler substances by the usual chemical methods of applying heat, light or electric energy.

There are 118 elements known at present, out of which 92 elements occur in nature, while remaining 26 elements have been prepared artificially except one.

Elements may be found in all the three forms as solid, liquid or gas.

Solid Sodium (Na), carbon (C), aluminium (Al) etc.

Liquid Mercury (Hg), bromine (Br) etc.

Gas Oxygen (O₂), hydrogen (H₂) etc.

Elements are divided in the following forms:

- (i) **Metals** The elements which have a tendency to form positive ions by loss of electrons are called metals, e.g. silver, tin, zinc etc. Metals are the elements having lustre, ductility, malleability, conductivity etc. All metals except mercury exists as solids at room temperature. Oxides of metals are basic or amphoteric in nature. Aluminium is the most abundant metal in the earth's crust.
- (ii) **Non-metals** The elements which have a tendency to form negative ion by gain of electrons are called non-metals. e.g. hydrogen, oxygen, sulphur etc. They are in solid or gaseous form under normal conditions except bromine which exists as liquid. Oxides of non-metals are neutral (in low oxidation state) or acidic (in higher oxidation state) in nature.
- (iii) **Metalloids** They are the elements whose properties fall between those of metals and non-metals. e.g. boron (B), silicon (Si), germanium (Ge), arsenic (As), antimony (Sb), tellurium (Te) and polonium (Po) etc.

Symbols Derived from Latin Name of the Elements

English name of the element	Latin name of the element	Symbol
Copper	Cuprum	Cu
Gold	Aurum	Au
Iron	Ferrum	Fe
Lead	Plumbum	Pb
Mercury	Hydrargyrum	Hg
Potassium	Kalium	K

English name of the element	Latin name of the element	Symbol
Silver	Argentum	Ag
Sodium	Natrium	Na
Tin	Stannum	Sn
Tungsten	Wolfram	W

2. Compounds

A compound is a substance made up of two or more elements chemically combined in a fixed proportion by weight, e.g. water, NaCl, NH_4OH and CO_2 etc.

Silicon (Si) is an element and silica (SiO_2) is a compound.

Properties of Compounds

Following are the main properties of compounds:

- A compound cannot be separated into its components by physical methods.
- The properties of a compound are entirely different from those of its constituent elements.
- The composition of a compound is fixed, i.e. the constituents are present in fixed proportion by weight.
- Compounds have fixed melting point, boiling point etc.
- A compound is a homogeneous substance.

MIXTURES

A mixture is a substance which consists of two or more elements or compounds not chemically combined together. e.g. air, milk, ink, brine, lime water, glass, paints, soil, food, wood, kerosene etc.

There are two types of mixtures, which are as follows

1. Homogeneous Mixture or Solution

A homogeneous mixture has a same composition throughout its mass. It has no visible boundaries of separation between the various constituents, e.g. solution of sugar in water, alloy, solution of salt in water, a mixture of alcohol and water etc.

2. Heterogeneous Mixture

A heterogeneous mixture does not have a uniform composition throughout its mass. It has visible boundaries of separation between the various components, e.g. solution of $\text{K}_2\text{Cr}_2\text{O}_7$ in water, solution of CaCO_3 in water, solution of oil in water, gun powder, soil, etc.

- **Note** A mixture which boils at a definite temperature and distills over without any change in composition is called **azeotropic mixtures**. e.g. ethanol-water, acetone-benzene, benzene-chloroform etc.

Properties of a Mixture

Following are the main properties of a mixture:

- A mixture can be separated into its components by physical methods like, filtration, evaporation, sublimation, distillation, magnet etc.

- A mixture shows the properties of all the constituents present in it. Energy is usually neither given out nor absorbed during the preparation of a mixture.
- The composition of a mixture is variable, i.e. the constituents can be present in any proportion by weight.
- A mixture does not have a definite melting point, boiling point etc. (except azeotropic mixture).

Methods for Separation of Mixture

General methods used for the separation of a mixture are as follows:

- Crystallisation** This method is based on the difference in the solubility of the various compound dissolved in a common solvent. e.g. a mixture of KNO_3 and NaCl can be separated by this process.
- By separatory funnel** This method is used to separate a mixture of two immiscible liquids. e.g. mixture of oil and water, extraction of iron from its ore.
- Sublimation** When a solid changes directly from solid to gaseous state on heating, the process is known as sublimation. This process is used to separate such mixtures that contain a sublimable volatile component from a non-sublimable impurity. This process is generally used for the separation of naphthalene, anthracene, benzoic acid, camphor, NH_4Cl , iodine etc. **Iodine** (I_2) is the only halogen which sublimes. NH_4Cl sublimes due its decomposition.
- Distillation** This method is used for the purification of liquids which boils without decomposition and contain non-volatile impurities. e.g. pure water can be obtained from sea water by distillation, mixture of ether and toluene, benzene and aniline, etc.
- Fractional distillation** This process is used to separate a mixture of two or more miscible liquids which possess their boiling points within the limit of 10 to 15 K. e.g. petrol, diesel, kerosene.
- Distillation under reduced pressure** This process is used for those liquids which decomposes below their boiling point under reduced pressure, liquid boils at low temperature. Hence, the temperature for decomposition is not reached. Thus, this process is known as **vacuum distillation**, e.g. glycerol can be separated by this method. It is also used for the concentration of sugar cane juice in sugar industry.
- Steam distillation** It is used for the separation and purification of liquids which are appreciably volatile in steam from non-volatile components of mixture, e.g. *o*-nitrophenol and *p*-nitrophenol are separated by this method. Aniline is also purified by this method.
- Evaporation** It is the process by which soluble solids can be obtained from their solution by allowing the solvent to vaporise, e.g. salt can be obtained from salt solution by evaporation.

- (ix) **Chromatography** It is a modern method proposed by Tswett in 1903. This method is based on the difference in the rates at which the components of a mixture are adsorbed on a suitable adsorbent.
This method has been used
(a) to separate *o* and *p*-nitrophenol,
(b) to separate blue and red dyes,
(c) to separate plant pigments and other natural products.
- (x) **Atmolysis** It is used for separating the mixture of gases. This method is based on the difference in their rates of diffusion.
 $^{235}\text{UF}_6$ and $^{238}\text{UF}_6$ can be separated by this method.
- (xi) **Dialysis** The process of separating the colloidal particles from those of crystalloids by diffusion of mixture through a parchment or animal membrane is known as dialysis e.g. A ferric hydroxide sol can be purified by this method.

> PRACTICE EXERCISE

- The most abundant gas in the atmosphere is
(a) nitrogen (b) oxygen
(c) helium (d) carbon dioxide
- Which one of the following is most abundant metallic element?
(a) Aluminium (b) Iron
(c) Gold (d) Silver
- An element which is not found in nature is
(a) Pt (b) K
(c) Zn (d) Pu
- Which one of the following is not a mixture?
(a) Air (b) Mercury
(c) Milk (d) Cement
- Which one among the following is an element?
(a) Graphite (b) Glass
(c) Brass (d) Steel
- Metalloids are
(a) alloys of alkali metals with other metals
(b) colloids of metals
(c) element having some properties of metals and non-metals
(d) metals heavier than lead
- Purest form of iron is
(a) cast iron (b) pig iron
(c) steel (d) wrought iron
- Magnesium is present in
(a) haemoglobin (b) chlorophyll
(c) vitamin B₁₂ (d) ascorbic acid
- Match list I with list II and select the correct answer from the codes given below the lists.

List I (Element)	List II (Symbol)
A. Thallium	1. Tm
B. Thorium	2. Tl
C. Thulium	3. Tb
D. Terbium	4. Th

Codes

A	B	C	D	A	B	C	D
(a) 2	4	3	1	(b) 2	4	1	3
(c) 1	3	2	4	(d) 4	2	1	3
- Which of the following is neither an element nor a compound?
(a) Air (b) Water
(c) Mercury (d) Sodium chloride
- LPG (Liquefied petroleum gas) is a
(a) mixture (b) compound
(c) element (d) None of these
- A student by chance mixed acetone with alcohol. This mixture of acetone and alcohol can be separated by
(a) filtration
(b) separating funnel
(c) fractional crystallisation
(d) fractional distillation
- Tinstone and wolframite is separated by
(a) magnetic method
(b) atmolysis
(c) chromatography
(d) None of the above
- A mixture of $^{235}\text{UF}_6$ and $^{238}\text{UF}_6$ is separated by
(a) sublimation (b) filtration
(c) atmolysis (d) None of these
- The boiling points of two miscible liquids X and Y are close to each other. Their separation is best carried out by
(a) simple distillation
(b) vacuum distillation
(c) steam distillation
(d) None of the above
- Which of the following are correctly matched with the method used for separating them?
I. Lanthanides—chromatography
II. H₂O and CCl₄—steam distillation
III. Glycerine and H₂O—vacuum distillation
IV. Phenol and benzoic acid—separating funnel
Codes
(a) Only III (b) I and III
(c) Only IV (d) IV and I
- A mixture containing SiO₂, NaCl and NH₄Cl is taken for separating the constituents. The suitable steps required for this are
(a) sublimation-dissolution filtration crystallisation
(b) dissolution-filtration-crystallisation distillation
(c) sublimation-evaporation-dissolution decomposition
(d) dissolution-distillation-decomposition-evaporation

- 18.** Steam distillation is used to separate
 (a) lemon oil
 (b) sandal wood oil
 (c) aniline
 (d) All of the above
- 19.** A mixture that can be separated by the sublimation method is
 (a) $\text{MgCl}_2 + \text{NaCl}$ (b) $\text{HgCl}_2 + \text{NaCl}$
 (c) $\text{AgCl} + \text{NaCl}$ (d) $\text{BaCl}_2 + 2\text{NaCl}$
- 20.** Iodine is separated from sand by
 (a) sublimation
 (b) chromatography
 (c) crystallisation
 (d) evaporation
- 21.** A mixture of methanol and acetone is separated by
 (a) fractional distillation
 (b) steam distillation
 (c) vacuum distillation
 (d) None of the above
- 22.** A mixture of red and blue ink can be separated by
 (a) distillation
 (b) crystallisation
 (c) chromatography
 (d) sublimation
- 23.** Choose the correct statements using the codes given below.
 I. Impure glycerine is purified by vacuum distillation.
 II. Glycerine dissolves in water.
 III. Water is a homogeneous mixture of hydrogen and oxygen.
Codes
 (a) I and II (b) II and III
 (c) I and III (d) All of these
- 24.** Chromatography is used to separate
 (a) plant pigment
 (b) blue and red ink
 (c) *o* and *p*-nitrophenol
 (d) All of the above
- 25.** In column chromatography, the substance obtained in the top most region of column is
 (a) maximum adsorbed
 (b) minimum adsorbed
 (c) have maximum rate of diffusion
 (d) have the highest molecular weight
- 26.** During fractional distillation, the substance with
 (a) lower boiling point is obtained first
 (b) higher boiling point is obtained first
 (c) higher molecular weight is obtained first
 (d) lowest melting point is obtained first
- 27.** Dialysis is used for the purification of
 (a) suspensions
 (b) true solutions
 (c) homogeneous mixture
 (d) colloidal solution
- 28.** Solution of CaCO_3 in water forms a
 (a) homogeneous mixture
 (b) heterogeneous mixture
 (c) azeotropic mixture
 (d) None of the above
- 29.** Pure water is obtained from sea water by
 (a) filtration
 (b) distillation
 (c) evaporation
 (d) All of the above
- 30.** I_2 in water is extracted with the help of
 (a) chloroform
 (b) carbon tetrachloride
 (c) carbon disulphide
 (d) All of the above
- 31.** Which one of the following is not separated by sublimation?
 (a) Corrosive sublimate
 (b) Calomel
 (c) CuSO_4
 (d) Both (b) and (c)
- 32.** By decreasing pressure boiling point of a liquid
 (a) increases (b) decreases
 (c) may increase or decrease depending upon temperature of liquid
 (d) remains unchanged
- 33.** Water is a compound because
 (a) it exists as solid, liquid or gas
 (b) it contains hydrogen and oxygen
 (c) it contains two different elements joined by chemical bonds
 (d) it can be split up into simpler substance by chemical means
- 34.** Which one of the following is the most abundant compound?
 (a) H_2O (b) SiO_2 (c) Al_2O_3 (d) Air
- 35.** First organic compound which was prepared in laboratory is
 (a) methane (b) urea
 (c) formaldehyde (d) water
- 36.** Who prepared the first organic the compound in laboratory?
 (a) Dalton (b) Wohler
 (c) Kolbe (d) Berthelot
- 37.** Barium carbonate is a/an
 (a) compound (b) mixture
 (c) element (d) alloy
- 38.** Which one of the following is a compound?
 (a) Glass (b) Water gas
 (c) CNG (d) Plaster of Paris
- 39.** Which of the following is a compound?
 (a) Rhombic sulphur
 (b) Marble
 (c) Diamond
 (d) Quick silver
- 40.** False statement is
 (a) germanium is a semi-conductor
 (b) steel is an alloy
 (c) graphite is an element
 (d) the fundamental unit in silicates is Si_2O_3
- 41.** Match List I with List II and select the correct answer from the codes given below the lists
- | List I | List II |
|---------------------------------|--------------------------|
| A. Bronze | 1. Solution |
| B. CO_2 | 2. Compound |
| C. Mixture of oil and water | 3. Heterogeneous mixture |
| D. Mixture of water and alcohol | 4. Solid solution |

03

LAWS OF CHEMICAL COMBINATION AND GAS LAWS

In last 2-3 years only 1 question has been asked from this chapter, based upon the understanding of laws of chemical combination.

During the quantitative studies of chemical changes, the combination of elements to form compounds is governed by some basic laws, these are known as **Laws of chemical combination.**

Law of Conservation of Mass

This law establish the relationship between the masses of reactants and products during a chemical reaction. This law was postulated by **A. Lavoisier** in 1750.

This law states “During any physical or chemical change, the total mass of the products is equal to the total mass of the reactants.”

Or

“Matter can neither be created nor destroyed during any physical or chemical change”.

12 g carbon combines with 32 g oxygen to give 44 g carbon dioxide. This law may be explained with the help of Landolt’s experiments.

Law of Conservation of Mass in the Light of Modern Research

It is stated by modern research that mass can be converted into energy. There is some energy formed in each reaction, by which some mass has been lost. According to Einstein, mass and energy are related as $E = mc^2$

where, m = the mass of substance, c = velocity of light (3×10^8 m/s) and E = energy.

But in chemical reactions energy released or absorbed is too less, hence, the change in mass (decrease or increase) taking place becomes negligible. These changes can be clearly seen in nuclear reactions.

Law of Constant Composition

This law was stated by French chemist **Joseph Proust**. This law states that

“A sample of a pure chemical compound always consists same elements combined together in the same definite proportions by mass, whatever be its source”.

e.g. it is found by the analysis of water (take from various places like river, falls and wells) that in each sample of water, the ratio of hydrogen and oxygen is 2 : 16 or 1 : 8 by mass.

Law of Multiple Proportions

This law was proposed by **John Dalton**. It states that, “An element may form more than one compound with another element. For a given mass of an element, the masses of other elements (in two or more compounds) come in the ratio of small integers.”

e.g. in NH_3 , 14 g of nitrogen requires 3 g of hydrogen and in hydrazine (N_2H_4) 14 g of nitrogen requires 2 g of hydrogen.

Hence, fixed mass of nitrogen required hydrogen in the ratio 3 : 2 in two different compounds (3 : 2 is a simple ratio). Thus, this is in agreement with “law of multiple proportions”.

Law of Reciprocal Proportions

This law was proposed by **Richter** in 1792. This law is known as the law of equivalent proportions or law of combining weights. This law states that “When two different elements combine separately with the same weight of a third element the ratio in which they do so will be the same or some simple multiple of the ratio in which they combine with each other. e.g. carbon and sulphur react separately with oxygen (third element) to give carbon dioxide (CO₂) and sulphur dioxide (SO₂). They also react together to form carbon disulphide (CS₂).

Now, in carbon dioxide 12 parts by weight of carbon are combine with 32 parts by weight of oxygen and in sulphur dioxide (SO₂) 32 parts by weight of sulphur combine with 32 parts by weight of oxygen.

Ratio of weight of carbon and sulphur which combine with fixed weight (32 parts) of oxygen is

$$= 12 : 32 \text{ or } 3 : 8 \quad \dots(i)$$

In carbon disulphide, 12 parts of weight of carbon reacts with 64 parts by weight of sulphur. Hence, ratio of weight of carbon and sulphur in which they combines to form CS₂ is

$$= 12 : 64 \text{ or } 3 : 16 \quad \dots(ii)$$

Ratio (i) and (ii) are related to each other as follows:

$$3 : 8 \text{ and } 3 : 16 \text{ or } 3 : 3 \text{ and } 8 : 16 \text{ and } 1 : 2$$

Thus, this is an agreement with “law of reciprocal proportions.”

Gay-Lussac's Law of Combining Volumes

This law was proposed by **Gay-Lussac**. This law deals with the relation between volumes of reactants and products during chemical reactions.

This law states that “Under the same conditions of temperature and pressure whenever gases react together, the volume of the reacting gases as well as products bears a simple whole number ratio.”

e.g. one volume of hydrogen react with one volume of chlorine to give two volumes of hydrogen chloride (gas).

Hence, volume ratio of H₂ : Cl₂ : 2HCl is 1 : 1 : 2.

GAS LAWS

Gaseous state is the simple state of the matter. The behaviour of gases is governed by some general laws known as **Gas laws**. These laws are relationships between temperature, pressure, volume and mass.

Gas laws are as follows:

Boyle's Law According to Boyle's law, at constant temperature, pressure of a gas varies inversely with its volume.

$$p \propto \frac{1}{V} \quad [\text{at constant } T]$$

$$\Rightarrow pV = K \quad [K = \text{constant}]$$

$$\Rightarrow p_1V_1 = p_2V_2$$

Charles' Law According to this law, at constant pressure the volume of a given mass of a gas varies directly with its temperature.

$$V \propto T \quad [\text{at constant } p]$$

$$V = KT \quad [K = \text{constant}]$$

$$\Rightarrow \frac{V}{T} = K$$

$$\Rightarrow \frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Bursting of hydrogen balloon and making of chappati are the applications of Charles' law.

Gay-Lussac's Law According to this law, “At a constant volume, the pressure of a given mass of a gas is directly proportional to its absolute temperature.”

$$P \propto T \text{ or } \frac{P}{T} = \text{constant}, \frac{P_1}{T_1} = \frac{P_2}{T_2}$$

Avogadro's Law Under similar conditions of temperature and pressure, equal volume of all gases contain equal number of molecules.

Or

At a given temperature and pressure, the volume of any gas is directly proportional to the number of moles of gas.

$$V \propto n \text{ where, } n = \text{number of moles}$$

$$\frac{V}{n} = K \text{ (constant)}$$

Dalton's Law of Partial Pressure

According to this law, if two or more gases, which do not react chemically, are enclosed in a vessel, the total pressure exerted by the gaseous mixture is the sum of partial pressures exerted by the constituent gases”.

$$p = p_1 + p_2 + p_3 + \dots$$

Where, p = Total pressure of mixture

$p_1, p_2, p_3 \dots$ = Partial pressures of gases 1, 2, 3

IDEAL GAS

The gas which obeys gas laws at all conditions of temperature and pressure is known as ideal gas.

Characteristics of an Ideal Gas

These are as follows:

- It obeys Boyle's law, Charles' law and Avogadro's law at all conditions of temperature and pressure.
- It is hypothetical.
- Attractive forces among the molecules do not exist therefore an ideal gas cannot be converted into liquid or solid.

► **Note** Real gases show ideal behaviour only at low pressure and high temperature. H_2 , O_2 , N_2 etc. are real gases.

Ideal Gas Equation

From Boyle's law and Charles' law,

we have $\frac{PV}{T} = \text{constant}$... (i)

for 1 mole gas,

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2} \quad \dots \text{(ii)}$$

This relation is known as gas equation.

Therefore gas equation for 1 mole gas, $\frac{PV}{T} = R$ or $PV = RT$

For n mole gas, $pV = nRT$ or $pV = \frac{W}{M}RT$ or $pM = dRT$

Where, W = mass of a gas, M = molar mass of a gas, d = density of a gas, p = pressure of a gas, T = temperature in Kelvin, V = volume

Here, R is a gas constant (universal gas constant). Its different values are as follows:

$$R = 0.0821 \text{ L atm mol}^{-1} \text{ K}^{-1}$$

$$= 8.314 \times 10^7 \text{ erg mol}^{-1} \text{ K}^{-1} = 1.99 \text{ cal mol}^{-1} \text{ K}^{-1}$$

IMPORTANT FACTS

- At higher temperature kinetic energy of gas molecules is higher due to which pressure of gas increased.
- Standard temperature and pressure (STP or NTP) mean 273.15 K (0°C) temperature and 1 bar (i.e. 10^5 pascal pressure. At STP molar volume of an ideal gas is $22.71098 \text{ mol}^{-1}$.
- The volume of 1 mole of any gas at STP is 22.4 L.

➤ PRACTICE EXERCISE

1. Which of the following law deals with mass of reactants and products during a chemical reaction?

- Law of definite proportions
- Law of conservation of energy
- Law of conservation of mass
- Law of reciprocal proportions

2. Law of conservation of mass is not correct for

- radioactive change
- oxidation
- hydrolysis
- None of the above

3. Chemical equation is balanced according to the law of

- multiple proportions
- reciprocal proportion
- conservation of mass
- definite proportion

4. Radioactive change follows the law of

- conservation of mass
- conservation of mass-energy
- Both (a) and (b)
- None of the above

5. Which of the following statement is correct about the reaction given below?

- Total mass of reactants = Total mass of product therefore it follows law of conservation of mass.
- Total mass of reactants = total mass of product, therefore, law of multiple proportions is followed
- Amount of Fe_2O_3 can be increased by taking any one of the reactants (iron or oxygen) in excess
- Amount of Fe_2O_3 produced will decrease if the amount of any one of the reactants (iron or oxygen) is taken in excess

6. If 2.0 g of the hydrogen reacts with 16.0 g of oxygen to form 18.0 g of water, which of the following laws is applicable?

- Law of conservation of mass
- Law of constant compositions
- Law of multiple proportions
- Law of reciprocal proportions

7. Which of the following is the best example of the law of conservation of mass?

- When 12 g of carbon is heated in vacuum, there is no change in mass.
- Weight of platinum wire is the same before and after heating.
- A sample of air increases in volume when heated at constant pressure but mass remains unchanged.
- 12 g of carbon combines with 32 g of oxygen to give 44 g of carbon dioxide.

8. Which one of the following is a correct relationship between mass and energy?

- $E = hc$
- $E = \frac{m}{c^2}$
- $c = \sqrt{E/m}$
- $m = Ec^2$

9. The law of constant proportion was proposed by

- Proust
- Einstein
- Richter
- Dalton

10. The ratio in weight by which carbon and oxygen combine in a molecule of carbon monoxide is

- 3 : 4
- 3 : 3
- 3 : 2
- 3 : 1

- 11.** Calcium carbonate is naturally available as limestone and can also be synthesised from quick lime. It is seen that the composition of the elements in both the natural and synthetic calcium carbonate are same. The validity of which one among the following laws is confirmed by this observation?
- Law of conservation of mass
 - Law of definite proportions
 - Law of multiple proportions
 - Avogadro's law
- 12.** Two different oxides of a metal contain 20% and 27% oxygen by weight. This is an accordance with the law of
- conservation of mass
 - constant composition
 - multiple proportion
 - reciprocal proportion
- 13.** The law of multiple proportions was proposed by
- Lavoisier
 - Dalton
 - Proust
 - Gay-Lussac
- 14.** Different proportions of oxygen in the various oxides of nitrogen prove the law of
- equivalent proportion
 - multiple proportions
 - constant proportions
 - conservation of matter
- 15.** Two samples of lead oxide were separately reduced to metallic lead by heating in a current of hydrogen. The weight of lead from one oxide was half the weight of lead obtained from the other oxide. The data illustrate
- law of reciprocal proportions
 - law of constant proportions
 - law of multiple proportions
 - law of equivalent proportions
- 16.** Two elements *A* and *B* combine to form two compounds in which a_1 g of *A* combines with b_1 and b_2 g of *B* respectively. According to the law of multiple proportions
- $b_1 = b_2$
 - b_1 and b_2 bear a simple whole number ratio
 - a_1 and b_1 bear whole number ratio
 - no relation exists between b_1 and b_2
- 17.** Which one of the following pairs of compounds illustrate the law of multiple proportion?
- H_2O , Na_2O
 - H_2O , H_2O_2
 - Na_2O , BaO
 - All of these
- 18.** Which of the following compound confirm the law of multiple proportion?
- H_2O and H_2O_2
 - CaO and Na_2O
 - H_3PO_4 and $Ca_3(PO_4)_2$
 - $NaCl$ and $AgCl$
- 19.** The law of multiple proportions is not illustrated by which pair of compounds.
- CO and CO_2
 - CuO and Cu_2O
 - CO_2 and H_2CO_3
 - SO_2 and SO_3
- 20.** Which of the following compounds confirm the law of multiple proportion?
- $HgCl_2$ and Hg_2Cl_2
 - Na_2O and CaO
 - $NaCl$ and $BaCl_2$
 - H_3PO_4 and $Ca_3(PO_4)_2$
- 21.** One part of an element *A* combines with two parts of another element *B*. Six parts of the element *C* combines with four parts of the element *B*. If *A* and *C* combined together the ratio of their weights will be governed by
- law of definite proportions
 - law of multiple proportions
 - law of reciprocal proportions
 - law of conservation of mass
- 22.** Hydrogen, sulphur and oxygen gives H_2S , SO_2 and H_2O . This is according to the law of
- constant proportions
 - multiple proportions
 - reciprocal proportions
 - conservation of mass
- 23.** 8 g of oxygen combine with 1 g of hydrogen and 20 g of calcium therefore, when calcium combines with hydrogen it must combine in the ratio of 20 : 1. This statement confirms to the law of
- multiple proportions
 - reciprocal proportions
 - definite proportions
 - gaseous volume
- 24.** Equal volumes of all gases under same temperature and pressure contain equal number of molecules according to
- Avogadro's law
 - Charles' law
 - Boyle's law
 - Graham's law
- 25.** Law of combining volumes was given by
- Dalton
 - Tswett
 - Gay-Lussac
 - Einstein
- 26.** According to which one of the following laws it is indicated that when two or more gases react with one another, their volume bear a simple ratio?
- Law of mass action
 - Law of multiple proportions
 - Law of reciprocal proportions
 - Law of combining volumes
- 27.** In the reaction,
 $N_2 + 3H_2 \longrightarrow 2NH_3$, ratio by volume of N_2 , H_2 and NH_3 is 1 : 3 : 2. This suggested law of
- definite proportions
 - multiple proportions
 - reciprocal proportions
 - combining volume
- 28.** Equal masses of oxygen, hydrogen and methane are kept under identical conditions. The ratio of the volumes of gases will be
- 1 : 1 : 1
 - 1 : 16 : 2
 - 2 : 16 : 1
 - 1 : 4 : 1
- 29.** Real gas will approach the behaviour of ideal gas at
- low temperature and high pressure
 - high temperature and low pressure
 - low temperature and low pressure
 - high temperature and high pressure
- 30.** Which of the following reactions is not correct according to the law of conservation of mass?
- $2Mg + O_2 \longrightarrow 2MgO$
 - $C_3H_8 + O_2 \longrightarrow CO_2 + H_2O$
 - $P_4 + 5O_2 \longrightarrow P_4O_{10}$
 - $CH_4 + 2O_2 \longrightarrow CO_2 + 2H_2O$
- 31.** Pressure of a gas increases due to increase of its temperature because at higher temperature
- gas molecules repel each other
 - potential energy of the gas molecules is higher
 - kinetic energies of the gas molecules are higher
 - gas molecules attract each other
- 32.** A pressure cooker works on the principle of
- elevation of boiling point of water by the application of pressure
 - making the food-grains softer by the application of pressure
 - making the food-grains softer by the application of pressure and temperature
 - keeping the food grains inside steam for a longer time
- 33.** With regard to the gaseous state of matter which of the following statements are correct?
- Complete order of molecules.
 - Complete disorder of molecules
 - Random motion of molecules
 - Both (b) and (c)

- 34.** Ideal gas equation is the combination of
 I. Boyle's law II. Charles' law
 III. Avogadro law
 IV. Dalton's law of partial pressure
 Choose the correct option.
 (a) I and II (b) I, II and III
 (c) II and III (d) I, III and IV
- 35.** Consider the following statements.
 I. The ideal gas consists of a large number of small particles called molecules.
 II. Under the same conditions of temperature and pressure equal volumes of gases contain the same number of molecules.
 III. Volume of a definite quantity of gas at constant pressure is directly proportional to absolute temperature.
 Which of the above statements is Avogadro's hypothesis?
 (a) Only I (b) Only II
 (c) I and II (d) None of the above

- 36.** Consider the following laws.
 I. Law of conservation of mass
 II. Law of definite proportions
 III. Law of multiple proportions
 Which of these govern(s) the quantitative aspects of chemical changes?
 (a) Only I (b) II and III
 (c) I and II (d) All of the above

Directions (Q. Nos. 37-38) *The following items consist of two statements, Statement I and Statement II. You have to examine these two statements carefully and select the answer to these items using the codes given below.*

- (a) Statement I is true, Statement II is true, Statement II is a correct explanation for Statement I.
 (b) Statement I is true, Statement II is true, Statement II is not a correct explanation for Statement I.
 (c) Statement I is true, Statement II is false.
 (d) Statement I is false, Statement II is true.

- 37. Statement I** One molecule of ammonia always contains one atom of nitrogen and three atoms of hydrogen.

Statement II According to the law of conservation of mass matter can neither be created nor destroyed in a chemical reaction.

- 38. Statement I** On increasing the temperature of an ideal gas 10°C at constant volume, the pressure increases by 10%.

Statement II At a constant volume, the pressure of a given mass of a gas is directly proportional to its absolute temperature.

► Previous Years' Question

- 39.** Ammonia (NH_3) obtained from different sources always has same proportion of nitrogen and hydrogen. It proves the validity the law of
 (a) reciprocal proportion
 (b) constant proportion
 (c) multiple proportions
 (d) None of the above

☞ 2015 (II)

► ANSWERS

1	c	2	a	3	c	4	b	5	a	6	a	7	a	8	c	9	a	10	a
11	b	12	c	13	b	14	b	15	c	16	b	17	b	18	a	19	c	20	a
21	c	22	c	23	b	24	a	25	c	26	d	27	d	28	b	29	b	30	b
31	c	32	a	33	d	34	b	35	b	36	d	37	b	38	a	39	b		

► Solutions

- 5.** (a) According to the law of conservation of mass.
 Total mass of reactants = Total mass of products
- 6.** (a) $\text{H}_2 + \frac{1}{2}\text{O}_2 \longrightarrow \text{H}_2\text{O}$
 $\begin{matrix} 2\text{g} & & 16\text{g} \\ & & 18\text{g} \end{matrix}$
 According to law of conservation of mass, mass of reactants = mass of products.
- 8.** (c) Einstein equation for the relationship between mass and energy is $E = mc^2$ or $c = \sqrt{E/m}$
- 10.** (a) In a molecule of carbon monoxide, the ratio of carbon and oxygen by weight is 12 : 16 or 3 : 4.

- 11.** (b) A pure compound contains the same elements in the fixed ratio of their weights whatever its methods of preparation may be. Therefore, CaCO_3 always contains 40 : 12 : 48 or 10 : 3 : 12 ratio of calcium, carbon and oxygen by weight respectively.

According to law of combining volumes; when gases react together, they always do so in volumes which bear a simple ratio to one another and to the volume of the products.

- 28.** (b) Oxygen Hydrogen Methane
 (O₂) (H₂) (CH₄)

Number of moles

$$\frac{1}{32} = 0.031; \quad \frac{1}{2} = 0.5; \quad \frac{1}{16} = 0.0625$$

Simple ratio 1 6 2

Equal number of moles of gases occupy equal volumes under similar conditions of temperature and pressure, therefore the ratio of the volumes of gases will be 1 : 16 : 2.

- 30.** (b) In equation,
 $\text{C}_3\text{H}_8 + \text{O}_2 \longrightarrow \text{CO}_2 + \text{H}_2\text{O}$
 $\begin{matrix} 44\text{g} & 32\text{g} & 44\text{g} & 18 \end{matrix}$

Mass of reactants \neq mass of products. Hence, law of conservation of mass is not followed.

04

CONCEPT OF ATOMIC, MOLECULAR AND EQUIVALENT MASSES

Generally 2-4 questions are asked from this chapter. Questions from this section are mostly based upon chemical equations, balancing of chemical equation and equation based problems.

Atomic Mass

The average relative mass of an atom of an element as compared to $\frac{1}{12}$ th the mass of one atom of carbon-12

(C-12). In other words atomic mass is a number which expresses as to how many times an atom of the element is heavier than $\frac{1}{12}$ th of the mass of carbon atom. Therefore,

$$\text{Atomic mass} = \frac{\text{Mass of an atom of the element}}{\frac{1}{12} \text{ th mass of one carbon atom (C-12)}}$$

Atomic mass is expressed in atomic mass unit (amu or u).

Atomic mass unit (u) is defined as $\frac{1}{12}$ th the mass of carbon atom C-12.

Average Atomic Mass

It has been found that majority of the elements found to possess several isotopes. Isotopes are the different atoms of the same element possessing different atomic masses but same atomic number. The atomic mass of each **isotope** is determined separately and then combined according to the ratio of their proportion of occurrence. This is known as average atomic mass. If an element have three isotopes with atomic masses m_1 , m_2 and m_3 and these occur in the ratio of x , y and z respectively, then its average atomic mass

$$= \frac{m_1 \times x + m_2 \times y + m_3 \times z}{x + y + z}$$

e.g. Boron occurs in nature in the form of two isotopes B^{10} , B^{11} with atomic mass 10 and 11 in the ratio of 1 : 4 respectively.

Therefore, average atomic mass of boron

$$= \frac{10 \times 1 + 11 \times 4}{4 + 1} = \frac{10 + 44}{5} = \frac{54}{5} = 10.8$$

Gram Atomic Mass

The atomic mass of an element expressed in grams is the gram atomic mass or it is also called gram atom, e.g. the atomic mass of oxygen is 16 u, therefore gram atomic mass of oxygen is 16 g.

Molecular Mass

The sum of the atomic masses of all the atoms in a molecule of the substance is called molecular mass of the substance. It is expressed in atomic mass unit(u).

e.g. Molecular mass of H_2SO_4 = 2 × atomic mass of hydrogen + atomic mass of sulphur + 4 × atomic mass of oxygen = 2 × 1 + 32 + 4 × 16 = 98

Gram Molecular Mass

Molecular mass of a substance expressed in grams is called gram molecular mass. It is also called as gram molecule, e.g. molecular mass of N_2 is 28 and its gram molecular mass is 28 g.

CHEMICAL EQUATION

A chemical equation is the symbolic representation of an actual chemical change,

A chemical equation represents:

- Compounds taking part in the reaction.
- Products or compounds formed during the reaction.
- Catalysts used for the reaction (if any).

Balancing of a Chemical Equation

When the number of atoms of an element present on right hand side [RHS] of the equation becomes equal to that of present on left hand side [LHS] of the equation, the equation is said to be balanced. To balance a chemical equation, following steps are followed:

- Check the number of atoms of each element present on RHS and LHS of an equation whether they are equivalent or not.
- If not, multiply the element by a number to the corresponding element.
- Continue multiplying until all numbers become equivalent to the corresponding element.

Balancing of Equation

Element	LHS	RHS
Na	2	1 × 2 = 2
O	1	1
H	1 × 2 = 2	2
Cl	1 × 2 = 2	1 × 2 = 2

The balanced chemical equation is

Equation Based Problem

Suppose, the equation is $2\text{H}_2 + \text{O}_2 \longrightarrow 2\text{H}_2\text{O}$

2 moles of H_2 react with 1 mole of O_2 gives 2 moles of H_2O .

2 molecules of H_2 react with 1 molecule of O_2 gives 2 molecules of H_2O .

4 g of H_2 reacts with 32 g of O_2 gives 36 g of H_2O .

Limiting Reagent

The substance that is completely consumed in a reaction is called limiting reagent because it determines the amount of product. The other reactant present in excess is called excess reagent e.g.

<i>Mole before reaction</i>	10	7	0
<i>Mole after reaction</i>	0	2	10

Thus, H_2 is limiting reagent and O_2 is excess reagent.

Strength of a Solution

It is generally expressed in terms of molarity and normality.

- (i) **Molarity (M)** It is the number of moles of solute present in 1L of the solution. It is denoted by M .

$$\text{Molarity } (M) = \frac{\text{Number of moles of solute}}{\text{Volume of solution (in L)}}$$

e.g. 0.25 mol L^{-1} (or 0.25 M) solution of NaOH means that 0.25 mol of NaOH is dissolved in 1 L of solution.

- (ii) **Formality (F)** It is the number of gram formula weight of solute dissolved in 1 litre of solution when formula weight equals to the atomic weight, then formality equals to molarity.

$$\text{Formality } (F) = \frac{\text{Gram formula weight of solute}}{\text{Volume in litre}}$$

- (iii) **Normality (N)** It is the number of gram equivalents of solute dissolved per litre of the solution.

$$\text{Normality } (N) = \frac{\text{Gram equivalent of solute}}{\text{Volume of solution (L)}}$$

e.g. $0.50 \text{ g equiv. L}^{-1}$ (or 0.50 N) solution of H_2SO_4 means that 0.50 g equiv. of H_2SO_4 is dissolved in 1 litre of solution.

- (iv) **Molality (m)** It is the number of moles of the solute dissolved in 1 kg of solvent. It is denoted by m .

$$\text{Molality } (m) = \frac{\text{Number of moles of solute}}{\text{Mass of solute (in kg)}}$$

e.g. 1.00 m kg^{-1} (or 1.00 m) solution of KCl means that 1 mol (74.5 g) KCl is dissolved in 1 kg of water.

Molality is independent of temperature whereas molarity, normality and formality change with temperature. This is because volume depends upon temperature and the mass do not.

PRACTICE EXERCISE

- Number of atoms present in a molecule is called
(a) mole ratio (b) molecularity
(c) atomicity (d) Avogadro's number
- 1u is equal to
(a) $\frac{1}{12}$ of C¹² (b) $\frac{1}{14}$ of O¹⁶
(c) 1g of H₂ (d) 1.66×10^{-23} kg
- The statement which is wrong about gram atomic mass is
(a) it is the atomic mass expressed in grams
(b) it is also called gram atom
(c) one gram atom of an element contain 6×10^{23} atoms
(d) None of the above
- Chlorine occurs in nature in the form of two isotopes with atomic mass 35 and 37 in the ratio of 3 : 1 respectively. The average atomic mass of chlorine is
(a) 38.5 (b) 35.5
(c) 36 (d) None of these
- If *M* is the molecular mass of KMnO₄ then equivalent weight of KMnO₄ in acidic medium is
(a) *M*/2 (b) *M*/4 (c) *M*/7 (d) *M*/5
- What is the equivalent mass of KMnO₄ when it change into Mn₂(SO₄)₃?
(a) *M* (b) *M*/5 (c) *M*/6 (d) *M*/4
- 74 g of a metallic chloride contains 35.5 g of chlorine. The equivalent weight of the metal is
(a) 38.5 (b) 74.4 (c) 35.5 (d) 71
- Approximate atomic weight of a metal is 26.89. If its equivalent weight is 8.9 its exact atomic weight will be
(a) 26.7 (b) 8.9 (c) 26.89 (d) 17.8
- Potassium permanganate gives the following reactions in neutral
 $\text{MnO}_4^- + 2\text{H}_2\text{O} + 3e^- \longrightarrow \text{MnO}_2 + 4\text{OH}^-$
The equivalent weight of KMnO₄ is (atomic mass of Mn = 55u)
(a) 158 (b) 79
(c) 52.66 (d) 31.6
- Equivalent weight of crystalline oxalic acid is
(a) 45 (b) 90 (c) 126 (d) 63
- Equivalent weight of nitrogen varies in its oxides, because it
(a) contains five electrons in its valence orbit
(b) contains half-filled *p* -orbitals
(c) is a diatomic molecule
(d) has variable valency
- Atomic weight of a trivalent element of equivalent weight 9 is
(a) 9 (b) 27 (c) 18 (d) 36
- A reaction between HCl and O₂ is given by
 $4\text{HCl} + \text{O}_2 \longrightarrow 2\text{H}_2\text{O} + 2\text{Cl}_2$
The equivalent weight of HCl is equal to
(a) its molecular weight
(b) half of its molecular weight
(c) twice of its molecular weight
(d) four times its molecular weight
- Equivalent weight of sulphur in SCl₂ is 16. What is the equivalent weight of S in S₂Cl₂?
(a) 16 (b) 64 (c) 32 (d) 8
- Equivalent weight of a metal is 29.4. It forms metal sulphate isomorphous with epsom salt. The atomic weight of the metal is
(a) 58.8 (b) 14.7 (c) 29.4 (d) 88.2
- The mass of an atom of nitrogen is
(a) $\frac{14}{6.022 \times 10^{23}}$ g (b) $\frac{28}{6.022 \times 10^{23}}$ g
(c) $\frac{1}{6.022 \times 10^{23}}$ g (d) 14 u
- How many atoms are present in a mole of H₂SO₄?
(a) $3 \times 6.02 \times 10^{23}$ (b) $5 \times 6.022 \times 10^{23}$
(c) $6 \times 6.02 \times 10^{23}$ (d) $7 \times 6.02 \times 10^{23}$
- 2 g of oxygen contain number of atoms equal to that contained in
(a) 0.5 g hydrogen (b) 4.0 g sulphur
(c) 7.0 g nitrogen (d) 2.3 g sodium
- The number of sulphur atoms in its 40 g is
(a) $40 \times 6.022 \times 10^{23}$ (b) $32 \times 6.022 \times 10^{23}$
(c) $\frac{40 \times 6 \times 10^{23}}{32}$ (d) $\frac{32 \times 6 \times 10^{23}}{40}$
- Number of atoms in 4.25 g of NH₃ is (approx.)
(a) 1×10^{23} (b) 1.5×10^{23}
(c) 2×10^{23} (d) 6×10^{23}
- Which of the following has maximum number of atoms?
(a) 18 g of water (b) 16 g of O₂
(c) 4.4 g of O₂ (d) 16 g of CH₄
- The mass of a molecule of water is
(a) 3×10^{-26} kg (b) 3×10^{-25} kg
(c) 1.5×10^{-26} kg (d) 2.5×10^{-26} kg
- Which of the following has largest number of atoms?
(a) 71 g of chlorine
(b) 48 g of magnesium
(c) 127 g of iodine
(d) 4 g of hydrogen
- The number of moles of CO₂ which contain 16 g of oxygen is
(a) 0.25 (b) 0.50 (c) 1 (d) 2
- A mole of compound is composed of 6.023×10^{23} atoms of hydrogen, 35.5 g of chlorine and 48 g of oxygen. The compound is
(a) HClO (b) HClO₂
(c) HClO₃ (d) HClO₄
- How many moles of electrons weigh one kilogram?
(a) 6.023×10^{23} (b) $\frac{1}{9.08} \times 10^{31}$
(c) $\frac{6.023}{9.108} \times 10^{54}$ (d) $\frac{1}{9.108 \times 6.023} \times 10^8$
- Number of electron present in 10 g of H₂O is
(a) $\frac{6.022 \times 10^{23}}{6}$ (b) $\frac{6.02 \times 10^{25}}{18}$
(c) $\frac{6.022 \times 10^{22}}{6}$ (d) None of these
- The volume occupied by 4.4 g of CO₂ at STP is
(a) 22.4 L (b) 2.24 L
(c) 0.224 L (d) 0.1 L
- Consider the following equation for the formation of ammonia from nitrogen and hydrogen
 $\text{N}_2 + 3\text{H}_2 \longrightarrow 2\text{NH}_3$

How many hydrogen molecules are required to react with 100 molecules of nitrogen?

- (a) 100 (b) 200 (c) 300 (d) 400

30. What weight of SO_2 can be made by burning sulphur in 5.0 moles of oxygen?

- (a) 640 g (b) 160 g (c) 80 g (d) 320 g

31. Which of the following statements are true?

- I. The valencies of elements forming isomorphous compounds are same.
- II. Equivalent mass may vary with change of valency.
- III. Some elements show variable valency.

Select the correct answer using the codes given below.

- (a) I and II (b) II and III
(c) I and III (d) All of these

32. Consider the following statements.

- I. The number of moles is directly proportional to the number of molecules of the substance.
- II. Mole concept is also applicable to ionic compounds, which do not contain molecules.
- III. 'Molecular mass' word is not suitable word for the ionic compounds.
- IV. Formula mass unit is taken for ionic compounds.

Select the correct answer using the codes given below

Codes

- (a) I, II and III (b) II, III and IV
(c) I, III and IV (d) All of these

Directions (Q. Nos. 33-34)

Following questions consist of two Statements, I and II. Examine these two statements and select the correct choice according to the codes given below.

- (a) Both the statements are true and Statement II is the correct explanation of Statement I.
- (b) Both the statements are true but Statement II is not the correct explanation of Statement I.
- (c) Statement I is true but Statement II is false.
- (d) Statement I is false but Statement II is true.

33. Statement I Average atomic mass of elements may be in fraction.

Statement II Due to presence of isotopes of elements.

34. Statement I Equivalent mass of element may vary.

Statement II Valency of element may vary.

35. Match List I with List II and select the correct answer from the codes given below the lists:

List I	List II
A. Molarity	1. Gram formula weight of solute in one litre of solution.
B. Molality	2. Number of gram equivalents of solute dissolved in one litre of solution
C. Normality	3. Number of moles of solute dissolved in 1kg of solvent.
D. Formality	4. Number of moles of solute in one litre of solution

Codes

- | | | | | | | | |
|-------|---|---|---|-------|---|---|---|
| A | B | C | D | A | B | C | D |
| (a) 4 | 3 | 2 | 1 | (b) 1 | 2 | 3 | 4 |
| (c) 4 | 2 | 3 | 1 | (d) 2 | 3 | 4 | 1 |

> Previous Years' Questions

36. Which one among the following equations is correctly balanced?

☑ 2012 (II)

- (a) $\text{NaOH} + \text{Al} + \text{H}_2\text{O} \longrightarrow 2\text{H}_2 + \text{NaAlO}_2$
- (b) $2\text{NaOH} + 2\text{Al} + 2\text{H}_2\text{O} \longrightarrow 3\text{H}_2 + 2\text{NaAlO}_2$
- (c) $2\text{NaOH} + 2\text{Al} + 3\text{H}_2\text{O} \longrightarrow 4\text{H}_2 + 2\text{NaAlO}_2$
- (d) $2\text{NaOH} + 2\text{Al} + \text{H}_2\text{O} \longrightarrow \text{H}_2 + 2\text{NaAlO}_2$

37. Which one among the following is the equivalent weight of sulphuric acid?

(Atomic weight : H = 1, S = 32 and O = 16) ☑ 2012 (II)

- (a) 98 (b) 60
- (c) 100 (d) 49

38. The number of aluminium ions present in 54 g of aluminium (atomic weight = 27) is ☑ 2014 (I)

- (a) 2 (b) 18
- (c) 1.1×10^{24} (d) 1.2×10^{24}

39. Consider the following balanced chemical equation,
 $2\text{CO} + \text{O}_2 \rightleftharpoons 2\text{CO}_2$

Which one of the following statements is significant in relation to the above chemical equation? ☑ 2014 (II)

- (a) One can add to a vessel only 2 moles of CO for each moles of O_2 is added
- (b) No matter how much of these two reagents are added to a vessel, 1 mole of O_2 is consumed
- (c) When they react, CO reacts with O_2 in a 2:1 mole ratio
- (d) When 2 moles of CO and 1 mole of O_2 are placed in a vessel, they will react to give 1 mole of CO_2

40. If the reaction of 1.0 mole $\text{NH}_3(g)$ and 1.0 mole $\text{O}_2(g)$

- (a) all the $\text{O}_2(g)$ is consumed
- (b) 4.0 moles of $\text{NO}(g)$ is produced
- (c) 1.5 moles of $\text{H}_2\text{O}(l)$ is produced
- (d) all the $\text{NH}_3(g)$ is consumed

41. How many grams of MgCO_3 contain 24.00 g of oxygen?

(The molar mass of MgCO_3 is 84.30 g mol^{-1}) ☑ 2014 (II)

- (a) 42.15 g
- (b) 84.30 g
- (c) 126.00 g
- (d) 154.00 g

42. Consider the following reaction,

What is y (the coefficient for O_2) when this equation is balanced using whole number coefficients?

☑ 2014 (II)

- (a) 5 (b) 7
- (c) 9 (d) 11

43. A compound X_2O_3 contains 31.58% oxygen by weight. The atomic mass of X is ☑ 2014 (II)

- (a) 34.66 g mol^{-1}
- (b) 45.01 g mol^{-1}
- (c) 52.00 g mol^{-1}
- (d) $104.00 \text{ g mol}^{-1}$

44. What is the number of mole(s) of $\text{H}_2(g)$ required to saturate one mole of benzene? ☑ 2016 (I)

- (a) 1 (b) 2
- (c) 3 (d) 4

45. Which one of the following has different number of molecules? (All are kept at normal temperature and pressure) ☑ 2016 (II)

- (a) 3 gram of Hydrogen
- (b) 48 gram of Oxygen
- (c) 42 gram of Nitrogen
- (d) 2 gram of Carbon

> Solutions

3. (d) 1 g-atom = N atoms = 6.023×10^{23} atoms = g-atomic weight
e.g. 1 g atom of oxygen = N atoms of oxygen
= 6.023×10^{23} atoms of oxygen = 16 g
4. (b) $M_{av} = \frac{35 \times 3 + 37 \times 1}{3 + 1} = 35.5$
5. (d) Eq. wt. of an oxidising agent
= $\frac{\text{Molar mass } (M)}{\text{Change in oxidation number}} = \frac{M}{5}$
7. (a) The number of parts of a substance that combines with 35.5 parts by mass of chlorine is called the equivalent mass of the substance. Therefore, equivalent weight (mass) of the metal is
 $74g - 35.5g = 38.5g$
9. (c) $\text{MnO}_4^- + 2\text{H}_2\text{O} + 3e^- \rightarrow \text{MnO}_2 + 4\text{OH}^-$
Change in oxidation number = 3
Equivalent weight of $\text{KMnO}_4 = \frac{158}{3} = 52.66$
10. (d) Eq. wt. of an acid = $\frac{\text{Mol. wt.}}{\text{Basicity of acid}} = \frac{126}{2} = 63$
12. (b) At. wt. of an element = eq. wt \times valency = $9 \times 3 = 27$
15. (a) Atomic wt. of a metal = eq. wt \times valency = $29.4 \times 2 = 58.8$
16. (a) Mass of an atom of an element
= $\frac{\text{Molar mass of an atom of element}}{6.023 \times 10^{23}} = \frac{14}{6.022 \times 10^{23}} \text{ g}$
17. (d) 1 mole $\text{H}_2\text{SO}_4 = 2$ mole of H atoms + 1 mole of S atom + 4 mole of O atoms
= 7 mole atoms
= $7 \times 6.023 \times 10^{23}$ atoms
18. (b) Equal number of moles contain equal number of atoms
2g of oxygen = $\frac{2}{16}$ mole = 0.125 mole
Similarly 4 g sulphur = $\frac{4}{32} = \frac{2}{16}$ mole = 0.125 mole
0.5 g hydrogen = $\frac{0.5}{1} = 0.5$ mole
7.0 g nitrogen = $\frac{7}{14} = 0.5$ mole
2.3 g sodium = $\frac{2.3}{23} = 0.1$ mole
Therefore atoms in 2 g oxygen = atoms in 4.0 g sulphur.
19. (c) 40 g sulphur = $\frac{40}{32}$ mole
1 mole = 6.023×10^{23} atoms
 $\frac{40}{32}$ mole = $\frac{40 \times 6.023 \times 10^{23} \text{ atoms}}{32}$
20. (d) 4.25 g $\text{NH}_3 = \frac{4.25}{17}$ mole NH_3
 $\frac{4 \times 4.25 \times 6.023 \times 10^{23}}{17} = 6.023 \times 10^{23}$ atoms
(1 mole $\text{NH}_3 = 1$ mole N atoms + 3 mole H atoms = 4 mole atoms)
21. (d) 18 g water = $\frac{18}{18} = 1$ mole
= $1 \times 3 \times 6.023 \times 10^{23}$ atoms
16 g $\text{O}_2 = \frac{16}{32} = 0.5$ mole
= $0.5 \times 2 \times 6.023 \times 10^{23}$ atoms
- 4.4 g $\text{O}_2 = \frac{4.4}{32} = 0.1375$ mole
= $0.1375 \times 2 \times 6.023 \times 10^{23}$ atoms
16 g $\text{CH}_4 = \frac{16}{16} = 1$ mole
= $1 \times 5 \times 6.023 \times 10^{23}$ atoms (maximum)
22. (a) Mass of 1 molecule of $\text{H}_2\text{O} = \frac{18}{6.023 \times 10^{23}} \text{ g} = 29885 \times 2 = 29885 \times 10^{-26} \text{ kg} \approx 3 \times 10^{-26} \text{ kg}$
23. (d) 71g chlorine = $\frac{71}{71} = 1$ mole Cl_2
= $2 \times 6.023 \times 10^{23}$ atoms
48g magnesium = $\frac{48}{24} = 2$ mole Mg
= $2 \times 6.023 \times 10^{23}$ atoms
127g iodine = $\frac{127}{127 \times 2} = 0.5$ mole I_2
= $2 \times 0.5 \times 6.023 \times 10^{23}$ atoms
4g hydrogen = $\frac{4}{2} = 2$ mole H_2
= $2 \times 2 \times 6.023 \times 10^{23}$ atoms (maximum atoms)
24. (b) 32 g oxygen present in 1 mole CO_2 therefore 16g oxygen present in
= $\frac{16 \times 1}{32} = 0.5$ mole CO_2
25. (c) 100 molecules of N_2 will react with 300 molecules of H_2
 6.023×10^{23} atom of H = 1 mole H atom
35.5 g chlorine = 1 mole Cl atom
48 g oxygen = 3 mole O atoms
Chemical formula of the compound = HClO_3

26. (d) 9.108×10^{-31} kg = mass of 1 electron

$$1 \text{ kg} = \frac{1}{9.108 \times 10^{-31}}$$

$$= \frac{1 \times 10^{31}}{9.108} \text{ electrons}$$

$$6.023 \times 10^{23} \text{ electrons} = 1 \text{ mole}$$

$$\frac{1 \times 10^{31}}{9.108} \text{ electrons}$$

$$= \frac{1 \times 10^{31}}{9.108 \times 6.023 \times 10^{23}} \text{ moles}$$

$$= \frac{10^8}{9.108 \times 6.023} \text{ moles of electrons}$$

27. (b) 18g H₂O contains

$$= 10 \text{ mole electrons}$$

$$= 10 \times 6.023 \times 10^{23} \text{ electrons}$$

10g H₂O will contain

$$= \frac{10 \times 10 \times 6.023 \times 10^{23}}{18} \text{ electrons}$$

$$= \frac{6.023 \times 10^{25}}{18} \text{ electrons}$$

28. (b) Volume occupied by 1 mole (44g) CO₂ = 224 L (at STP)

Hence, $\frac{4.4}{44}$ mole CO₂ will occupy

$$= \frac{224 \times 4.4}{44}$$

$$= 2.24 \text{ L}$$

29. (c) $\text{N}_2 + 3\text{H}_2 \longrightarrow 2\text{NH}_3$

1 molecule of N₂ reacts with 3 molecules of H₂.

100 molecules of N₂ = 300 molecules of H₂

30. (d) $\text{S} + \text{O}_2 \longrightarrow \text{SO}_2$
1 mole (32+2×16 = 64g)

1 mole O₂ gives = 64 g SO₂

Therefore, 5 mole O₂ will give = 64 × 5 = 320g SO₂

37. (d) Equivalent weight

$$= \frac{\text{Molecular weight}}{\text{Basicity}}$$

Basicity of H₂SO₄ = 2

$$\text{Equivalent weight} = \frac{98}{2} = 49$$

38. (d) Number of aluminium ions present in 54 g of aluminium

$$= \frac{6.023 \times 10^{23} \times 54}{27}$$

$$= 1.2 \times 10^{24}$$

40. (a) $4\text{NH}_3(\text{g}) + 5\text{O}_2(\text{g}) \longrightarrow$

1 mole of NH₃ requires $\frac{5}{4}$ moles

of O₂ = 1.25 mol

Since, for 1 mole of NH₃, 1.25 moles of O₂ are required, therefore, O₂ is the limiting factor (here O₂ is only 1 mole). Hence, all the O₂ will be consumed in reacting with 1 mole of NH₃.

41. (a) In MgCO₃, there are 3 oxygen atoms in each mole.

Atomic mass of oxygen is 16 g/mol. So, there are (16 × 3) = 48 grams of oxygen in one mole of MgCO₃.

Molar mass of MgCO₃ = 84.30 g mol⁻¹

$$\frac{48 \text{ g of O}}{84.3 \text{ MgCO}_3} = \frac{24 \text{ g O}}{x \text{ MgCO}_3}$$

$$x = 42.15 \text{ g}$$

42. (c) Balanced chemical equation is $2\text{As}_2\text{S}_3 + 9\text{O}_2 \longrightarrow 2\text{As}_2\text{O}_3 + 6\text{SO}_2$
 So, y is 9.

43. (c) In compound X₂O₃,

Percentage of oxygen by weight = 31.58

Percentage of X by weight = 68.42

Let the atomic mass of X = x

$$\frac{2x}{2x + 48} \times 100 = 68.42$$

$$\therefore x = 51.65 \approx 52$$

So, atomic mass of X is 52 g mol⁻¹.

44. (c)

3 moles of H₂(g) is required to saturate one mole of benzene.

45. (d) The mass of 1 mole of a substance is equal to its relative atomic or molecular mass in grams.
 1 mole = 6.022×10^{23}

1 gram hydrogen = 6.022×10^{23} atoms

3 gram hydrogen = $3 \times 6.022 \times 10^{23}$ atoms

= $\frac{3}{2} \times 6.022 \times 10^{23}$ molecules (since

hydrogen is diatomic molecule)

16 gram oxygen = 6.022×10^{23} atoms

48 gram oxygen

= $3 \times 6.022 \times 10^{23}$ atoms

= $\frac{3}{2} \times 6.022 \times 10^{23}$ molecules

(As oxygen is diatomic molecule)

Similarly, 42 gram of nitrogen

contains $\frac{3}{2} \times 6.022 \times 10^{23}$ molecules.

12 gram carbon = 6.022×10^{23} atoms

2 gram carbon

= $\frac{1}{6} \times 6.022 \times 10^{23}$ atoms

= $\frac{1}{6} \times 6.022 \times 10^{23}$ molecules

(As carbon is monoatomic molecule.)

Hence, 2 gram of carbon contains different number of molecules.

05

ATOMIC STRUCTURE AND RADIOACTIVITY

Generally 2-4 questions are asked from this chapter. Questions from this chapter are based upon properties of cathode rays, α -particle scattering experiment, Bohr's atomic model, atomic number and mass number, isotopes, electronic configuration of elements and basic knowledge of radioactivity.

DALTON'S ATOMIC THEORY

The first definite theory about the structure of the matter was put forward by **John Dalton** in **1890**.

Its main postulates are

- All matter is made up of very small particles known as atoms.
- Atom neither be created nor be destroyed, it is the smallest particle that takes part in a chemical reaction.
- All atoms of an element are alike and of different elements are different.
- Atoms of different elements have different masses and chemical properties.
- Atoms combine together in the ratio of small whole numbers.

Drawbacks of Dalton's Atomic Theory

- It does not explain why atoms of different elements differ in their mass, valencies etc.
- It does not explain the existence of isotopes and isobars.
- It does not explain how and why atoms of elements combine with each other to form molecules.

Constitution of Atom

Several phenomenon like radioactivity reveals that atoms are divisible and comprises of three fundamental particles namely electron, proton and neutron.

Electron (${}_{-1}e^0$)

Electron was discovered by **J.J. Thomson** in 1897. When an electric charge at high voltage is passed through a gas at low pressure, (10^{-6} atm) a stream of rays is emitted from the cathode surface. These are called as **cathode rays**.

- Magnitude of charge on electron = -1.6×10^{-19} C.
- Mass of electron = 9.108×10^{-28} g.

Properties of Cathode Rays

- Cathode rays always travel in straight line path away from the cathode and cast shadows of metallic objects placed in their path.
- Cathode rays produce mechanical motion of a spin wheel placed in their path. Thus, they possess kinetic energy and must be material particles.
- The beam of cathode rays are deflected towards the positively charged plate, hence the particles in the cathode rays carry negative charge.

- Cathode rays can be deflected by an electric and as well as in magnetic field.
- Cathode rays can penetrate through thin layers of matter.
- Cathode rays produce X-rays when they strike a metallic target with high melting point like tungsten.
- Cathode rays upon striking glass or certain other material cause them to glow.
- The nature of cathode rays is independent of (i) the nature of the cathode and (ii) the gas in the discharge tube.

Charge/Mass Ratio [e/m]

J.J. Thomson determined the ratio of the charge (e^-) of the electron to its mass (m) by measuring the deflection under the simultaneous influence of electric and magnetic fields.

- The value of e/m was found to $-1.7588 \times 10^{11} \text{ C kg}^{-1}$ for electrons.
- The charge on the electron was measured by **R.A. Millikan**.

Proton (${}_1p^1$ or ${}_1H^1$)

The existence of positively charged particles in an atom was shown by **E. Goldstein** in 1886. When high voltage is supplied across the electrodes a new kind of rays produced which passed through the perforated cathode and caused a glow on the wall opposite to the anode. These rays are also known as **anode rays** or **canal rays**.

- The magnitude of charge on proton is $1.6 \times 10^{-19} \text{ C}$.
- Mass of proton = $1.673 \times 10^{-27} \text{ kg}$.

Properties of Anode Rays

- The anode rays travel in a straight line and cast shadow.
- The anode rays are deflected by the magnetic and electric field and bent in the opposite direction of cathode rays.
- The anode rays can also rotate the wheel placed in their path and also have heating effect.
- The charge to **mass ratio** (e/m) for positive rays depends upon the nature of the gas taken in the tube and it is less than e/m of electron.

$$\frac{e}{m} = 9.579 \times 10^7 \text{ C kg}^{-1}$$

- The removal of electrons from neutral atoms or molecules of gas results in the formation of positively charged ions. These positively charged ions move towards perforated cathode and constitute beam of **positive rays**.

Neutron (${}_0n^1$)

The neutrons were discovered by **James Chadwick**. These particles are neutral having charge equals to zero. Their mass is approximate same as that of a hydrogen atom, i.e. $1.675 \times 10^{-27} \text{ kg}$.

ATOMIC MODELS

Various atomic models were proposed to show the arrangement and distribution of particle [electrons, protons and neutrons] within an atom.

Thomson's Atomic Model

The first simple model of an atom was proposed by **J.J. Thomson**. According to Thomson, an atom is a positively charged uniform sphere of radius 10^{-8} cm in which electrons are embedded in such a way that negative charge equals to positive charge. This model also called **plum-pudding model** and **watermelon model**. This model was unable to explain the stability of an atom.

Rutherford's Atomic Model (1912)

This model was based upon α -particle scattering experiment. The α -particles scattering experiments performed by Rutherford are concerned with the discovery of the nucleus.

The following conclusions were drawn from these experiments:

- A major portion of the atom is empty space because most of α -particles passed straight through the atom.
- The atom has a very small rigid, positively charged body called nucleus and the α -particles are repelled from the metal foil due to this positively charged nucleus.
- The whole mass of the atom is concentrated in the nucleus, so it is very heavy and rigid.

Main postulates of this model are as follows

- An atom mainly consists of free space. Each atom contain a heavy positively charged body at its centre called the **nucleus**.
 - The negatively charged electrons revolving around the nucleus are called planetary electrons.
 - The size of the nucleus ($r = 10^{-15} \text{ m}$) is very small as compared to that of atom ($r = 10^{-10} \text{ m}$).
 - All protons and neutrons are stabilised in the nucleus by a strong interaction force.
 - Rutherford atomic model failed because he could not explain the electronic structure of atom. In other words it does not tell about the distribution of electrons around the nucleus.
- **Note** During α -particle scattering experiment, α -particles were subjected to bombard a thin sheet of heavy metals like gold, platinum because their nuclei is large, thus provides good results.

Electromagnetic Radiations

These radiations exhibit both particle and wave like properties. These radiations do not require medium and can move in vacuum. Order of different types of electromagnetic radiations according to their increasing wavelength is as follows

Cosmic rays < γ -rays < X-rays < UV rays < visible light < infrared rays < microwaves < FM radiowaves < long radiowaves

- The small portion around 10^{15} Hz is called visible light.
- Relation between frequency (ν), wavelength (λ) and velocity of light (c) is as follows

$$c = \nu \lambda$$

Wave number $\bar{\nu} = \frac{1}{\lambda}$. Its unit is m^{-1} .

- **Note** X-rays are produced effectively when electrons strike the dense metal anode and have a very high penetrating power through the matter that's why these rays are used to study the interior of objects.
- Penetrating power of X-rays can be increased by increasing potential difference between anode and cathode.

PLANCK'S QUANTUM THEORY

This theory was proposed by **Max Planck**.

The main postulates of this theory are as follows

- The energy emitted or absorbed by the atoms and molecules will be in the form of discrete packets of energy called **quanta**.
- The energy of quanta (E) is proportional to its frequency (ν)

$$E \propto \nu \text{ or } E = h\nu$$

where, h = Planck's constant (6.626×10^{-34} Js)

- The energy of quanta is quantised, thus, $E = nh\nu$

Bohr's Atomic Model (1913)

- **Neils Bohr** proposed this atomic model which is based upon the Planck's quantum theory of radiations.
- The electrons in an atom revolve around the nucleus only in certain selected circular paths called **orbits**. Each orbit have a definite amount of energy.
- Electron in the particular orbit, does not lose or gain energy.
- Only those orbits are permitted in which the angular momentum (mvr) of the electron is a whole number multiple of $\frac{h}{2\pi}$ (' h ' is a Planck's constant i.e. $mvr = \frac{nh}{2\pi}$ where $n = 1, 2, 3 \dots$)
- The energy is emitted when an electron jumps from higher energy level to lower energy level and energy is absorbed when an electron jumps from lower energy level to higher energy level.

- The frequency of radiation absorbed or emitted when transition occurs between two different energy levels or states is given by

$$\nu = \frac{\Delta E}{h} = \frac{E_2 - E_1}{h}$$

where, E_1 and E_2 are the energies of lower and higher energy states.

- The energy of an electron residing in a particular energy level (n) is given by

$$E_n = -21.8 \times 10^{-12} \times \frac{Z^2}{n^2} \text{ erg atom}^{-1}$$

$$= -21.8 \times 10^{-19} \times \frac{Z^2}{n^2} \text{ J atom}^{-1}$$

$$= -13.6 \times \frac{Z^2}{n^2} \text{ eV atom}^{-1}$$

$$E_n = \frac{hc}{\lambda_n} = -R_H \left(\frac{1}{n_2^2} - \frac{1}{n_1^2} \right) Z^2$$

- Radius of n th orbit (r_n) = $\frac{0.53 n^2}{Z}$ Å.
- **Velocity of electron** in n th orbit = $\frac{2.18 \times 10^8 Z}{n}$ cm/s.

Failures of Bohr's Atomic Theory

- He could not explain the splitting of spectral lines in the presence of magnetic field (Zeeman effect) and electric field (Stark effect).
- He could not explain the line spectra of atoms containing more than one electron called multi-electron atoms.
- He could not explain the three dimensional existence of atom.
- Bohr's theory failed due to the dual nature of matter and uncertainty principle.

Energy of electron in a hydrogen atom in different energy levels

Energy level	Energy (Joule atom ⁻¹)
$n = 1$	-21.79×10^{-19}
$n = 2$	-5.42×10^{-19}
$n = 3$	-2.41×10^{-19}
$n = 4$	-1.36×10^{-19}
$n = 5$	-0.87×10^{-19}
$n = \infty$	0

The largest absorption of energy will be for transition $n = 1$ to $n = 2$. For transition $n = \infty$ to $n = 1$, is although maximum but in this transition energy will be released.

Example The ratio of the difference between 1st and 2nd Bohr's orbits energy to that between 2nd and 3rd orbits energy is

- (a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $\frac{27}{5}$ (d) $\frac{5}{27}$

Sol. (c) $\Delta E_{1,2} = E_2 - E_1$

$$= \frac{E_H}{(n_2)^2} - \frac{E_H}{(n_1)^2} = E_H \left(\frac{1}{2^2} - \frac{1}{1^2} \right) = -\frac{E_H \times 3}{4}$$

$$\Delta E_{2,3} = E_3 - E_2 = -\frac{E_H \times 5}{36}$$

$$\frac{\Delta E_{1,2}}{\Delta E_{2,3}} = E_H \times \frac{3}{4} \times \frac{36}{E_H \times 5} = \frac{27}{5}$$

Atomic Number (Z)

- The concept of atomic number was given by **Moseley**.
- Atomic number (Z) = number of protons in the nucleus

For neutral atom, number of protons = number of electrons

Mass Number (A)

- The sum of number of protons and neutrons present in the nucleus is called mass number.
- Mass number (A) = number of protons
+ number of neutrons
- An atom with atomic number and mass number is represented as ${}_Z X^A$.
- Protons and neutrons are collectively called nucleons.

Different Atomic Species

There are different types of atomic species

Isotopes Isotopes were discovered by **F. Soddy**. Isotopes have the same atomic number but differ in their mass numbers. Isotopes have identical chemical properties but differ in physical properties. e.g., ${}_1\text{H}^1$ (Protium), ${}_1\text{H}^2$ (Deuterium) and ${}_1\text{H}^3$ (Tritium), ${}_8\text{O}^{16}$, ${}_8\text{O}^{17}$ and ${}_8\text{O}^{18}$. The element polonium (Po) possesses maximum isotopes. ${}_1\text{H}^1$ is the lightest isotope.

Isobars Isobars are atoms with same mass number but different atomic numbers. Isobars are the atoms of different elements and they possess different physical and chemical properties.

e.g., ${}_1\text{H}^3$ and ${}_2\text{He}^3$; ${}_{18}\text{Ar}^{40}$, ${}_{19}\text{K}^{40}$ and ${}_{20}\text{Ca}^{40}$; ${}_{52}\text{Te}^{130}$, ${}_{56}\text{Ba}^{130}$ and ${}_{54}\text{Xe}^{130}$.

Isotones Isotones are the atoms of different elements possessing the same number of neutrons but different mass numbers.

e.g., ${}_1\text{H}^3$ and ${}_2\text{He}^4$, ${}_{15}\text{P}^{31}$ and ${}_{16}\text{S}^{32}$, ${}_{19}\text{K}^{39}$ and ${}_{20}\text{Ca}^{40}$.

Isoelectronic Isoelectronic species have same number of electrons. e.g., Ne, Na^+ , Mg^{2+} all have 10 electrons.

Quantum Mechanical Model of the Atom

The formulation of a quantum mechanical model of an atom is based upon two important concepts

1. Dual Nature of Material Objects

[de-Broglie Concept]

In 1924 **de-Broglie** suggested that matter like radiation behaves as both particle and wave.

According to de-Broglie, the wavelength ' λ ' associated with a particle of mass m , moving with velocity v is given by

$$\lambda = \frac{h}{mv} = \frac{h}{p} \quad [:\ p = mv]$$

where, h = Planck's constant, p = momentum

This equation is called de-Broglie equation.

2. Heisenberg's Uncertainty Principle

Heisenberg in 1927, pointed out that it is not possible to measure both position and momentum (or velocity) of a microscopic particle at the same time with absolute accuracy.

Mathematically, $\Delta x \times \Delta p = \frac{h}{4\pi}$

Here, Δx = uncertainty in position

Δp = uncertainty in momentum

Now, $p = mv$

Hence, $\Delta p = m\Delta v$

By putting the value of Δp in the above expression, we get

$$m\Delta v \times \Delta x \geq \frac{h}{4\pi} \quad \text{or} \quad \Delta v \times \Delta x \geq \frac{h}{4\pi \times m}$$

QUANTUM NUMBERS

Position and nature of electron is completely described by four sets of quantum numbers.

1. Principal Quantum Number (n) (Bohr) It

determines the size of the electron orbits and energy of an electron. It is denoted by n , where $n = 1, 2, 3, \dots, \infty$ (only positive integers). The various shells are designated as K, L, M, \dots respectively. Maximum numbers of electrons in any orbit is $2n^2$, where n is principal quantum number.

2. Azimuthal Quantum Number (l) (Sommerfeld)

Also known as angular momentum quantum number or secondary quantum number.

It determines the shape of electron orbit and orbital angular momentum of an electron and is denoted by l . It has the values from zero to $(n-1)$. l is equal to 0, 1, 2, 3 for s, p, d and f orbitals respectively.

3. **Magnetic Quantum Number (m)** (Lande) It determines direction of orientation of electrons in suborbit (subshell) because it gives the orientation or distribution of the electron cloud. It has all values from $-l$ through zero to $+l$, with total of $(2l+1)$ values. It explains splitting of spectral lines under the influence of magnetic field (Zeeman effect).
4. **Spin Quantum Number (s)** (Uhlenbech and Goldschmidt) It determines the orientation of the spin of the electron. It has two values of spinning of electron about its own axis. The spin quantum number either equal to $-\frac{1}{2}$ (anti-clockwise) and $+\frac{1}{2}$ (clockwise) depending upon the spin of electron.

e.g., Let us consider 5th electron of an atom

$$n = 2, l = 1 (p\text{-orbit})$$

$$m = -1, s = -\frac{1}{2} \text{ or } +\frac{1}{2}$$

Electronic Configuration of Elements

The arrangement of electrons in various shells, subshells or orbitals of an atom is known as electronic configuration of the element.

Filling of electrons in different orbitals is governed by the following rules

Aufbau's Principle

According to this principle, "Sub-shells are filled with electrons in the increasing order of their energies."

This suggests that sub-shell of lower energy will be filled first with electrons followed by higher energy sub-shell.

- According to $(n+l)$ rule, the lower the value of $(n+l)$ for an orbital the lower is its energy e.g; between $3d$ and $4s$, the $4s$ ($4+0 = 4$) will be filled before $3d$ ($3+2 = 5$). If two orbitals have same value of $(n+l)$, the orbital with lower value of n will be filled first e.g; between $2p$ and $3s$, $2p$ ($2+1 = 3$) will be filled first than $3s$ ($3+0 = 3$). the order of increasing energies is summed as $1s, 2s, 2p, 3s, 3p, 4s, 3d, 4p, 5s, 4d, 5p, 6s, 4f, 5d, 6p, 7s, 5f, 6d, 7p$

➔ **Note** ${}_{24}\text{Cr}$ and ${}_{29}\text{Cu}$ do not obey this law.

- The completely filled and completely half-filled sub-shells have lesser energy and thus assume more stability than any other arrangement. Thus, $3d^5 4s^1$ and $3d^{10} 4s^1$ are more stable arrangement than $3d^4 4s^2$ and $3d^9 4s^2$ respectively.

Hund's Rule of Maximum Multiplicity

According to this rule, "Pairing of electrons in a sub-shell starts after all the available atomic orbitals or the sub-shell are singly filled (half-filled)."

Pauli's Exclusion Principle

It states that, "No two electrons can have the same value of all the four quantum numbers."

RADIOACTIVITY

The spontaneous emission of electromagnetic radiations [α , β and γ -rays] due to the disintegration of unstable nucleus is called radioactivity. The elements showing radioactivity are called **radioactive elements**. It was discovered by **Prof. Henry Becquerel** in 1896 but the term radioactivity was coined by **Madam Curie**.

Radioactivity does not affected by temperature, pressure etc.

The activity of a radioactive material is measured in terms of the disintegrations per unit time. Its SI unit is becquerel which is the same as 1 disintegration per second.

1 curie = 3.7×10^{10} disintegrations s^{-1} .

Stability of Nucleus

- If neutron-proton ratio, i.e. $n/p > 1.5$, nucleus is unstable. The maximum stability is attained by nucleus when $n/p = 1$
 - Greater in the mass defect (A stable nucleus has less mass than its constituent particles. This difference is mass defect) lesser is the energy level of nucleus, more is its stability.
- ➔ **Note** Practical determination of the activity of radioactive substance is done by **Geiger Muller** counter.

Alpha Rays (α -rays)

- They are deflected towards negative plate in electric field.
- Each particle carry two units positive charge and four unit mass that is they are doubly ionised helium atom.
- Emission of α -particle decreases the atomic number by 2 and mass number by 4.
- They produce maximum ionisation in gases because of maximum kinetic energy.
- Their penetration power is very small because of large mass.

Beta Rays (β -rays)

- They are deflected towards positive plate in electric field.
- β -particles carries one unit negative charge and negligible mass that is these are electrons.
- Emission of one β -particle from unstable nucleus results in increase in number of protons by one unit.
- They produce lesser ionisation in gases than α -particles.
- β -particle is the strongest reducing agent.

Gamma Rays (γ -rays)

- γ -rays are electromagnetic radiations of very high frequencies even more than X-rays. Thus, the γ -rays have no charge and no mass.
- Emission of γ -rays does not have any effect on either atomic number or mass number.
- They are not deflected from their path in electric or magnetic field.
- They produce minimum ionisation in gases and possess maximum penetration power.

Disintegration Theory

Radioactive elements are unstable and undergo spontaneous breakdown from one chemical atom to another with the emission of either α -particle or β -particle. The process is continuous until finally a stable and non-radioactive nuclear species is obtained.

Group Displacement Law

In an α -particle emission, the resulting element has an atomic number less by 2 units (and atomic weight less by 4 units) hence it lies 2 columns to the left of the original element and in a β -particle emission, the resulting element has an atomic number increase by 1 unit (and same atomic weight) hence it lies 1 column to the right of the original element.

- There is no change in the atomic number and atomic mass during the emission of γ -particle.

Half-life Period

The time in which a substance remains half of its original amount is called the **half-life** of the substance. It is represented by $t_{1/2}$ and related to decay constant by the following expression $t_{1/2} = \frac{0.693}{\lambda}$

$$\text{Average-life} = \frac{1}{\lambda} = 1.44 \times t_{\frac{1}{2}}$$

Half life period of a radioactive element is independent of its amount.

$$N_t = N_o \times \left[\frac{1}{2}\right]^n$$

$$T \text{ (total time)} = t_{1/2} \times n$$

Where N_o = initial amount and N_t = amount after time t and n = number of half lives.

Nuclear Fission

The reaction in which a heavy nucleus is broken down into two or more lighter nuclei is called nuclear fission. It is usually accompanied by the emission of neutrons alongwith a large amount of energy.

Nuclear fission reactions are of two types

- Uncontrolled chain reaction
- Controlled chain reaction

- The principle of atom bomb is based on uncontrolled nuclear fission reaction.
- The principle of nuclear reactor is based on controlled nuclear fission reaction.

Nuclear Reactor

- It is a device that is used to produce electricity and permits a controlled chain nuclear fission.
- It contains fuels e.g., $^{235}_{92}\text{U}$, moderator (e.g., graphite and heavy water, D_2O) to slow down neutrons and control rods (made up of boron steel or cadmium) to absorb neutrons.
- It may also contain heavy water, liquid sodium or potassium as coolant.

Nuclear Fusion

The reaction in which two or more lighter nuclei combines to form a heavier nuclei is called nuclear fusion. This reaction takes place at extremely high temperature, therefore, these reactions are called **thermonuclear reactions**.

- Nuclear fusion is the source of sun's energy and stars.
- Hydrogen bomb is based on nuclear fusion.

Uses of Radioactive Isotopes

Radioactive isotopes are used in food irradiation; in nuclear medicine in two different ways; diagnosis and therapy; as tracers in chemical and biological processes and in carbon dating.

- Tc^{99} – In the treatment of thyroid, brain, kidney
- I^{123} – In the treatment of thyroid
- Co^{60} – Cancer treatment
- C^{14} – Age determination, photosynthesis research.
- Na^{24} – To measure blood flow in the body

➤ PRACTICE EXERCISE

- According to Dalton's atomic theory the smallest particle which is capable of independent existence is
 - element
 - atom
 - molecule
 - ion
- Electron was discovered by
 - Crookes
 - J. J. Thomson
 - Henry
 - Rutherford
- The atomic number of an element of mass number 27, which has 13 neutron is
 - 10
 - 14
 - 12
 - 13
- The atom of an element contains 2 electrons in its *M* shell. The element is
 - aluminium
 - sodium
 - chlorine
 - magnesium
- Which of the following properties of the element can be a whole number?
 - Atomic mass
 - Atomic number
 - Atomic radius
 - Atomic volume
- Which of the following is the correct sequence in terms of increasing mass?
 - Proton, electron, alpha particle, hydrogen atom
 - Electron, proton, hydrogen atom, alpha particle
 - Hydrogen atom, proton, electron, alpha particle
 - Alpha particle, proton, hydrogen atom, electron
- Neutrons are present in all atoms except
 - He
 - C
 - H
 - N
- Which one of the following pairs is correctly matched?
 - Mass spectrograph–Chadwick
 - Atomic number–Moseley
 - Neutron–Millikan's
 - Measurement of charge of an electron–Astron
- The relation between energy of a radiation and its frequency was given by
 - Bohr's
 - de-Broglie
 - Rutherford
 - Planck's
- Bohr's theory is applicable to
 - H atom
 - He⁺ ion
 - Li²⁺ ions
 - All of these
- According to Bohr's model of an element
 - $mvr = nh/2\pi$
 - $mvr = 2\pi/nh$
 - $mvr = n^2h^2/2\pi^2$
 - $mvr^2 = \frac{nh}{\pi}$
- When an electron moves from a higher orbit to the lower orbit then
 - emission of energy takes place
 - the size of atom increases
 - absorption of energy takes place
 - an electron in an atom moves without emission or absorption
- The value of Planck's constant is
 - $6.6 \times 10^{-32} \text{ g/m}^2\text{s}$
 - $6.6 \times 10^{-34} \text{ kgm}^2\text{s}^{-1}$
 - $6.6 \times 10^{-33} \text{ kg/ms}^{-1}$
 - $6.6 \times 10^{-34} \text{ gs}^{-1}$
- Which of the following statements does not form part of Bohr's model of the hydrogen atom?
 - Energy of the electrons in the orbit is quantised
 - The electron in the orbit nearest the nucleus has the lowest energy
 - Electrons revolve in different orbits around the nucleus
 - The position and velocity of the electrons in the orbit cannot be determined simultaneously
- The number of neutrons in ${}_{13}\text{Al}^{27}$ is
 - 40
 - 27
 - 14
 - 13
- An element *M* has atomic mass 19 and atomic number 9. Its ion is represented as
 - M^+
 - M^{2+}
 - M^-
 - M^{2-}
- The number of electrons in ${}_{8}\text{O}^{18}$ an isotope of oxygen is
 - 8
 - 6
 - 12
 - 10
- Which one among the following most correctly determines the atomic number of an element?
 - Number of protons
 - Number of protons and neutrons
 - Number of ions
 - Number of nucleons
- Consider the following statements. In ${}_{38}^{90}\text{Sr}^{2+}$
 - Atomic number is 36.
 - Number of electrons is 38.
 - Number of neutrons is 52.
 - Number of protons is 38.
 Which of the above statements is/are correct?
 - I and II
 - II and III
 - III and IV
 - I and IV
- Consider the following statements in reference to the structure of atom.
 - Isotopes are the atoms of the same element having same atomic number but different mass-numbers.
 - Isobars are the atoms of different elements having different atomic number but same mass-number.
 - Isotones are atoms of different elements having same number of neutrons.
 Which of the above statements is/are correct?
 - Only I
 - Only II
 - II and III
 - All of the above
- Which of the following statement is incorrect?
 - Isobars possess same chemical properties
 - Isotopes occupy same position in periodic table
 - Isotopes possess same atomic number
 - In isobars the total number of protons and neutrons in the nucleus is same
- The number of protons in a negatively charged atom (anion) is
 - more than the atomic number of an element
 - less than the atomic number of an element
 - more than the number of electrons in the atom
 - less than the number of electrons in the atom
- Who modified Bohr's theory by introducing elliptical orbits for electron path?
 - Hund
 - Thomson
 - Sommerfeld
 - Rutherford
- Which of the following electronic configuration is not possible?
 - $1s^2$
 - $1s^2 2s^2 2p^6 3d^{10} 3s^2$
 - $1s^2 2s^2 2p^2$
 - $1s^2 2s^2 2p^6 3s^1$

- 25.** The rule which states that no two electrons can have same value of all the four quantum numbers is
- Pauli's exclusion principle
 - Heisenberg's uncertainty principle
 - Aufbau principle
 - de-Broglie principle

- 26.** The electronic configuration of chromium ($Z = 24$) is
- $1s^2 2s^2 2p^6 3s^2 3p^6 3d^4 4s^2$
 - $1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$
 - $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 4p^4$
 - $1s^2 2s^2 2p^6 3s^2 3p^6 3d^6$

- 27.** From amongst the following chemical species

The species having identical electronic configuration are

- I and II
 - II and III
 - III and IV
 - I, II and III
- 28.** A stable nucleus (light with $A < 10$) has
- exactly the same number of neutrons and protons
 - more neutrons than protons
 - no neutrons
 - no protons
- 29.** Protons and neutrons are bound in a nucleus by
- short range 'weak interaction'
 - short range 'strong interaction'
 - long range 'electromagnetic interaction'
 - long range 'gravitational'

Directions (Q. Nos. 30-33)

Following questions consist of two statements labelled as Statement I and Statement II. Examine both the Statements carefully and mark the correct choice according to the codes given below.

- Both Statement I and Statement II are true and Statement II is the correct explanation of Statement I.
- Both Statement I and Statement II are true but Statement II is not the correct explanation of Statement I.
- Statement I is true, but Statement II is false.
- Statement I is false, but Statement II is true.

- 30. Statement I** Bohr theory is not applicable to ionised hydrogen atom.

Statement II H^+ is devoid of electron.

- 31. Statement I** An atom is electrically neutral.

Statement II Atoms contain equal number of proton and neutron.

- 32. Statement I** Among C^{12} , C^{13} and C^{14} only C^{14} is radioactive.

Statement II The n/p ratio in C^{14} is higher.

- 33. Statement I** Gamma rays are more penetrating than X-rays.

Statement II Gamma rays have wavelengths that are smaller than those of X-rays.

- 34.** Match the following.

List I (Electronic configuration)	List II (Elements)
A. $1s^2$	1. Chlorine
B. $1s^2 2s^2 2p^6$	2. Fluoride ion
C. $1s^2 2s^2 2p^6 3s^2$	3. Hydride ion
D. $1s^2 2s^2 2p^6 3s^2 3p^5$	4. Magnesium

Codes

A	B	C	D	A	B	C	D		
(a)	3	2	4	1	(b)	3	4	2	1
(c)	4	2	1	3	(d)	2	3	4	1

> Previous Years' Questions

- 35.** Which one among the following transitions of electron of hydrogen atom emits radiation of the shortest wavelength?

☑ 2012 (I)

- $n = 2$ to $n = 1$
- $n = 3$ to $n = 2$
- $n = 4$ to $n = 3$
- $n = 5$ to $n = 4$

- 36.** The penetrating power of X-rays can be increased by ☑ 2012 (I)

- increasing the current in the filament
- decreasing the potential difference between the cathode and the anode
- decreasing the current in the filament
- increasing the potential difference between the cathode and the anode

- 37.** Which of the following statements is correct? ☑ 2012 (I)

- Isotopes atoms with same atomic number but different atomic mass.
- Isobars atoms with same number of neutrons but different atomic number.
- Isotones atoms with same mass number but different atomic number.

Select the correct answer using the codes given below

- Only 2
- Only 1
- 1 and 2
- All of these

- 38.** The nucleus of a singly ionised carbon atom contains ☑ 2012 (I)

- 6 protons and 6 neutrons
- 5 protons and 6 neutrons
- 6 protons, 6 neutrons and 6 electrons
- 12 protons, 6 neutrons and 6 electrons

- 39.** The process of nuclear fusion in the sun requires ☑ 2012 (II)

- very high temperature and very high pressure
- low temperature and high pressure
- high temperature and low pressure
- very high temperature and no pressure

- 40.** Which one among the following transitions is associated with the largest change in energy in hydrogen atom? ☑ 2012 (II)

- $n = 5$ to $n = 3$
- $n = 2$ to $n = 1$
- $n = 3$ to $n = 2$
- $n = 4$ to $n = 2$

- 41.** Match the following ☑ 2012 (II)

List I (Scientist)	List II (Discovery)
A. Goldstein	1. Atomic theory
B. Chadwick	2. Proton
C. J.J Thomson	3. Neutron
D. John Dalton	4. Electron

Codes

A	B	C	D	A	B	C	D		
(a)	2	3	4	1	(b)	2	4	3	1
(c)	1	4	3	2	(d)	1	3	4	2

- 42.** Two atoms are said to be isotopes, if ☑ 2013 (I)

- they have same atomic number but different mass numbers
- they have same number of neutrons but different mass number
- the sum of the number of protons and neutrons is same but number of protons are different
- they have same number of neutrons but different modes of radioactive decay

- 43.** The phenomenon of radioactivity was discovered by ☑ 2013 (I)

- Marie Curie
- Pierre Curie
- Henry Becquerel
- J J Thomson

- 44.** The most of the mass of an atom can be found in ☑ 2014 (I)

- electrons
- charges
- nucleus
- electron cloud

- 45.** The mass number of an atom is determined by **☑ 2014 (I)**
 (a) adding the number of neutrons and number of electrons
 (b) adding the number of protons and number of electrons
 (c) the number of protons only
 (d) adding the number of neutrons and number of protons
- 46.** Which one of the following is the correct electronic configuration of chlorine? **☑ 2014(II)**
 (a) 2, 7, 8 (b) 2, 8, 7
 (c) 2, 8, 8 (d) 7, 8, 9
- 47.** Which one among the following contains the most neutrons? **☑ 2014(II)**
 (a) $^{59}_{26}\text{Fe}$
 (b) $^{61}_{29}\text{Cu}$
 (c) $^{61}_{30}\text{Zn}$
 (d) $^{60}_{30}\text{Zn}^{2+}$
- 48.** A monoatomic species that has 18 electrons and a net charge of 2–has **☑ 2014(II)**
 (a) the same number of electrons as a neutral argon atom
 (b) more protons than electrons
 (c) 2 unpaired electrons
 (d) 20 protons
- 49.** Which one of the following statements is correct? **☑ 2015 (II)**
 (a) Rutherford's α -particle scattering experiment led to the discovery of electron
 (b) J.J. Thomson suggested that the nucleus of an atom contains protons
 (c) The atomic number of an element is the same as the number of protons in the nucleus of its atom
 (d) The mass number of an atom is equal to the number of electrons in its shells
- 50.** Which of the following are the properties of an electron? **☑ 2015 (II)**
 1. Electron is a constituent of cathode ray.
 2. Electron is a negatively charged particle.
 3. The mass of the electron is equal to the mass of the proton.
 4. Electron is deflected by the electric field but not by magnetic field.
 Select the correct answer using the codes given below
 (a) 1 and 2 (b) 1, 2 and 3
 (c) 3 and 4 (d) 1 and 4
- 51.** An atom of carbon has 6 protons. Its mass number is 12. How many neutrons are present in an atom of carbon? **☑ 2016 (I)**
 (a) 12 (b) 6
 (c) 10 (d) 14

ANSWERS

1	b	2	b	3	b	4	d	5	d	6	b	7	c	8	b	9	d	10	d
11	a	12	a	13	b	14	d	15	c	16	c	17	a	18	a	19	c	20	d
21	a	22	d	23	c	24	b	25	a	26	b	27	d	28	a	29	b	30	a
31	c	32	a	33	a	34	a	35	a	36	d	37	b	38	a	39	a	40	b
41	a	42	a	43	c	44	c	45	d	46	b	47	a	48	a	49	c	50	a
51	b																		

Solutions

- 11.** (a) Angular momentum, $mvr = \frac{nb}{2\pi}$
- 15.** (c) Number of neutrons in $^{27}_{13}\text{Al}$ is 14.
 (number of neutrons = mass number – atomic number)
- 16.** (c) $^{19}_9\text{M} = 1s^2 2s^2 2p^5$
 Its ion is represented by M^- .
- 19.** (c) $^{90}_{38}\text{Sr}^{2+}$ Atomic number = 38
 = number of protons.
 Number of electrons = 38 – 2 = 36
 Number of neutrons = 90 – 38 = 52
 Hence, statement III and IV are correct.
- 26.** (b) $^{24}_{12}\text{Cr} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6 3d^5, 4s^1$
- 27.** (d) $^{39}_{18}\text{Ar}$, $^{40}_{19}\text{K}^+$ and $^{40}_{20}\text{Ca}^{2+}$ are isoelectronic species, thus, all these have same electronic configuration.
- 28.** (a) A stable nucleus has exactly the same number of neutrons and protons. The maximum stability is attained when $\frac{n}{p} = 1$.
- 40.** (b) The change in energy released or absorbed during transition is given by $\Delta E = 218 \times 10^{-18} \left[\frac{1}{n_1^2} - \frac{1}{n_2^2} \right]$
 $E \propto \frac{1}{n^2}$. Thus, for a transition of $n = 2$ to $n = 1$, largest change in energy is involved.
- 48.** (a) A monoatomic species has the same number of electrons as a neutral argon atom. The monoatomic species must be S^{2-} .
- | Monoatomic species | Number of electrons |
|---------------------------------|---------------------|
| Sulphur (S) | 16 |
| Sulphur ion (S^{2-}) | 16 + 2 = 18 |
| Argon (Ar) | 18 |
- 51.** (b) We know that,
 Mass no. (A) = No of proton (p) + no. of neutron (n)
 $12 = 6 + n \Rightarrow n = 6$
 Mass number determines the atomic mass of atoms.

06

PERIODIC CLASSIFICATION OF ELEMENTS

Usually 1-2 questions are asked from this chapter. Questions are mostly based upon isoelectronic species and properties and uses of alkali metals.

PERIODIC CLASSIFICATION

The arrangement of elements in such a way so that elements having similar properties reappear at a regular interval, is called periodic classification or periodic arrangement of elements.

Earlier Development in Classification of Elements

Several attempts have been made for the classification of elements into group and it leads to the development of periodic classification and periodic table of elements.

Dobereiner's Triads

In 1817, Dobereiner found that elements could be arranged in a group of three called triads in such a way that the middle element had an atomic weight almost the average of other two, e.g.

Element	– Li	Na	K
Atomic weight	– 7	23	39
Mean of atomic masses	$= \frac{7 + 39}{2} = 23$		

Newlands' Law of Octaves

John A.R. Newland (1866) found that, if the elements were arranged in the increasing order of their atomic weights, the properties of every eight elements were similar to those of first one. Newland called it law of octaves.

Lothar Meyer's Arrangement of Elements

Lothar Meyer (1869) plotted various physical properties such as atomic volume against atomic weight and said, "the properties of the elements were the periodic functions of their atomic volumes." He arranged the elements in a way resembling Mendeleev's arrangement of elements.

MENDELEEV'S PERIODIC TABLE

Mendeleev's periodic table is based on atomic weight. Mendeleev periodic law states that 'the properties of elements are the periodic functions of their atomic masses'.

- It contains vertical columns called groups and horizontal rows called periods. In this table, there were 8 groups and 7 periods.
- Mendeleev arranged 63 elements in this table.

Defects of Mendeleev's Periodic Table

- Position of hydrogen in the periodic table was not correctly defined.
- In certain pair of elements the increasing order of atomic masses was not obeyed. Isotopes have not been given separate places in the periodic table.
- Some similar elements were separated and dissimilar elements were grouped together.
- Mendeleev could not explain the cause of periodicity among the elements.

Modern Periodic Table

It was given by British chemist Moseley in 1913 on the basis of his discovery that atomic number is the most fundamental property. It is a tabular form of modern periodic law, according to which, 'the physical and chemical properties of the elements are the periodic function of their atomic numbers'.

Characteristics of Long Form of Periodic Table

- The horizontal rows are called **periods** and the vertical columns are called **groups**.
- The groups are numbered from 1 to 18 and there are altogether 7 periods.
- Elements having similar outer electronic configurations in their atoms are arranged in the vertical columns, *i.e.*, groups or families. That's why elements of a group possess similar chemical properties.
- The period number corresponds to the highest principal quantum number (n) of the elements in the period and each period marks a new electronic shell getting filled.
- The first period contains 2 elements and the subsequent periods consist of 8, 8, 18, 18 and 32 elements respectively and seventh period is incomplete.
- In this form of the periodic table, 14 elements of both six and seventh periods (lanthanoids and actinoids respectively) are placed in separate panels at the bottom.

CLASSIFICATION OF ELEMENTS

The electronic configuration of atoms provides a theoretical foundation for the periodic classification. Elements of a group exhibit similar chemical properties because they have same electronic configuration of their outermost shell.

Depending upon the type of orbital receiving the valence electron, the elements can be classified into following four blocks

s-block Elements (ns^{1-2})

The elements in which the last electron enters the s -orbital of their outermost energy level are called s -block elements and hence these elements are called representative elements.

The s -block elements are present on the extreme left in the periodic table.

It consists of elements of group IA and IIA.

Elements of IA group are called alkali metals while that of IIA group are called alkaline earth metals.

Properties of s-block Elements Except Hydrogen

- They all are metals, malleable, ductile and good conductors of heat and electricity.
- They show low ionisation potential.
- They are soft metals (due to weak metallic bond) and have low melting and boiling points.
- They are highly electropositive. They are powerful reducing agent, hence cannot be prepared by reduction. These are prepared by electrolysis of their salts in fused or molten state.
- Except Li and Be they form ionic compounds (because of small size of Li and Be form covalent compounds according to Fajans rule).
- The ionic nature of compounds increase from top to bottom.
- Elements of **IA form** monovalent cation while that of **IIA form** divalent cation. By the loss of electrons from their outermost shell.
- They do not show variable oxidation state.
- They form diamagnetic (no unpaired electrons) and colourless salts except dichromates and permanganates which are coloured.
- Due to high reactivity, alkali metals are stored under liquid paraffins.
- They form hydrides with hydrogen.
- Of all these elements, only hydrogen is a non-metallic gas.

p-block Elements (ns^2np^{1-6})

The elements in which the last electron enters the p -orbital of the outermost energy levels are called p -block elements. These elements are present in the right portion of periodic table. The elements of group 13 to 18 are in p -block.

Properties of p-block Elements

- p -block elements include metals, non-metals as well as metalloids.
- These elements have smaller atomic radii than s -block elements. The atomic radius decreases from left to right in a period due to increase in nuclear charge.
- They have high electronegativities. It is due to their small atomic size, p -block elements possess higher electron affinities than s -block elements.
- Halogens, oxygen, sulphur and phosphorus are reactive elements of p -block elements.
- They usually form covalent compounds.
- Some of these elements show variable valency and exist in more than one oxidation state in their compounds.
- Few elements, *viz* oxygen, sulphur, phosphorus etc. exhibit allotropy.
- They have high value of ionisation energy.
- Their oxides are acidic in nature.

***d*-block Elements $(n-1)d^{1-10}ns^{1-2}$**

The element in which the last electron enters the *d*-orbitals, i.e. $(n-1)$ energy level constitute *d*-block element. They constitute group 3 to 12 in the periodic table.

The *d*-block comprises of three series which are

- (i) First transition series scandium ($Z = 21$) to zinc ($Z = 30$)
- (ii) Second transition series yttrium ($Z = 39$) to cadmium ($Z = 48$)
- (iii) Third transition series lanthanum ($Z = 57$); hafnium ($Z = 72$) to mercury ($Z = 80$)

Properties of *d*-block Elements

- They are metals having high melting and boiling points (strong metallic bond).
- They are good conductor of heat and electricity due to free and mobile electrons. Silver is the best conductor of heat and lead is the poorest.
- Almost all of them show variable valence and exist in several oxidation state in their compounds.
- They form complex compounds.
- Transition elements and their compounds act as catalysts.
- They form both ionic and covalent compounds.
- Density of *d*-block elements are very high as compared to *s*-block elements.
- Properties of transition elements on moving across a period from left to right do not change gradually as those of *s* and *p*-block elements because the last two orbits are incomplete.
- Most of these ions contains unpaired electrons hence they are paramagnetic and coloured (due to *d-d* transition).
- Zinc, cadmium, mercury having d^{10} configuration do not form coloured salts.

***f*-block Elements $(n-2)f^{1-14}(n-1)d^{0-1}ns^2$**

- The elements in which the last electron enter the *f*-orbitals of their atom are called *f*-block elements (penultimate orbit).
- The first series follows lanthanums (lanthanide series) from $Z = 58$ to $Z = 71$. This is also known as $4f$ inner-transition series.
- The second series follow actinium (actinide series) from $Z = 90$ to $Z = 103$ also known as $5f$ inner-transition series.

Properties of *f*-block Elements

- All *f*-block elements are metals and are highly reactive.
- These have high density, high melting and boiling points.

- They show variable valency. Their ions are coloured and paramagnetic in nature.
- They form complex compounds.
- They are radioactive.
- These are highly electropositive metals due to low ionisation energies.
- They generally form ionic compounds.

PERIODIC PROPERTIES

In a period as well as in a group there is a regular gradation (gradual increase or decrease in a particular property) in physical and chemical properties of elements with the change in atomic number. This regular gradation in properties is called periodicity. The reason of periodicity in properties is the repetition of similar configuration at regular intervals.

Atomic Radius

- It is defined as the distance from the centre of the nucleus to the outermost shell of electrons.
- In case of covalent bond, the radius is covalent radius; in ionic bond the radius is ionic radius and in absence of bond the radius is van der Waal's radius. In general, van der Waal's radius > covalent radius.
- Atomic radii of elements increases on moving down the group due to increase in number of shells by a factor of one, which reduces effective nuclear charge.
- Atomic radii of elements decreases on moving left to right in a period due to increase in on effective nuclear charge as the electrons enter in the same shell throughout the period.
- Radius of cation is always smaller than its neutral atom because of increase in effective nuclear charge per electron. e.g. $\text{Sn} > \text{Sn}^{2+} > \text{Sn}^{4+}$
- Radius of an anion is always larger than its neutral atom because of decrease in effective nuclear charge per electron. e.g. $\text{O}^{2-} > \text{O}^- > \text{O}$
- **Isoelectronic species** These species have same number of electrons. In case of isoelectronic species, the ionic radii decreases with increase in atomic number.
e.g. Ion $[\text{O}^{2-} > \text{F}^- > \text{Na}^+ > \text{Mg}^{2+}]$
(8) (9) (11) (12)

Ionisation Potential (IP)

It is the minimum amount of energy required to remove an electron from outermost orbit of an isolated gaseous atom. IP measures tendency of cation formation.

- IP increases from left to right due to increase in effective nuclear charge while it decreases from top to bottom.

$$\text{IP} \propto \frac{1}{\text{size of atom}}$$

- IP_1 of group 2 elements is greater than the corresponding elements of group 13. e.g. IP_1 of Mg > IP of Al.

- N_2 can show maximum four covalency in their compounds, e.g. NH_4^+ . Various oxides of nitrogen are

N_2O : (laughing gas)-neutral, diamagnetic, linear.

NO : neutral, paramagnetic, exists as a dimer in solid state.

N_2O_3 : acidic, diamagnetic.

NO_2 : acidic, paramagnetic, V-shape.

N_2O_5 : most acidic (solid)

- Basic nature of hydrides follows the order

$SbH_3 < AsH_3 < PH_3 < NH_3$

- Bond angle of hydrides decreases as

$NH_3 > PH_3 > AsH_3 > SbH_3$

- Order of boiling point of hydrides

$SbH_3 > NH_3 > AsH_3 > PH_3$
(H-Bond)

- Among red and white phosphorus the former is less reactive and used in match industry.

VIA Group Elements (O, S, Se, Te, Po)

- The general electronic configuration is ns^2np^4 . These elements are known as chalcogens or ore forming elements.

- The elements show +2, +4 and +6 oxidation state and a coordination number of +4 and +6.

- O_2 molecule is paramagnetic due to the presence of two unpaired electrons.

- Oxygen due to high electronegativity generally show -2 oxidation state. It also exhibit oxidation state of -1 (peroxides), 0 (O_2), +2 (OF_2) and +1 (O_2F_2).

- Ozone is an allotrope of oxygen and acts as a good bleaching agent.

- Order of acidic nature and reducing power of hydrides is

$H_2O < H_2S < H_2Se < H_2Te$

- Bond angle shows the order $H_2O > H_2S > H_2Se > H_2Te$

$104.5^\circ \quad 92.2^\circ \quad 91.0^\circ \quad 90^\circ$

- The decreasing order of volatile nature of hydrides of VIA group elements are

$H_2O > H_2Te > H_2Se > H_2S$
Least volatile Most volatile

- H_2S is more volatile than H_2O due to hydrogen bonding in H_2O .

VII A Group Elements (F, Cl, Br, I, At)

- General electronic configuration is ns^2np^5 .

- These are known as halogens.

- F shows -1 oxidation state, while others show -1, +1, +3, +5 and +7 states.

- Reactivity of halogens follow the order

$F > Cl > Br > I$

- Order of electron affinity of halogens

$Cl > Br > F > I$

- Order of oxidising character of halogens

$F_2 > Cl_2 > Br_2 > I_2$

- Strength of hydroacid and reducing character follow the order

$HF < HBr < HCl < HI$.

- Order of stability of halides is $HF > HCl > HBr > HI$.

- Order of bond dissociation energy of halogens is

$I_2 < Br_2 < F_2 < Cl_2$

Zero Group Elements

(He, Ne, Ar, Kr, Xe, Rn)

General electronic configuration of these elements is $ns^2 np^6$.

- The first noble gas compound $XePtF_6$ was obtained by N. Bartlett in 1962.
- All the elements are colourless, tasteless and odourless gases.
- All these are present in atmosphere except radon.
- They are all monoatomic and their atomic size increases with the increase in the atomic number.
- All these gases have zero electron affinities.

USES OF NOBLE GASES

- He is used in gas cooled atomic reactors as a cooling medium.
- Mixture of 85% He and 15% H_2 is used for filling in balloons and airships as it is light, non-combustible gas.
- Mixture of He and O_2 is used for respiration of sea divers.
- Ne is used in neon discharge lamps and signs for advertising purposes.
- Mixture of 85% Ar and 15% N_2 is filled in electric bulb.
- Radon is used in treatment of cancer.

Transition Elements (VIII Group Elements)

- All the transition elements are *d*-block elements but all the *d*-block elements are not transition elements.
- Transition metals have small atomic size and hence their ionisation potential values are high.
- The characteristic property of transition elements is to show several oxidation states.
- They have high density, melting and boiling points.
- They form metallic bond.
- They are coloured and paramagnetic.
- The atomic volume of the transition elements are low as compared with group IA and IIA elements.
- Mn shows maximum oxidation state of +7 in $KMnO_4$.
- Insoluble silver halides are soluble in sodium thiosulphate therefore, sodium thiosulphate is used in photography as a fixer.

Sodium Sodium argento
thiosulphate thiosulphate

- Most abundant transition element is Fe.

PRACTICE EXERCISE

- Mendeleev corrected the atomic weight of
 - Be
 - In
 - Os
 - All of these
- The base of modern periodic table is
 - atomic weight
 - atomic number
 - atomic volume
 - atomic energy
- Group number and valency has no relation in
 - zero group
 - first group
 - IIIrd group
 - VII group
- Which period and group in the long form of periodic table contain maximum number of elements?
 - 5th period, IIInd group
 - 6th period, IIIrd group
 - 6th period, IIInd group
 - Ist period, IIInd group
- Zero group was introduced by
 - Lothar Meyer
 - Mendeleev
 - Ramsay
 - Lockyer
- The block in which metals, metalloids, non-metals and inert gases are all present
 - s-block
 - p-block
 - d-block
 - f-block
- Which of the following has least density?
 - Na
 - Li
 - Mg
 - K
- Which of the following groups may contain a metalloid?
 - IA
 - IIA
 - VIA
 - None of these
- The element with electronic configuration $3d^5 4s^1$ is
 - metalloid
 - non-metal
 - transition metal
 - metal
- In which of the following the tendency towards the formation of coloured ion is maximum?
 - s-block elements
 - d-block elements
 - p-block elements
 - All of the above
- Which of the following is known as wonder element?
 - Zr
 - Zn
 - Ti
 - None of these
- Element *A* belongs to group VIIA in p-block and element *B* belongs to group IA in s-block of the periodic table. Out of the following assumptions, the correct one is
 - A* and *B* are metals
 - A* and *B* are non-metals
 - A* is a metal and *B* is a non-metal
 - A* is a non-metal and *B* is a metal
- All alkaline earth metal ions are
 - coloured
 - colourless
 - paramagnetic
 - colourless and diamagnetic
- Which of the following belongs to representative group of elements of periodic table?
 - Lanthanum
 - Argon
 - Chromium
 - Aluminium
- The common semiconductor material is
 - nitrogen
 - phosphorus
 - antimony
 - arsenic
- Which of the following sets of elements belong to the same period?
 - He, Ne, Ar
 - Ni, Cu, Zn
 - Cl, Br, I
 - Na, Cu, Mg
- Which of the following is most abundant transition element?
 - Copper
 - Iron
 - Zinc
 - Nickel
- Which of the following is most electronegative?
 - Lead
 - Silicon
 - Carbon
 - Tin
- Which has least ionisation potential?
 - N
 - O
 - F
 - Ne
- Which of the following has the largest ionic radius?
 - Be²⁺
 - Mg²⁺
 - Ca²⁺
 - Sr²⁺
- On descending a group, electropositive character of elements
 - increases
 - decreases
 - remains same
 - None of these
- Which of the following order of ionisation energy is correct?
 - Be < B < C < N < O
 - B < Be < C < O < N
 - Be > B > C > N > O
 - B < Be < N < C < O
- In the following, the elements with the highest electro-positivity is
 - copper
 - cesium
 - barium
 - chromium
- In which of the following energy is absorbed?
 - F → F⁻
 - Cl → Cl⁻
 - O → O²⁻
 - H → H⁻
- The electron affinity of Be is similar to that of
 - Li
 - B
 - Na
 - Ne
- The solubility of hydroxides of group IIA increases from Mg(OH)₂ to Ba(OH)₂ due to
 - increase in lattice energy
 - decrease in lattice energy
 - increase in ionisation energy
 - increase in thermal stability
- Fluorine, the most electronegative element in Paulings scale have the value
 - 1
 - 2
 - 3
 - 4
- In the context of lanthanoids, which of the following statements is not correct?
 - There is a gradual decrease in the radii of the members with increasing atomic number in the series
 - All the members exhibit + 3 oxidation state
 - Because of similar properties the separation of lanthanoids is not easy
 - Availability of 4f-electrons results in the formation of compounds in +4 state for all members of the series
- Identify the incorrect statement among the following.
 - d-block elements show irregular and erratic chemical properties among themselves
 - La and Lu have partially filled d-orbitals and no other partially filled orbitals

07

CHEMICAL BONDING

In general 1-2 questions are asked from this chapter. Questions are mainly asked upon the topics of valency and hydrogen bonding.

CHEMICAL BOND

The attractive force which holds various constituents (atoms, ions, etc) together in different chemical species is called a **chemical bond**. During the formation of a chemical bond, energy is released.

Valency

- The capacity of an element to form chemical bonds is known as its valency. The valency of an element is the combining capacity of an element.
- The valency of an element decides the number of other atoms which can combine with one atom of that element, e.g. the valency of carbon is 4 and that of hydrogen is 1. So, one atom of carbon can combine with four atoms of hydrogen to form a methane molecule CH_4 as follows:

- Valency of metal = Number of valence electrons in its atom, e.g. sodium (Na) = 2, 8, 1
 \therefore Valency of sodium = 1
- Valency of non-metal = 8 - Number of valence electrons in its atom. e.g. chlorine Cl_{17} = 2, 8, 7
 \therefore Valency of Cl = 8 - 7 = 1

Some important elements and their valencies are as follows:

- (i) H, Cl, Br, I, Cu (ous) etc. are monovalent as their valency is 1.
 - (ii) O, S, Mg, Ca Zn, Fe (ous), Cu (ic), Pb, Co, Ni etc. are divalent as their valency is 2.
 - (iii) N, P, Al, Cr, B etc are trivalent as their valency is 3.
 - (iv) C, Si etc are tetravalent as their valency is 4.
- Some elements e.g., Cu, Fe etc. exhibit more than one valencies (variable valency). Cu and Hg exhibit + 1 and + 2 valencies and Fe exhibits + 2 and + 3 valencies.

Electronic Theory of Chemical Bonding (Octet Rule)

Kossel and Lewis in 1916 developed a theory of chemical combination between atoms known as electronic theory of chemical bonding which was based on inertness of noble gases.

According to this theory "atoms can combine either by transfer of valence electrons from one atom to another (gaining or losing) or by sharing of valence electrons in order to have an octet or stable configuration just like noble gases in their valence shells". This is known as **octet rule**.

TYPES OF CHEMICAL BOND

There are three types of chemical bond

1. Electrovalent or ionic bond
2. Covalent bond
3. Coordinate bond

1. Electrovalent or Ionic Bond

- These types of bonds are formed by the transference of one or more electrons from one atom to another atom.

e.g.

- Electrovalent bond is formed between most electropositive elements i.e. metals (like, Na, K, Ca, Ba, Mg, etc) and most electronegative elements i.e. non-metals (like, O, F, N, S, Cl, Br etc.,).
- The number of electrons lost or taken up by the element is called electrovalency of the element which is equal to charge of cation or anion respectively and these types of compounds are called **electrovalent compounds**.
- Electropositive elements form cations by losing electrons and electronegative elements form anions by gaining electrons.
- If the difference in electronegativity of the atoms is around 1.9 and more, then bond is generally ionic.

Characteristics of Ionic Compounds

The main characteristics are as following

- Ionic compounds are crystalline in nature. Their constituent units are ions. These ions are arranged together in a regular way in an ionic lattice, e.g., in NaCl lattice each sodium ion is bonded with six Cl^- ions and each Cl^- ion is surrounded by six Na^+ ions.
- Ionic compounds are hard and brittle in nature due to the strong force of attraction between oppositely charged ions. These solids have low volatility, high stability and high density.
- These have high melting and boiling points due to the presence of powerful electrostatic force between the ions.
- These are good conductors of heat and electricity in molten state or aqueous medium due to the mobility of ions.
- These are soluble in polar solvents like water but insoluble in non-polar solvents like CCl_4 , C_6H_6 etc.
- Ionic compounds form ions in solution, hence exhibit ionic reactions which are quite fast and instantaneous.
- The bond in ionic compound is non-rigid and non-directional, so these do not show isomerism.

Variable Electrovalency

The elements which change their valency and have more than one electrovalency are said to possess variable electrovalency. This is due to following two reasons

- Inert pair effect** It is observed that in the case of heavy elements like Pb, Bi, etc ns^2 electrons have extra stability and hence do not take part in bond formation. This effect is called inert pair effect. This effect increases with increasing the atomic number in a group,

e.g. Ge and Pb belongs to the 14th group of Periodic Table, but Ge stable in Ge^{4+} state and Pb stable in Pb^{2+} state. Thus, Pb^{2+} salts are stable than Pb^{4+} salts.

- Unstable configuration of the core** In *d*-block elements, core possess unstable arrangement of electrons. Hence, they show variable valency, e.g. Fe^{2+} ($3s^2, 3p^6, 3d^6$) lose an electron to change into Fe^{3+} which cannot lose further electrons.

2. Covalent Bonds

These types of bonds are formed by the mutual sharing of equal number of electrons by the atoms in the molecules. Thus, the bond formed by the sharing of electrons is called covalent bond and compounds possessing covalent bond are called covalent compounds.

Formation of H_2 molecule $\text{H} \cdot + \cdot \text{H} \longrightarrow \text{H}:\text{H}$ or $(\text{H} - \text{H})$

- Single, double and triple bonds are formed by the sharing of one, two and three electron pairs respectively.

Covalent bonds are of two types

- Non-polar Covalent Bonds** These types of covalent bonds are formed between two identical atoms or atoms having the same electronegativity. The atoms which share electrons have approximately equal electronegativity, the electron pair is equally shared between them, such a bond is called polar covalent bond e.g. Cl_2 , O_2 etc.
- Polar Covalent Bonds** These types of covalent bonds are formed between different elements or elements having different electronegativity. In this bond the electron pair is attracted towards more electronegative atom, therefore one atom have partial negative charge and other atom have partial positive charge, e.g. HBr, HCl etc.

Characteristics of Covalent Compounds

The main characteristics are as following

- In general covalent compounds are gases or liquids. Some of the compounds are soft solids.
- These compounds are slightly soluble in water but highly soluble in organic solvents such as alcohols, ethers etc.
- Those covalent molecules which form hydrogen bonds with water molecules becomes fairly soluble in water. e.g. lower alcohols, lower carboxylic acids etc.
- They are bad conductors of electricity because they do not contain ion, but, when a covalent molecule reacts with water, it dissolves and produces ions, and hence, begins to conduct electricity.
- They have relatively low melting and boiling points [except diamond, silica, carborundum (SiC)] due to weak covalent bonds.

- (vi) Due to low melting and boiling points, covalent solids are more volatile than ionic solids and therefore have high vapour pressure.
- (vii) They are generally rigid and directional hence show isomerism.
- (viii) They undergo chemical reactions which are quite slow because these reactions involve breaking of older bonds and formation of new bonds.

Dipole Moment

The property which measures the extent of polarity in the bond is called dipole moment.

Dipole moment = Magnitude of charges (e) \times distance (d)

- Dipole moments of diatomic molecules is zero because they are non-polar, e.g. H_2 , Cl_2 , F_2 , O_2 , N_2 etc.
- Dipole moments of HF, HCl, HBr and HI are very large due to their high electronegativity differences.
- Molecules like CO_2 , CS_2 and BeF_2 are linear and possess polar covalent bonds. The bond moments of two bonds being equal but opposite in direction cancel each other so their dipole moment is zero.
- The dipole moment of CH_4 , CCl_4 , BF_3 are zero due to their symmetrical structure.

3. Coordinate or Dative Bond

The bond in which both electrons in the shared pair come from one atom is called coordinate covalent bond.

Such type of bond is formed between atoms one of which is deficient in atleast two electrons, while the other atom has already acquired stable noble gas configuration.

The atom which donates the electrons is called the donor while the other which only accepts the electrons pair is known as **acceptor**. This bond is usually represented by an arrow (\rightarrow) pointing from donor to the acceptor atom.

e.g., a hydrogen ion can combine with water molecules by coordinate covalent bond to form hydronium ion (H_3O^+).

Coordinate Covalent Bonds in Complex Compounds

In complex compounds ligands donate a pair of electron to the central metal atom. Thus, in a complex, ligands join with central metallic atom by a coordinate covalent bond, e.g. $K_4[Fe(CN)_6]$.

- In complex salts, central metal atom act as **Lewis acid**.

Characteristics of Coordinate Covalent Compounds

The main characteristics are as following

- (i) These exist as solids, liquids, and gases under normal conditions.
- (ii) These are sparingly soluble in polar solvent like water but readily soluble in **non-polar solvents**.
- (iii) These are bad conductor of heat and electricity.
- (iv) The melting and boiling points are higher than purely covalent compounds.
- (v) Coordinate bond is rigid and directional. Thus, these compounds show isomerism.
- (vi) Compounds which have coordinate covalent bond possess high values of dielectric constant.

➤ **Note** According to octet rule, an atom has a tendency to occupy 8 electrons (2 in H like He) in its valence shell, which is stable arrangement, but a number of molecules are known which violates octet rule.

- e.g. (i) BeF_2 , BF_3 (incomplete octet)
 (ii) NO , NO_2 (odd number electrons)
 (iii) PCl_5 , SF_6 (expanded octet)

HYDROGEN BOND

The attractive interaction of a hydrogen atom with an electronegative atom such as nitrogen (N), oxygen (O) or fluorine (F) that comes from another molecule or chemical group, is called hydrogen bond.

It is stronger than van der Waals' interaction and has energy 5 to 30 kJ/mol. It occurs in both inorganic molecules such as water and organic molecules such as DNA.

Hydrogen bonds can be of the following two types

- (i) **Intermolecular H-bonding** It occurs between different molecules of a substance and results in increasing solubility in water and high boiling point
 e.g. HF , H_2O , C_2H_5OH etc.
 $H-F \cdots H-F \cdots H-F$
- (ii) **Intramolecular H-bonding** It is found within different parts of a single molecule and results in decreasing solubility in water and low boiling point e.g. *o*-nitrophenol.

- Metals possess **metallic bond**.
- **Soft metals** like Na, K possess weak metallic bond and hence can be cut with a knife.
- The atoms of transition metals are held together by strong metallic bonds because of large number of unpaired electrons in their atoms. Therefore, all transition metals are much harder and less volatile.

➤ PRACTICE EXERCISE

- An element has the electronic configuration $1s^2, 2s^2 2p^6, 3s^2 3p^2$. The number of valence electrons will be
(a) 2 (b) 3 (c) 4 (d) 5
- Outermost shells of two elements X and Y have two and six electrons respectively. If they combine the expected formula of the compound will be
(a) XY (b) X_2Y (c) X_2Y_3 (d) XY_3
- The formula of a metallic chloride is MCl_2 , the formula of its bicarbonate is
(a) MCO_3 (b) $MHCO_3$
(c) $M(HCO_3)_2$ (d) $M(CO_3)_2$
- Two elements gallium and oxygen combine to form a compound Ga_2O_3 . Which among the following is the valency of gallium?
(a) 1 (b) 2 (c) 3 (d) 4
- The formation of chemical bond is accompanied by
(a) increase in energy
(b) decrease in energy
(c) neither decrease nor increase in energy
(d) the repulsive forces overcoming the attractive forces
- An electrovalent compound does not show isomerism due to
(a) high melting point
(b) presence of ions
(c) strong electrostatic force between ions
(d) non-directional nature of electrovalent bond
- Elements whose electronegativities are 1.2 and 3.0, bond formed between them would be
(a) ionic (b) covalent
(c) coordinate (d) metallic
- Ionic bond formation is
(a) exothermic (b) endothermic
(c) Both (a) and (b) (d) None of these
- Many ionic crystals dissolve in water because
(a) water is an amphiprotic solvent
(b) water is high boiling liquid
(c) the process is accompanied by positive heat of solution
(d) water decreases the interionic attraction in the crystal lattice due to solvation
- Which one of the following has high melting and boiling points?
(a) CCl_4 (b) $AlCl_3$ (c) $CaCl_2$ (d) NCl_3
- Which one of the following has a giant covalent structure?
(a) PbO_2 (b) SiO_2 (c) $NaCl$ (d) $AlCl_3$
- Which one of the following is a covalent molecule?
(a) Al_2Cl_6 (b) Al_2O_3
(c) AlF_3 (d) All of these
- Which one of the following is correct?
(a) Water is a non-polar molecule in normal conditions
(b) Water is a polar molecule in normal conditions
(c) Water exist in the form of H^+OH^- in normal conditions
(d) All of the above are correct
- Carbon suboxide (C_3O_2) has recently been shown as a component of the atmosphere of Venus. Which of the following formulation represents the correct ground state Lewis structure for C_3O_2 ?
(a) $:O:C:C:O:$
(b) $:O:C::C:O:$
(c) $:\ddot{O}::C::C::\ddot{O}:$
(d) $:O::C:C::O:$
- Hydrogen fluoride is a liquid unlike other hydrogen halides because
(a) HF molecule associate due to hydrogen bonding
(b) F_2 is highly reactive
(c) HF is the weakest acids of all hydrogen halides
(d) fluorine atoms is the smallest of all halides
- Which one of the following has highest dipole moment?
(a) CO_2 (b) $CHCl_3$
(c) CCl_4 (d) CH_2Cl_2
- Both ionic and covalent bond present in
(a) CH_4 (b) $NaCl$
(c) SO_2 (d) KOH
- Which contain both polar and non-polar bonds?
(a) NH_4Cl (b) HCN (c) H_2O_2 (d) CH_4
- Which of the following having electrovalent, covalent and coordinate covalent bond?
(a) BF_3 (b) $CuCl_2$
(c) $CuSO_4 \cdot 5H_2O$ (d) $FeCl_3 \cdot H_2O$
- Type of bonds present in $K_4[Fe(CN)_6]$ molecule is
(a) covalent and electrovalent bonds
(b) covalent and coordinate covalent bonds
(c) electrovalent, covalent and dative bonds
(d) electrovalent bond and dative bonds
- Which one of the following has odd electron bond?
(a) PCl_3 (b) SF_4 (c) NO (d) $POCl_3$
- Which of the following is soluble in water?
(a) CS_2 (b) C_2H_5OH
(c) CCl_4 (d) $CHCl_3$
- Consider the following statements.
I. $NaCl$ is ionic solid.
II. Benzene is covalent compound.
III. Carbon has tetravalency.
Codes
(a) I and II (b) II and III
(c) I and III (d) All of these
- Which of the following statements are true?
I. Water is liquid at room temperature due to hydrogen bonding.
II. Covalent bond is directional.
III. Co-ordinate or dative bond containing compounds have high values of dielectric constant.
Codes
(a) I and II (b) II and III
(c) I and III (d) All of these
- Consider the properties related to co-ordinate or dative linkage compounds.
I. They are rigid and directional.
II. They exhibit isomerism.

- III. They contain high dielectric constants.
 IV. They are poor conductors of electricity in solid as well as in fused state.

Codes

- (a) I, II and III (b) II, III and IV
 (c) I, III and IV (d) All of these

Directions (Q. Nos. 26-28)

Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and match the correct choice according to the codes given below.

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of the Statement I.
 (b) Both Statement I and Statement II are true but Statement II is not the correct explanation of the Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.

- 26. Statement I** Water (H₂O) is more polar than hydrogen sulphide (H₂S).

Statement II Oxygen is more electronegative than sulphur.

- 27. Statement I** Purely covalent compounds cannot conduct electricity in their aqueous solution or in molten state.

Statement II Purely covalent compounds have lower melting and boiling points.

- 28. Statement I** Fluorine exhibits the same oxidation state in all its compounds.

Statement II Fluorine atom has no *d*-orbital in its valence shell.

- 29. Match List I with List II and select the correct answer from the codes given below the lists:**

List I	List II
A. Ionic compound	1. NH ₄ Cl
B. Polar covalent	2. O ₂
C. Non-polar covalent molecule	3. HCl
D. Dative bond	4. KCl

Codes

- A B C D
 (a) 4 3 2 1
 (b) 1 3 2 4
 (c) 4 1 2 3
 (d) 1 2 4 3

- 30. Match List I with List II and select the correct answer from the codes given below the lists.**

List I (Elements)	List II (Valency)
A. K	1. two
B. Zn	2. one
C. Al	3. four
D. C	4. three

Codes

- A B C D A B C D
 (a) 2 1 4 3 (b) 2 3 1 4
 (c) 3 1 4 2 (d) 3 4 1 2

> Previous Years' Questions

- 31. Three elements Na, S and O combine to form a compound Na₂SO₃. What is the valency of S in this compound?** ☑ 2012 (II)
 (a) +2 (b) +4 (c) +6 (d) +8
- 32. The bond which is present between water molecules is** ☑ 2012 (II)
 (a) electrovalent bond
 (b) covalent bond (c) hydrogen bond
 (d) van der Waals' bond

- 33. The number of valence electrons in the O²⁻ ion is** ☑ 2014(I)

- (a) 4 (b) 6
 (c) 8 (d) 10

- 34. Which one of the following is the correct electronic configuration of chlorine?** ☑ 2014(I)

- (a) 2, 7, 8 (b) 2, 8, 7
 (c) 2, 8, 8 (d) 7, 8, 9

- 35. The high heat of vaporisation of water is mainly a result of**

- (a) van der Waals' forces ☑ 2014(II)
 (b) covalent bonds
 (c) interionic attraction
 (d) hydrogen bonding

- 36. Which of the following element combinations will form ionic compounds?** ☑ 2014(II)

1. Ca (Z = 20) and Ti (Z = 22)
 2. Si (Z = 14) and Br (Z = 35)
 3. Mg (Z = 12) and Cl (Z = 17)

Select the correct answer using the codes given below.

- (a) Only 2
 (b) Only 3
 (c) 2 and 3
 (d) All of the above

- 37. Which one among the following does not wet the walls of the glass vessel in which it is kept?**

- (a) Water ☑ 2015(I)
 (b) Alcohol
 (c) Mercury
 (d) Phenol

- 38. Which one of the following statements is correct?** ☑ 2016(II)

- (a) Covalent bonds are directional
 (b) Ionic bonds are directional
 (c) Both covalent and ionic bonds are directional
 (d) Both covalent and ionic bonds are non-directional

ACIDS, BASES AND SALTS

In general 2-3 questions have been asked from this chapter every year. Questions from this chapter usually test your basic knowledge of acids and bases which are used in your daily life. Properties and uses of acids and bases and pH of the solution are important topics of this chapter.

ACIDS

Substances, which have sour taste and turn blue litmus red, are called acids.

- According to **Arrhenius**, acids are the substances, which give H^+ ions in their aqueous solutions.
e.g. $HCl \longrightarrow H^+ + Cl^-$
- According to **Bronsted-Lowry concept**, acids are proton donor.

A conjugate base is obtained, when an acid give up a proton (H^+).

The acid and base which differ by a proton are said to form a conjugate acid-base pair. Generally, a strong acid has a weak conjugate base and a weak acid has a strong conjugate base.

- According to **Lewis concept**, acids are electron pair acceptor i.e. these are generally positively charged or electron deficient species. e.g. BF_3 , $AlCl_3$, Na^+ , K^+ , PF_3 , SF_4 etc.

Classification of Acids

Acids can be classified in the following classes:

Class I On the basis of degree of dissociation, acids are of two types

- Strong acids** Dissociates completely even in concentrated solution, e.g. HCl , HNO_3 , H_2SO_4 , $HClO_4$ etc.
 $HCl + H_2O \longrightarrow H^+(aq) + Cl^-(aq)$
- Weak acids** Dissociates partially when dissolved in water, e.g. acetic acid (CH_3COOH), formic acid ($HCOOH$) etc.
 $CH_3COOH + H_2O \rightleftharpoons CH_3COO^-(aq) + H^+(aq)$

Class II On the basis of the presence of oxygen or hydrogen in the acid, these can be divided into two classes

- Hydracids** These do not contain oxygen. Besides hydrogen they contain other non-metallic elements like hydrochloric acid (HCl), hydrofluoric acid (HF) etc.
- Oxyacids** These contain both oxygen and hydrogen and also have another non-metallic element, e.g. sulphuric acid (H_2SO_4), nitric acid (HNO_3) etc.

Basicity of Acid

The number of displacing protons present in an acid is known as basicity of the acid.

- **Monobasic acid** has only one hydrogen ion and can combine with one hydroxyl (OH) group to give one kind of salt, e.g., HCl , HNO_3 , CH_3COOH etc.

Types of Bases

On the basis of degree of dissociation bases are of two types

- **Strong base** Dissociates completely even in concentrated solutions, e.g. KOH, NaOH etc.
- **Weak base** Partially dissociates in water, e.g. Mg(OH)₂, NH₄OH, NaHCO₃, Ca(OH)₂ etc.

Properties of Bases

Bases possess the following general properties

- (i) Bases react with metals to form salt with the evolution of hydrogen gas.

This reaction is not given by all bases.

- (ii) The reaction of bases with acids is known as neutralisation reaction, which leads to the formation of corresponding salt and water.
- (iii) Bases react with non-metallic oxides to form salt and water.

Above reaction is similar to neutralisation reaction (acid-base reaction). Therefore nature of non-metallic oxides is acidic.

- (iv) Bases on dissolving in water give hydroxide ions (OH⁻ ions)

All the bases do not dissolve in water. The bases which dissolve in water are called alkali e.g. NaOH, KOH, Ca(OH)₂, NH₄OH etc. Hence, all alkalis are bases but all the bases are not alkalis.

Acidity of Base

The number of hydroxyl ions present in a base is known as acidity of the base.

- **Monoacidic bases** which produces one hydroxide ions in aqueous solutions are called monoacidic bases. e.g. KOH, NH₄OH, NaOH.
- **Diacidic bases** which produces two hydroxide ions in aqueous solutions are called diacidic bases. e.g. Ca(OH)₂, Fe(OH)₂, Zn(OH)₂.
- **Triacidic bases** which produces three hydroxide ions in aqueous solutions are called triacidic bases. e.g. Fe(OH)₃, Al(OH)₃.

Uses of Some Important Bases

- **Sodium hydroxide** is used in manufacture of soap purification of bauxite and manufacture of rayon.
- **Potassium hydroxide** is used in the manufacture of soft soap. A suspension of **magnesium hydroxide** in water is used in medicines as an antacid. (milk of magnesia)

- **Calcium hydroxide** is used in preparation of sodalime (mixture of calcium hydroxide and caustic soda), for white washing buildings and softening of hard water.

pH SCALE

- The acidic or basic strength of a solution is expressed on a scale known as **pH scale**. The idea of pH scale and the scale was given by **Sorensen**.
- pH of a solution is defined as the negative logarithm of the concentration in moles per litre of H⁺ ions which it contains.

$$\text{pH} = -\log [\text{H}^+] = \log \frac{1}{[\text{H}^+]}$$

- pH is a measure of acidity. As the pH increases, the acidic nature decreases. For pure water or neutral solutions, pH = 7, for bases pH > 7 and for acids pH < 7. (That's why pH of 10⁻⁸ M HCl or 10⁻⁹ M HCl is in between 6 to 7).
- pH of the solution of strong or weak neutral salt in water is always neutral.
- pH of the solution of acidic salt in water is always acidic (i.e. <7). pH of the solution of basic salt in water is always basic (i.e. >7).
- On dilution, pH of an acidic solution increases but pH of a basic solution decreases.

pH Range of Some Common Substances

Gastric juice	—	1.0 – 3.0
Soft drinks	—	2.0 – 4.0
Lemon	—	2.2 – 2.4
Vinegar	—	2.4 – 3.4
Urine (human)	—	4.8 – 8.4
Saliva (human)	—	6.5 – 7.5
Rain water	—	6.0
Tears	—	7.4
Sea water	—	8.5
Milk of magnesia	—	10.5
Milk (cow)	—	6.3 – 6.6
Blood plasma (human)	—	7.36 – 7.42

Indicator

An indicator is a substance which gives different colours in an acid and a base. Thus, it is possible to check whether a given substance is acid or base or neutral with the help of indicator.

- Litmus, red cabbage leaves, turmeric (haldi) coloured petals of some flowers such as hydrangea, petunia and geranium etc. are natural acid-base indicators. Methyl orange, phenolphthalein etc. are synthetic indicators.
- **Universal indicator** is a mixture of several indicators. It shows different colours at different concentrations of hydrogen ions. We can estimate the strength of acids and bases by using universal indicators.

Some Important Indicators

1. **Alizarin** It is yellow at pH 5.5 and red at pH 6.8.
2. **Cochineal** It is yellow in acidic solution, and deep violet in alkaline solution.
3. **Curcumin** It is yellow at pH 7.4 and red at pH 8.6.
4. **Turmeric** Turmeric solution stays yellow in the presence of acids and changes to purple brown in the presence of bases. Dry turmeric paper is bright yellow and changes to red in the presence of bases.
5. **Phenolphthalein** Phenolphthalein is purple in very basic solutions and colourless in acidic solutions.
6. **Red cabbage** Red cabbage juice indicator is red in acid solution, purple in neutral solutions and greenish yellow in basic solutions. Cabbage paper turns green in the presence of bases and pink to red in the presence of acids.

BUFFER SOLUTIONS

- The solution which maintains its pH or reserve acidic or basic nature even upon addition of a small amount of acid or a base is called buffer solution.
- These solutions have a definite pH value.
- In industries, buffer solutions are used for alcoholic fermentation (pH 5 to 6.5), tanning of leather, electroplating, sugar and paper industries.
- In biological systems buffer system of carbonic acid and sodium bicarbonate is found in our blood. It maintains the pH of our blood (about 7.4).

Types of Buffers

Synthetic buffers are of two types

- (i) **Acidic Buffer** These are the mixtures of weak acids and its conjugate bases.
e.g. $\text{CH}_3\text{COOH} + \text{CH}_3\text{COONa}$
- (ii) **Basic Buffer** These are the mixtures of weak bases and its conjugate acids. e.g. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$

SALTS

When acid and base react together, they form salt and water. This reaction is known as **neutralisation reaction**. e.g.

When acid and base both are strong, 13.7 kcal energy is released. However, if either the acid or the base is weak, energy released is less than 13.7 kcal. This is because some of the energy is utilised to ionise the weak acid or weak base. The energy released is called **enthalpy of neutralisation**.

Types of Salts

Salts are of the following types

- (i) **Simple salts** These salts are obtained by the complete neutralisation reaction of acids and bases.
e.g. NaCl, KCl, BaCl₂, CaCl₂ etc.
- (ii) **Acidic salts** Salts having replaceable H-atom are known as acidic salt. These are formed due to incomplete neutralisation reactions e.g. NaHSO₄, NaH₂PO₄ etc.
- (iii) **Basic salts** Salts having replaceable OH group are known as basic salts. These are also formed due to incomplete neutralisation reactions, e.g. Ca(OH)NO₃.
- (iv) **Double salts** In these salts two or more normal salts are present in a molecule in crystalline state,
e.g. Mohr's salt $\text{FeSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$
Potash alum $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$
Carnallite $\text{KCl} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$
- (v) **Mixed salts** In these salts more than one type of cations or anions are present. e.g. NaKSO₄, Ca(OCl) Cl, Mg (NH₄), PO₄ etc.
- (vi) **Complex salts** Complex salts retain their identity even when dissolved in water, e.g. when ferrous sulphate solution and potassium cyanide solution are mixed together, K₄[Fe(CN)₆] is formed.
 $\text{FeSO}_4 + 6\text{KCN} \longrightarrow \text{K}_4[\text{Fe}(\text{CN})_6] + \text{K}_2\text{SO}_4$

Hydrolysis of Salts

- When a salt of strong base and weak acid or weak base and strong acid is dissolved in water, it reacts with water to give back the original acid and base from which the salt was formed. This process is known as salt hydrolysis.
- Hydrolysis is the reverse process of neutralisation reaction.
- Only salt of weak acid + strong base, weak base + strong acid undergo hydrolysis.
- The phenomena in which cation or anion of both of a salt react with water to produce acidic or alkaline solution is known as hydrolysis

- The interaction of cation of a salt with water to give acidic solution is called cationic hydrolysis.

- The interaction of anion of a salt with water to give alkaline solution is called anionic hydrolysis.

- The aqueous solution of salt of strong acid and strong base is neutral e.g. NaCl, KCl, Na₂SO₄ etc.
- The aqueous solution of salt of strong acid and weak base is acidic e.g. FeCl₃, NH₄Cl, (NH₄)₂SO₄ etc.
- The aqueous solution of salt of weak acid and strong base is basic e.g. CH₃COONa, Na₂CO₃ etc.

> PRACTICE EXERCISE

1. According to Arrhenius theory, an acid is a substance which

- (a) gives a proton in aqueous solution
- (b) accepts a proton in aqueous solution
- (c) gives a hydrogen ion in aqueous solution
- (d) accepts a lone pair of electron

2. Aqueous solution of acetic acid contains

- (a) CH_3COOH , CH_3COO^-
- (b) CH_3COO^- , H^+ ,
- (c) CH_3COOH , CH_3COO^- , H_3O^+
- (d) CH_3COOH , H^+

3. Acids generally react with alkalies to form salt and water. Which one of the following bases, on reaction with acid, does not produce water along with salt?

- (a) Ammonia
- (b) Sodium bicarbonate
- (c) Sodium hydroxide
- (d) Calcium hydroxide

4. Human stomach produces acid X which helps in digestion of food. Acid X is

- (a) acetic acid
- (b) methanoic acid
- (c) hydrochloric acid
- (d) citric acid

5. Which one of the following is the strongest acid?

- (a) $\text{ClO}_3(\text{OH})$
- (b) $\text{ClO}_2(\text{OH})$
- (c) $\text{ClO}(\text{OH})$
- (d) $\text{Cl}(\text{OH})$

6. Amongst the trihalides of nitrogen, which one is least basic?

- (a) NF_3
- (b) NCl_3
- (c) NBr_3
- (d) NI_3

7. The conjugate acid of NH_2^- is

- (a) NH_3
- (b) NH_2OH
- (c) NH_4^+
- (d) N_3H

8. Which one of the following is amphiprotic in nature?

- (a) F^-
- (b) HPO_4^{2-}
- (c) PO_4^{3-}
- (d) Cl^-

9. When an organic compound is heated with cupric oxide, a gas X and H_2O produced as a result. When the gas X is passed through

the lime water, it turns the lime water into milky. When it passed in the excess the milky colour disappears. By the litmus solution it is found that the gas X is acidic in nature. The gas X is

- (a) CO
- (b) CO_2
- (c) SO_2
- (d) SO_3

10. Select the strongest acid among the following.

- (a) HCOOH
- (b) CH_3COOH
- (c) $\text{C}_2\text{H}_5\text{COOH}$
- (d) $\text{C}_3\text{H}_7\text{COOH}$

11. Reaction,

and BF_3 are

- (a) Lewis base and Lewis acid
- (b) Lewis base and Lewis base
- (c) Lewis acid and Lewis base
- (d) Arrhenius acid and base

12. A strong acid has a conjugate

- (a) strong base
- (b) weak base
- (c) strong acid
- (d) weak acid

13. Which of the following is incorrect?

- (a) HCOOH is stronger acid than CH_3COOH
- (b) HClO is stronger acid than HClO_4
- (c) Water is more acidic than methanol
- (d) All of the above

14. Base turn red litmus blue and acids turn blue litmus red. A student tested a liquid with a red litmus paper and it stayed red with no change. This shows that the liquid

- (a) must be pure water
- (b) must be an acid
- (c) is not a base
- (d) is neither a base nor an acid

15. When concentrated H_2SO_4 spilt on the surface, it should be immediately cleaned

- (a) with a piece of cloth
- (b) by adding cold water
- (c) by adding solid Na_2CO_3
- (d) by adding solid BaCl_2

16. A student heated some sulphur in a spatula and collected the gas ' X '. Which one among the following is correct about ' X '?

- (a) X is SO_2 and it turns moist litmus to blue
- (b) X is SO_3 and it turns moist litmus to red
- (c) X is SO_2 and it turns moist litmus to red
- (d) X is SO_3 and it turns dry litmus to blue

17. pH values for acids A, B, C, D are 1, 2, 4, and 2.5 respectively. Which one of the strongest acid?

- (a) A
- (b) B
- (c) C
- (d) D

18. Solutions in test tubes containing H_2O and aqueous NaOH can be differentiated with the help of

- (a) red litmus
- (b) blue litmus
- (c) Na_2CO_3
- (d) HCl (aqueous)

19. Iodised salt is a

- (a) mixture of potassium iodide and common salt
- (b) mixture of molecular iodine and common salt
- (c) compound formed by combination of potassium iodide and common salt
- (d) compound formed by combination of molecular iodine and common salt

20. Acidity of BF_3 can be explained on the basis of which of the following concepts?

- (a) Arrhenius concept
- (b) Bronsted Lowry concept
- (c) Lewis concept
- (d) Bronsted Lowry as well as Lewis concept

21. A soda water bottle has pH

- (a) < 7
- (b) > 7
- (c) $= 7$
- (d) unpredictable

22. The pH of the blood is maintained by the carbonic acid and bicarbonate buffer. The pH of the blood is

- (a) 8.0
- (b) 5.0
- (c) 6.0
- (d) 7.4

23. pH of the solution produced when aqueous solution of pH = 5 is mixed with equal volume of an aqueous solution of pH = 3 is
(a) 3.3 (b) 3.5 (c) 4.5 (d) 4.0

24. Fear or excitement, generally cause on to breathe rapidly and it results in the decrease of CO₂ concentration in blood. In what way will it change the pH of blood?
(a) pH will increase (b) No change
(c) pH will decrease
(d) pH will adjust to 7

25. The concentration of hydrochloric acid in a given solution is 10⁻⁸ M. What is the value of pH for this solution?
(a) 7 (b) > 7 but nor 14
(c) < 7 (d) 14

26. Arrange the following base in increasing order of their, basic strength.
I. Sodium hydroxide
II. Magnesium hydroxide
III. Aluminium hydroxide
IV. Ammonium hydroxide

Select the correct answer.

(a) IV < II < I < III (b) IV < I < II < III
(c) IV < III < II < I (d) I < II < III < IV

27. When applied to the affected area, which one of the following will relieve the pain due to ant-bite or bee-sting?
(a) Lemon juice (b) Vinegar
(c) Baking soda (d) Caustic soda

28. NH₄Cl is a salt of a
(a) weak acid and weak base
(b) weak acid and strong base
(c) strong acid and strong base
(d) strong acid and weak base

29. Which one of the following salts when dissolved in water makes the solution acidic?
(a) Sodium sulphate
(b) Potassium nitrate
(c) Sodium acetate
(d) Ferric sulphate

30. Aqueous solution of CuSO₄ changes blue litmus to red as
(a) Cu²⁺ is present
(b) SO₄²⁻ is present
(c) hydrolysis takes place
(d) reduction takes place

31. An aqueous solution of potash alum is
(a) alkaline (b) acidic
(c) neutral (d) soapy to touch

32. An aqueous solution of borax is
(a) alkaline (b) corrosive
(c) neutral (d) acidic

33. The aqueous solution of AlCl₃ is acidic due to the hydrolysis of
(a) aluminium ion (b) chloride ion
(c) Both aluminium and chloride ion
(d) None of the above

34. An aqueous solution of sodium carbonate is alkaline because sodium carbonate is a salt of
(a) weak acid and weak base
(b) strong acid and weak base
(c) weak acid and strong base
(d) strong acid and strong base

35. If acetic acid is mixed with sodium acetate then H⁺ ion concentration will
(a) increase
(b) decrease
(c) remain unchanged
(d) pH decreases

36. Which one among the following is not a property of salt?
(a) Salt have ordered packing arrangements called lattices
(b) Salts have low melting points but high boiling points
(c) Salts are brittle
(d) Salts conduct electricity when dissolved in water or even in the molten state

37. Which among the following statements with regard to pH scale is/are correct?
I. It is logarithmic scale.
II. The scale is limited to 0–14 because the ionic product of water is about 10⁻¹⁴.
III. The lower the value of pH the greater is the acidity of the solution.

Select the correct answer using the codes given below.

(a) I and II (b) Only II
(c) I and III (d) All of these

Directions (Q. Nos. 38-40) *Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and match the correct choice according to the codes given below.*

(a) Both Statement I and Statement II are true and Statement II is the correct explanation of the Statement I.
(b) Both Statement I and Statement II are true but Statement II is not the correct explanation of the Statement I.

(c) Statement I is true, but Statement II is false.
(d) Statement I is false, but Statement II is true.

38. **Statement I** Aqueous solution of ammonium acetate is neutral.
Statement II Ammonium acetate is the salt of acetic acid and ammonium hydroxide.

39. **Statement I** Na₂SO₄ forms a neutral solution upon hydrolysis.
Statement II Na₂SO₄ is the salt of strong acid and strong base.

40. **Statement I** HClO₄ is the strongest oxyacid of chlorine.
Statement II In HClO₄, Cl is in +7 oxidation state.

41. Match List I and List II and select the correct answer using the codes given below the lists.

List I	List II
A. AlCl ₃	1. Lewis base
B. Theory of ionisation	2. Bronsted-Lowry
C. Conjugate acid-base pairs	3. Lewis acid
D. Alcohol	4. Arrhenius

Codes

A B C D A B C D
(a) 3 2 4 1 (b) 2 1 3 4
(c) 2 3 1 4 (d) 3 4 2 1

42. Match List I and List II and select the correct answer using the codes given below the lists.

List I	List II
A. Amphoteric oxide	1. SO ₂
B. Basic oxide	2. PbO
C. Acidic oxide	3. N ₂ O
D. Neutral oxide	4. MgO

Codes

A B C D A B C D
(a) 4 2 3 1 (b) 4 2 1 3
(c) 2 4 1 3 (d) 2 4 3 1

> Previous Years' Questions

43. Sometimes, indigestion is caused by the secretion of too much hydrochloric acid in the stomach. To ease the pain caused a tablet can be taken that reacts to reduce the amount of acid present which one among the following would be inappropriate for a manufacture

- to include as a major reactant in the table? ☑ 2012 (I)
- (a) CaCO_3 (b) MgCO_3
(c) NaOH (d) Mg(OH)_2
- 44.** Which one among the following is the correct order of strength of acids? ☑ 2012 (II)
- (a) $\text{H}_2\text{SO}_4 > \text{H}_3\text{PO}_3 > \text{CH}_3\text{COOH}$
(b) $\text{H}_3\text{PO}_3 > \text{H}_2\text{SO}_4 > \text{CH}_3\text{COOH}$
(c) $\text{CH}_3\text{COOH} > \text{H}_3\text{PO}_3 > \text{H}_2\text{SO}_4$
(d) $\text{CH}_3\text{COOH} > \text{H}_2\text{SO}_3 > \text{H}_3\text{PO}_3$
- 45.** Which one among the following is a double salt? ☑ 2012 (II)
- (a) $\text{K}_4[\text{Fe(CN)}_6]$
(b) $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$
(c) $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$
(d) NaCl
- 46.** The acid contained in vinegar is ☑ 2013 (I)
- (a) acetic acid
(b) ascorbic acid
(c) citric acid
(d) tartaric acid
- 47.** The acid in gastric juice is ☑ 2013 (I)
- (a) acetic acid (b) nitric acid
(c) hydrochloric acid (d) sulphuric acid
- 48.** The pH of fresh milk is 6, when it turns sour the pH ☑ 2013 (I)
- (a) becomes < 6
(b) remains the same, i.e. 6
(c) becomes > 6
(d) becomes neutral, i.e. 7
- 49.** Turmeric (Haldi) rapidly becomes colourless on addition of ☑ 2013 (II)
- (a) baking soda (b) vinegar
(c) lemon juice (d) alcohol
- 50.** The pH of the solution obtained by dissolving pure sodium chloride in water is ☑ 2013 (II)
- (a) acidic (b) basic
(c) neutral
(d) dependent on the amount of sodium chloride dissolved in water
- 51.** Which of the following acids is a mineral acid? ☑ 2014 (I)
- (a) Citric acid (b) Hydrochloric acid
(c) Ascorbic acid (d) Tartaric acid
- 52.** Which one of the following is/are amphoteric? ☑ 2014 (I)
- (a) Al(OH)_3 (s) and Fe(OH)_3 (aq)
(b) Al(OH)_3 (s) and HCO_3^- (aq)
(c) Ba(OH)_2 (s) and NaOH (aq)
(d) Only Al(OH)_3 (s)
- 53.** The burning sensation of a bee sting can be stopped by rubbing the affected area with soap. This is because ☑ 2014 (II)
- (a) a bee sting is acidic and soap, an alkali, neutralises it
(b) a bee sting is alkaline and soap, an acid, neutralises it
(c) soap cleans the affected area and removes the sting
(d) soap acts as an anaesthetic and dulls the sensation
- 54.** Match List I with List II and select the correct answer using the codes given below the lists. ☑ 2015 (I)
- | List I
(Compound) | List II
(Nature) |
|----------------------|---------------------|
| A. Sodium hydroxide | 1. Strong acid |
| B. Calcium oxide | 2. Alkali |
| C. Acetic acid | 3. Weak acid |
| D. Hydrochloric acid | 4. Base |
- Codes**
- | A | B | C | D | A | B | C | D |
|-----|---|---|---|---|-----|---|---|
| (a) | 2 | 3 | 4 | 1 | (b) | 2 | 4 |
| (c) | 1 | 4 | 3 | 2 | (d) | 1 | 3 |
| | | | | | | | |
- 55.** Boric acid is an acid because its molecule ☑ 2015 (II)
- (a) accepts OH^- from water releasing proton
(b) combines with proton from water molecule
(c) contains replaceable H^+ ion
(d) gives up a proton
- 56.** Suppose you have four test tubes labelled A, B, C and D. A contains water, B contains solution of an alkali, C contains solution of an acid, and D contains solution of sodium chloride. Which one of these solutions will turn phenolphthalein solution pink? ☑ 2015 (II)
- (a) Solution A (b) Solution B
(c) Solution C (d) Solution D
- 57.** Which one of the following oxides of nitrogen is known as 'anhydride' of nitric acid? ☑ 2016 (I)
- (a) N_2O (b) N_2O_3 (c) NO_2 (d) N_2O_5
- 58.** Which one of the following oxides dissolve in water? ☑ 2016 (I)
- (a) CuO (b) Al_2O_3 (c) Fe_2O_3 (d) Na_2O
- 59.** Which one of the following is the chemical name for baking soda? ☑ 2016 (I)
- (a) Sodium bicarbonate (sodium hydrogen carbonate)
(b) Sodium carbonate
(c) Potassium bicarbonate (potassium hydrogen carbonate)
(d) Potassium carbonate

OXIDATION, REDUCTION AND ELECTROCHEMISTRY

Generally 1-2 questions are asked from this chapter. Questions are mainly based upon the basic knowledge of oxidation, reduction, oxidising agents, reducing agents and calculation of oxidation number.

OXIDATION

The process of addition of oxygen or any other electronegative element or removal of hydrogen or any other electropositive element (or radical) by a substance, is known as oxidation,

The loss of one or more electrons by an atom, ion or molecule, is known as oxidation.

► Increase in valency or oxidation number of an element is oxidation,

(oxidation number of Zn changes from zero to +2)

Oxidising Agents

- The substance which undergoes reduction in a chemical reaction is known as **oxidising agent** or **oxidant**. Thus, oxidant is an electron acceptor.

As in above reaction, CuSO_4 undergoes reduction, therefore, $\text{CuSO}_4(\text{Cu}^{2+})$ is an oxidising agent.

- F_2 is the strongest oxidising agent.
- Some oxides like MgO , CuO , CO_2 and CrO_3 are oxidants.
- Some molecules are made up of electronegative elements, e.g. O_2 , O_3 , Cl_2 , Br_2 , I_2 , H_2O_2 etc., acts as oxidants.
- The compounds in which elements are present in its highest oxidation number are oxidising agent, e.g. HNO_3 , KMnO_4 , $\text{K}_2\text{Cr}_2\text{O}_7$, $\text{Na}_2\text{Cr}_2\text{O}_7$, H_2SO_4 , FeCl_3 , CuCl_2 etc.
- All the positively charged species behaves as oxidising agents.
- Oxidising agents are Lewis acids.

REDUCTION

The process of addition of hydrogen or any other electropositive element (or radical) or removal of oxygen or any other electronegative element (or radical) by a substance, is known as reduction, e.g.

- The process of gain of one or more electrons by an atom, ion or molecule is known as reduction, e.g.

- Decrease in valency or oxidation number of an element is reduction, e.g.

Reducing Agents

- The substance which undergoes oxidation in a chemical reaction is known as reducing agent or reductant. Thus, reductant is an **electron loser**. e.g. in the above example Zn is reducing agent.
 - All metals like Zn, Na, Fe, Al, Mg, K and few non-metals C, S etc., are reductants.
 - Hydracids of electronegative elements e.g. HCl, HBr, HI, H₂S etc., are reductants.
 - Compounds containing element in its lower oxidation state are also reductant, e.g. Cu₂Cl₂, Hg₂Cl₂, SnCl₂, FeCl₂, CO, Cu₂O, Na₂S₂O₃, KI etc.
 - All negatively charged species behave like reducing agents.
 - Reducing agents are Lewis bases.
- **Note** White phosphorus has the property of only slow oxidation in air.

REDOX REACTIONS

The reactions involving oxidation and as well as reduction as its two half reactions are called **redox reactions**. In these reactions, one substance is oxidised and other substance is reduced.

e.g.

OA → oxidising agent

RA → reducing agent

The reaction in which same element is oxidised as well as reduced is called **disproportion reaction**.

e.g.

- Oxidation and reduction take place together in equivalent amounts.
- All metal displacement reactions are redox reactions.
- The formation of ionic solid from its elements is always a redox reaction.

- **Note** Compounds like H₂O, O₃, HNO₃, H₂SO₃, NaNO₂, SO₂, NO₂S₂O₃ act as oxidising as well as reducing agents.

Reducing agents are oxidised and oxidising agents are reduced in a chemical reaction.

OXIDATION NUMBER

The real or imaginary charge which an atom appears to have in its combined state, is called oxidation number of that atom. Oxidation number of an element in a compound is determined as the number of electrons that have passed from one atom of a given element to other atom (positive oxidation) or to one atom of a given element from other atom (negative oxidation). Thus, oxidation number gives the effective charge associated with an element (it may be positive or negative).

General Rules for Calculation of Oxidation Number

- The oxidation number of hydrogen is +1 in all its compounds but in metallic hydride the oxidation state of hydrogen is -1 (NaH, CaH₂).
- The common oxidation state of oxygen is -2.
- Oxidation number of oxygen in peroxides like H₂O₂, Na₂O₂ is -1, in superoxides like KO₂, RbO₂ it is -1/2 and compounds in which O-atom bonded to fluorine like OF₂, O is in +2 while in O₂F₂ is in +1 state.
- The common oxidation state of halogen (Cl, F, etc.) is -1.
- The common oxidation state of alkali metal (e.g. Li, Na, K etc.) is +1.
- The oxidation number of alkaline earth metals (e.g. Be, Mg, Ca, Ba, etc.) is +2.
- Oxidation number of elements in its elementary state is taken to be zero. e.g. N₂, Cl₂, O₂, H₂, Br₂ etc., has oxidation number zero.

- Oxidation number of an ion is same as its charge, e.g. oxidation number of Na^+ , Ba^{2+} , Al^{3+} , Cl^- is +1, +2, +3, -1, respectively.
- Oxidation number of metal in metal carbonyl is zero e.g., Fe is in 0 oxidation state in $\text{Fe}(\text{CO})_5$.
- In C_3O_2 [carbon suboxide] oxidation number of carbon is $4/3$, Br_3O_8 [tribromooctaoxide], Br is in $16/3$ oxidation state and $\text{Na}_2\text{S}_4\text{O}_6$ [sodium tetrathionate], S is in 2.5 oxidation state.
- The sum of the oxidation numbers of all the atoms in the formula of compound is always zero.

Some Examples

(i) Oxidation number (ON) of S in H_2SO_4 .

Let oxidation number of S be x .

Now, oxidation number of hydrogen is +1, oxygen is -2.

$$\therefore 2 \times 1 + x + (-2) \times 4 = 0$$

$$\Rightarrow 2 + x - 8 = 0$$

$$x = +6$$

(ii) Oxidation number of Mn in KMnO_4

(potassium permanganate).

Let oxidation number of Mn be x .

Now, oxidation number of K is +1 and O is -2.

$$\therefore +1 + x + (-2) \times 4 = 0$$

$$x + 1 - 8 = 0; x = +7$$

(iii) Oxidation number of Fe in $[\text{Fe}(\text{H}_2\text{O})_5 \text{NO}] \text{SO}_4$.

Let oxidation number of Fe be x

Oxidation number of $\text{H}_2\text{O} = 0$, $\text{NO} = +1$,

$\text{SO}_4 = -2$

$$[\text{Fe}(\text{H}_2\text{O})_5 \text{NO}] \text{SO}_4 = x + 0 \times 5 + (+1) - 2 = 0$$

$$\Rightarrow x + 1 - 2 = 0 \Rightarrow x = +1$$

ELECTROCHEMISTRY

The branch of chemistry dealing with the interconversion of chemical energies and electrical energies during spontaneous redox reactions.

These are following important terms which are related to electrochemistry.

Electrolytes

The substances, which allow the electricity to pass through them in their molten state or aqueous solution are called **electrolytes**. e.g. common salt (NaCl), sulphuric acid (H_2SO_4) etc.

Non-Electrolytes

The substances which do not allow the electricity to pass through them in their molten state or aqueous solution are called **non-electrolytes**. e.g. sugar, wax, naphthalene etc.

Electrochemical Cell

A device in which spontaneous redox reaction is carried out to produce an electric current is called electrochemical cell.

- An electrochemical cell comprises of two metallic electrodes namely anode [$-ve$ electrode] and cathode [$+ve$ electrode] dipped in electrolytic solution.
- There are two types of electrochemical cell **galvanic cell** and **electrolytic cell**. In galvanic cell, the chemical energy of a spontaneous redox reaction is converted into electrical energy while in electrolytic cells, electrical energy is used to carry out a non-spontaneous reaction.

Electrode

It is a metal conducting plate (anode or cathode) that emits or collects electrons in a cell. Electrode made up of an element with lower reduction potential act as **anode**.

Oxidation takes place at anode. While reduction takes place at cathode.

Electrode Potential

The potential of an electrode with respect to its solution is called the electrode potential. It is a measure of its tendency to lose or gain electrons, when it comes in contact with a solution of its own ions. The tendency of an electrode to gain electrons or to get reduced is called its reduction potential while the tendency of an electrode to lose electrons or to get oxidised is called its oxidation potential. It depends upon the following

- Concentration of solution
- Nature of electrolyte
- Nature of metal
- Conditions of temperature and pressure

BATTERY

The arrangement of one or more cells in a series connection is called battery. It is basically a galvanic cell.

There are two types of battery

- Primary battery** (non-rechargeable) can be used only once. e.g. dry cell (Leclanche cell), mercury cell.
- Secondary battery** (rechargeable) can be reused again and again. This battery can act both as galvanic and electrolytic cell. e.g. lead storage battery, nickel-cadmium battery.

Fuel Cell

The type of galvanic cell in which the energy released by the combustion of fuels (hydrogen, methane, methanol) is directly converted into electrical energy is called **fuel cell**. e.g. fuel cell using H_2 and O_2 to form water in order to produce electricity. Efficiency of these cells is 70%. This cell was used first-time in Apollo Space Programme.

ELECTROLYSIS

The process of decomposition of an electrolyte on passing an electric current through its aqueous solution or in the fused state is called **electrolysis**. Cations move towards cathode, gain electrons and become neutral atoms. Similarly anions move towards anode, lose electrons and become neutral atoms. In electrorefining of metals, impure metals act as anode and a strip of pure metal acts as cathode.

Faraday's Laws of Electrolysis

Faraday gave following two laws to explain a relation of amount of substance produced with current or its equivalent weight.

First Law of Electrolysis It states that "the quantity (mass) of any substance deposited or liberated at any electrode is directly proportional to the quantity of electricity passed through electrolyte."

$$w \propto Q \Rightarrow w = ZQ = Zit$$

\therefore Charge (Q) = current (i) \times time (t)

$$Z = \text{Electrochemical equivalence} = \frac{E}{96500}$$

(where, E = Equivalent weight)

Second Law of Electrolysis It states, "when same quantity of electricity is passed through solutions of different electrolytes connected in series, the weight of substance produced at the electrodes is directly proportional to their equivalent weight".

$$\text{i.e. } \frac{\text{Weight of Cu deposited } (w_1)}{\text{Weight of Ag deposited } (w_2)} = \frac{\text{Equivalent weight of Cu } (E_1)}{\text{Equivalent weight of Ag } (E_2)}$$

Electrochemical Series

- The arrangement of elements in order of increasing their standard reduction potential values is known as electrochemical series or activity series.

[as reactivity follows the reverse order].

- Thus, gold is least reactive while potassium is most reactive element.
- Substances which have lower reduction potentials are stronger reducing agents.

$$\text{Reducing power} \propto \frac{1}{\text{reduction potential}}$$

- Only those metals can liberate hydrogen from the acid which have negative values of reduction potentials or which are placed before H-atom.
- The more reactive metals of the activity series displaces the less reactive metals from their salt solutions.

CORROSION

- It is a process of oxidative deterioration of a metal as a result of its reaction with air and moisture present in the environment.
- Corrosion of iron is called **rusting**. Rust is hydrated iron (III) oxide.
- Similarly, in presence of moist air, copper acquires a green coating of basic copper carbonate, $[\text{Cu}(\text{OH})_2 \cdot \text{CuCO}_3]$ silver acquires a black coating of silver sulphide $[\text{Ag}_2\text{S}]$ and aluminium acquires a dull coating of aluminium oxide (a protective layer).
- A sliced apple turns brown if left open for sometime due to the **oxidation of iron** present in it as a nutrient.
- The rusting of iron can be prevented by painting, oiling, greasing, galvanising (coating of iron with zinc) and chrome plating.
- Anodisation (an electrolytic process) is the process of forming a thick oxide layer on the surface of metal. This oxide layer is protective and prevents the metal from further oxidation.
- Formation of a layer of Al_2O_3 on aluminium surface protects the metal from further corrosion.

> PRACTICE EXERCISE

- A reducing agent is a substance which can
 - accept electrons
 - donate electrons
 - accept protons
 - donate protons
- The reaction which takes place at the anode is
 - oxidation
 - reduction
 - dissociation
 - ionisation
- The strongest reducing agent is
 - HNO₃
 - H₂S
 - H₂SO₃
 - SnCl₂
- Which one of the following is not a reducing agent?
 - NaNO₂
 - NaNO₃
 - HI
 - SnCl₂
- Which of the following act as an oxidising agent?
 - HNO₃
 - K₂Cr₂O₇
 - KMnO₄
 - All of these
- Which of the following is best reducing agent?
 - Na
 - Ca
 - Sr
 - Ba
- Which is strongest reducing agent?
 - F⁻
 - Cl⁻
 - Br⁻
 - I⁻
- The process of ${}^{56}_{28}\text{Fe}^{2+} \longrightarrow {}^{56}_{28}\text{Fe}^{3+}$ is appropriate classified as
 - ionisation
 - oxidation
 - reduction
 - nuclear reaction
- In the reaction, $4\text{Fe} + 3\text{O}_2 \longrightarrow 4\text{Fe}^{3+} + 6\text{O}^{2-}$ Which of the following statements is incorrect?
 - It is redox reaction
 - Metallic iron is a reducing agent
 - Fe³⁺ is an oxidising agent
 - Metallic iron is reduced to Fe³⁺
- Among Cl⁻, Br⁻ and I⁻ the correct order for being oxidised to dihalogen is
 - I⁻ > Cl⁻ > Br⁻
 - Cl⁻ > Br⁻ > I⁻
 - I⁻ > Br⁻ > Cl⁻
 - Br⁻ > I⁻ > Cl⁻
- Among the following chemical compounds, which one of the following has the highest reducing power?
 - AsH₃
 - BiH₃
 - NH₃
 - PH₃
- The process in which oxidation number of element increases is
 - oxidation
 - reduction
 - autoxidation
 - None of these
- Oxidation state of Ni in Ni(CO)₄ is
 - +2
 - 0
 - +4
 - 8
- Oxidation number of oxygen in ozone
 - 0
 - 2
 - +2
 - 6
- Oxygen has an oxidation state +2 in
 - H₂O₂
 - OF₂
 - H₂O
 - SO₂
- Oxidation state of oxygen atom in potassium superoxide is
 - $-\frac{1}{2}$
 - 1
 - 2
 - 0
- In haemoglobin the iron is in oxidation state of
 - +2
 - +1
 - +3
 - +4
- Oxidation number of sulphur in perdisulphuric acid is
 - +8
 - 6
 - +6
 - +4
- The oxidation number of iron in Fe₃O₄ is
 - +2
 - +3
 - $\frac{8}{3}$
 - $\frac{2}{3}$
- Oxidation number of oxygen in hydrogen peroxide is
 - 1
 - +1
 - 2
 - None of these
- In the reaction of potassium permanganate in acidic medium (mol. wt. = 158.04) with ferrous ammonium sulphate (mol. wt. = 392.14), the change in the oxidation state of manganese in potassium permanganate is
 - +5 to +2
 - +6 to +2
 - +7 to +2
 - +7 to +3
- Which of the following is correct?
 - Oxidation state of bromine varies from -1 to +6
 - Among IO₄⁻, ClO₄⁻ and BrO₄⁻, the last one (BrO₄⁻) is the strongest oxidising agent
 - HNO₃ is an oxidising agent
 - All of the above
- The correct statement is
 - zinc displaces Cu from CuSO₄
 - Cu cannot displace Fe from FeSO₄
 - Zn metal displaces H₂ gas from H₂SO₄
 - All of the above
- Which of the following statement(s) is/are false for electrolytic cell?
 - External source of voltage is applied to carry the chemical reaction
 - These cells are mainly used in laboratory and chemical industry
 - These cells consist of two copper strips dipped in an aqueous solution of CuSO₄
 - None of the above
- Mark the correct statement(s) for the corrosion.
 - It fastly coats the surfaces of metallic object
 - Its examples are—Rusting of iron, tarnishing of silver
 - It does not cause damage to buildings, ship made metals especially that are made up of iron
 - All of the above
- Consider the following equation, $\text{Cr}_2\text{O}_7^{2-}(\text{aq}) + \text{Br}^-(\text{aq}) + \text{H}^+(\text{aq}) \longrightarrow \text{Br}_2(\text{l}) + \text{Cr}^{3+}(\text{aq}) + \text{H}_2\text{O}(\text{l})$. In this reaction which one of the following is a reducing agent?
 - Br₂
 - Br⁻
 - H⁺
 - Cr₂O₇²⁻
- A compound contains atom, X, Y, Z. The oxidation number of X is +2, Y is +5 and Z is -2, therefore, a possible formula of the compound is
 - XY₁Z₂
 - X₂(YZ₃)₂
 - X₃(YZ₄)₂
 - X₃(YZ₄)₂
- In the reaction, $3\text{Br}_2 + 6\text{CO}_3^{2-} + 3\text{H}_2\text{O} \longrightarrow 5\text{Br}^- + \text{BrO}_3^- + 6\text{HCO}_3^-$
 - bromine is oxidised and carbonate is reduced
 - bromine is both reduced and oxidised
 - bromine is neither reduced nor oxidised
 - bromine is reduced and water is oxidised

29. The correct oxidation states of N in NH_4NO_3 molecule are

- (a) -3 and +5 (b) +3 and -5
(c) -3 and +3 (d) -5 and +5

30. An oxidising agent is a substance which

- (a) increases the oxidation number of an element in a given substance
(b) decreases the oxidation number of an element in a given substance
(c) is oxidised itself in an oxidation reduction reaction
(d) loses electrons in an oxidation reduction reaction

31. When a copper rod is dipped in aqueous silver nitrate solution, the colour of the solution changes to blue. This is because

- (a) Cu is more easily reduced than Ag
(b) Ag is more easily reduced than Cu
(c) nitrate ion acts as an oxidising agent
(d) nitrate ion acts as a reducing agent

32. Iron nails are dipped into blue copper sulphate solution. After some time iron nails are

- (a) dissolved and blue colour is discharged
(b) dissolved but blue colour is not discharged
(c) not dissolved and blue colour is not discharged
(d) not dissolved but blue colour is discharged

33. Which one among the following metals is more reactive than hydrogen?

- (a) Mercury (b) Copper
(c) Silver (d) Tin

34. Which one among the following is the correct order of reactivity of the elements?

- (a) $\text{Cu} > \text{Mg} > \text{Zn} > \text{Na}$
(b) $\text{Na} > \text{Zn} > \text{Mg} > \text{Cu}$
(c) $\text{Cu} > \text{Zn} > \text{Mg} > \text{Na}$
(d) $\text{Na} > \text{Mg} > \text{Zn} > \text{Cu}$

35. Aluminium is more reactive than iron but aluminium is less easily corroded than iron, because

- (a) oxygen forms a protective oxide layer
(b) it is a noble metal
(c) iron undergoes reaction easily with water
(d) iron forms ions

36. Silver ware turns black after a period of time due to formation of

- (a) nitrate coating on silver
(b) sulphide coating on silver
(c) chloride coating on silver
(d) oxide coating on silver

37. Which of the statements is/are true?

- I. The process of oxidation leads to gain of electrons.
II. The process of oxidation leads to loss of electrons.
III. The process of reduction leads to gain of electrons.
IV. The process of reduction leads to loss of electrons.

Select the correct answer from the codes given below.

- (a) I and IV (b) II and III
(c) Only I (d) Only IV

38. Which of the following cause the rusting of iron?

- I. Oxidation II. Reduction
III. Chemical reaction with oxygen
IV. Chemical reaction with CO_2

Select the correct answer from the codes given below.

- (a) I and II (b) I and III
(c) II and III (d) III and IV

39. In oxidation

- I. Hydrogen is displaced from a substance.
II. An electropositive element is added to or proportion of electropositive element increase in a substance.

Select the correct answer using the codes given below

- (a) Only I
(b) Only II
(c) Both I and II
(d) Neither I nor II

40. Match the terms of Column I and Column II and choose the correct option from the codes given below.

Column I	Column II
A. Leclanche cell	1. Cell reaction $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$
B. Ni-Cd cell	2. Does not involve any ion in solution and is used in hearing aids.
C. Fuel cell	3. Rechargeable
D. Mercury cell	4. Reaction at anode, $\text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^-$
	5. Converts energy of combustion into electrical energy

Codes

- A B C D
(a) 1 2 3,4 5
(b) 5 2 1,3 4
(c) 2 3 1,5 4
(d) 4 3 1,5 2

41. Match List I and List II and select the correct answer by using the codes given below the lists.

List I (The atom for which the oxidation state is to the found)	List II (Oxidation state)
A. Oxygen in BaO_2	1. -1
B. Sulphur in $\text{S}_2\text{O}_6^{2-}$	2. 0
C. Carbon in $\text{C}_{12}\text{H}_{22}\text{O}_{11}$	3. +7
D. Manganese in MnO_4^-	4. -2
	5. 5

Codes

- A B C D
(a) 1 4 2 3
(b) 1 5 2 3
(c) 4 1 2 3
(d) 4 5 3 1

Directions (Q. Nos. 42-43) Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and match the correct choice according to the codes given below.

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of the Statement I.
(b) Both Statement I and Statement II are true but Statement II is not the correct explanation of the Statement I.
(c) Statement I is true, but Statement II is false.
(d) Statement I is false, but Statement II is true.

42. **Statement I** Fluorine exhibits the same oxidation state in all its components.

Statement II Fluorine atom has no *d*-orbital in the valence shell.

43. **Statement I** When hydrogen gas is passed over heated metallic oxide it removes the oxygen from it.

Statement II Hydrogen is an oxidising agent.

44. The standard electrode potential values of the element A, B and C are 0.68 V, -2.50 V and -0.50 V respectively. The order of their reducing power is

- (a) $A > B > C$
(b) $A < C > B$
(c) $C > B > A$
(d) $B > C > A$

10

NON-METALS AND THEIR COMPOUNDS

Generally 2-5 questions are asked from this chapter. Questions are mostly based upon preparation and properties of hydrogen, hard and soft water, diamond and graphite, oxides of carbon and nitrogen, water gas and producer gas. A good number of statement based questions have been asked from this chapter.

Non-metals have the properties opposite of metals. Non-metals such as sulphur, chlorine etc. are found on the right side of the periodic table. In the modern periodic table total non-metals are 22(11-gas, 10-solid and 1 liquid).

HYDROGEN

Hydrogen is the first element in the periodic table and is the lightest element known. It exists as a diatomic molecule H_2 (dihydrogen). It was discovered by **Henry Cavendish**, but name hydrogen was given by **Lavoisier**. He prepared the gas by treating iron with dilute H_2SO_4 . Its atomic number is 1 and it has the electronic configuration $1s^1$. It resembles both alkali metals and halogens.

e.g. it may donate one electron forming H^+ like alkali metals or may accept one electron forming H^- like halogens. But some properties of hydrogen are different with respect to these properties, therefore it is unique in behaviour so it is placed separately in the periodic table. It is the most abundant element in the universe. Jupiter and Saturn planets consist mainly of hydrogen. It constitutes about 0.9% by weight of earth crust.

Isotopes

Hydrogen has three isotopes with mass numbers 1, 2 and 3 and these are called protium, deuterium and tritium respectively.

Isotopes of Hydrogen and their Mass Number

Name	Symbol	Atomic number	Mass number	Nature
Protium	${}_1H^1$ or H	1	1	Non-radioactive
Deuterium	${}_1H^2$ or D	1	2	Non-radioactive
Tritium	${}_1H^3$ or T	1	3	Radioactive

Method of Preparation of Dihydrogen (H_2) or Hydrogen Gas

Some methods for preparation of hydrogen gas are as follows :

(i) **Laboratory preparation of dihydrogen**

Hydrogen is collected over water by upward displacement as H_2 is lighter than water.

(ii) **By the electrolysis of water** Dihydrogen of high purity is prepared by the electrolysis of water in the presence of a small amount of acid or base. (During electrolysis dihydrogen is collected at cathode).

(iii) **By the action of acids on metal** Those metals which are placed above the hydrogen in the electrochemical series or have positive value of standard oxidation

potential [E_{oxid}°] liberate hydrogen gas from acids.

e.g.

Some amount of SO_2 is also produced in this reaction because H_2 reduced H_2SO_4 to SO_2 .

The reactivity of metals decreases as follows

- (iv) **By the action of alkali on metals** Metals like Zn, Mg, Sn etc., liberates hydrogen on reaction with alkalis.

- (v) **By the action of water on metals** Very active metals like Na, K and Ca react with water at room temperature.

(so, sodium is kept under kerosene oil)

Less reactive metal like Zn, Mg, Al etc., can react with water only upon heating.

- (vi) **Bosch process** (Manufacture method) Dihydrogen is prepared by passing steam over red hot coke at 1270 K.

CO_2 is removed either by dissolving in water under pressure of 25-30 atm or by scrubbing the mixture with sodium arsenite.

- (vii) **Lane's process** Hydrogen is prepared by passing the alternate currents of steam and water gas over red hot iron.

This method consists of two stages:

- (a) **Oxidation stage** Superheated steam is passed over iron filings heated about 1025–1075 K.

- (b) **Reduction stage** When the whole iron has been oxidised then steam is stopped and water gas is passed to reduce Fe_3O_4 .

Physical Properties

Some physical properties of hydrogen are given below:

- It is a colourless, tasteless and odourless gas.
- It is slightly soluble in water because its molecules are non-polar. Hydrogen forms diatomic molecules H_2 and the two atoms are joined by very strong covalent bond (enthalpy) 435.9 kJmol^{-1} .
- It is the lightest known substance. Its relative density is 0.0695. Its melting point is 13.8 K and boiling point is 20.4 K. It is highly combustible. It can be liquefied at very low temperature and high pressure.
- Metals like Ni, Pt, Pd, Fe, Au etc. can adsorb or occlude large volumes of H_2 gas at different temperatures (Pd can occlude 1000 times of its own volume).

Chemical Properties

Some chemical properties of hydrogen are given below:

- (i) Dihydrogen is **quite stable** due to its high bond dissociation energy thus it is not very reactive.

- (ii) Dihydrogen is **neutral** to litmus paper.

- (iii) **Action with metals** It combines with metals like Na, K, Ca etc., to give corresponding interstitial hydrides which are ionic in nature.

- (iv) **Reaction with non-metals** The reactivity of halogens towards dihydrogen decreases as

- (v) **Reaction with metal oxides** Dihydrogen acts as a strong reducing agent and thus it reduces metal oxides to metal.

- (vi) **Reaction with unsaturated hydrocarbons**

Dihydrogen reacts with unsaturated hydrocarbons to give saturated hydrocarbons.

This reaction is used in the hydrogenation of oils.

The vegetable ghee such as Dalda are prepared by this process.

Uses of Dihydrogen

Some uses of dihydrogen are given below

- It is used in the manufacture of synthetic petrol.
- It is used as a rocket fuel in the form of liquid hydrogen which does not cause any pollution and produces greater energy per unit mass of fuel.
- It is used in the hydrogenation of vegetable oils.
- It is used as a reducing agent in the laboratory and industry.
- It is used in the preparation of compounds like ammonia (Haber's process), water gas, and fertiliser such as urea, ammonium sulphate etc.
- It is used in the preparation of many organic compounds such as methanol.

Ortho and para Hydrogen

- A molecule of dihydrogen contains two atoms, the nuclei of both the atom in each molecule are spinning.
- Molecules of hydrogen in which spins of both the nuclei are in same directions are called **ortho hydrogen**.
- Molecules in which both the nuclei spin in the opposite directions are called **para hydrogen**. The compound usually consist of discrete covalent molecules. Only weak van der Waals' forces holding the molecule together.
- *para* hydrogen has lower energy and at 0°K the gas contains 100 % *para* hydrogen.
- At room temperature, the ratio of *ortho* to *para* hydrogen is 3 : 1.
- *Ortho* and *para* hydrogen, both have similar chemical properties but their properties like boiling points, heating conductivity and specific heat etc. are different.

Hydrides

Compounds of hydrogen in which hydrogen is suppose to be present as H^- are called hydrides. Oxidation state of H in these compounds is -1 . These are the binary compounds of hydrogen with other elements.

Types of Hydrides

Hydrides are the following types

- Ionic or Saline Hydrides** These are formed by reaction of alkali metal, alkaline earth metals (except Be and Mg) and some lanthanides with hydrogen. These hydrides are crystalline, non-volatile and conducting in fused state. Their aqueous solution is alkaline in nature. Their reaction with water is explosive.

- Covalent or Molecular Hydrides** These are formed by reaction of *p*-block elements (except noble gases) and by Be and Mg with hydrogen.

Molecular hydrides are of three types

- Electron-deficient hydrides** These are formed by group-13 (IIIA) elements e.g. B_2H_6 etc.
 - Electron-precise hydrides** These are formed by group-14 (IV A) elements e.g. CH_4 etc.
 - Electron rich hydrides** These are formed by group 15, 16 and 17 elements e.g. NH_3 , H_2O , HF etc.
- Metallic or Interstitial (Non-stoichiometric) Hydrides** These are formed by reaction of transition metals and inner-transition metals with hydrogen. These are non-stoichiometric compounds and show conductivity. *d*-block elements of group 7, 8 and 9 do not form hydride, therefore this region in the periodic table is called **hydride gap**.
 - Polymeric Hydrides and Complex Hydrides** These are formed by reaction of elements having electronegativity in the range 1.4 to 2.0 like Al, Si etc with hydrogen.

Water

A major part of all living organisms is made up of water (H_2O). Human body has 65% (about) and some plants have as much as 95% water. 97% part of the entire water is assumed to be confined in oceans while rest is present in pure form. Rain water is the purest form of water.

Properties of Water

Some properties of water are given below

- Water is the neutral oxide of hydrogen.
- It is colourless liquid under ordinary conditions.
- It is polar compound (dipole moment = 1.85 D) and possesses a high dielectric constant (approx 81). Which makes it is a universal solvent.
- It has abnormally high melting point and boiling point due to the association of H_2O molecules through hydrogen bonding.
- **Melting point** of ice is lowered with increase in pressure.
- In solid state (ice) water molecules are joined together in three dimension network. It is responsible for low density of water. As the temperature of ice is increased above 0°C, some **H-bond** are broken, this results in decrease in volume and increase in density. Density of water is maximum at 4°C.

- **Density** of ice is less than water hence it floats on water.
- pH of water is 7.
- **Covalent molecules** which are capable of forming hydrogen bonds with water molecules get dissolved e.g. lower alcohols, lower carboxylic acid, sugars are soluble in water due to hydrogen bond formation.
- Covalent molecules which cannot form hydrogen bonds with water are not soluble in it, e.g. CHCl_3 , CCl_4 , benzene, alkanes etc.

Water is a universal solvent

The various properties of water which make it a universal solvent are

- The polar nature of water molecule.
- The ability of water molecule to make hydrogen bonds with molecules of many compounds.
- High dielectric constant of water molecule.
- The ability of water molecule undergo chemical reaction with many element and compounds.

Hard Water

Presence of calcium and magnesium salts (mainly) and iron salt in the form of hydrogen carbonate, chloride and sulphate in water makes water hard. Hard water does not give lather with soap. Hard water forms scum/precipitate with soap. It is, therefore, unsuitable for laundry. It is **harmful for boilers** as well because of deposition of salts in the form of scale.

Soft Water

Rain water is almost pure. The water free from soluble salts of calcium and magnesium, is called soft water. It gives lather with soap.

Temporary Hardness

Temporary hardness is due to the presence of magnesium and calcium hydrogen carbonates in water. It can be removed by

- Boiling** During boiling, the soluble magnesium hydrogen carbonate is converted into insoluble magnesium hydroxide and calcium hydrogen carbonate is converted into insoluble calcium carbonate. These insoluble precipitates can be removed by filtration.
- Clark's Method** In this method, calculated amount of lime is added to hard water. It precipitates out calcium carbonate and magnesium hydroxide which can be filtered off.

Permanent Hardness

It is due to the presence of soluble salts of magnesium and calcium in the form of chlorides and sulphates in water.

Permanent hardness can be removed by the following methods

- Treatment with Washing Soda** (Na_2CO_3 or Sodium Carbonates) Washing soda reacts with soluble calcium and magnesium chlorides and sulphates in hard water to form insoluble carbonates.
- Calgon's Method** Sodium hexametaphosphate ($\text{Na}_6\text{P}_6\text{O}_{18}$), commercially called 'calgon', when added to hard water, complex anions are formed. The complex anion keeps the Mg^{2+} and Ca^{2+} ions in solution.
- Ion Exchange Method** This method is also called **zeolite/permutit** process. Hydrated sodium aluminium silicate is called zeolite. When zeolite is added to hard water, exchange reactions take place which results in softening of water.
 $\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_8 \cdot x\text{H}_2\text{O}$, (also known as zeolites) which have property of exchanging cations such as Ca^{2+} , Mg^{2+} with sodium salt ions.
- Synthetic Resins Method** Now-a-days hard water is softened by using synthetic cation exchangers. This method is more efficient than zeolite process.

Structure of Water Molecule

- The molecule of water consists of two hydrogen atoms bonded to oxygen atom by **covalent bonds**.
- The density of ice is less than water.
- In water molecule, the central oxygen atom is sp^3 hybridised and contain two lone pairs.
- The geometry of water is distorted and $\text{H}-\text{O}-\text{H}$ bond angle is 104.5° .

Structure of H_2O

Heavy Water

- Chemically heavy water is deuterium oxide (D_2O). It was discovered by **Urey** in 1932. It is colourless, odourless and tasteless liquid.
- It is used in nuclear reactor as moderator because it slow down the fast moving neutrons.

Properties of H_2O and D_2O

Property	H_2O	D_2O
Freezing point	0°C	3.8°C
Boiling point	100°C	101.42°C
Temperature of maximum density	4°C	11.6°C
Dielectric constant	81	80
Solubility of substances	High	Low
Density	1.0000 g cm^{-3}	1.1059 g cm^{-3}

CARBON

Carbon is the first element of **IV A group** of periodic table. It occurs in the free state in the form of coal, diamond and graphite. In combined state carbon is found as carbonates of metals like calcium and magnesium and as hydrocarbons and in air as CO_2 (0.03)%.

The **phenomenon of existence** of an element in more than one form and each form has different physical properties but identical chemical properties are known as allotropy and these different forms are called allotropes. Carbon shows allotropism due to the property of catenation and $p\pi - p\pi$ bond. Carbon exists in two different allotropic forms

- (i) **Crystalline form** Diamond, graphite and fullerene.
- (ii) **Amorphous form** Coal, wood charcoal, animal charcoal, lamp black, coke etc.

Crystalline Forms of Carbon

Diamond

Diamond is the purest form of carbon. Diamond prepared in laboratory is called artificial diamond.

Properties of Diamond

Some properties of diamond are given below

- It is the hardest substance. Its m.pt. is very high (about 3600°C).
 - It is colourless, shining and transparent crystalline solid. It has a density about 3.51 g/cm^3 .
 - It is bad conductor of heat and electricity.
 - It burns in air at 900°C to give CO_2 .
 - It is insoluble in all the solvents.
 - Due to the lattice vibrations, it has the highest thermal conductivity among all known materials.
 - Diamond is a covalent solid. In its crystal, each carbon atom is covalently bonded to four other carbon atoms situated around it tetrahedrally.
 - The hybridisation of carbon in diamond is sp^3 .
 - The carbon-carbon bond distance in diamond is 1.54 \AA .
 - Diamonds are transparent to light and have very high refractive index (2.5).
- **Note** X-rays penetrate diamond but these rays do not penetrate glass (identification test for glass and diamond).

Uses of Diamond

Some uses of diamond are given below

- It is used for cutting glass, making bores for rock drilling and for making abrasives.
- Diamond is used as a gem stone on account of reflection and refraction of light.
- It is used for grinding and polishing hard materials.
- It is also used for making dies for drawing thin wires from metals.
- Sequence of hardness is boron carbide (B_4C) > silicon carbide (SiC) > diamond > glass > iron.

Graphite

It is an important allotrope of carbon which is more widely distributed in nature than diamond. It is also called black lead. It can be prepared by heating anthracite coal with a small amount of iron or silica in an electric furnace.

Properties of Graphite

Some properties of graphite are given below

- It is shining gray, opaque solid.
- It is softer than diamond.
- It has a density about 2.25 g/cm^3 .
- Its melting point is very high (3500°C).
- It is good conductor of heat and electricity.
- It is also pure but less than that of diamond (95–97% C).
- It burns in air at $973 - 1073 \text{ K}$ to give CO_2 .
- Two dimensional layer structure having regular hexagonal sheets.
- Only 3 of the 4 valence electrons of C participate in bonding. Thus, hybridisation is sp^2 having 3 covalent bonds with 3 other C-atoms in the same plane. This fourth free electron is responsible for its conductivity.
- The carbon-carbon bond distance in graphite (1.42 \AA) is shorter than diamond (1.54 \AA). It is insoluble in ordinary solvents like water, alcohol, ether etc.

Uses of Graphite

Some uses of graphite are given below

- It is used in making electrodes.
- It is used as a lubricant for heavy machines.
- It is used in the manufacture of crucibles which can withstand high temperatures.
- Mixed with clay it is used for making lead pencils.
- It is also used as a moderator for fast moving neutrons in atomic reactors.

Fullerene

Fullerene or Bucky balls were discovered in 1980. Its general formula is C_{2n} (where $n = 30 - 48$).

Buckminster fullerene, C_{60} has soccer ball like shape with 12 pentagons and 20 hexagon rings of carbon atoms. While C_{70} has rugby ball shape. In fullerene each carbon is sp^2 -hybridised.

- These are the only pure form of carbon.
 - These are soluble in organic solvents due to their covalent nature and form coloured solutions.
 - These react with metals of group 1 and form solids e.g. K_3C_{60} . These compounds act as superconductors below 18 K . Their thermal stability is less than that of diamonds and graphite.
- **Note** Thermodynamically most stable allotrope of carbon is graphite. Therefore $\Delta_f H^\circ$ for graphite is zero. Whereas $\Delta_f H^\circ$ for diamond and fullerene is 1.90 and 38.1 kJmol^{-1} respectively.

Micro Crystalline Forms of Carbon Coal

It is a complex mixture of compounds of carbon (mainly), hydrogen, oxygen and some free carbon. The compounds of nitrogen, sulphur are also present in a very small amount in coal. Coal was formed by the decomposition of large plants and trees buried under the earth millions of years ago. This is slow chemical process. This process of conversion of dead vegetation into coal is called **carbonisation**.

- Peat is the most inferior and anthracite is the most superior quality of coal.
- Bituminous coal is the most common variety of coal, used in house holds.
- Wood contains about 40% carbon.

Different Varieties of Coal are as follows

Types of coal	Carbon content
Peat	60% carbon
Lignite (brown coal)	70% carbon
Bituminous (household coal)	80% carbon
Anthracite (hard coal)	90% carbon

Uses of Coal

Some uses of coal are given below

- Coal is used as a fuel.
- Coal is used in the manufacture of fuel gases like coal gas, water gas, producer gas etc.
- **Coal gas** is the mixture of CO, H₂, CH₄ and hydrocarbon.
- **Water gas** is the mixture of CO and H₂.
- **Producer gas** is CO + N₂.
- Coal is also used in the manufacture of synthetic petrol, coke, natural gas etc.
- Coal is a source of organic compounds like benzene, toluene, phenol, aniline, naphthalene, phenanthrene, anthracene etc.
- **Note Oil gas** is a mixture of methane, ethylene and acetylene. It is used in burners in laboratory. Calorific value of coal gas is higher than the producer gas.

Charcoal

- It is a black, soft, and highly porous substance.
- It is prepared by the strong heating of wood in closed vessels in the absence of air. Thus, charcoal is prepared by the destructive distillation of wood. Charcoal is most reactive form of carbon.
- Charcoal is used as black pigment and a fuel for domestic heating purpose.

- Charcoal is however a good fuel than wood because charcoal has a higher calorific value (33 kJ/g) than wood (17 kJ/g) and charcoal does not produce smoke while burning, whereas wood produces a lot of smoke on burning and pollutes air.

It can be obtained in three varieties

- Wood charcoal** It is obtained by heating wood in a limited supply of air. Most impure form of carbon is wood charcoal. It is highly porous and is therefore, used as an adsorbent for gases and in making gas masks.
- Animal charcoal** It is obtained by destructive distillation of bones and is also known as **bone black**. It contains about 10% carbon. It is mainly used for decolourising sugar syrup in the manufacture of sugar and other organic substance.
- Sugar charcoal** It is the purest form of amorphous carbon and is obtained by the action of concentrated sulphuric acid on cane sugar.

Fuel

Fuels are those substances which produce heat and sound upon heating e.g. coal, petroleum, wood, kerosene etc.

- In general fuels are the compounds of carbon and hydrogen.
- Ideal fuel is cheap, readily available, readily combustible and easy to transport.
- Fuel efficiency is expressed in terms of its calorific value which is expressed in kJkg⁻¹. The amount of heat energy produced on complete combustion of 1 kg of a fuel is called its **calorific value**.
- On the basis of origin fuels are of two types:
 - Primary fuels** These fuels are obtained directly from nature e.g. wood, petroleum.
 - Secondary fuels** These fuels are obtained from primary fuels e.g. petrol, diesel, kerosene, water gas, coal gas etc.

Importance of liquid and gas fuels

Liquid and gas fuels are more useful than that of the solid fuels because

- These fuels do not produce residues, burn easily without smoke, have low ignition temperature.
- Their calorific value is high so produce more heat.

Petroleum

It is a dark oily liquid with an unpleasant odour. It is a mixture of various hydrocarbons.

The process of separating the various constituents of petroleum is known as refining. It is carried out in refinery. Various constituents of petroleum and their uses are as follows:

Petroleum is also known as **black gold** as it is more precious than gold.

Constituents of petrol	Uses
(i) Petroleum gas in liquid form	Fuel for home and industry
(ii) Petrol	Motor fuel, aviation fuel, solvent for dry cleaning
(iii) Kerosene	Fuel for stoves, lamps, for jet aircrafts
(iv) Diesel	Fuel for heavy motor vehicles, electric generators
(v) Lubricating oil	Lubrication
(vi) Paraffin wax	Ointments, candles, vaselines etc.
(vii) Bitumen	Paints, road surfacing

Octane Number

In the cylinder of combustion engine, some fuels burn before time and produce objectionable metallic sound known as **knocking**. It leads to wastage of fuel. Therefore, an antiknock compound e.g. tetraethyl lead is added to gasoline (petrol) to reduce knocking. Generally 0.15 mL TEL is mixed with ethyl bromide in each litre petrol.

Octane number of a gasoline is defined as the volume percentage of iso-octane in a mixture of iso-octane and *n*-heptane which matches the fuel (gasoline) in knocking. Higher the octane number of a gasoline, better is its quality.

- Octane number of iso-octane (2, 2, 4-trimethyl pentane) is 100.
- Octane number of *n*-heptane is zero.
- Benzene toluene xylene (BTX) is also a good antiknocking compound.

Gasohole

It is a mixture of petrol (10%) and ethanol (90%).

- It is used to minimise the pollution created by burning petroleum products.
- Ethanol is obtained by the fermentation of sugarcane juice.

Some other fuels

These are as follows

- Liquefied Petroleum Gas (LPG)** It is a mixture of butane (C_4H_{10}), iso-butane (C_4H_{10}) and some propane (C_3H_8). A strong foul smelling substance ethyl mercaptan or thioethanol (C_2H_5SH) is also added to LPG to detect its leakage because LPG is a colourless and odourless gas. It is used in cylinders for domestic purposes. Its calorific value is 50 kJg^{-1} .
- Natural Gas** It is a mixture of methane (80-90%), ethane and propane. Its calorific value is 50 kJg^{-1} .
- Bio Gas** Biogas is obtained by breakdown of organic matter in absence of oxygen. It is a mixture of methane (mainly), CO_2 , H_2S , moisture and siloxanes.
- Compressed Natural Gas** The use of diesel and petrol as fuels in automobiles is being replaced by CNG (Compressed natural gas), because it produces 70% CO and 87% nitrogen oxide lesser than that of petrol and diesel. CNG is a cleaner fuel.

Flame

A hot glowing visible gaseous part of a fire. The substances which vaporise during burning, give flames. There are three zones of the flame:

- Outer zone of complete combustion** It is the hottest part of the flame and blue in colour.
 - Middle zone of partial combustion** Yellow in colour due to incomplete combustion of carbon.
 - Inner zone of unburnt wax vapours** Black in colour due to the presence of unburnt carbon particles.
- Blue flame is non-luminous whereas yellow flame is luminous.

Organic Compounds

Compounds of carbon and hydrogen and their derivatives are called **organic compounds**. In earlier time, the chemical substances found in the living beings were called organic compounds.

- Methane, ethane, ethene, (ethylene), ethyne (acetylene) etc. are the examples of organic compounds.
- Urea is the first synthesised organic compound. F. Wohler synthesised urea by heating a mixture of ammonium sulphate and potassium cyanate.
- The property of catenation in carbon and ability of carbon to form multiple bonds form the basis of multiplicity of carbon compounds in organic chemistry.
- Hydrocarbons are classified into saturated hydrocarbons and unsaturated hydrocarbons.
- Methane, ethane, propane etc. are saturated hydrocarbons whereas ethylene, acetylene, butane, butyne are unsaturated hydrocarbons.

Some Important Organic Compounds

- Methane (CH_4)** It is also called marsh gas. It is used in preparation of carbon black, organic compounds and as a gaseous fuel. Its mixture with air is explosive that's why methane is responsible for explosion in coal mines.
- Ethylene (C_2H_4)** It is used in mustard gas ($ClCH_2CH_2SCH_2CH_2Cl$) preparation, in the form of an anaesthesia, in the production of oxyethylene flame for cutting and welding of metals and in the artificial ripening of fruits.
- Acetylene (C_2H_2)** It is prepared in laboratory by the reaction of calcium carbide with water. It is used in preparation of lewisite gas ($C_2H_2AsCl_3$), in production of light, in making camphor, in the form of anaesthesia, in oxyacetylene flame for cutting and welding of metals.

(iv) **Acetic acid** (CH_3COOH) In vinegar 6-7% acetic acid is present.

- **Note** All common activities of a living organism involve reactions of certain organic compounds. Such compounds are called biomolecules. Carbohydrates, lipids, proteins, vitamins, hormones, nucleic acids etc. are biomolecules.

IMPORTANT POINTS

- Hydrocarbons are the compounds of carbon and hydrogen. In hydrocarbons calorific value increase with increase in % of hydrogen and decrease with increase in oxygen content.
- In complete combustion of even saturated hydrocarbons giving a sooty flame.

OXIDES OF CARBON

Carbon dioxide and carbon monoxide are the two important oxides of carbon.

Carbon Dioxide

Carbon dioxide is an oxide of carbon in which the oxidation state of carbon is +4. Carbon dioxide occurs about 0.03–0.05% in the atmosphere. It is a product of combustion of carbon and carbon containing fuels, respiration and fermentation.

Methods of Preparation

Laboratory Method

In laboratory carbon dioxide is prepared by the action of cold dilute HCl on marble chips in a Kipp's apparatus.

This gas is collected by the upward displacement of air. Dilute H_2SO_4 is not used for the preparation as coating of insoluble CaSO_4 is formed on the surface which prevents further reaction between acid and CaCO_3 .

By Carbon or CO

Carbon dioxide is prepared by burning carbon, a hydrocarbon, or carbon monoxide in excess of air.

From Carbonates

Pure carbon dioxide can be prepared by heating metallic carbonates and bicarbonates.

- Seth's Carbonates of Fr, K, Rb, Cs, does not give CO_2 on heating.

Carbon dioxide can also be prepared by the action of dilute acids on carbonates and bicarbonates.

By Fermentation of Molasses

Carbon dioxide can also be prepared from fermentation of molasses with yeast in the formation of ethanol.

It is also obtained as a byproduct in the preparation of ethanol by the fermentation of starch.

Physical Properties

Some physical properties of CO_2 are given below

- It is colourless, odourless gas about 1.5 times heavier than air. It is fairly soluble in water more than CO. Aerated water is a solution of carbon dioxide in water under pressure. The solubility increases with increasing pressure.
- Carbon dioxide can be easily liquefied under a pressure of 50–60 atm at room temperature. Solid carbon dioxide used for refrigeration and it is also called **dry ice**.
- CO_2 is not poisonous in nature.
- KOH absorbs CO_2

Chemical Properties

Some chemical properties of CO_2 are given below

- Carbon dioxide is a stable gas and it is not decomposed.
- Ordinary carbon dioxide is neither combustible nor supporter of combustion. However certain active metals like K, Mg, Na, etc., burn in atmosphere of CO_2 .

- It dissolves in water to form carbonic acid

Carbonic acid is a weak acid and forms two series of salts. CO_2 is an anhydride of carbonic acid.

- Carbon dioxide turns blue litmus into red, thus, it is an acidic oxide.
- On passing carbon dioxide gas through lime water it turns milky. Milkiness is due to the formation of CaCO_3 .

In excess of CO_2 milkiness disappears due to the formation of soluble calcium bicarbonate.

Uses of Carbon Dioxide

Some uses of carbon dioxide are given below

- As a fire extinguisher.
- In the preparation of aerated waters like soda water.
- As a refrigerant under the commercial name drikold.
- For artificial respiration as a mixture of $O_2 + CO_2$ called carbogen.
- In creating inert atmosphere free from air.

Carbon Monoxide

When CO_2 is passed through red hot coke, CO is obtained.

Carbon monoxide is extremely poisonous because it combines with haemoglobin to form a stable salt carboxy haemoglobin and a result of this suffocation taken place (Asphyxia). Low level poisoning results in headache and drowsiness whereas high level poisoning may cause death. It is neutral to litmus. It reduces metal oxide to metal and is used in the manufacture of methanol, formic acid and phosgene gas. It is used in purification of nickel by Mond's process and in preparation of metal carbonyls.

OXYGEN

Oxygen belongs to group VIA (group 16) of the periodic table. The atomic number of oxygen is 8 and electronic configuration is $1s^2 2s^2 2p^4$.

In air it occurs in free state and constitute 21% by volume of air. In combined state it constitutes about 88.8% by mass of water and 46.5% by mass of earth's crust. Almost all of the dioxygen in the atmosphere is believed to be due to the photosynthesis taking place in green plants in the presence of sunlight.

It is an essential constituent of all acids.

Method of Preparation of Dioxygen (O_2)

Oxygen molecule is diatomic therefore it is also called dioxide.

(i) By decomposition of oxygen rich compounds

Certain compounds containing large amounts of oxygen such as chlorates, nitrates, permanganates etc., give dioxygen on strong heating.

Here MnO_2 acts as a catalyst.

(ii) By heating dioxides, peroxides and higher oxides

Oxides of certain metals, on heating give dioxygen.

(iii) By the action of water on sodium peroxide

(Used in laboratory)

(iv) By the decomposition of peroxide or hypochlorites

(v) By the action of chemical reagent on compounds rich in oxygen

(vi) Industrial preparation

(a) **From air** Oxygen is prepared by fractional distillation of air. During this process dinitrogen with less boiling point (78 K) distills as vapour while dioxygen with higher boiling point (90 K) remains in the liquid state and can be separated.

(b) **From water** Dioxygen is obtained by electrolysis of water containing small amount of acid or alkali.

Physical Properties

Some physical properties of oxygen are given below

- Dioxygen is a colourless, tasteless and odourless gas.
- It is slightly soluble in water and can be liquefied to a pale blue liquid and can be solidified to bluish white solid at -291°C under pressure.
- Its melting point is 54.4 K and boiling point is 90.2 K.
- It exists in three isotopic forms of ${}_8O^{16}$, ${}_8O^{17}$, ${}_8O^{18}$ in the ratio of 1000 : 1 : 8. ${}_8O^{18}$ is radioactive.
- It is slightly heavier than air and sparingly soluble in water.
- Oxygen is absorbed by alkaline pyrogallol solution which turns brown.
- Oxygen does not burn itself but it is a supporter of combustion.
- Oxygen has two unpaired electrons in its p -orbital, so it is paramagnetic in nature.

Chemical Properties

Some chemical properties of oxygen are given below:

- (i) The dioxygen is quite stable in nature as its bond dissociation energy is very high.
- (ii) Chemical reactions of dioxygen are exothermic.
- (iii) **Action with litmus** It is neutral and has no effect on blue or red litmus.
- (iv) **Reaction with metals** Almost all the metals burn in oxygen or air to form oxides most of which are basic in nature.

Oxides of Zn, Al and Sn are amphoteric in nature.

- (v) **Reaction with non-metals** Non-metals also burn in oxygen gives acidic oxides which are soluble in water.

However, some non-metals such as carbon (CO) and nitrogen (NO, N₂O) form neutral oxides.

- (vi) **Reaction with compounds** Dioxygen is an oxidising agent and it oxidises many compounds under specific conditions.

(Reaction with HCl—Deacon's process)

(Ostwald process for manufacture of NO)

- (vii) **Reaction with hydrocarbons** Saturated as well as unsaturated hydrocarbons burn in excess of air or oxygen to give CO₂ and H₂O.

Uses of Oxygen

Some uses of oxygen are given below:

- It is used in the oxy-hydrogen or oxy-ethylene or oxy-acetylene torches which are used for welding and cutting of metals.
- Liquid oxygen is used as a rocket fuel.
- It is used as an oxidising agent and bleaching agent.
- Oxygen-18 isotope is used as a tracer in the study of reaction mechanism.
- A mixture of carbon dust and liquid oxygen is used as explosive for coal mining.
- It is used for artificial respiration in case of surgery.

Oxides

The binary compounds of oxygen with other elements are known as oxides. They are classified on the basis of their chemical properties and their oxygen content.

1. Classification on the basis of Chemical Properties

- (i) **Acidic oxides** Those oxides which dissolve in water giving oxy-acids and neutralise alkali are called acidic oxides. Generally non-metals form acidic oxides. e.g. B₂O₃, SiO₂, CO₂, N₂O₃, P₂O₅, I₂O₅ etc.
- (ii) **Basic oxides** These oxides dissolve in water to give alkali. They are metallic oxides. They neutralise acids. e.g. K₂O, CaO, BaO, BaO₂ etc.
- (iii) **Neutral oxides** These oxides have no action on litmus. They produce neither base nor acid with water, e.g. CO, N₂O, NO etc.
- (iv) **Amphoteric oxides** These oxides behave like acids and also as bases depending upon conditions, e.g. ZnO, Al₂O₃, SnO, SnO₂, As₂O₃, PbO, BeO, SbO and PbO₂ etc.

2. Classification on the basis of Oxygen Content

- (i) **Normal oxides** These oxides contain as much oxygen as needed according to the oxidation number of the element, e.g. H₂O, MgO, Al₂O₃, SiO₂ etc.
- (ii) **Polyoxides** They contain more oxygen than permitted by the normal oxidation number of element, e.g. BaO₂, KO₂, PbO₂, MnO₂ etc.
- (iii) **Suboxides** They contain less oxygen than expected from the normal oxidation number of element, e.g. N₂O, C₃O₂ (carbon suboxide) etc.
- (iv) **Mixed oxides** These oxides are made up of two simpler oxides, e.g. Pb₃O₄, Fe₃O₄ etc.

OZONE

- Ozone is a highly unstable triatomic allotropic form of oxygen and it is known as ozonised oxygen.
- Ozone is dark blue in colour.
- Ozone is prepared in the laboratory by Siemen's ozoniser and Brodie's ozoniser.

$$3 \text{O}_2 \rightleftharpoons 2 \text{O}_3; \Delta H = +68 \text{ kCal}$$
- It acts as oxidising as well as reducing agent.
- Ozone is heavier than air and slightly soluble in water.
- Ozone is diamagnetic.
- Mercury loses its meniscus in contact with ozone (tailing of mercury). It is used as a test for ozone.
- Ozone is used for disinfecting water for drinking purposes because of its *germicidal* properties.
- Ozone is used for bleaching fabrics, oils, starch, ivory etc.
- It is used for making camphor and artificial silk.

NITROGEN

Nitrogen belongs to group VA (or 15) of the periodic table. Its atomic number is 7 and electronic configuration is ${}_{7}\text{N}^{14} = 1s^2 2s^2 2p^3$. It is a diatomic molecule with a triple bond ($\text{N}\equiv\text{N}$). It was discovered by **D Rutherford** in 1772

Nitrogen occurs in the atmosphere to the extent of 78% by volume. In combined state it is present in many compounds such as potassium nitrate (KNO_3) and many ammonium compounds.

➤ **Note** It is an essential constituent of plants, animals (as plant and animal protein) and soil (in the form of nitrites, nitrates and ammonium compounds). The **non-leguminous plants** like Ginkgo also fix atmospheric nitrogen.

Methods of Preparation

Some methods for preparation of nitrogen are as follows

(i) **Laboratory preparation** In laboratory nitrogen is prepared by heating an aqueous solution of ammonium chloride and sodium nitrite.

(ii) **By thermal decomposition of ammonium dichromate or ammonium nitrite**

(iii) **From ammonia**

(a) Nitrogen can be prepared from ammonia by passing over red hot copper in the presence of NO.

(b) By oxidation of ammonia with chlorine or cupric oxide or bleaching powder.

(iv) **Commercial preparation** Commercially dinitrogen is prepared by the fractional distillation of liquid air.

Physical Properties

Some physical properties of nitrogen are given below

- Dinitrogen is a colourless, odourless and tasteless gas.
- It is a **non-toxic** gas however animals die in an atmosphere of N_2 for want of oxygen.
- It is slightly lighter than air and the vapour density is 14.
- Its melting point is 63.2 K and boiling point is 77 K.
- It is slightly soluble in water.

Chemical Properties

Some chemical properties of nitrogen are given below

- Dinitrogen is chemically unreactive at ordinary temperatures. The N—N bond in nitrogen molecule is a triple bond ($\text{N}\equiv\text{N}$).
- The low reactivity of nitrogen is due to its very small molecular size and high bond dissociation energy.
- Action with litmus** Dinitrogen is neutral towards litmus.
- Its maximum covalency is four because of the absence of *d*-orbitals.
- It forms nitrides on heating strongly with a number of active metals.

(vi) Dinitrogen combines with dihydrogen and dioxygen.

Uses of Dinitrogen

Some uses of dinitrogen are given below

- Dinitrogen is used in the manufacture of compounds like ammonia, nitric acid, calcium cyanamide etc.
- Liquid nitrogen is used as refrigerant to preserve biological specimens and freezing foodstuffs and also in cryosurgery.
- It is used in providing inert atmosphere in iron and steel industries.
- It is used in gas filled thermometers used for measuring high temperatures.

Oxides of Nitrogen

- Nitrogen and oxygen react together to form oxides of nitrogen during lightning in the clouds in the rainy season.
- N_2O causes laughing **hysteria** when inhaled.
- N_2O_3 (dinitrogen trioxide) is anhydride of nitrous acid.
- NO_2 is a reddish brown gas, it dimerises to N_2O_4 . It is known as the mixed anhydride of nitrous acid and nitric acid.

$$2\text{NO}_2 + \text{H}_2\text{O} \rightleftharpoons \text{HNO}_2 + \text{HNO}_3$$
- N_2O_5 is anhydride of nitric acid and it is most **acidic oxide**.

Ammonia

- It was first isolated by **Priestley** in 1774.
- In laboratory it is prepared by heating ammonium chloride with slaked lime.

$$2\text{NH}_4\text{Cl} + \text{Ca}(\text{OH})_2 \longrightarrow \text{CaCl}_2 + 2\text{H}_2\text{O} + 2\text{NH}_3 \uparrow$$
- It is prepared on industrial scale by Haber's process.
- It is a strong Lewis base. Its aqueous solution is basic in nature.
- Ammonia is used in the manufacture of nitric acid, sodium carbonate and rayon.
- It is used in preparation of tear gas. Its aqueous solution (NH_4OH) is used as a laboratory reagent.
- In the form of ammonium nitrate, ammonium sulphate is used as a fertilizer.

Nitric Acid

- It is the hydrate of N_2O_5 .
- Nitric acid (HNO_3) is manufactured by Ostwald process.
- Anhydrous nitric acid is colourless fuming liquid with a pungent smell.
- Nitric acid usually acquires yellow colour due to its decomposition into NO_2 by sunlight. This colour can be removed by passing O_2 through it.
- Nitric acid is very strong oxidising agent and nitrating agent.
- Nitric acid is used in manufacture of TNT, nitro glycerine, picric acid, dynamite, gun cotton and amatol (80% NH_4NO_3 + 20% TNT) etc.

> PRACTICE EXERCISE

- The radioactive isotope of hydrogen is
 - hydrogen
 - parahydrogen
 - deuterium
 - tritium
- Hydrogen was discovered by
 - Lavoisier
 - Cavendish
 - Dalton
 - Newton
- Tritium is composed of
 - one proton, one electron and two neutrons
 - one proton, two electrons and one neutron
 - two protons and one electron
 - one proton, one electron and one neutron
- Select the true statement.
 - Among protium, deuterium and tritium, protium has largest atomic radius
 - Absolutely pure *ortho* hydrogen is formed at 20 K
 - Atomic weight of deuterium is 3 and that of hydrogen is 2
 - Para* and *ortho* hydrogen possess same chemical properties
- The metal which cannot liberate hydrogen from acid is
 - platinum
 - silver
 - gold
 - All of these
- Hydrogen from HCl can be prepared from
 - copper
 - phosphorus
 - magnesium
 - mercury
- Hydrogen acts as a
 - reducing agent
 - oxidising agent
 - both reducing and oxidising agent
 - neither reducing nor oxidising agent
- Hydrogen will not reduce heated
 - CuO
 - Fe_2O_3
 - Al_2O_3
 - SnO_2
- Which of the following metal adsorb hydrogen?
 - Zn
 - Pd
 - Al
 - K
- In Bosch process hydrogen is obtained from
 - natural gas
 - water
 - water gas
 - None of these
- In Lane process reduction of steam is carried out by heated
 - Ca
 - Fe
 - K
 - Sr
- Moist hydrogen cannot be dried over conc. H_2SO_4 because
 - it can catch fire
 - it is reduced by H_2SO_4
 - it can oxidised by H_2SO_4
 - it decomposes by H_2SO_4
- Hydrogen is not obtained when zinc reacts with
 - cold water
 - dil. H_2SO_4
 - dil. HCl
 - hot 20% NaOH
- Zinc react with conc. H_2SO_4 to form
 - $\text{ZnSO}_4 + \text{H}_2$
 - ZnSO_4
 - $\text{ZnSO}_4 + \text{SO}_2 + \text{H}_2\text{O}$
 - None of the above
- Hydrogen is collected
 - over water
 - over mercury
 - over alcohol
 - None of these
- Consider the following statements about *ortho* or *para* forms of hydrogen
 - Ortho* or *para* hydrogens are isotopes of hydrogen.
 - Specific heats of the two forms are same.
 - Chemical properties of two forms are same.
 - Boiling points of two forms are same.
 Which of these is/are correct statements?
 - I and II
 - Only III
 - III and IV
 - IV and I
- When hydrogen is passed over Pd, hydrogen is adsorbed over the surface of Pd, this process is called
 - hydrogenation
 - occlusion
 - evaporation
 - halogenation
- Which one of the following elements is used as catalyst in the hydrogenation of vegetable oils?
 - Pt
 - Na
 - Ru
 - P
- Dihydrogen reacts with CO at 700 K in the presence of a catalyst to form methanol, the catalyst is
 - $\text{ZnO} \cdot \text{Cr}_2\text{O}_3$
 - $\text{ZnO} \cdot \text{C}_2\text{O}_4$
 - $\text{ZnO} \cdot \text{CrO}$
 - $\text{ZnO} \cdot \text{Cr}_2\text{O}_3$

- 20.** Nascent hydrogen consists of
 (a) hydrogen atom with excess of energy
 (b) hydrogen ions in excited state
 (c) hydrogen molecule with excess of energy
 (d) solvated proton

- 21.** Consider the following types of hydrides

I. Covalent hydride

II. Ionic hydride

III. Metallic hydride

Which of these are formed by hydrogen?

- (a) I and II (b) I and III
 (c) II and III (d) All of these

- 22.** Ionic hydrides are formed by
 (a) highly electropositive element
 (b) transitional metals
 (c) highly electronegative element
 (d) inner-transitional element

Directions (Q. Nos. 23-29) *Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and mark the correct choice according to the codes given below.*

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of Statement I.
 (b) Both Statement I and Statement II are true but Statement II is not the correct explanation of Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.

- 23. Statement I** Fused lithium hydride liberates hydrogen gas at anode on its electrolysis.

Statement II In lithium hydride, hydrogen is in negative oxidation state.

- 24. Statement I** Hydrogen forms largest number of compounds in chemistry.

Statement II Hydrogen is the most abundant element in the universe.

- 25. Statement I** In the reaction between Na and H₂, hydrogen behave like an oxidising agent.

Statement II Hydrogen atom accepts an electron.

- 26. Statement I** Nitrogen is an inert diatomic gas with the structure

$$\begin{array}{c} \cdot\cdot \\ \cdot\cdot \\ \text{N} \equiv \text{N} \end{array}$$

Statement II The heat of dissociation of N₂ is extremely large (954 kJ).

- 27. Statement I** Nitrogen is a poisonous gas.

Statement II Animals die in its atmosphere for want of oxygen.

- 28. Statement I** Oxygen is oxidised on combination with fluorine.

Statement II Fluorine is more electronegative element than oxygen.

- 29. Statement I** Oxygen is paramagnetic.

Statement II Hydride of oxygen is less volatile than that of sulphur.

- 30.** Which is the most abundant element in earth's crust?

- (a) Ca (b) C
 (c) Si (d) O

- 31.** Carbon forms large number of compounds because it has

- (a) hardness
 (b) catenation property
 (c) tetravalent structure
 (d) variable valency

- 32.** The nature of chemical bonds in diamond is

- (a) ionic (b) covalent
 (c) coordinate bond (d) metallic

- 33.** Carbon atoms in diamond are bonded with each other in which configuration?

- (a) Planar (b) Linear
 (c) Octahedral (d) Tetrahedral

- 34.** Use of diamond as a gem depends upon its

- (a) high cost
 (b) refractive index
 (c) extreme hardness
 (d) bad conductance

- 35.** The inert form of carbon is

- (a) diamond (b) graphite
 (c) coal (d) charcoal

- 36.** Diamond is a

- (a) good conductor and soft
 (b) non-conductor and soft
 (c) non-conductor and hard
 (d) good conductor and hard

- 37.** Lead pencil contains

- (a) lead sulphate (b) lead
 (c) ferrous sulphate (d) graphite

- 38.** Distance between two layers of carbon atoms in graphite is

- (a) 335 pm (b) 154 pm
 (c) 5.33 pm (d) None of these

- 39.** Graphite is used in nuclear reactor

- (a) as a lubricant (b) as a fuel
 (c) for lining the inside of the reactor as insulator
 (d) for reducing the velocity of neutrons

- 40.** Graphite is a good conductor because

- (a) carbon has sp²-hybridisation
 (b) graphite has free electrons
 (c) graphite is crystalline
 (d) graphite has free atoms

- 41.** Difference between diamond and graphite is that

- (a) graphite combines with oxygen to form carbon dioxide but diamond does not
 (b) the atoms in each have different masses
 (c) the crystal structure in diamond is different form that in graphite
 (d) All of the above

- 42.** Diamond and graphite both are made of carbon atoms. Diamond is extremely hard whereas graphite is soft. This is because

- (a) the chemical bonds between any two carbon atoms in diamond are stronger
 (b) diamond is ionic whereas graphite is covalent
 (c) each carbon atom in diamond is chemically bonded to a greater number of neighbouring carbon atoms
 (d) certain atoms in diamond are smaller in size

- 43.** The variety of coal having the highest carbon content is

- (a) anthracite (b) bituminous
 (c) lignite (d) peat

- 44.** The variety of coal having the lowest carbon content is

- (a) peat (b) lignite
 (c) bituminous (d) anthracite

- 45.** What happens when steam is passed over red hot carbon?

- (a) CO₂ + H₂ are formed
 (b) H₂ + O₂ + steam are formed
 (c) CO + H₂ are formed
 (d) None of the above

- 46.** Activated charcoal is employed to remove colouring matter from pure substance it works by

- (a) bleaching (b) oxidation
 (c) reduction (d) adsorption

- 47.** Formation of coal from wood is

- (a) adsorption (b) carbonisation
 (c) decarboxylation (d) None of these

- 48.** The charcoal used to decolourise brown sugar solution is
 (a) wood charcoal
 (b) coconut charcoal
 (c) animal charcoal
 (d) sugar charcoal
- 49.** The most reactive form of carbon is
 (a) diamond (b) graphite
 (c) coal (d) charcoal
- 50.** Charcoal is activated by treating with
 (a) steam in retort
 (b) super heated water
 (c) hot air
 (d) None of the above
- 51.** Coke is obtained from wood by
 (a) cracking
 (b) destructive distillation
 (c) fractional distillation
 (d) None of the above
- 52.** Coal gas is a mixture of
 (a) H₂ and CO (b) H₂, CO and CH₄
 (c) H₂O and CO (d) CO and CH₄
- 53.** Producer gas is a mixture of
 (a) air and water (b) CO, H₂ and N₂
 (c) CO and N₂ (d) CO and H₂
- 54.** Which has the highest calorific value?
 (a) Coal gas (b) Coal
 (c) Producer gas (d) CO₂
- 55.** Maximum calorific value is of
 (a) peat (b) lignite
 (c) bituminous (d) anthracite
- 56.** Which one of the following oxide of carbon is most stable?
 (a) CO (b) C₃O₂ (c) CO₂ (d) CO₃
- 57.** Drikold is
 (a) carbon dioxide
 (b) carbon monoxide
 (c) carbon suboxide
 (d) water
- 58.** Soda water contains
 (a) formic acid (b) sulphuric acid
 (c) carbonic acid (d) acetic acid
- 59.** An anhydride of carbonic acid is
 (a) CO (b) C₃O₂
 (c) CO₂ (d) None of these
- 60.** Fixation of carbon dioxide by plants is called
 (a) photosynthesis (b) fermentation
 (c) respiration
 (d) burning of oxygen
- 61.** Dry powder extinguishers contain
 (a) sand
 (b) sand + Na₂CO₃
 (c) sand + baking soda
 (d) sand and K₂CO₃
- 62.** Carbon dioxide is not used as a fire extinguisher in fire caused by
 (a) metal
 (b) non-metal
 (c) acids
 (d) None of the above
- 63.** Which one of the following is a linear molecule?
 (a) H₂O (b) CO₂
 (c) N₂O₃ (d) NO₂
- 64.** Which of the following is decomposed on heating?
 (a) Na₂CO₃
 (b) Li₂CO₃
 (c) Both (a) and (b)
 (d) None of the above
- 65.** Carbogen is a mixture of
 (a) oxygen + carbon dioxide
 (b) oxygen + chlorine
 (c) oxygen + carbon monoxide
 (d) None of the above
- 66.** Pick up the false statement.
 (a) Solid CO₂ is known as drikold
 (b) Dry ice is used as a refrigerant
 (c) Dry ice sublimates on heating
 (d) Dry ice is covalent solid
- 67.** Which one of the following statement is not correct?
 (a) Carbon dioxide is heavier than air
 (b) The solubility of carbon dioxide decreases with increase in pressure
 (c) Carbon monoxide reduces metal oxides to metal
 (d) Carbon monoxide is used in the manufacture of methanol
- 68.** Conversion of glucose into ethanol is called
 (a) formylation (b) fermentation
 (c) conversion (d) photosynthesis
- 69.** Compound formed on heating CO with NaOH under pressure is
 (a) sodium carbide (b) sodium formate
 (c) sodium acetate (d) sodium oxalate
- 70.** Carbon dioxide can oxidise
 (a) red hot iron (b) red hot carbon
 (c) red hot silver (d) red hot lead
- 71.** A gas which reacts with CaO not with NaHCO₃ is
 (a) CO₂ (b) Cl₂ (c) O₂ (d) N₂
- 72.** Dry ice is used for making cold-baths in laboratories by mixing with volatile organic solvents. Identify the form of dry ice from the following.
 (a) Gaseous carbon dioxide
 (b) Liquid carbon dioxide
 (c) Solid carbon dioxide
 (d) Solid hydrogen oxide
- 73.** Identify the correct statement
 (a) Carbogen is an antidote for carbon monoxide poisoning
 (b) Foamite fire extinguisher contains solutions of aluminium sulphate and baking soda
 (c) Dry powder extinguisher contain sand and baking soda
 (d) All of the above
- 74.** Which is the correct representation of the reaction when steam is passed over red hot coke at 1000°C?
 (a) C + H₂O → CO + H₂
 (b) C + 2H₂O → CO₂ + 2H₂
 (c) 2H₂O → 2H₂ + O₂
 (d) None of the above
- 75.** Suppose you have to determine the percentage of carbon dioxide in a sample of a gas available in a container. Which of the following would be the best absorbing material for the carbon dioxide?
 (a) Cold, solid calcium hydroxide
 (b) Cold, solid calcium chloride
 (c) Heated copper oxide
 (d) Heated charcoal
- 76.** Consider the following statements with regard to diamond and graphite.
 I. Diamond and graphite are isotopes of carbon.
 II. In diamond each carbon atom is sp³-hybridised whereas in graphite each carbon atom is sp²-hybridised.
 III. C—C bond length in diamond is greater than that in graphite.
 IV. Graphite is less reactive than diamond.
 Which of these statements are correct?
 (a) I and II (b) II and III
 (c) III and IV (d) II and IV
- 77.** Which of the following statements about diamond are correct?
 I. It is used as a gem in jewellery because of its ability to reflect light.
 II. It is a good conductor of electricity.
 III. It is used for cutting glass, marble, stones and other hard materials.
 IV. It is used for drilling of rocks.
 Select the correct answer using the codes given below.
 (a) I, III and IV (b) II, III and IV
 (c) I, II and III (d) II and IV

78. Consider the following statements regarding diamond.

- I. It is an allotrope of silicon.
- II. It is a bad conductor of heat and electricity.
- III. It is the hardest substance.
- IV. It burns to produce carbon dioxide.

Which of the statements given above are correct?

- (a) I, III, and IV
- (b) II, III and IV
- (c) I and II
- (d) All of these

79. Crude oil is a direct source of

- I. Asphalt
- II. Paraffin wax
- III. Fatty acids
- IV. Gas oil

Which of the above are correct?

- (a) I and II
- (b) II and III
- (c) I and IV
- (d) I, II and IV

80. Following statements are made in connection with carbon dioxide (CO₂)

- I. CO₂ is a poisonous gas.
- II. CO₂ is an acidic oxide.
- III. CO₂ turns lime water milky.

Which of the statements given above is/are correct?

- (a) I and II
- (b) II and III
- (c) Only III
- (d) I and III

81. Following statements are made in Connection with carbon dioxide (CO₂).

- I. Carbon dioxide is prepared by burning carbon or by the reaction of a carbonate and an acid or by decomposition of lime stone.
- II. In all these methods of preparation of CO₂, the elements carbon and oxygen are available in a fixed ratio 3 : 8.
- III. When CO₂ is continuously bubbled through lime water, initially lime water turns milky and then again colourless.

Which of the statements given above is/are correct?

- (a) I and III
- (b) II and III
- (c) I and III
- (d) All of these

Directions (Q. Nos. 82-89) *Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and mark the correct choice according to the codes given below.*

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of Statement I.

- (b) Both Statement I and Statement II are true but Statement II is not the correct explanation of Statement I.
- (c) Statement I is true, but Statement II is false.
- (d) Statement I is false, but Statement II is true.

82. Statement I Diamond is used as a precious stone.

Statement II In diamond carbon atoms are tetrahedrally arranged.

83. Statement I Graphite behaves as a lubricant.

Statement II The layers of carbon atoms in graphite can slip past one over another.

84. Statement I Graphite is more reactive than diamond.

Statement II Graphite has a two dimensional sheet like structure, where the adjacent layers are held by weak van der Waals' forces.

85. Statement I Diamond, graphite and charcoal when burnt in oxygen change to carbon dioxide.

Statement II Chemical properties of the elements in solid state depends upon the arrangement of atoms.

86. Statement I Diamond is very hard and has high melting point.

Statement II In diamond, each carbon is covalently bonded to four other carbon atoms to form a three-dimensional network.

87. Statement I Carbon can form more compounds than any other element.

Statement II Carbon can exist in various allotropes.

88. Statement I CO is neutral but CO₂ is an anhydride of carbonic acid.

Statement II CO₂ dissolves in H₂O forming carbonic acid.

89. Statement I Carbon dioxide turns lime water milky.

Statement II Calcium carbonate is insoluble in water.

90. Match the list I with list II and select the correct answer using the codes given below the list.

List I	List II
A. CO ₂	1. Fermentation
B. Zymase	2. Non-metal
C. Carbon	3. Fire extinguishing
D. CaCO ₃	4. Chalk

Codes

A	B	C	D	A	B	C	D		
(a)	2	3	1	4	(b)	3	1	2	4
(c)	1	3	4	2	(d)	4	2	1	3

91. Match the list I with list II and select the correct answer using the codes given below the list.

List I	List II
A. Marble	1. Formation of urea
B. Hydrated CO ₂	2. KOH
C. CO ₂ absorbs	3. H ₂ CO ₃
D. Use of CO ₂	4. CaCO ₃

Codes

A	B	C	D	A	B	C	D		
(a)	4	3	2	1	(b)	4	2	3	1
(c)	1	2	3	4	(d)	1	3	2	4

92. Oxygen was discovered by

- (a) Priestley
- (b) Boyle
- (c) Scheele
- (d) Cavendish

93. Gases respectively absorbed by the alkaline pyrogallol and oil of cinnamon are

- (a) O₃, CH₄
- (b) O₂, O₃
- (c) SO₂, CH₄
- (d) Na₂O, O₃

94. O₂ molecule is paramagnetic in

- (a) solid state
- (b) liquid state
- (c) gaseous state
- (d) All of these

95. Oxygen is obtained by heating

- (a) ammonium dichromate
- (b) sodium peroxide
- (c) potassium permanganate
- (d) green vitriol

96. The molecule having two unpaired electrons is

- (a) CO
- (b) NO
- (c) CN
- (d) O₂

97. Which of the following is neutral oxide?

- (a) H₂O₂
- (b) Na₂O
- (c) NO
- (d) PbO

98. Which one is known as oil of vitriol?

- (a) H₂S₂O₃
- (b) H₂SO₄
- (c) H₂SO₅
- (d) H₂S₂O₈

99. Ozone is the name given to

- (a) ozonised oxygen
- (b) Na₂O₂
- (c) KO₂
- (d) pyrogallol

100. Oxygen and ozone are

- (a) allotropes
- (b) isomers
- (c) isotopes
- (d) isobars

101. B₂O₃ is

- (a) acidic
- (b) basic
- (c) neutral
- (d) amphoteric

102. Which one of the following is not a basic oxide?

- (a) SiO₂
- (b) MgO
- (c) Na₂O
- (d) CaO

- 103.** Which of the following statements are true regarding oxygen?
 I. It reacts with non-metals to form oxides, which are basic in nature.
 II. Ozone is an allotrope of oxygen.
 III. It is soluble in acidic pyrogallol.
 IV. It is slightly heavier than air.
 Select the correct answer using codes given below
 (a) I and III (b) II and IV
 (c) III and IV (d) I and IV
- 104.** Nitrogen can be obtained from air by removing
 (a) oxygen (b) hydrogen
 (c) carbon dioxide (d) Both (a) and (b)
- 105.** The name azota is used for
 (a) nitrogen
 (b) oxygen
 (c) hydrogen
 (d) None of the above
- 106.** Which of the following gives nitrogen on heating?
 (a) NaNO_2 (b) AgNO_2
 (c) $\text{Ba}(\text{NO}_2)_2$ (d) NH_4NO_2
- 107.** Which one of the following element does not have allotropic forms?
 (a) Oxygen (b) Nitrogen
 (c) Sulphur (d) Phosphorus
- 108.** When ammonia is passed over hot CuO it is oxidised to
 (a) N_2 (b) NO_2
 (c) N_2O (d) HNO_2
- 109.** Nitrogen has no *d*-orbital in its valence shell and therefore it cannot
 (a) exhibit the oxidation state of +5
 (b) have covalency greater than 4
 (c) exhibit orbital hybridisation
 (d) form oxides with oxidation states greater than +3
- 110.** Man dies when nitrous oxide is inhaled in large quantities because
 (a) it is poisonous
 (b) it combines with haemoglobin
 (c) it causes laughing hysteria
 (d) None of the above
- 111.** The correct order for the increasing acidic strength of oxides of nitrogen is
 (a) $\text{N}_2 < \text{NO} < \text{N}_2\text{O}_4 < \text{N}_2\text{O}_3 < \text{N}_2\text{O}_5$
 (b) $\text{NO} < \text{N}_2\text{O} < \text{N}_2\text{O}_4 < \text{N}_2\text{O}_5$
 (c) $\text{N}_2\text{O} < \text{N}_2\text{O}_3 < \text{N}_2\text{O}_4 < \text{N}_2\text{O}_5 < \text{NO}$
 (d) $\text{N}_2\text{O} < \text{NO} < \text{N}_2\text{O}_3 < \text{N}_2\text{O}_4 < \text{N}_2\text{O}_5$
- 112.** The yellow colour of nitric acid can be removed by
 (a) boiling the acid
 (b) bubbling air through the warm acid
 (c) passing ammonia through acid
 (d) adding a little Mg powder
- 113.** Which of the following is obtained when N_2 reacts with calcium carbide?
 (a) Calcium cyanate
 (b) Calcium acetate
 (c) Calcium cyanamide
 (d) Calcium carbonate
- 114.** The one which does not form pentachloride is
 (a) N (b) P (c) As (d) Sb
- 115.** Oxidation of NO in air produces
 (a) N_2O (b) N_2O_3 (c) NO_2 (d) N_2O_5
- 116.** Ammonia can be dried by
 (a) conc. H_2SO_4 (b) P_4O_{10}
 (c) CaO (d) anhydrous CaCl_2
- 117.** Which one of the following is not correct for N_2O ?
 (a) It is laughing gas
 (b) It is nitrous oxide
 (c) It is not a linear molecule
 (d) It is least reactive of all the oxides of nitrogen
- 118.** Nitrogen is used to fill electric bulbs because it
 (a) is lighter than air
 (b) makes the bulb give more light
 (c) does not support combustion
 (d) is non-toxic
- > Previous Years' Questions**
- 119.** Which one of the following elements will replace hydrogen from acids to form salts?
 (a) Sulphur (S) (b) Silicon (Si)
 (c) Zinc (Zn) (d) Phosphorus (P)
- 120. Statement I** At high temperature, hydrogen can reduce PbO to elemental lead.
Statement II Hydrogen has great affinity to oxygen. **2012(I)**
 (a) Both the Statements I and II are correct and Statement II is the correct explanation of the Statement I.
 (b) Both the Statements I and II are correct but Statement II is not the correct explanation of the Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.
- 121. Statement I** Water is a high boiling point liquid.
Statement II Hydrogen bonding in water is responsible for high boiling point of water. **2012 (I)**
 (a) Statements I and II are true and Statement II is the correct explanation for Statement I.
 (b) Statements I and II are true and Statement I is not the correct explanation for Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.
- 122.** Deionised water is produced by
 (a) Calgon's process **2012 (II)**
 (b) Ion-exchange resin process
 (c) Clark's process
 (d) Permutit process
- 123. Statement I** Hard water does not give lather with soap.
Statement II Calcium and magnesium salts present in hard water form participate with soap. **2012 (II)**
 (a) Statements I and II are true and Statement II is the correct explanation for Statement I.
 (b) Statements I and II are true and Statement I is not the correct explanation for Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.
- 124.** Which one among the following does not have an allotrope?
2012(II)
 (a) Oxygen (b) Sulphur
 (c) Nitrogen (d) Carbon
- 125.** Consider the following statements.
 I. Diamond is hard and graphite is soft.
 II. Diamond is soft and graphite is hard.
 III. Diamond is a bad conductor, but graphite is a good conductor.
 IV. Diamond is a good conductor, but graphite is a bad conductor. **2012(II)**
 Which of the statement (s) given above is/are correct?
 (a) I and III (b) Only I
 (c) II and III (d) I and IV
- 126.** The pure form of carbon is **2013(I)**
 (a) diamond (b) graphite
 (c) charcoal (d) fullerene

127. Biogas consists of mainly
☑ 2013 (I)

- (a) methane (b) ethane
(c) butane (d) carbon dioxide

128. Which of the following statements in connection with the properties of water is/are correct? ☑ 2013 (I)

- I. Water has higher specific heat in comparison with other liquids.
II. Water has no dipole moment.
III. Water has low heat of vaporisation.

Select the correct answer using the codes given below.

- (a) Only I (b) II and III
(c) I and III (d) Only III

129. Water is a good solvent. This is due to high ☑ 2013 (I)

- (a) dielectric constant of water
(b) surface tension of water
(c) specific heat of water
(d) heat of fusion of water

130. Which one of the following statements regarding the property of hard water is/are correct? ☑ 2013 (I)

- I. Temporary hardness of water is due to the presence of soluble magnesium and calcium hydrogen carbonate.
II. Temporary hardness of water can be removed by boiling.
III. Calgon's method is applied to remove temporary hardness of water.
IV. Permanent hardness of water is removed by Clark's method.

Select the correct answer using the codes given below.

- (a) I and II (b) I, II and III
(c) III and IV (d) Only II

131. **Statement I** Very little hydrogen is produced when sulphuric acid is added to calcium.

Statement II The salt calcium sulphate, produced is insoluble.
☑ 2013(II)

- (a) Both the Statements I and II are correct and Statement II is the correct explanation of the Statement I.
(b) Both the Statements I and II are correct but Statement II is not the correct explanation of the Statement I.
(c) Statement I is true, but Statement II is false.
(d) Statement I is false, but Statement II is true.

132. Oxygen on reactions with non-metals forms oxides which are ☑ 2013(II)

- (a) basic oxide (b) acidic oxide
(c) amphoteric oxide (d) neutral oxide

133. A gas is evolved when a piece of zinc metal is placed in dilute sulphuric acid (H_2SO_4). What is the gas? ☑ 2013(II)

- (a) Hydrogen (b) Oxygen
(c) Water vapour (d) Sulphur dioxide

134. Two reactants in a flask produce bubbles of gas and it turns lime water into milky. The reactants in the flask are ☑ 2013 (II)

- (a) zinc and hydrochloric acid
(b) magnesium carbonate and hydrochloric acid
(c) magnesium nitrate and hydrochloric acid
(d) magnesium sulphate and hydrochloric acid

135. The most stable form of carbon is ☑ 2014 (I)

- (a) diamond (b) graphite
(c) fullerene (d) coal

136. Which one of the following statements about hydrogen is/are correct? ☑ 2014(II)

1. Hydrogen has three isotopes of which protium is the most common.
2. Hydrogen ion (H^+) exists freely in the solution.
3. Dihydrogen (H_2) acts as a reducing agent.

Select the correct answer using the codes given below.

- (a) Only 1 (b) 1 and 3
(c) Only 3 (d) All of these

137. Which one of the following statements is correct? ☑ 2014 (II)

- (a) Fullerenes have only six-membered carbon rings
(b) Fullerenes are cage-like molecules
(c) Diamond is thermodynamically the most stable allotrope of carbon
(d) Graphite is slippery and hard and is therefore, used as a dry lubricant in machines

138. Dihydrogen can be prepared on a commercial scale by the action of steam on hydrocarbons, when a mixture of CO and H_2 gas is formed. It is known as ☑ 2014(II)

- (a) water gas (b) producer gas
(c) industrial gas (d) fuel gas

139. A sample of gas is to be identified by means of its behaviour in the presence of a glowing splint.

Which of the following gases will neither itself burn nor cause the splint to burn? ☑ 2014(II)

- (a) Oxygen (b) Nitrogen
(c) Hydrogen (d) Methane

140. **Statement I** Colour of nitrogen dioxide changes to colourless at low temperature. ☑ 2015(I)

Statement II At low temperature, nitrogen tetraoxide (N_2O_4) is formed, which is colourless.

- (a) Both the Statements I and II are correct and Statement II is the correct explanation of the Statement I.
(b) Both the Statements I and II are correct but Statement II is not the correct explanation of the Statement I.
(c) Statement I is true, but Statement II is false.
(d) Statement I is false, but Statement II is true.

141. Why is the graphite used in electrolytic cells? ☑ 2015 (I)

- (a) Graphite is soft and can be easily moulded into electrodes
(b) Graphite is made up of layers of carbon atoms which can be slide
(c) Graphite is inert to most of the chemicals and remains intact in electrolytic cells
(d) Graphite is a good conductor of electricity

142. Permanent hardness of water is due to the presence of ☑ 2015 (I)

- (a) sulphates of sodium and potassium
(b) sulphates of magnesium and calcium
(c) carbonates of sodium and magnesium
(d) bicarbonates of magnesium and calcium

143. Which of the following statements regarding heavy water are correct? ☑ 2015 (II)

- I. It is extensively used as a moderator in nuclear reactors.
II. It cannot be used in exchange reaction to study reaction mechanism.
III. Viscosity of heavy water is relatively smaller than that of ordinary water.
IV. The dielectric constant of heavy water is smaller than that of ordinary water.

Select the correct answer using the codes given below:

- (a) I and II
(b) II and III
(c) III and IV
(d) I and IV

SOME IMPORTANT CHEMICAL COMPOUNDS

In general 3-7 questions are asked from this chapter. Questions are mainly based upon raw materials and composition of soaps, glass, cement, gun powder and nitrogenous fertilizers. A good number of statement based questions have been asked from this chapter.

There is hardly any work of life where we do not need the chemical compounds. Chemical compounds such as soaps, detergents, paints, drugs, fertilizers etc. play an important role in our daily life.

CLEANSING AGENTS

In fact, those chemicals which concentrate at the surface of the solution or interfaces, reduce surface tension of the solution and help in removing dirt and dust by emulsifying grease are known as surfactants. Soaps and detergents belong to this class.

Soaps

Soaps are sodium or potassium salt of higher fatty acids like, stearic acid, oleic acid, palmitic acid etc. Soaps are obtained by the alkaline hydrolysis of oils and fats. Only glycerides of fatty acid give soaps on alkaline hydrolysis.

Raw Materials

The important raw material used for the manufacture of soaps are

- (i) **Oil or Fat** Mustard oil, mohwa oil, coconut oil, cotton seed oil, olive oil or animal fat.
- (ii) **Fillers** The substance added to increase the weight and volume of soaps, e.g. sodium silicates, powdered pumice, starch, sodium carbonate.
- (iii) **Alkali** Caustic soda for hard or washing soaps and caustic potash for soft soap is used for saponification.
- (iv) **Colouring Material**

ZnO	:	White colour
Methylene blue	:	Blue colour
Uranium	:	Yellow
Eosine	:	Red
- (v) **Perfumes** Perfumes are used to make soap pleasant smelling, e.g. lemon grass oil.

Types of Soaps

There are following types of soaps

- (i) **Washing Soaps** These are made from cheaper fats like mohwa oil, resin oil etc.
- (ii) **Toilet Soaps** These are made from best quality animal or vegetable fats or mixture of both. These soaps do not injure the skin.
- (iii) **Medicated Soaps** Toilet soaps containing some substance of medicinal value, e.g. carbolic soap, neem soap etc.
- (iv) **Metallic Soaps** These soaps contains salt of metals other than sodium and potassium.
- (v) **Transparent Soaps** These are prepared by dissolving toilet soaps in alcohol and evaporating the filtrate. These contain glycerol.
- (vi) **Shaving Soaps** These toilet soaps contain gum and glycerol. Their mildness increases by adding potassium carbonate. Resin is also added to shaving soaps as it forms lather well.
- (vii) **Liquid Soaps** These soaps are obtained by the action of coconut oil and caustic potash and contain about 8% of water.
- (viii) **Floating Soaps** These soaps are obtained by beating large amount of air into soap while it is in creamy stage.

Detergents

Detergents are generally ammonium or sulphonate salts of long chain carboxylic acids. Although these do not contain soaps like sodium salts of fatty acids. Hence, these are known as 'soapless soap'.

- These can be used even in acidic solutions and have a strongest cleansing action.
- These are more soluble in water and can be used with hard water as these produces no precipitates with Ca^{2+} , Mg^{2+} , Fe^{3+} ions present in hard water. They are used in powder form for domestic purpose.
- The liquid form may be used for dish washing, cleaning of floors etc.
- Biological degradation is an important property of good detergent.

Cleansing Action of Soap or Detergent

- The principle of cleaning by soap is surface tension.
- A soap (or detergent) molecule is made up of two parts : A long hydrocarbon part and a short ionic part containing $\text{—COO}^- \text{Na}^+$ group.
- The long hydrocarbon chain is **hydrophobic** (water—repelling) so it is insoluble in water but soluble in oil and grease and the ionic part is hydrophilic (water—attracting). Thus, soluble in water.
- When soap is applied to dirty clothes soaked in water, the hydrocarbon part of the soap molecules attach themselves to the greasy and oily dirt particles whereas the ionic part of the soap molecule remain attached to water.

- When the dirty cloth is agitated in soap solution, dirt particles attached to the soap molecules get washed away in water and the cloth gets cleaned.

► **Note** The cluster of molecules in which the hydrophobic tails are in the interior of the cluster and the ionic ends are on the surface of the cluster is called a micelle.

GLASS

Glass is an amorphous hard, brittle, super cooled liquid. It is not a true solid.

Chemically glass is a mixture of number of silicates and has no definite formula. But the general composition can be represented as $xM_2O \cdot yM'O \cdot 6SiO_2$ where M is monovalent alkali metal like Na, K, etc., M' is a bivalent metal like Zn, Pb etc., and x, y are whole numbers. Silica is the major constituent of all glasses.

- Glass is a mixture and not a compound.
- Glass is chemically inert towards a lot of chemicals.
- Glass is known as super cooled liquid with no sharp melting and boiling point.
- Glass stoppers should not be used in containers of NaOH or KOH.
- Glass is soluble in HF due to formation of H_2SiF_6 . Therefore, HF solution is used for etching of glass.

Raw Material

The important raw material used for the manufacture of glass are

- (i) Silica (SiO_2) and cullet (glass pieces)
- (ii) Compounds of alkali metals e.g. Na_2CO_3 , NaNO_3 , K_2CO_3 , KNO_3 , Na_2SO_4 and K_2SO_4 .
- (iii) Compounds of alkaline earth metals (e.g. CaCO_3 , BaCO_3 , CaO).
- (iv) Oxides of heavy metals e.g. PbO , Pb_3O_4

Coloured Glass

These are obtained by mixing colour supplying substances in the molten or fused state of glass. Such substances are tabulated below

Colour producing substance and their colour

Substance Used	Colour of Glass
Cuprous oxide	Red
Cupric oxide	Peacock blue
Potassium dichromate	Green or greenish yellow
Ferrous oxide	Green
Ferric oxide	Brown
Manganese dioxide	Light pink, in excess black
Cobalt oxide	Blue
Gold chloride	Ruby red
Cadmium sulphide	Yellow
Carbon	Amber colour (brownish black)

Annealing of Glass

Glass is prepared at a very high temperature if it is cooled suddenly, glass being a bad conductor of heat, its upper layer cools down while interior portion remains in a state of strain, due to this unequal expansion glass cracks into pieces. To avoid this, glass is cooled slowly. This slow cooling is called as **annealing of glass**.

Types of Glasses, their Properties and uses

Types of Glasses	Properties	Uses
Soda glass or soft glass	Contains sodium carbonate, calcium carbonate and silica, brittle and cheapest.	Window glass, bottles, dishes, tubelights, domestic utensils etc
Potash glass or hard glass	Contains carbonate of K, Ca and silica, high temperature resistant.	Hard boiling glass test tubes, beakers, etc
Photochromatic glass	Turns dark in sun light because of the presence of embedded microcrystalline silver compound (silver chloride) in glass	Eye lenses and goggles
Pyrex glass (borosilicate glass)	Contains borax and silica, withstand sudden alterations in temperature	Laboratory equipments
Flint glass	Contains sodium, potassium and lead silicate, have high refractive index	Optical instruments like lens of camera, prisms, microscopes, telescope and in electric bulbs
Crown glass	Contains oxides of potassium, barium and silicon, have high refractive index.	Optical instruments
Jena glass (best form of glass)	Soft, strong and more resistant to acids and alkalis, contains zinc and barium borosilicate.	Bottles for keeping acids and alkalis in laboratory
Crook's glass	Contains cerium oxide (CeO_2) and silica, thus, absorbs UV rays.	Eye lenses used in different eye defects
Lead crystal glass	Contains potassium carbonate, lead oxide and silica, shows optical phenomenon of total internal reflection.	Various ornamental items, costly glass containers
Quartz glass or silica glass	Ultraviolet rays emerge out through it.	In making bulb of ultraviolet lamp, laboratory equipments

Ink

The knowledge of ink was known before 4000 years in Egypt. First time ink was prepared from coal and resin. On the basis of preparation, ink is of two types

- (i) Aniline ink and (ii) Iron gel ink

Raw Material for Aniline Ink

The important raw material used for the manufacture of aniline ink

- Eosin, glycerine, carbonic acid, phenol.

- Carbonic acid (H_2CO_3) and boric acid (H_3BO_3) to prevent the production of fungi in ink, thus used as fungicide
- Glycerine is used in manufacturing the stamp pad ink.
- Resin or glue or gum for shine.

Colours of Ink due to Different Substances

Colour of ink	Colouring substance
Black-blue ink	Naphthalene black
Blue colour	Methylene blue
Red colour	Eosine and congo red
Green colour	Malachite green
Black colour	Aniline black

Raw Material for Iron Gel Ink

The important raw material used for the manufacture of iron gel ink

- Resin or glue or gum arabic, glycerine.
- Alcohol or spirit or phenol.
- Tannic acid and galic acid used in blue-black ink.
- Ferrous sulphate (FeSO_4) and dilute hydrochloric acid (HCl) are main constituents of this ink.

Paper

- Cellulose is used as raw material for the manufacture of paper. Paper is prepared by boiling small pieces of old rags, grass and pieces of wood with caustic soda. After cooling the mixture is bleached to a perfect white paste.
- Alum, white clay and resin are added to white paste to form thin sheets. Sheets prepared and dried by steam and cut in proper sizes.

Cement

- It is dirty greyish heavy powder containing limestone and clay. When mixed with water it set to a hard stone like mass similar to Portland rock a famous building stone of England. So, it is also known as Portland cement.
- It was first named by **Joseph Aspdin** as Portland cement and was discovered in England.

Approximate Composition of Portland Cement		
• Calcium oxide (CaO)	–	62%
• Silica (SiO_2)	–	22%
• Alumina (Al_2O_3)	–	7.5%
• Magnesia (MgO)	–	2.5%
• Ferric oxide (Fe_2O_3)	–	2.5%

Raw Material

The important raw material used for the manufacture of cement

- Limestone and clay. Limestone provides CaO while clay provides SiO_2 , Al_2O_3 and Fe_2O_3 .
- In cement almost entire amount of lime is present in the combined state as calcium silicate ($2\text{CaO}\cdot\text{SiO}_2$) and ($3\text{CaO}\cdot\text{SiO}_2$) and calcium aluminates ($\text{CaO}\cdot\text{Al}_2\text{O}_3$, $4\text{CaO}\cdot\text{Al}_2\text{O}_3$).

- When clay and lime are strongly heated together they fuse and react to form 'cement clinker'. 2-3% of gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) is added to slow down the setting of cement so that it becomes sufficiently hard.
- Excess of silica (SiO_2) decrease the setting time of cement and alumina (Al_2O_3) increase the setting time of cement.
- When cement is mixed with water it becomes hard due to the formation of a solid jelly. This process is called setting of cement.
- Setting of cement involves hydrolysis reaction in which heat is generated (exothermic process) therefore, cement structures have to be cooled during setting by sprinkling water. Cement containing tetracalcium aluminoferrite sets at the slowest rate.
- White cement does not contain colouring matter such as oxides of iron, chromium, magnesium and manganese.
- The function of sand in mortar is to prevent excessive shrinkage which might result in cracks.
- **Mortar** is a mixture of cement and sand in the ratio 1 : 3 in water.
- **Concrete** is a mixture of cement, sand and pieces of stones in the ratio of 1 : 2 : 4 in water.
- **Reinforced Cement Concrete (RCC)** Cement, sand and pieces of stone with iron frame-work used in making pillars, roofs, linters etc.

Paints

Paint is a mixture of pigments suspended in a solvent.

Paints are widely used in surface coatings.

- Plasticisers are added during the manufacturing of paint in order to provide elasticity to the film and minimise its cracking.
- Aluminium paints are heat resistant but cannot be used for water pipe. Lithopone [$\text{BaSO}_4 + \text{ZnS}$] is a substitute of white lead.
- Chromium oxide is used as an ingredient in paints to obtain green colour.
- Cadmium lithopones (cadmopones) ($\text{CdS} + \text{BaSO}_4$) is used as yellow pigment.
- Titanium dioxide (Titanox) is extensively used in the manufacture of paints and pigments.

Constituents of Paints

Main constituents of paints are as follows

- Pigments** These substances give colour to another substance. These have a definite colour.
- Solvents** Normally some oil like turpentine oil is used as a solvent.
- Driers** The compounds which are used to dry the paints. These are cobalt, lead manganese, rosinate compounds. e.g. MnO , CoO , etc.
- Thinners** The substances which are used to reduce the viscosity of paints. These increase the volume of paint. e.g. alcohol, kerosene oil etc.

- Fillers or extenders** The substances are used to increase the concentration of pigment or paint. These are low gravity material e.g. $\text{BaSO}_4 \cdot (\text{CuSO}_4) \cdot 2\text{H}_2\text{O}$ etc.

Commonly Used Pigments

Pigment	Colour	Formula
White lead	White	$2[\text{Pb}(\text{OH})_2 \cdot 2\text{PbCO}_3]$
Chrome yellow	Yellow	PbCrO_4
Chrome red	Red	$\text{PbCrO}_4 \cdot \text{PbO}$
Basic lead sulphate	White	$2\text{PbSO}_4 \cdot \text{PbO}$
Red lead or sindhur	Red	Pb_3O_4
Lithopone	White	$\text{BaSO}_4 + \text{ZnS}$
Malachite	Green	$\text{Cu}(\text{OH})_2 \cdot \text{CuCO}_3$
Azurite	Green	$\text{Cu}(\text{OH})_2 \cdot 2\text{CuCO}_3$
Thenard	Blue	$\text{CoO} \cdot \text{Al}_2\text{O}_3$
Smelt	Blue	$\text{K}_2\text{O} \cdot \text{CoO} \cdot 3\text{SiO}_2$

Safety Matches

Modern safety match was developed only about two hundred years ago. A mixture of antimony trisulphide, potassium chlorate and white phosphorus with some glue and starch was applied on the head of a match made of suitable wood. These days the head of the safety match contains only antimony trisulphide (Sb_2S_3) and potassium chlorate (KClO_3). The rubbing surface has powdered glass and a little red phosphorus (which is less dangerous).

When the match is struck against the rubbing surface, some red phosphorus get converted into white phosphorus. This immediately reacts with potassium chlorate in the matchstick head to produce enough heat to ignite antimony trisulphide and start the combustion.

Gun Powder

It consists of a fuel (charcoal or sugar) and oxidiser (salt peter, nitre or potassium nitrate) and sulphur (allows for a stable reaction and **lower ignition temperature**).

- The granules of modern gun powder (black powder) are coated with graphite because graphite reduces the moisture absorbing capacity of the powder. Graphite also prevents the build-up of electrostatic charge to prevent accidental ignition.
- It is first chemical explosive and during explosion N_2 and CO_2 are evolved in the ratio of 1 : 3.

Note

- Water is the most common fire extinguisher but it is not suitable for fires involving oil, petrol and electrical equipment. In these cases CO_2 is the best extinguisher.
- **Dry powder** of chemical like sodium bicarbonate or potassium bicarbonate are used as a fire extinguisher. Sodium bicarbonate and sulphuric acid are used in soda acid fire extinguisher and aluminium sulphate in foam fire extinguisher.

Plastics

When unsaturated hydrocarbons e.g., ethylene, propylene, butylene etc. undergo polymerisation under specific conditions then higher polymer plastic is obtained.

These are of two types:

- (i) **Thermoplastics** are linear in structure can be soften on heating and becomes harden on cooling. This character is maintained through out its existence. e.g. polythene, polystyrene, polyvinylchloride, teflon.
- (ii) **Thermosetting plastics** undergo permanent change on heating due to excessive cross linking and cannot be remoulded and reused, e.g. bakelite, melmac.

Polymers along with their Monomers

Polymer	Monomer
Polyethylene	Ethene
Polystyrene	Styrene
Polyvinylchloride (PVC)	Vinylchloride
Polytetrafluoroethylene [PTFE/Teflon]	Tetrafluoroethene
Bakelite	Formaldehyde + Phenol
Urea-formaldehyde resin	Urea + Formaldehyde
Melmac	Melamine + Formaldehyde

Fibres

The solid substance which has thin long chain structure is called fibre. Cotton, jute, silk, wool are natural fibres whereas rayon, nylon, polyester are synthetic fibres. Fibres possess strong intermolecular forces like hydrogen bonding, e.g. nylon –66 dacron, orlon.

➔ Rayon (acetate rayon and viscose rayon) is called artificial silk.

Synthetic Fibres with their Monomers

Fibres	Monomers	Uses
Nylon-66	Adipic acid + hexamethylene diamine	In making bristles for brushes, parachutes, as a substitute for metal, in bearings.
Nylon-6 or perlon	Caprolactum	In making fibres, plastics tyre cords and ropes
Terylene or Dacron	Ethylene glycol and terephthalic acid	For making wash and wear fabrics, tyre cords, safety belts, tents etc.
Polyurethanes	Toluene diisocyanate + ethylene glycol	For making washable and long lasting mattresses, cushions

- Orlon is obtained by polymerisation of vinyl cyanide.
- Carbon fibres are made from long chains of carbon atoms in which corrosion does not take place. These are used in making parts of space vehicles and sports items.

Natural Rubber

- Natural rubber is a linear polymer of isoprene and it is also called *cis*-1, 4 poly isoprene. It is an elastomer which is insoluble in water, dilute acids and alkalis.
- Natural rubber absorbs a large amount of water and possess low tensile strength.
- The process of heating a natural rubber with 5% sulphur in the presence of ZnO at 373K in order to improve their properties is called vulcanisation of rubber. Carbon black is added to vulcanised rubber for hardening of tyres.

IMPORTANT POINTS

- Hydrofluoric acid (HF) is used in etching of glass.
- Silicon based chemicals are used in beauty parlours.
- Enzyme lipase easily removes the oily stains (fatty stains from cloth).
- Silver bromide is used in photography.
- Hydrogen peroxide is used as a bleaching agent.

FERTILIZERS

The chemical substances which are added to the soil to increase its fertility by providing essentials nutrients to the soil which are lost due to continuous cropping are called chemical fertilisers.

These are added to the soil during sowing season to avoid starvation of the plants to ensure healthy crops. About 16 elements are needed for the healthy growth of a plant. Among these, **nitrogen**, **phosphorus** and **potassium** are the major elements needed in large amounts.

Types of Fertilizers

There are two types of fertilizers

1. Chemical Fertilizers/Synthetic Fertilizer

These are man-made and nutrient specific fertilizers that are added to the soil according to their need. These fertilizers are also called artificial fertilizers.

Chemical fertilizers mainly of three types:

(i) Nitrogenous Fertilizers

These fertilizers react with the moisture in the soil and produces ammonia which is converted into nitrates by soil bacteria.

These fertilizers mainly supply nitrogen. Plants require nitrogen for growth and protein content.

Some of them are as follows

(a) **Urea** (NH_2CONH_2)

- Urea is the best nitrogenous fertilizer having 47% nitrogen by weight.

→ **Note** Percentage of an element in a compound

$$= \frac{\text{Total mass of an element} \times 100}{\text{Molar mass of compound}}$$

$$\text{N\% by weight} = \frac{\text{Total mass of N}}{\text{Total mass of urea}} \times 100$$

$$\text{N\%} = \frac{2 \times 14}{60} \times 100 = 46.67\% \approx 47\%$$

- Urea is a white crystalline solid (melting point 133°C). It is soluble in water but insoluble in ether.
- Urea is not as stable as other nitrogenous fertilisers and decomposes even at lower temperature in humid atmosphere.
- On hydrolysis, urea gives CO_2 and NH_3 .

(b) **Ammonium Sulphate** $[\text{NH}_4]_2 \cdot \text{SO}_4$

- It is prepared by absorbing ammonia in sulphuric acid.

- It is a white crystalline solid, soluble in water. It contains 21% nitrogen.
- Hydrolysis of ammonium sulphate produces H_2SO_4 .

Therefore, its repeated use makes the soil acidic and unfit for germination of seeds. To neutralise it, lime is added to acidic soil. Hence, ammonium sulphate should not be used very frequently.

(c) **Calcium Cyanamide or Nitrolim** (CaCN_2)

- It is prepared by passing a stream of nitrogen gas over hot CaC_2 at 1100°C , when nitrolim is obtained

- Calcium cyanamide is a slow acting manure having 19% nitrogen by weight.
- It is black in colour. It contains 19% nitrogen. It is slowly hydrolysed by the soil moisture to ammonia and calcium carbonate.

(d) **Calcium Ammonium Nitrate**

- It is prepared by treating limestone with excess of nitric acid. The resulting solution is neutralised by passing ammonia gas. From the solution CAN is crystallised out.
- It contains nitrogen in readily palatable forms for plants.

(ii) **Phosphatic Fertilizers**

- These fertilizers mainly supply phosphorus. Phosphorus is needed for stimulating growth and enables the plants to resist the attack of diseases and also helps in the ripening of fruits.
- These fertilizers supply phosphorus whose content is expressed as P_2O_5 .

Some of them are as follows

(a) **Calcium Superphosphate or Superphosphate of Lime** $[\text{Ca}(\text{H}_2\text{PO}_4)_2 + 2\text{CaSO}_4 \cdot 2\text{H}_2\text{O}]$

- The water soluble component of superphosphate of lime is calcium dihydrogenphosphate $[\text{Ca}(\text{H}_2\text{PO}_4)_2]$.
- It contains 15–16% of P_2O_5 .

(b) **Triple Superphosphate** $[\text{Ca}(\text{H}_2\text{PO}_4)_2]$

- It is soluble in water.
- It is prepared by the action of 54% phosphoric acid on calcium phosphate.
- Triple superphosphate usually contain 43–46% of P_2O_5 .

(c) **Thomas Slag** $\text{Ca}_3(\text{PO}_4)_2 \cdot (\text{Ca SiO}_3)$
(Phosphatic Slag)

- It is soluble in water in the presence of salt and carbon dioxide.
- Phosphatic slag gives a steady supply of phosphatic acid for the plant growth. It has 14–18% of P_2O_5 .

(iii) **Potash Fertilizers**

- It gives structural growth to the plant. These are mainly required for the development of healthy roots and also aids ripening of cereals and fruits.
- These fertilisers are available in nature as soluble salts like KCl , K_2CO_3 , KNO_3 and K_2SO_4 . These supply mainly potassium to the plants, e.g. muriate of potash (KCl), potassium nitrate; (KNO_3), potassium sulphate, (K_2SO_4).
- Potassium sulphate has been found to be more stable for tobacco plants. It is because the ash of tobacco grown by it has a high melting point. Tobacco needed for making cigarettes should have high melting point.
- Potash fertilizer evaluated as K_2O .

Mixed Fertilizers or NPK Fertilizers

- These contain more than one fertilizing ingredient.
- NPK also called as Kisan Khad or Kisan Urea. It contains nitrogen, phosphorus and potassium.
- It is better to use these fertilizers as these supplies all the essential nutrients to the plants.
e.g. nitrophosphate, ammonium phosphate.

Harmful Effects of Chemical Fertilizers

- These are expensive, and their production releases pollutants and cause pollution of soil, air and water.
- These are lost readily when applied in field.

2. Natural Fertilizers

Natural fertilizers are of biological origin. These can be classified as

Manure

- It contains large quantities of organic substances formed by the decomposition of animal excreta and plant waste.
- It supplies small quantities of nutrients to the soil.
- The bulk of organic matter in manure helps in improving soil structure.
- Manure includes farmyard manure, compost and green manure.

Green Manure

- Some plants like guar or sunhemp are grown and mulched by ploughing them into the soil. These plants turn into green manure.
- Green manure helps in enriching the soil in nitrogen and phosphorus.

Biofertilizers

- **Biofertilizers** are organism which can bring soil nutrient enrichment. The main sources of biofertilizers are bacteria, cyanobacteria and fungi.
- **Rhizobium and blue green algae** are two important biofertilizers.

- **Mycorrhiza** is a symbiotic association of certain fungi with roots of higher plants. It increase water and nutrient intake by plants and increases growth and yield of plants.
- Biofertilizer and green manures do not pollute the soil.
- Field with leguminous plants is rich with nitrogen element.
- Legumes revive soil fertility.

Important Reagents

- Fehling solution : $\text{CuSO}_4 + \text{Sodium potassium tartrate (Rochelle salt)} + \text{NaOH}$.
- Tollen's reagent : AgNO_3 solution + $\text{NaOH} + \text{NH}_4\text{OH}$
- Sodalime : $\text{Ca(OH)}_2 + \text{NaOH}$
- Lithopone : $\text{BaSO}_4 + \text{ZnS}$
- Nessler's reagent : $\text{K}_2[\text{HgI}_4]$
- Milk of magnesia : Suspension of Mg(OH)_2 in water.

Important Processes

- Nelson cell : NaOH
- Mac Arthur Forest process : Ag (cyanide process)
- Mond process : Ni
- Berkeland Eyde process : NO, HNO_3
- Lead chamber process : H_2SO_4

Some Important Compounds and Minerals

- Magnesite : MgCO_3
- Kieserite : $\text{MgSO}_4 \cdot \text{H}_2\text{O}$
- Epsomite : $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$
- Sorel's cement : $\text{MgCl}_2 \cdot 5\text{MgO} \cdot x\text{H}_2\text{O}$
- Limestone, marble, chalk : CaCO_3
- Gypsum : $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
- Plaster of Paris : $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$
- Quick lime : CaO
- Slaked lime : Ca(OH)_2
- Carnallite : $\text{KCl MgCl}_2 \cdot 6\text{H}_2\text{O}$
- Permutit (Zeolite) : $\text{Na}_2\text{Al}_2\text{SiO}_4 \cdot x\text{H}_2\text{O}$
- Soda ash : anhy. Na_2CO_3
- Washing soda : $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$
- Crystal carbonate : $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$
- Marshall's acid : $\text{H}_2\text{S}_2\text{O}_8$
- Borazine (Inorganic benzene) : $\text{B}_3\text{N}_3\text{H}_6$
- Blue vitriol : $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$
- Horn silver : AgCl
- Philosophere wool : ZnO
- Corundum : Al_2O_3
- Bauxite : $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$
- Carborundum : SiC
- Calomel excess : Hg_2Cl_2
- Freon : CF_2Cl_2
- Oil of vitriol : conc. H_2SO_4
- Refrigerant : $\text{NH}_3, \text{CF}_2\text{Cl}_2, \text{CO}_2$ etc.

> PRACTICE EXERCISE

1. To which class of organic compounds soap belongs?

- (a) Aldehydes
(b) Salts of organic acid
(c) Esters
(d) Amines

2. Which of the following is not a fatty acids?

- (a) Stearic acid (b) Palmitic acid
(c) Oleic acid (d) Phenyl acetic acid

3. Toilet soap is a mixture of

- (a) calcium salt of fatty acids
(b) potassium salt of fatty acids
(c) fatty acids and alcohol
(d) phenol and olive oil

4. Washing soap can be prepared by saponification with alkali of which of the following oil?

- (a) Olive oil (b) Paraffin oil
(c) Groundnut oil (d) Kerosene oil

5. The substance added to harden the soap is

- (a) sodium silicate
(b) sodium carbonate
(c) soap stone
(d) All of these

6. Saponification of an oil or fat gives soap and

- (a) methanol (b) ethanol
(c) pentanol (d) glycerol

7. Which gives white colour to soap?

- (a) MnO (b) ZnO
(c) CaO (d) PbO

8. Which one of the following is used to increase the weight of soap?

- (a) Starch
(b) Sodium carbonate
(c) Both (a) and (b)
(d) None of these

9. Which of the following enzymes hydrolysis triglycerides to fatty acids and glycerol?

- (a) Amylase (b) Maltase
(c) Lipase (d) Pepsin

- 10.** The reaction that takes place in soap making is called saponification. Basically soap is sodium or potassium salts of
(a) long chain monocarboxylic acids
(b) glycerol
(c) long chain dicarboxylic acids
(d) long chain tricarboxylic acids
- 11.** By which one among the following mechanism, soap removes dirt (soil) from cloth?
(a) Soap dissolves the soil as such.
(b) Soap reacts with soil and converts them into soluble silicates.
(c) Soap takes away the oily part of the soil and thus separates the soil from the cloth.
(d) The soap molecules bind with the soil, lift the soil and keep it suspended which can then be rinsed away.
- 12.** In the manufacture of glass, the addition of MnO_2 gives
(a) yellow colour (b) red colour
(c) violet colour (d) light pink colour
- 13.** The principal constituent of pyrex glass is
(a) Zn (b) B (c) Pb (d) Cl
- 14.** Which glass has the highest percentage of lead?
(a) Soda glass (b) Flint glass
(c) Safety glass (d) Pyrex glass
- 15.** Which one of the following is incorrect about flint glass?
(a) It is soft and transparent
(b) It's refractive index is very high
(c) It is $K_2O \cdot PbO \cdot 6SiO_2$
(d) It does not break's on red hot
- 16.** Which one of the following type of glass has a layer of plastic?
(a) Safety glass
(b) Ground glass
(c) Reinforced glass
(d) Borosilicate glass
- 17.** Reinforced glass has
(a) oxides of alkaline metals
(b) network of wires (c) SiO_2
(d) layer of plastic
- 18.** Percentage of silica
(a) increases brittleness of glass
(b) decrease resistivity of glass
(c) Both (a) and (b)
(d) None of the above
- 19.** For making optical and chemical resistant glass the substance used is
(a) Al_2O_3 (b) Na_3AlF_6
(c) B_2O_3 (d) Na_2SiO_3
- 20.** Etching of glass is based on
(a) solubility of glass in HF
(b) softening of glass over a wide range of temperature
(c) glass being a supercooled liquid
(d) All of the above
- 21.** Crooke's glass contains CeO_2 which
(a) makes glass strong
(b) makes glass unbreakable
(c) cuts off UV rays
(d) All of the above
- 22.** Glass is actually
(a) a crystalline solid (b) an ionic solid
(c) an elastic solid (d) a vitrified liquid
- 23.** The material used in solar cell contains
(a) glass (b) Ce
(c) Si (d) Ti
- 24.** Which gives red colour to ink?
(a) Eosine (b) Methylene
(c) $FeSO_4$ (d) $BaCl_2$
- 25.** Which acts as a fungicide in ink?
(a) H_2CO_3 (b) H_3BO_3
(c) Both (a) and (b) (d) None of these
- 26.** Raw material used in the manufacturing of aniline ink is
(a) eosine, glycerol, $FeSO_4$, phenol
(b) eosine, alcohol, tannic acid, phenol
(c) eosine, glycerol, carbonic acid, phenol
(d) eosine, glycerol, dil HCl, phenol
- 27.** Which compound is used to stop hydrolysis of organic compound in ink?
(a) Carboxylic acid (b) Carbolic acid
(c) Hydrochloric acid (d) None of these
- 28.** Which gives blue black colour in ink?
(a) Tannic acid and $FeSO_4$
(b) Naphthalene black
(c) Both (a) and (b)
(d) None of the above
- 29.** Stamp pad is a
(a) aniline ink (b) permanent ink
(c) Both (a) and (b) (d) None of these
- 30.** Compound used for shining of ink is
(a) dextrans (b) Resin
(c) eosine (d) None of these
- 31.** Mortar is a mixture of
(a) cement + sand + water
(b) sand + iron
(c) cement + sand + iron
(d) None of the above
- 32.** Presence of gypsum in cement gives
(a) setting time low (b) setting time high
(c) hardness (d) softness
- 33.** Which is correct about cement?
(a) Gypsum is added to regulate setting time of cement
(b) White cement does not contain iron
(c) Lime is main constituent of cement
(d) All of the above are correct
- 34.** A major constituent of cement besides lime is
(a) silica (b) alumina
(c) iron oxide (d) magnesia
- 35.** The function of sand in mortar is
(a) to prevent excessive shrinkage which might result in cracks
(b) to make the mass compact
(c) to decrease the plasticity of mass
(d) to increase the hardness
- 36.** Which one of the following components of cement sets at the slowest rate?
(a) Dicalcium silicate
(b) Tricalcium silicate
(c) Tricalcium aluminate
(d) Tetracalcium aluminoferrite
- 37.** Excess of silica in cement
(a) increase setting time
(b) decrease setting time
(c) increase hardness
(d) helps in hydrolysis
- 38.** During setting of cement the reaction is
(a) hydrolysis of cement
(b) dehydration of cement
(c) hydration of cement
(d) hydrolysis and hydration of cement
- 39.** Concrete with iron frame-work is known as
(a) ACC (b) RCC
(c) RDC (d) Clinker
- 40.** Lithopone, a substitute of white lead is
(a) $BaSO_4 + ZnS$ (b) $BaSO_4 + ZnO$
(c) Pb_3O_4 (d) $Pb(CH_3COO)_2$
- 41.** Which of the following is a yellow pigment?
(a) $PbCrO_4 \cdot PbO$ (b) $PbCrO_4$
(c) Pb_3O_4 (d) $PbS + PbO$
- 42.** Which oxides are used as drier in paints?
(a) MnO , PbO , CdO (b) MnO , CoO , NiO
(c) NiO , K_2O , CdO (d) K_2O , MgO , CaO
- 43.** Red lead is
(a) Pb_3O_4 (b) PbO_2
(c) PbO (d) Pb_4O_3
- 44.** White lead is
(a) $PbCO_3$ (b) $PbCO_3 \cdot PbO$
(c) $2PbCO_3 \cdot Pb(OH)_2$ (d) $2PbSO_4 \cdot PbO$

- 45.** Fillers are used to
 (a) increase the volume of paints
 (b) increase the concentration of paints
 (c) increase both volume and weight of paints
 (d) None of the above
- 46.** Match stick have some solid mixture at one end which is
 (a) antimony sulphide + potassium chlorate + potassium dichromate
 (b) antimony sulphide + lead + sodium chlorate
 (c) antimony sulphide + potassium chlorate + potassium bicarbonate
 (d) potassium chlorate + lead + lead trisulphide
- 47.** Which one of the following is used on the side of matches box?
 (a) P_2S_3 (b) P_2S_5
 (c) powdered glass + red P
 (d) All of the above
- 48.** Gun powder is a mixture of
 (a) $KNO_3 + S + \text{charcoal}$
 (b) $KHCO_3 + S + \text{charcoal}$
 (c) $KNO_3 + S + \text{coal}$
 (d) All of the above
- 49.** During explosion of gunpowder, which of the following gases are evolved in the proportion of 1 : 3 ?
 (a) Oxygen : nitrogen
 (b) Nitrogen : carbon monoxide
 (c) Nitrogen : carbon dioxide
 (d) Carbon dioxide : nitrogen
- 50.** Artificial silk is
 (a) rayon (b) nylon-6
 (c) nylon-66 (d) None of these
- 51.** Natural rubber is
 (a) polyisoprene
 (b) polyvinyl chloride
 (c) polychloroprene
 (d) polyfluoroethylene
- 52.** Which of the following is a polyamide?
 (a) Nylon (b) Orlon
 (c) Teflon (d) Terylene
- 53.** Which is an example of thermosetting polymer?
 (a) Polythene (b) Neoprene
 (c) PVC (d) Bakelite
- 54.** The substance used to harden the rubber for tyre manufacture is
 (a) wax (b) 1, 3-butadiene
 (c) CaC_2 (d) carbon black
- 55.** Monomer of teflon is
 (a) difluoroethane (b) monofluoroethane
 (c) tetrafluoroethene
 (d) tetrafluoroethane
- 56.** Terylene is made by polymerisation of terephthalic acid with
 (a) ethylene glycol (b) phenol
 (c) ethanol (d) catechol
- 57.** Process involving heating of rubber with sulphur is called
 (a) galvanisation (b) vulcanisation
 (c) bessemerisation (d) sulphonation
- 58.** Which of the following is used to make non-stick cookware?
 (a) PVC
 (b) Polystyrene
 (c) Polyethylene
 (d) Polytetrafluoroethylene
- 59.** Bakelite is a polymer of
 (a) formaldehyde and acetic acid
 (b) formaldehyde and phenol
 (c) ethylalcohol and phenol
 (d) acetic acid and benzene
- 60.** Bronze is often used to make statues and medals whereas brass is used in making utensils, scientific apparatus and cartridges. Both brass and bronze are copper containing alloys, yet they differ in their chemical composition for additionally containing
 (a) Zinc in brass and tin in bronze
 (b) Chromium in brass and nickel in bronze
 (c) Nickel in brass and tin in bronze
 (d) Iron in brass and nickel in bronze
- 61.** Which one of the following chemicals is used in beauty parlours for hair-setting?
 (a) Sulphur based
 (b) Phosphorus based
 (c) Silicon based
 (d) Iron based
- 62.** Which of the following is not correctly matched?
 (a) Galena - Lead sulphide
 (b) Blue vitriol - Copper sulphate
 (c) Plaster of Paris - Calcium sulphate hemihydrate
 (d) Calomel - Mercurous chloride
- 63.** The common elements present in artificial fertilizers are
 (a) nitrogen, phosphorus and potassium
 (b) nitrogen, phosphorus and sodium
 (c) calcium, potassium and sodium
 (d) all elements of periodic table
- 64.** Which one of the following cannot be used as a nitrogenous fertilizer?
 (a) $CaCN_2$ (b) NH_4NO_3
 (c) HNO_3 (d) NH_2CONH_2
- 65.** Which of the following substances is used as a fertilizer?
 (a) $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$
 (b) $CaCN_2$
 (c) $Ca(H_2PO_4)_2 \cdot H_2O + 2(CaSO_4 \cdot 2H_2O)$
 (d) Both (b) and (c)
- 66.** The metal atom, which is present in superphosphate, is
 (a) sodium (Na) (b) potassium (K)
 (c) calcium (Ca) (d) magnesium (Mg)
- 67.** Which one of the following is not a nitrogenous fertilizer?
 (a) $Ca(CN)_2$ (b) $CaCN_2$
 (c) NH_4NO_3 (d) Urea
- 68.** What is the composition of nitrolim—a chemical fertilizer?
 (a) Nitrogen and limestone
 (b) Calcium carbide and nitrogen
 (c) Calcium carbide and carbon
 (d) None of the above
- 69.** NPK is also called as
 (a) vigan urea (b) potash fertilizer
 (c) mixed fertilizer
 (d) nitrogenous fertilizer
- 70.** Which one has the highest percentage of nitrogen?
 (a) Urea (b) CAN
 (c) NH_4NO_3 (d) $CaNO_3$
- 71.** Lime is sometimes applied to soil in order to
 (a) control the acidity of soil
 (b) increase the alkalinity of soil
 (c) make the soil more porous
 (d) restore nitrates of the soil
- 72.** The nitrogen in urea is present in the form of
 (a) ammonium (b) nitrate
 (c) nitrite (d) amide
- 73.** Which of the following refers to "green manure"?
 (a) Putting NPK manure
 (b) Putting farmyard manure
 (c) Growing leguminous crops and ploughing it
 (d) Applying slurry manure obtained from gobar gas plants
- 74.** Potash fertilizers are evaluated as
 (a) KO_2 (b) K_2O (c) K (d) K_2O_2
- 75.** Which one of the following contains maximum percentage of nitrogen by mass?
 (a) Urea (b) Ammonium cyanide
 (c) Ammonium carbonate
 (d) Ammonium nitrate
- 76.** Which of the following is a balanced fertilizer for plants?
 (a) Urea (b) Compost
 (c) Nitrates
 (d) Ammonium sulphate

- 77.** Application of nitrogeneous manure to a plant causes
 (a) vigorous vegetative growth
 (b) early flowering
 (c) early fruiting
 (d) growth retardation due to toxicity of NH_3
- 78.** Nodules with nitrogen fixing bacteria are present in
 (a) Mustard (b) Rice
 (c) Gram (d) Cotton
- 79.** Superphosphate of lime is obtained from the reaction of
 (a) calcium carbonate with phosphoric acid
 (b) calcium phosphate with hydrochloric acid
 (c) calcium phosphate with ortho phosphoric acid
 (d) bones with gypsum
- 80.** Which of the following nitrogeneous fertilizer is not very effective in acidic soil?
 (a) Ammonium sulphate
 (b) Urea
 (c) Nitrolium
 (d) Calcium cyanamide
- 81.** The correct sequence in decreasing order of the percentage of nitrogen in the given compounds is
 (a) urea > ammonium chloride > ammonium nitrate > ammonium nitrite
 (b) urea > ammonium nitrite > ammonium nitrate > ammonium chloride
 (c) urea > ammonium nitrite > ammonium chloride > ammonium nitrate
 (d) ammonium nitrate > ammonium nitrite > ammonium chloride > urea
- 82.** Urea on hydrolysis gives
 (a) only ammonia
 (b) only carbon dioxide
 (c) ammonia and carbon dioxide
 (d) None of the above
- 83.** At high temperature, nitrogen combines with calcium carbide to give
 (a) calcium cyanamide
 (b) calcium cyanide
 (c) calcium carbonate
 (d) calcium nitrate
- 84.** Underground water is maximum contaminated by
 (a) Nitrogeneous fertilizer
 (b) Phosphatic fertilizer
 (c) Potash fertilizer (d) Natural fertilizer
- 85.** Which of the statements about glass are correct?
 I. Glass is a supercooled liquid having infinite viscosity.
 II. Violet coloured glass is obtained by adding MnO_2 .
 III. Glass is a man made silicate.
 IV. Glass is a crystalline substance.
 Select the correct answer using the codes given below.
 (a) I, II and IV (b) II, III and IV
 (c) I, II and III (d) I and III
- 86.** Which among the following are the properties of good paint?
 I. The paint should be opaque and have high covering power.
 II. The solid particles in paint should reflect much of the destructive light to ensure long life of the paint.
 III. Combination of pigments, e.g. white lead and TiO_2 give better result.
 IV. Addition of plasticiser destroy the elasticity of the film and leads to cracking.
 Select the correct answer using the codes given below.
 (a) I, II and IV (b) I, II, and III
 (c) II and III (d) I and III
- 87.** Consider the following statements.
 I. Soap cannot be used in acidic water.
 II. Ionic part of a soap is $\text{—COO}^- \cdot \text{Na}^+$
 III. Soap dissolves in water faster than detergent.
 Which of the statements given above is/are correct?
 (a) I and II
 (b) II and III
 (c) Only III
 (d) Only II
- 88.** Consider the following statements regarding aluminium paint.
 I. It is fairly good heat-resistant.
 II. It possesses good electrical resistance.
 III. It cannot be used for hot water pipe.
 Which of the statements given above is/are correct?
 (a) I and III
 (b) Only I
 (c) I and II
 (d) II and III
- 89.** Which of the following statements are true about the fertilizers?
 I. They are nutrient specific.
 II. They do not provide any humus to the soil.
 III. They are absorbed slowly by the plants as they are not much soluble in water.
 (a) Only II (b) I and II
 (c) II and III (d) All of these
- 90.** Which of the following statements are true about urea?
 I. Urea is the first organic compound which is synthesised in the laboratory.
 II. Urea is the best water soluble nitrogeneous fertilizer.
 III. Urea leaves only CO_2 after ammonia has been assimilated by plants.
Codes
 (a) I and II (b) II and III
 (c) I and III (d) All of these
- 91.** Consider the following statements.
 I. Plants require nitrogen for growth and protein content.
 II. Phosphorus is needed for stimulating growth, ripening of fruits and protecting from diseases.
 III. Potassium is required for the development of healthy roots and aids ripening of cereals and fruits.
 Which of the above statements are correct?
 (a) I and II (b) II and III
 (c) I and III (d) All of these
- 92.** Which of the following are nitrogen fertilizers?
 I. Calcium cyanamide
 II. Urea
 III. Bone ash
 IV. Ammonium sulphate
 Select the correct answer using the codes given below.
 (a) (I), (II) and (III) (b) (I), (II) and (IV)
 (c) (II), (III) and (IV) (d) (I), (III) and (IV)
- 93.** Consider the following statements.
 I. Nitrogen, phosphorus and potassium are the major elements needed in large amounts for the healthy growth of a plant.
 II. NPK is called as Kissan khad.
 III. Mixed fertilizers provide nitrogen, phosphorus and potassium to the plants.

IV. Green manure helps in enriching the soil in nitrogen and phosphorus.

Which of the above statements are correct?

- (a) I, II, and III (b) II, III and IV
(c) I, III and IV (d) All of these

94. Consider the following statements relevant to fertilizers.

- I. Superphosphate of lime contains $\text{Ca}(\text{H}_2\text{PO}_4)_2$ and CaSO_4 .
II. Triple superphosphate is obtained by treating calcium phosphate with concentrated H_2SO_4 acid.
III. Chief potash manures are KCl , K_2SO_4 and KNO_3 .
IV. The chemical manures must be soluble in soil moisture.

Which of the above statements are correct?

- (a) I and II (b) II, III and IV
(c) I, II and III (d) I, III and IV

95. Consider the following statements:

- I. The main sources of bio fertilizers are bacteria, cyanobacteria and fungi.
II. Biofertilizer and green manures do not pollute the soil.
III. Potash fertilizer evaluated as K_2O .
IV. Phosphatic fertilizer content is expressed as P_2O_5 .

Select the correct answer using the codes given below.

- (a) I, II and III (b) II, III and IV
(c) I, II and IV (d) All of the above

Directions (Q. Nos. 96-103)

Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and match the correct choice according to the codes given below.

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of the Statement I.
(b) Both Statement I and Statement II are true but Statement II is not the correct explanation of the Statement I.
(c) Statement I is true, but Statement II is false.
(d) Statement I is false, but Statement II is true.

96. Statement I The growth of rice plant is better when it is cultivated along with a blue green algae.

Statement II Blue green algae increases, soil fertility through nitrogen fixation.

97. Statement I Pure potash is a good farm manure.

Statement II Potash minerals are vital to plants, assisting starch formation.

98. Statement I Legumes revive the soil fertility.

Statement II Microbes in the root nodules of leguminous plant fix the atmospheric nitrogen.

99. Statement I Lithopone is a better white pigment than white lead.

Statement II Lithopone ($\text{ZnS} + \text{BaSO}_4$) remains unaffected by the H_2S present in atmosphere.

100. Statement I Magnesium alloys are used in the manufacture of aeroplane part.

Statement II Magnesium alloys with metal to provide lightness and strength.

101. Statement I Red phosphorus is used for making matches.

Statement II Red phosphorus is non-poisonous and has high ignition temperature.

102. Statement I Rayon is a semisynthetic polymer and is taken as a better choice than cotton fabric.

Statement II Mechanical and aesthetic properties of cellulose can be improved by acetylation.

103. Statement I Network polymers are thermosetting.

Statement II Network polymers have high molecular mass.

104. Match List I and List II and select the correct answer using the codes given below the lists.

List I	List II
A. Glass	1. Soap
B. Cement	2. Supercooled liquid
C. $\text{C}_{17}\text{H}_{35}\text{COONa}$	3. Mixture
D. Paper	4. Cellulose

Codes

- A B C D
(a) 3 2 1 4
(b) 2 3 1 4
(c) 4 1 3 2
(d) 1 4 2 3

105. Match List I and List II and choose the correct answer by the codes given below the lists.

List I	List II
A. Mercuric chloride	1. $\text{K}_2\text{Cr}_2\text{O}_7$
B. Mercurous chloride	2. HgCl_2
C. Potassium chromate	3. K_2CrO_4
D. Potassium dichromate	4. Hg_2Cl_2

Codes

- A B C D A B C D
(a) 4 2 3 1 (b) 4 2 1 3
(c) 2 3 1 4 (d) 2 4 3 1

106. Match List I and List II and choose the correct answer by the codes given below the lists.

List I (Chemical compounds)	List II (Uses)
A. Silver bromide	1. Etching of glass
B. Hydrogen peroxide	2. Photography
C. Hydrofluoric acid	3. Purification of air
D. Ozone	4. Bleaching agent

Codes

- A B C D A B C D
(a) 2 3 1 4 (b) 2 4 1 3
(c) 3 1 4 2 (d) 4 2 1 3

107. Match List I with List II and select the correct answer using the codes given below the lists.

List I (Metallic oxide)	List II (Colour imparted to glass)
A. Uranium oxide	1. Red
B. Cuprous oxide	2. Blue
C. Cobalt oxide	3. Green
D. Chromium oxide	4. Yellow

Codes

- A B C D A B C D
(a) 4 1 2 3 (b) 3 2 1 4
(c) 4 2 1 3 (d) 3 1 2 4

108. Match List I and List II and choose the correct answer by the codes given below the lists.

List I (Material)	List II (Important ingredient)
A. Cement	1. Sodium salt of fatty acids
B. Glass	2. Carbon black
C. Ink	3. Silica in the form of quartz
D. Soap	4. Aluminates and silicates of calcium

Codes

- A B C D A B C D
(a) 4 3 2 1 (b) 1 2 3 4
(c) 1 3 2 4 (d) 4 2 3 1

- 109.** Match List I and List II and choose the correct answer by the codes given below the lists.

List I (Substance)	List II (Raw material)
A. Glass	1. Fat and caustic alkali
B. Soap	2. Cellulose fibre and gelatin
C. Paper	3. Silicates of calcium and aluminium
D. Cement	4. Silica

Codes

A B C D	A B C D
(a) 3 2 1 4	(b) 4 2 1 3
(c) 3 1 2 4	(d) 4 1 2 3

- 110.** Match List I with List II and select the correct answer from the codes given below the lists:

List I (Fertilisers)	List II (Chemical formula)
A. Urea	1. $(\text{NH}_4)_2\text{SO}_4$
B. Nitrolim	2. NH_2CONH_2
C. Thomas Slag	3. CaCN_2
D. Sindri fertiliser	4. $\text{Ca}_3(\text{PO}_4)_2 \cdot \text{CaSiO}_3$

Codes

A B C D	A B C D
(a) 2 3 4 1	(b) 1 2 3 4
(c) 4 3 2 1	(d) 2 3 1 4

> Previous Years' Questions

- 111.** Which one among the following is the correct order of amount of lime (CaO), silica (SiO_2), alumina (Al_2O_3) and ferric oxide (Fe_2O_3) in Portland cement? **2012 (I)**
- (a) $\text{CaO} > \text{SiO}_2 > \text{Al}_2\text{O}_3 > \text{Fe}_2\text{O}_3$
 (b) $\text{SiO}_2 > \text{CaO} < \text{Fe}_2\text{O}_3 > \text{Al}_2\text{O}_3$
 (c) $\text{Al}_2\text{O}_3 > \text{SiO}_2 > \text{CaO} > \text{Fe}_2\text{O}_3$
 (d) $\text{Fe}_2\text{O}_3 > \text{Al}_2\text{O}_3 > \text{SiO}_2 < \text{CaO}$
- 112.** Which one among the following is the major constituent of sodalime glass? **2012 (I)**
- (a) Sodium oxide
 (b) Calcium oxide
 (c) Calcium carbonate
 (d) Silica
- 113.** Which one among the following nitrogen compounds has the least percentage of nitrogen by mass? **2012 (I)**
- (a) $(\text{NH}_4)_3\text{PO}_4$
 (b) NH_3
 (c) NH_4OH
 (d) NH_4NO_3

- 114.** Match List I (compound) with List II (use) and select the correct answer using the codes given below the lists. **2012 (II)**

List I (Compound)	List II (Uses)
A. Cellulose nitrate	1. Soft soap
B. Potassium sulphate	2. Gunpowder
C. Potassium salt of fatty acids	3. Fertiliser
D. Calcium oxide	4. Glass

Codes

A B C D	A B C D
(a) 2 3 1 4	(b) 2 1 3 4
(c) 4 1 3 2	(d) 4 3 1 2

- 115.** The most important raw materials used in the manufacture of cement are **2012 (II)**
- (a) potassium nitrate, charcoal and sulphur
 (b) limestone, clay and gypsum
 (c) transition metal oxides, sodium hydroxide or potassium hydroxide
 (d) limestone, sodium carbonate and silica

- 116.** Given below is an approximate composition of a substance, CaO –60-70%; SiO_2 –20-25% Al_2O_3 –5-10%; Fe_2O_3 –2-3%
 The substance is **2012 (II)**
- (a) plaster of Paris (b) cement
 (c) marble stone (d) quartz

- 117.** Which one among the following is the chemical formula of gypsum, which is an ingredient of cement? **2013 (I)**
- (a) Ca_2SiO_2 (b) $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$
 (c) CaO (d) $\text{CaSO}_4 \cdot 3\text{H}_2\text{O}$

- 118.** Sodium stearate is a salt and is used **2013 (I)**
- (a) in gunpowder (b) in paint
 (c) to make soap (d) to make fertiliser

- 119.** The principle of cleaning by soap is **2013 (I)**
- (a) surface tension (b) floatation
 (c) viscosity (d) elasticity

- 120.** Solutions of three enzymes were prepared namely lipase, trypsin and amylase, in order to remove stains from a piece of cloth. Out of these three enzyme solutions, only lipase could completely remove the stain. This indicates that the stain was due to **2013 (I)**
- (a) oil
 (b) protein
 (c) mixture of protein and oil
 (d) starch containing plant pigment

Directions (Q. Nos. 121-122)

Following questions consist of two statements labelled as Statement I and Statement II. Examine both the statements carefully and match the correct choice according to the codes given below.

- (a) Both Statement I and Statement II are true and Statement II is the correct explanation of the Statement I.
 (b) Both Statement I and Statement II are true but Statement II is not the correct explanation of the Statement I.
 (c) Statement I is true, but Statement II is false.
 (d) Statement I is false, but Statement II is true.

- 121. Statement I** Limestone decomposes when it is heated in air. **2013 (II)**

Statement II Increase in the content of CO_2 in the atmosphere in recent years is mainly due to the using of limestone in the manufacture of cement.

- 122. Statement I** Glass is not considered as a true compound.

Statement II Glass does not have a definite melting point.

2013 (II)

- 123.** The presence of sulphur in gunpowder **2013 (II)**

- (a) decreases the ignition temperature
 (b) increases the final temperature
 (c) increases explosiveness of the gunpowder
 (d) makes the powder smokeless

- 124.** Chromium oxide is used as an ingredient in paints to obtain

2013 (II)

- (a) green colour (b) blue colour
 (c) red colour (d) violet colour

- 125.** Calcium Ammonium Nitrate (CAN) is a popular nitrogen fertiliser because it is **2013 (II)**

- (a) slow supplier of nitrogen
 (b) having more percentage of nitrogen in it
 (c) fixing the nitrogen in the soil
 (d) capable of making the soil acidic

- 126.** A fertiliser contains 20% nitrogen by mass. To provide a fruit tree with an equivalent of 1 kg of nitrogen, the quantity of fertiliser required is **2014 (I)**

- (a) 20 kg (b) 0.20 kg
 (c) 0.05 kg (d) 5 kg

- 127.** Turpentine oil in paints is used as a ☑ 2014(II)
 (a) pigment
 (b) film-forming material
 (c) thinner (d) drier
- 128.** Which one of the following substances is most likely to be used as soap? ☑ 2014(II)
 (a) $\text{CH}_3(\text{CH}_2)_{12}\text{COOCH}_3$
 (b) $\text{CH}_3(\text{CH}_2)_5\text{O}(\text{CH}_2)_5\text{CH}_3$
 (c) $\text{CH}_3(\text{CH}_2)_{12}\text{COONa}$
 (d) $\text{CH}_3(\text{CH}_2)_{12}\text{CHCl}_2$
- 129. Statement I** The granules of modern gunpowder (also called black powder) are typically coated with graphite.
Statement II Graphite prevents the build-up of electrostatic charge.
Codes ☑ 2015(I)
 (a) Both the statements are individually true and Statement II is the correct explanation of Statement I
 (b) Both the statements are individually true but Statement II is not the correct explanation of Statement I
 (c) Statement I is true, but Statement II is false
 (d) Statement I is false, but Statement II is true
- 130.** The chemical used as a fixer/developer in photography is ☑ 2015(I)
 (a) sodium sulphate
 (b) sodium sulphide
 (c) sodium thiosulphate
 (d) sodium sulphite
- 131.** Washing soda is the common name for ☑ 2015 (I)
 (a) calcium carbonate
 (b) magnesium carbonate
 (c) sodium carbonate
 (d) potassium carbonate
- 132.** Which one among the following is used in making gunpowder?
 (a) Magnesium sulphate ☑ 2015 (I)
 (b) Potassium nitrate
 (c) Sodium stearate
 (d) Calcium sulphate
- 133.** The cleansing action of soap and detergent in water is due to the formation of ☑ 2015 (I)
 (a) micelle (b) salt
 (c) base (d) acid
- 134.** Addition of gypsum to cement ☑ 2015 (I)
 (a) reduces setting time of cement
 (b) produces very light colour of cement
 (c) increases setting time of cement
 (d) shining surface is formed
- 135.** Which one of the following are the characteristics of organic farming?
 1. Use of chemical fertilisers to improve soil fertility.
 2. Frequent decomposing and fallowing.
 3. Use of herbs to control pests.
 4. Higher productivity per hectare.
 Select the correct answer using the codes given below ☑ 2015(I)
 (a) 1 and 4
 (b) 1, 3 and 4
 (c) 2 and 3
 (d) 2, 3 and 4
- 136.** The phosphorus used in the manufacture of safety matches is ☑ 2016 (I)
 (a) red phosphorus
 (b) black phosphorus
 (c) white phosphorus
 (d) scarlet phosphorus
- 137.** Soap is the sodium or potassium salt of ☑ 2016 (I)
 (a) stearic acid
 (b) oleic acid
 (c) palmitic acid
 (d) All of the above

DIVERSITY IN LIVING WORLD

Generally 3-4 questions are asked from this chapter. Questions are mostly based upon mammals, insector, cold-blooded and warm blooded animals, difference between member of phylums.

Biology (Gr. *Bios*–life; *logos*–study) is the branch of science, which deals with the study of living organisms. The term ‘Biology’ was first used by **Lamarck** and **Treviranus** in 1800. A Greek Philosopher, **Aristotle** is regarded as the Father of Biology. **Biology has been divided into three main branches**

- (i) **Botany** (Gr. *Botane*–herbs) or **Phytology** Theophrastus is the Father of Botany.
- (ii) **Zoology** (Gr. *Zoon*–animal; *logos*–study) Aristotle is the Father of Zoology.
- (iii) **Microbiology** (Gr. *Microb*–minute; *bios*–life; *logos*–study) Antony van Leeuwenhoek is the Father of Microbiology. He firstly saw bacteria by his own made microscope.

LIVING AND NON-LIVING

Living beings are distinguished from non-living things on the basis of some fundamental characteristics. These include presence of protoplasm, cellular organisation or cellular structure, nutrition and metabolism, growth, reproduction and homeostatic response to environment.

Differences between Living and Non-living

Characters	Living	Non-living
Shape and size	A living body has its own kind of size and form.	Non-living objects do not have a form or size of their own.
Growth and development	All living organisms take the food material and utilise it for their growth and development.	There are no growth and development in non-living.
Metabolic activities	Metabolism (catabolism and anabolism) present.	Absent
Excretion	Waste products are excreted.	Excretion is absent.
Lifespan	Show a definite lifespan from birth to death.	Absent
Reproduction	Show reproduction.	Reproduction is absent.
Adaptability	Show adaptability to environment for survival.	Adaptability is absent.
Nutrition	Take food for performing different vital activities.	Nutrition is absent.
Movement and locomotion	Movement and locomotion are present.	Only mechanical movement is present by external forces.
Respiration	Cause breakdown of organic materials of the body and release energy for physiology.	May release heat on burning.
Irritability	Respond to stimuli.	No irritability.

Characteristics of Living Beings

There are some characteristics of living beings used to distinguish them from non-living things. These are as follows

- (i) **Protoplasm** It is the physical basis of life. All the metabolic activities occurs inside the protoplasm. It is the most dynamic feature of a living being. Life is dependent upon this dynamic nature of protoplasm.
- (ii) **Cell Structure** Living beings are made up of one or more cells. A cell is the structural and functional unit of life. It is the most peculiar feature of living organisms.
- (iii) **Nutrition** Living beings require energy, that they can use for growth and development. They get this energy from food. Nutrition is the process by which organisms obtain energy from nutrients such as proteins, carbohydrates and fats. For examples, plants make food from water, minerals and CO₂ in the presence of sunlight with the help of chlorophyll.
- (iv) **Metabolism** It is the sum total of all the chemical reactions taking place in an organism. Metabolism includes anabolism (making of substances) and catabolism (breaking of substances). Metabolism leads to energy production in an organisms.
- (v) **Respiration** It is an important characteristic of all living beings. In this process, they take up oxygen and release carbon dioxide. By this process the energy stored in food, is released and it is utilised for various activities.
- (vi) **Movement** All living things show movement. Animals show locomotion to search for food, shelter, mate, etc. Plants show movement of their parts or organs in response to a stimuli such as sunlight. In non-living organisms mechanical movement may be present.
